Rules and Regulations for the Construction and Classification of Steel Ships

Part 1

Regulations

July 2016

IRCLASS

Indian Register of Shipping

General Information

This consolidated version of the ‘Rules and Regulations for the Construction and Classification of Steel Ships’ (July, 2016) supersedes the July, 2015 edition of the Rules and includes the amendments published in Rules Change Notice No.1 of October, 2015 and Rules Change Notice No.2 of January, 2016.

A summary of additions and amendments incorporated in this consolidated version (further to amendments in Rule Change Notice No.1 of October, 2015 and Rule Change Notice No.2 of January, 2016) are indicated in Table 1.

RULES AND REGULATIONS FOR THE CONSTRUCTION AND CLASSIFICATION OF STEEL SHIPS – JULY 2016

TABLE 1 – AMENDMENTS INCORPORATED

These amendments will come into force as indicated in the Table

Section / Clause	**Subject / Amendments**
Part 1 Chapter 1 : General *The amendments are effective from 01 July 2016*	
1/1.9.1 &1.9.4	The term "surveys" is changed to appropriate term "inspections"
1/1.9.2 & 19.3	Requirement of verification of performance of service providers is added.
2/2.9.2	"Alternative Certification Scheme" (given in new section 4) is added as an option for certification of materials, components, equipment and machinery.
2/2.18.1.1	It is clarified that automatic suspension will be made only after the expiry of any extension granted to the certificate of class.
2/2.21	Reference is made to the requirements for transparency of information in Rules for Bulk Carriers and Tankers for vessels where IMO Goal Based Standards are applicable.
4	New section indicating requirements of Alternative Certification Scheme based upon QMS is added.
Part 1 Chapter 2 : Periodical Surveys *The amendments are applicable to surveys commenced on or after 01 July 2016*	
1/1.1.3	The clause is re-worded to reflect the present status of HSSC.
1/1.10.1	It is clarified that when the scope of annual surveys are increased to that of intermediate or special surveys and scope of intermediate surveys are increased to that of special surveys: thickness measurements, as per relevant tables, are to be carried out.
2/2.4.7.4	Requirements for close up survey and thickness measurements of hatch cover and coaming are now given in relevant tables.
2/Table 2.4.9.1 a), b) and c) ; 6/6.4.5.1, Table 6.4.7.1 and Table 6.4.8.1 a)	It is clarified that, for inaccessible internal structures of approved hatch covers, close up survey and TM are not required.
2/ Table 2.4.9.1 b)	Requirements for close up survey of side structure of bulk carriers: Transverse framing and Longitudinal framing system members are specified.
3/3.4.7, 4/4.4.7	It is clarified that tank testing procedure is to specify fill heights, tank being filled and bulkheads being tested.
3/Table 3.4.8.1 b), 4/Table 4.4.8.1 b)	Under note 7 "longitudinal bulkhead vertical girder" has been amended to "longitudinal bulkhead structural elements"
9/9.1.1 & 9.1.9	Possibility of extension of boiler surveys by 3 months beyond due date shifted from 9.1.9 to 9.1.1
18	New Section added (Section 18) stipulating requirements for periodical surveys of diving systems
Part 2 Chapter 1 : General Requirements *The amendments are effective from 01 July 2016*	
2	Reference is made to Part 1 Chapter 1 for general requirements for ACS and duplicated requirements in this chapter are deleted. Specific requirements for materials are retained.

Section / Clause	Subject / Amendments
Part 3 Chapter 5 : Longitudinal Strength *The amendments are applicable to ships contracted for construction on or after 01 July 2016*	
1/1.1.6	It is clarified that the requirements for longitudinal strength in this section do not apply to Container ships. Separate requirements for container ships are given in Pt.5, Ch.5, Sec.4.
Part 3 Chapter 6 : Bar Keel, Stem and Sternframe *The amendments are applicable to ships contracted for construction on or after 01 July 2016*	
4/4.3 & 4.5	Requirements for the structural strength of sole pieces and rudder horns have been indicated in Pt.3, Ch.14, Sec.7. Hence, the existing structural strength requirements in Pt.3, Ch.6 for sole pieces and rudder horn are deleted
Part 3 Chapter 12 : Opening and Closing Appliances *The amendments are applicable to ships contracted for construction on or after 01 July 2016*	
1/1.3.2	A note is added which clarifies that the horizontal design weather load need not be considered for the direct strength calculation unless it is used in the sub structures of horizontal support.
1/1.3.3	Several editorial changes are made in the requirements for cargo loads for better understanding.
1/1.3.4.2	The loads at each corner of container stack resulting from heave and pitch are specified.
1/1.3.4.4	Load cases with partial loading of containers are specified. Existing Fig.1.3.4.1 has been deleted and new Fig.1.3.4.4 is added. The partial loading for each Heel direction is indicated in the figure.
1/1.3.4.5	Requirements for the case of mixed stowage of 20 feet and 40 feet containers are added.
1/1.5	The corrosion additions and steel renewal requirements of hatch covers are given in this sub-section.
2/2.2.9	It is clarified that materials for hatch coaming are to satisfy the requirements of Pt. 2, Ch.2.
2/2.5.1	The types of hatch coaming stay constructions where simple beam analysis may be used and those requiring FEM analysis are separately shown in Fig.2.5.1.
2/2.6.4	Requirement for extension of coaming plate is added. Fig.2.6.4 gives example of hatch side girder.
3/3.1.3	It is clarified that materials of hatch covers are to comply with Pt.3, Ch.2 with Class I for top plate, bottom plate and primary support members.
3/3.3.1	Guidance on evaluation of stresses in finite elements of flanges of unsymmetrical girders is added
3/3.4	Fig.3.2 for determination of normal stresses is modified indicating that maximum stresses in the panel are to be considered .
3/3.4.2	The requirement of plate thickness when normal cargo is carried and when project cargo is carried are separated. Definition of project cargo is given in note.
3/3.5	Separate formula given for requirements of secondary stiffeners for considering weather loads and cargo loads.
3/3.7	It is clarified that double skin hatch covers or hatch covers with box girders are to be assessed using FEM.
4/4.4.1	It is clarified that accelerations in longitudinal and transverse directions need not be considered simultaneously.
4/4.4.2	Note added to clarify conditions for relaxation in permissible nominal surface pressures for hatch cover supports.

Section / Clause	Subject / Amendments
Part 3 Chapter 14 : Rudders *The amendments are applicable to ships contracted for construction on or after 01 July 2016*	
1/1.1	General requirements regarding acceptance of alternatives to the rules are indicated.
3/Table 3.1.1	Factor K2 for calculation of Rudder force for additional rudder profile types are given.
3/3.3.2	Detailed guidelines for calculating Bending moments and shear force distribution for various types of rudders are given in Sec.8 (new). Existing formulae in 3.3.2 are deleted.
4/4.1.2	Requirements for welding between plates and heavy pieces are given.
4/4.1.3 & 4.1.4	Existing 4.1.3 deleted and 4.1.4 has been renumbered. Details for slot welding are provided
4/ 4.1.5 to 4.1.8	New clauses added clarifying construction requirements for rudder blades.
4/4.3	Requirements for scantlings of rudder stock, blade and arms of single plated rudder are given.
4/4.4	Details of connection of solid parts with rudder blade are specified.
5/5.1.7	It is specified that where significant reductions in rudder stock diameter is achieved by using high strength steels, deformations are to be checked.
5/5.2.3	Requirement for Push up pressure of pintle bearings is specified.
5/5.3	Requirements for thickness of liners and bushes and minimum bearing surface area and maximum pressures are specified.
6/6.1.6	Detail of welded joint between rudder stock and coupling flange is given in Fig.6.1.6.
6/6.3	Requirements added for key dimensions for rudder couplings.
6/6.4	New formulae for push up pressure and push up length for rudder couplings are added.
7	Requirements for the structural strength of sole pieces and rudder horns have been indicated.
8	This section gives guidelines for calculation of BM, SF and support reactions on Rudder –Rudder stock system for various types of rudders.
Part 4 Chapter 1 : General Requirements for Design and Construction of Machinery *The amendments are effective from 01 July 2016*	
4/4.1	The existing requirements for certification based on QMS are deleted and reference is made to Pt.1. Ch.1, Sec.4.
4/4.2.1	It is clarified that in the case of diesel engines, ACS can be considered only where engines are type approved.
4/4.2.2	Individual components of diesel engines are to be certified in accordance with the new Classification Notes “ Approval of IC engines”.
Part 4 Chapter 4 : Prime Movers and Propulsion Shafting System	
4/4.1	*The amendments are effective from 01 July 2016* Reference is made to new Classification notes “Approval of IC engines” which covers documentation for approval, type testing and certification of engine components. The corresponding existing requirements in this chapter are deleted.
4/4.11	*The amendments are applicable to engines with an application for certification dated on or after 01 July 2016.* Requirements for Factory acceptance tests are added: This includes works trials in 4.11.3
4/4.12	*The amendments are applicable to engines:* *i) with an application for certification dated on or after 01 July 2016; or* *ii) installed on ships contracted for construction on or after 01 July 2016.* Requirements for test loads for various types of engine applications are added in Table 4.12.5.1 a) to e)

Section / Clause	Subject / Amendments
10	*The amendments are effective from 01 July 2016* Section 10 : “Turbochargers” is deleted as the requirements are now covered in classification notes “ Approval of IC engines”.
Part 4 Chapter 5 : Boilers and Pressure Vessels *The amendments are applicable to shell type exhaust gas heated economizers:* *i) when an application for certification of a shell type exhaust gas heated economizers is dated on or after 01 July 2016; or* *ii) which are installed onships contracted for construction on or after 01 July 2016*.	
3/3.2.1.9 b) and c)	3.2.1.9 b) and c) are deleted as operating practices are more relevant than design measures in this case.
Part 4 Chapter 8 : Electrical Installations *The amendments are effective from 01 July 2016*	
12/12.6	Reference is given to specific IEC standard 60092-503 for creepage distances and existing requirements are deleted.
12/12.11.4	It is specified that shutters of withdrawable circuit breakers are to be clearly marked for incoming and outgoing circuits
12/12.11.6	Internal arc classification for switchgear and control gear is specified
12/12.13	Requirement for clear working space in the vicinity of equipment. Ceiling/ deckhead clearances to meet internal arc classification requirements.
12/12.13.2	Voltage withstand test requirements after installation are harmonized with that of IEC 60502(1) and 60502(2)
Part 5 Chapter 1 : Dry Bulk Cargo Carriers *The amendments are applicable to ships contracted for construction on or after 01 July 2016*	
1/1.6.15	Where vertical ladders are installed with ladder linking platforms, the offset distances and arrangements are specified in Figure A and B.
Part 5 Chapter 4 : Liquefied Gas Carriers *The amendments are applicable to Gas Carriers constructed on or after 01 July 2016*	
All sections	The chapter has been completely revised in accordance with revised IGC Code (MSC 370(93)) and revised IACS UIs.
Part 5 Chapter 5 : Container Ships *The amendments are applicable to Container Ships contracted for construction on or after 01 July 2016*	
4	Requirements for hull girder strength in Section 4 have been completely revised in accordance with new IACS UR S11A
5	Existing Section 5 has been renumbered to Section 9. Existing requirements for local structure shifted from Section 4 to Section 5
6	Method for buckling assessment for container ships is elaborated.
7	Method for calculation of ultimate hull girder strength is given in this section.
8	Functional requirements and load cases for FE analysis are specified.
Part 5 Chapter 26 : Diving Support Vessels and Diving Systems *The amendments are effective from 01 July 2016*	
All sections	The chapter has been completely revised, to allow classification of diving systems independently from diving support vessels. The revised chapter also incorporates IMO requirements for Code of Safety for Diving Systems (A.831(19))

Section / Clause	Subject / Amendments
Part 6 Chapter 2 : Prevention of Fire and Explosion *The amendments are effective from 01 July 2016*	
2/IR 2.2.1.3	It is clarified that the fan in a HVAC control unit or a circulation fan inside a cabinet/ switchboard is not considered to be a ventilation fan if they are not capable of supplying outside air to the space when the power ventilation is shut down.
Part 6 Chapter 3 : Suppression of Fire *The amendments are applicable to all ships contracted for construction on or after 01 July 2016*	
4/4.5.2	The amendment clarifies the application of 4.5.2 relevant to the provision of additional fire-extinguishing arrangements. The word "of category A" were added to read : "Machinery spaces of category A containing internal combustion machinery"
Part 6 Chapter 4 : Escape *The amendments are applicable to ships contracted for construction on or after 01 Feb 2016*	
2/IR 2.3.3.3	It is clarified that the lowest open deck is an open deck (defined in Ch.3) at the lowest height from base line in way of accommodation spaces.
2/IR 2.4.1	Interpretations of escape routes are provided. Clear width in escape trunks are indicated by Fig.2.4.1.4.1.
2/IR 2.4.2.2.1 new	It is clarified that steering gear spaces which do not contain emergency steering position need only have one means of escape. Where it contains emergency steering position, one means of escape can be accepted if it leads directly to open deck.
2/IR 2.4.2	Interpretations for escape routes for cargo ships similar to that in 2.4.1 for passenger ships.

Section 1

General Information

1.1 Indian Register of Shipping

1.1.1 Indian Register of Shipping (hereinafter referred to as "IRS") was incorporated in 1975 as a Public Limited Company under Section 25 of the Indian Companies Act, 1956 for the purpose of providing amongst other things a faithful and accurate classification of mercantile shipping classed with it, to approve designs of, to survey and to issue reports on mercantile and non mercantile ships, hovercrafts, hydrofoils etc; all within the scope of classification described in the Rules. This Section contains General Regulations which have been adopted by IRS for its governance.

1.1.2 The management of the affairs of IRS are carried out under the direction and control of the Board of Directors (hereinafter referred to as the 'Board'), in accordance with the provisions of its Memorandum and Articles of Association.

1.1.3 The Board of Directors shall consist of representative of the interests of various members of the Company and those concerned with shipping in general as under:

3	Directors representing Indian Shipowners
2	Directors representing Indian Shipbuilders
1	Director representing General Insurance Corporation of India and other Indian underwriters
1	Director being the Director General of Shipping, Ministry of Surface Transport, Govt. of India
1	Director representing Ship Design Research and Development Institutions
1	Director representing Manufacturers of Marine Engines/General Engineering Goods
1	Director representing Indian Navy/Coast Guard
1	Director being a person of eminence from the field of Law
3	Directors being persons of eminence from any industry allied with maritime activities
1	Managing Director being full-time employee appointed by the Board of Directors.

The composition of the Board as above is to be in accordance with the Articles of Association of IRS (as may be amended from time to time).

1.1.4 The Board shall consist of not less than six and not more than fifteen Directors. The Board of Directors shall elect one of its members to be Chairman of the Board of Directors.

1.1.5 The Board is to appoint a Sub-Committee of Classification representing concerned interests.

1.1.6 The Board is to appoint the Chairman of the Sub-Committee of Classification and the Managing Director, IRS to be 'ex- officio' member of the Sub-Committee of Classification.

1.1.7 The employees of IRS are to be appointed by and be under the direction of the Board.

1.1.8 The Surveyors of IRS are not to be permitted without the special sanction of the Board of Directors to receive any fee, gratuity or reward whatsoever, for their own use or benefit, for any service performed by them in their capacity as Surveyors to IRS, except on pain of immediate dismissal.

1.1.9 The Funds and Accounts are to be under the authority and control of the Board of Directors.

1.2 Fees

1.2.1 Fees will be charged for all surveys and for other services rendered by IRS or any of its publications in accordance with established scales. Traveling expenses incurred by the Surveyors in connection with such services are also chargeable.

1.3 Technical committee

1.3.1 The Board is to appoint a Technical Committee whose function will be to consider:-

a) Formulation of Technical Rules for Classification Surveys, building of ships, their machinery and equipment.

b) Important alterations to Rules once framed as may be required from time to time.

1.3.2 All decisions of the Technical Committee including amendments and/or additions to the Rules for classification surveys and building of ships' hull, their machinery and equipment to be reported to the Board of Directors.

1.3.3 The Technical Committee to be constituted as follows:

Number of Members	**Nominees/Representatives of**
3	Board of Directors of IRS
1	Marine Engine Unit of M/s. Garden Reach Ship-builders and Engineers Ltd.
1	Other Marine Engine Builders
6	Shipbuilders
2	Indian Institution of Naval Architects
2	Institute of Marine Engineers (India)
1	Company of Master Mariners
2	Directorate General of Shipping
1	IMU (Earlier NSDRC)
4	Indian National Shipowners Association
1	Institution of Engineers (India)
1	Ex-Officio - Managing Director of IRS or his nominee
1	Indian Coastal Conference Shipping Association
1	Oil Industry Safety Directorate
5	Indian Navy
2	Indian Coast Guard
1	Research Institutes
2	Indian Institute of Technology/ National Institute of Technology
2	Maritime Training Institutes
3	Other Flag Administrations
1	Inland Waterways Authority of India.

1.3.4 In addition to the foregoing, the Technical Committee may co-opt to the main body other members of high managerial positions in Ship Building and Engineering, Naval Architecture, Marine Insurance, Steel Making, etc.

1.3.5 Nomination of all members to the Technical Committee to be subject to confirmation by the Board.

1.3.6 The Technical Committee can appoint panels from amongst its body to which representatives of any organisation or industry or individuals specialised in relevant disciplines could be co-opted for the purpose of considering any particular Technical problem or area of Rules.

1.3.7 The Board of Directors to appoint biennially, the Chairman of the Technical Committee and the Technical Committee to appoint from their own body biennially a Vice-Chairman. The appointment of Vice-Chairman to be confirmed by the Board of Directors.

1.3.8 The terms of office of all members to be not more than four years, one-fourth of all members (including those co-opted) to retire at the end of each calender year. The members so retiring being those who have been longest in office since their last nomination and such members to be eligible for re-nomination for a second term. Unless specially so authorised by the Board of Directors, no member other than Chairman and/or Vice- Chairman, who has served for two periods of nomination, to be eligible for re-nomination. In the event of any vacancy occurring before the expiration of the normal term of office, a representative to be nominated to fill the vacancy from the same group/body/institution and for such nominee the date of his nomination by the respective body to be considered as date of his joining the Technical Committee for purposes of his retirement by rotation.

1.3.9 The meeting of the Technical Committee to be convened as often and at such time and place as may appear necessary, but there shall be at least two meetings in each year.

1.3.10 The members desiring to propose alterations in, or additions to the Rules for the classification, survey or building of ship (hull and machinery) shall give notice of such proposals to the Secretary. Every meeting to be convened by notice from the Secretary, if possible one month before the date of the meeting and the Secretary to send to each member an Agenda paper as soon as possible thereafter.
Proposals for changes to rules may also be given by Flag Administrations, shipowners, shipbuilders and other interested parties who may not be represented in the Technical Committee.

1.3.11 The quorum for any meeting of Technical committee will be six members, with at least 50% of the members present being those who do not represent shipowners, shipbuilders or others engaged commercially in the manufacture, equipping, repair or operation of ships.

1.3.12 In the event that any matter is not decided by unanimity, the same may be decided by a majority of votes cast in favor, with each member, including co-opted members, having one vote only. In the event of a parity of votes, the Chairman of the Technical Committee would be entitled to an additional casting vote.

1.3.13 When any discussion relates to an item of interest to those representing shipowners, shipbuilders or others engaged commercially in the manufacture, equipping, repair or operation of ships, such representatives would not be entitled to vote, if such matter is to be decided by voting.

1.3.14 In the event that any member of the Technical Committee absents himself for 3 consecutive meetings of the Technical Committee without seeking leave of absence, he would be deemed to have vacated office and his vacancy would be filled by seeking fresh nomination from concerned interest represented.

1.3.15 In the absence of the Chairman & the Vice Chairman of the Technical Committee, the members of the Technical committee shall elect a Chairman, by majority vote, to preside over that particular meeting only.

1.3.16 The Board of Directors reserves to themselves the right of altering, adding to or rescinding any/or all of the above terms of reference including the dissolution of the Technical Committee.

1.4 Survey reports

1.4.1 All reports of survey are to be made by the Surveyors according to the form prescribed and submitted for consideration of the Board or the Sub-Committee of Classification, but the character assigned by the latter is to be reported to the Board. The Board may, in specified instances, vest in the Managing Director discretionary powers to act on its behalf, and all such actions being reported to the Board at its subsequent meeting.

1.4.2 The reports of the Surveyors shall, subject to the approval of the Managing Director, be open to inspection of the Owner and any other person authorised in writing by the Owner. Copies of the reports will, subject to the approval of the Managing Director, be supplied to Owners or their representatives.

1.5 Register of Ships

1.5.1 A Register Of Ships is available on-line on IRCLASS Website which contains the names of ships, character of class and notations assigned together with other relevant useful information for ships classed with IRS.

1.6 Liability

1.6.1 Whilst Indian Register of Shipping (hereinafter referred to as IRS) and its Board/Committees use their best endeavours to ensure that the functions of IRS are properly carried out, in providing services, information or advice, neither IRS nor any of its servants or agents warrants the accuracy of any information or advice supplied. Except as set out herein, neither IRS nor any of its servants or agents (on behalf of each of whom IRS has agreed this clause) shall be liable for any loss damage or expense whatever sustained by any person due to any act or omission or error of whatsoever nature and howsoever caused of IRS, its servants or agents or due to any inaccuracy of whatsoever nature and howsoever caused in any information or advice given in any way whatsoever by or on behalf of IRS, even if held to amount to a breach of warranty. Nevertheless, if any person uses services of IRS, or relies on any information or advice given by or on behalf of IRS and suffers loss, damage or expenses thereby which is proved to have been due to any negligent act omission or error of IRS its servants or agents or any negligent inaccuracy in information or advice given by or on behalf of IRS then IRS will pay compensation to such person for his proved loss up to but not exceeding the amount of the fee charged by IRS for that particular service, information or advice.

1.6.2 Any notice of claim for loss, damage or expense as referred to in 1.6.1 shall be made in writing to IRS Head Office within six months of the date when the service, information or advice was first provided, failing which all the rights to any such claim shall be forfeited and IRS shall be relieved and discharged from all liabilities.

1.7 Audits and assessments by external organizations

1.7.1 The surveys required by the regulations, and conducted by IRS may be subject to Audit by an independent Accredited Certification Body (ACB) as per the requirements of ISO 9001:2008 standard and Quality Management System Certification Scheme (QSCS) of IACS. For this purpose, ACB auditors are to be given the necessary access to the ship, shipyard or works when requested by IRS.

Access is also to be given to auditors or inspectors accompanying the Surveyors as required by other external organizations.

1.8 Access of Surveyor to ships, shipyards or works

1.8.1 The Surveyors are to be given free access to ships classed with IRS as well as to shipyards, works, etc. so as to perform their duties, and are to receive adequate assistance for this purpose.

1.9 Requirements for service suppliers

1.9.1 In general, the following categories of service suppliers are to be approved:

a) Classification and / or Statutory services

- Firms engaged in thickness measurements on ships
- Firms engaged in tightness testing of closing appliances such as hatches, doors, etc with ultrasonic equipment
- Firms carrying out in-water survey of ships and mobile offshore units.
- Firms engaged in the examination of Ro-ro ships, bow, stern, side and inner doors.
- Firms engaged in measurement of noise levels onboard ships
- Firms engaged in tightness testing of primary and secondary barriers of gas carriers with membrane cargo containment systems for vessels in service.
- Firms engaged in inspections and maintenance of fire extinguishing equipment and systems
- Firms engaged in testing of coating systems in accordance with the requirements of IMO performance standards for protective coatings.

b) Statutory services

- Firms engaged in servicing inflatable liferafts, inflatable lifejackets, hydrostatic release units, inflatable rescue boats, marine evacuation systems, etc.

- Firms engaged in the inspections and testing of radio communication equipment

- Firms engaged in inspections and maintenance of self contained breathing apparatus

- Firms engaged in the annual performance testing of voyage data recorder and simplified voyage data recorders

- Firms engaged in the inspections of low location lighting systems using photo luminescent materials and evacuation guidance systems used as an alternative to low location lighting systems

- Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships

- Firms engaged in the servicing and maintenance of lifeboats, launching appliances, on-load release gear and davit-launched liferaft automatic release hooks

- Firms engaged in the inspection, performance testing and maintenance of Automatic Identification Systems (AIS).

1.9.2 Where the results of the following service providers are used by a Surveyor of IRS in making decisions affecting Classification services, then that service provider is to be approved and service performance verified by IRS:

- Firms engaged in thickness measurements on ships

- Firms carrying out in-water survey of ships and mobile offshore units

- Firms engaged in tightness testing of closing appliances such as hatches, doors etc with ultrasonic equipment

IRS may also accept the services of firms approved by other IACS member classification societies for such services other than those listed above.

1.9.3 Where services are used by the Surveyors in making decisions affecting statutory certification and services, the firms are subject to approval and performance verification by IRS, where IRS is so authorized by the relevant Flag Administration (i.e. the Flag of the ship on which the servicing is to be done or the service equipment is to be used). For such services, IRS may accept approvals done by:

I. The Flag Administration itself,
II. Duly authorized organisation acting on behalf of the Flag Administration, or
III. Other organizations those are acceptable to the Flag Administration (e.g. other governments etc).

1.9.4 Use of the approved service suppliers is not mandatory for the following services, unless instructed otherwise by the flag Administration with respect to statutory certification:

- Firms engaged in the inspections of low location lighting systems using photo luminescent materials and evacuation guidance systems used as an alternative to low location lighting systems

- Firms engaged in sound pressure level measurements of public address and general alarm systems on board ships

- Firms engaged in measurement of noise levels onboard ships

- Firms engaged in testing of coating systems in accordance with the requirements of IMO performance standards for protective coatings.

- Firms engaged in the examination of bow, stern, side and inner doors.

1.10 Responding to Port State Control

1.10.1 When requested by Port State and upon concurrence by the vessel's owner/master IRS Surveyors would attend onboard a ship in order to assist in the rectification of reported deficiencies or other discrepancies that affect or may affect classification or the statutory certificates issued by IRS. The owner and the vessel's flag state will be notified of such attendance and survey. IRS Surveyors will also cooperate with Port States by providing inspectors with background information.

Section 2

Classification Regulations

2.1 General

2.1.1 When a ship is assigned a specific Character of Class by Indian Register of Shipping, it implies that IRS has been satisfied that the said ship meets, for this particular class, with these Rules and Regulations or requirements equivalent thereto. The ship will continue to be classed with IRS so long as she is found, upon examination at the prescribed annual and periodical surveys, to be maintained in a fit and efficient condition and in accordance with the Periodical Survey requirements of these Rules. Classification will be conditional upon compliance with IRS requirements and assignment of character of class for both hull and machinery.

2.1.2 The Rules are framed on the understanding that ships will be properly loaded and handled; they do not, unless stated in the class notation, provide for special distributions or concentrations of loading and that ships will not be operated in environmental conditions more severe than those agreed for design basis and approval.

2.1.3 Compliance with the following IMO conventions, codes and resolutions, as amended, and as applicable, is a pre-requisite of classification:

- International Convention on Loadlines (ILLC)
- International Convention for the Safety of Life at Sea (SOLAS)
- International Convention for the Prevention of Pollution from Ships (MARPOL)
- International Convention on the Control of Harmful Antifouling Systems on Ships (AFS Convention)
- International Bulk Chemical Code (IBC Code) or Bulk Chemical Code (BCH Code)
- International Gas Carrier Code (IGC Code) or Gas Carrier Code (GC Code)
- Fire Test Procedures Code (FTP Code) of the International Maritime Organization (IMO)
- Codes on noise levels on board ships.
- Related Resolutions of the IMO Assembly, the Maritime Safety Committee (MSC) and the Marine Environment Protection Committee (MEPC) of IMO.

In addition, the Unified Interpretations of IACS (International Association of Classification Societies) related to the above IMO Conventions and Codes are also to be complied with unless provided with written instruction to apply a different interpretation by the flag Administration.

2.1.4 Where a vessel holds dual classification with IRS and the periodical survey requirements of the corresponding Society differ from those of the Rules of IRS, IRS may permit the requirements of the corresponding Society being applied, in so far as they are equivalent in purpose or are no less stringent than the IRS rule requirement.

2.1.5 The classification of a ship with IRS does not exempt the owners from compliance with any additional and/or more stringent requirements issued by the Administration of the state whose flag the ship is entitled to fly and provision for their application.

2.1.6 It is the responsibility of the Owners to ensure that the operating and maintenance instructions/manuals for the ship machinery equipment essential to the safe operation of the ship are available in a language understandable by those officers and crew members who are required to understand such information /instructions in the performance of their duties.

2.1.7 When a ship is detained by Port State Control, IRS is to be immediately notified by the owner / operator for arranging attendance by a Surveyor.

2.2 Application of Rules

2.2.1 Unless directed otherwise by IRS, no new Regulations or amendments to the Rules relating to the character of classification or class notation is to be applied to the existing vessels.

2.2.2 Unless directed otherwise by IRS, no new Rules and Regulations or amendments to the existing Rules & Regulations become applicable within 6 months after the date of issue.

2.3 Scope of classification

2.3.1 Classification covers ship's hull, appendages and machinery including electrical systems to the extent as specified in these Rules & Regulations. Classification does not guarantee the design or performance of a vessel except for those aspects covered by the rule requirements and subject to the conditions of operation of the vessel mentioned in 2.1.2.

2.3.2 On application by Builder or Owner, certain installation, e.g. refrigerating machinery may be classed by IRS.

2.4 Interpretations of the Rules

2.4.1 The correct interpretation of the requirements contained in the Rules and other Regulations is the sole responsibility and at the sole discretion of IRS.

2.5 Definitions

2.5.1 **Clear water** : Water having sufficient depth to permit the normal development of wind generated waves.

2.5.2 **Fetch** : The extent of clear water across which a wind has blown before reaching the ship.

2.5.3 **Sheltered water** : Water where the fetch is six nautical miles or less.

2.5.4 **Reasonable weather** : Reasonable weather is assumed to exclude winds exceeding Beaufort force six associated with sea states resulting in green water being frequently taken on board the ship's deck. However it is realised that this is largely a matter of judgment and good seamanship and can vary for particular ships.

2.5.5 **Type notation** : A notation indicating that the ship has been designed and constructed with applicable Rules to that type of ship, e.g. "Bulk Carrier", "Oil Tanker", etc.

2.5.6 **Cargo notation** : A notation indicating that the ship has been designed, modified or arranged to carry one or more particular cargoes, e.g. "Phosphoric Acid". Ships with one or more particular cargo notations are not thereby prevented from carrying other cargoes for which they are suitable.

2.5.7 **Special feature notation** : A notation indicating that the ship incorporates special features which significantly affect the design, e.g. "movable decks".

2.5.8 **Service restriction notation** : A notation indicating that a ship has been classed on the understanding that it will be operated only in suitable areas or conditions which have been agreed to by IRS e.g. "Sheltered Water Service".

2.6 Character of classification

2.6.1 The following Characters and symbols are assigned by IRS to indicate classification of Steel Ships. (For explanation of abbreviations, see Appendix I).

2.6.2 **Character SUL** assigned to sea-going vessels indicates that the hull and its appendages and equipment (i.e. anchors, chain cable and hawsers) meet the Rule requirements for assignment of this Character of Class.

Guidance Note : Appendages to the hull referred to in 2.6.2, 2.6.3 and 2.6.4 means the rudder & rudder stock, rudder horn, sole pieces, propeller nozzles, shaft brackets, skeg etc. which are covered by the rule requirements.

2.6.3 **Character SU-** assigned to sea-going vessels indicates that the hull and its appendages meet the Rule requirements but equipment (i.e. anchors, chain cable and hawsers) is not supplied or maintained as per the relevant Rules but is considered by IRS to be acceptable for particular service.

2.6.4 **Character SU** assigned to sea-going vessels indicates that the hull and its appendages meet the Rule requirements but where special consideration has been given for reason of particular purpose of service and normal equipment may be unnecessary. In such cases letter 'L' is omitted from the Character SUL.

2.6.5 **Character IY** assigned to self-propelled seagoing vessels indicates that the machinery meets the Rule requirements for assignment of this Character of Class.

2.6.6 **The distinguishing mark** 卐 inserted before a Character of Class (SUL, SU-, SU, IY as appropriate) is assigned to new ships where the hull and its appendages, equipment and the machinery, as appropriate, are constructed under special survey of IRS in compliance with the Rules to the satisfaction of IRS.

2.7 Class notations - Hull

2.7.1 When requested by an Owner and agreed to by IRS or when considered necessary by IRS, a class notation will be appended to the character of classification. This class notation will consist of one of, or a combination of - a type notation, a cargo notation, a special duties notation, a special features notation and/or a service restriction notation, e.g. 卐 SUL CHEMICAL TANKER, "Sulphuric Acid", ESP, "Indian Coastal Service".

2.7.2 Details of the ship types and additional class notations are given in Appendix 1 and applicable Chapters in Pt.5 of the Rules.

2.7.3 Service restriction notation will generally be assigned in one of the forms given below, but this does not preclude the Owners or Shipbuilders from requesting special consideration for other forms of restrictions.

a) Sheltered Water Service : Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered water between islands. The geographical limits will form part of the Class Notation.

b) Restricted Water Service : Service in sheltered waters and also for short distances (generally less than 15 nautical miles) beyond sheltered waters in 'reasonable weather'. The geographical limits will form part of the Class Notation.

c) Specified Coastal Service : Service along a coast, during the course of which the vessel does not go more than 20 nautical miles from the nearest land and may cross gulfs or similar features recognised by the local Administration as a part of the coastal service. The geographical limits will form part of the Class Notation, e.g. "Indian Coastal Service".

d) Specified Route Service : Service between two or more points or other geographical features which will form part of the Class Notation.

e) Specified Operating Area Service : Service within one or more geographical area(s) which will form part of the Class Notation.

2.8 Class notations - Machinery

2.8.1 The class notations that may be assigned by IRS are given in Appendix 1. IRS may prescribe additional notations as found necessary / expedient from time to time.

2.9 Materials, components, equipment and machinery

2.9.1 The materials used in the construction of hull and machinery intended for classification, or in the repair of ships already classed, are to be of good quality and free from defects and are to be tested in accordance with the relevant Rules. The steel is to be manufactured by an approved process at works recognized by IRS. Alternatively, tests to the satisfaction of IRS will be required to demonstrate the suitability of the steel.

Consideration may be given by IRS to accept the works approved by IACS Member Societies with whom IRS currently has Cooperation Agreements for this purpose.

2.9.2 Certification of materials, components, equipment and machinery is carried out on basis of the following, considering IRS and/or IMO requirements, as applicable:

a) Type approval carried out by IRS.

b) Unit certification by IRS.

c) Alternative Certification Scheme by IRS (see Section 4).

d) Mutual recognition of certificates, if type approved by an IACS Member Society or European Union recognized organization based on commonly agreed design requirements between IRS and the recognized organization.

2.10 Request for surveys

2.10.1 It is the responsibility of the Builders or Owners, as applicable, to inform the Surveyors of IRS in the port at which the surveys for supervision during new construction or ships in service are to be undertaken and to ensure that all surveys for issue of class certificate for new construction, and maintenance of class for ships in service are carried out.

2.11 Repairs

2.11.1 Any repairs to the hull, machinery and equipment either as a result of damage or wear and tear which are required for the maintenance of ship's class are to be carried out under the inspection of and to the satisfaction of the Surveyors.

2.11.2 Where a vessel is damaged to an extent resulting in towage outside port limits, it shall be the Owners' responsibility to notify IRS at the first practicable opportunity.

2.11.3 Where such repairs are effected at a port where there is no Surveyor of IRS, the ship is to be surveyed by one of its Surveyors at the earliest opportunity.

2.11.4 Where repairs to hull, machinery or equipment, which affect or may affect classification, are to be carried out by a riding crew, they are to be planned in advance. A complete repair procedure including the extent of proposed repairs and the need for Surveyor's attendance during the voyage is to be submitted to and agreed upon by the Surveyor reasonably in advance. Failure to notify IRS, in advance of the repairs, may result in suspension of the vessel's class.

Where in any emergency circumstance, emergency repairs are to be effected immediately, the repairs should be documented in the ship's log and submitted thereafter to IRS for use in determining further survey requirements.

2.12 Alterations

2.12.1 Any alterations proposed to be carried out to approved scantlings and arrangements of the hull, machinery or equipment are to meet with the approval of IRS and for this purpose plans and technical particulars are to be submitted for approval in advance. Such approved alterations are to be carried out under the inspection of, and to the satisfaction of, the Surveyors. If such alterations are carried out on items which may affect the classification of the ship without informing IRS, the class of the vessel will be liable to be suspended except in the case of emergency repairs mentioned in 2.11.4.

2.13 Classification of new constructions

2.13.1 The request for classification of new constructions is to be submitted to IRS by the shipyard or shipowner in the form provided by IRS. The request is to include complete details regarding class notation and statutory certificates required, where applicable.

The IRS Rules in force on the date of contract for construction of the vessel (See 2.14) will be applicable for classification, in general. However, statutory requirements coming into force after the date of contract for construction may have to be complied with if they become applicable based on any other criteria such as the date on which vessel is constructed (keel laid).

2.13.2 Where orders for major machinery and equipment are placed on manufacturer or suppliers, IRS will have to be informed. Responsibility for compliance with IRS Rules and Regulations shall be with the manufacturers/suppliers.

Where relevant, the date of application for certification of specific major machinery will also be considered in addition to the date of contract for construction of the vessel, for determining the applicable rules for such machinery.

2.13.3 Plans and particulars as specified in the Rules will have to be submitted to IRS in triplicate sufficiently in advance of commencement of construction. One copy with stamp of approval will be returned. Any deviation from approved drawings will require to be approved by IRS prior to execution of work.

IRS reserves the right to request for additional plans, information or particulars to be submitted.

Where it is proposed to use existing previously approved plans for a new contract, written application is to be made to IRS.

Approval of plans and calculations by IRS does not relieve the Builders of their responsibility for the design, construction and installation of the various parts, nor does it absolve the Builders from their duty of carrying out any alterations or additions to the various parts on board deemed necessary by IRS during construction or installation on board or trials.

2.13.4 IRS will assess the production facilities and procedures of the shipyard and other manufacturers as to whether they meet the requirements of the construction Rules.

Review of the construction facilities prior to any steel work or construction shall be carried out under the following circumstances:

a) Where IRS has none or no recent experience of the construction facilities – typically after a one year lapse – or when significant new infrastructure has been added.

b) Where there has been a significant management or personnel re-structuring having an impact on the ship construction process, or

c) Where the shipbuilder contracts to construct a vessel of a different type or substantially different in design.

2.13.5 During construction of a vessel, IRS will ensure by surveys that parts of hull and machinery requiring approval have been constructed in compliance with approved drawings, all required tests and trials are performed satisfactorily, workmanship is in compliance with current engineering practices and welded parts are produced by qualified welders.

2.13.6 All hull, machinery and electrical installations will be subjected to operational trials in the presence of IRS Surveyor.

2.13.7 On completion of the ship copies of as fitted plans showing the ship as built, essential certificates and records, loading manual etc. are to be submitted by the Builder generally prior to issuance of the Interim Certificate of Class.

2.13.8 For each new construction the shipbuilder is required to prepare and deliver a ship construction file containing documents / plans / manuals etc. for facilitating the future inspection of survey, repair and maintenance as detailed in Pt.3, Ch.1, Sec.3. Some of these documents may be directly supplied by other parties e.g. shipowner, for inclusion in the ship construction file. The ship construction file is to be maintained onboard each ship.

2.14 Date of contract for construction

2.14.1 The date of “contract for construction” of a vessel is the date on which the contract to build the vessel is signed between the prospective owner and the shipbuilder. This date and the construction numbers (i.e. hull numbers) of all the vessels included in the contract are to be declared to IRS by the party applying for the assignment of class to a new building.

2.14.2 The date of “contract for construction” of a series of vessels, including specified optional vessels for which the option is ultimately exercised, is the date on which the contract to build the series is signed between the prospective owner and the shipbuilder.

For the purpose of this requirement, vessels built under a single contract for construction are considered a “series of vessels” if they are built to the same approved plans for classification purposes. However, vessels within a series may have design alterations from the original design provided:

a) Such alterations do not affect matters related to classification, or

b) If the alterations are subject to classification requirements, these alterations are to comply with the classification requirements in effect on the date on which the alterations are contracted between the prospective owner and the shipbuilder or, in the absence of the alteration contract, comply with the classification requirements in effect on the date on which the alterations are submitted to IRS for approval.

The optional vessels will be considered part of the same series of vessels if the option is exercised not later than 1 year after the contract to build the series was signed.

2.14.3 If a contract for construction is later amended to include additional vessels or additional options, the date of “contract for construction” for such vessels is the date on which the amendment to the contract, is signed between the prospective owner and the shipbuilder. The amendment to the contract is to be considered as a “new contract” to which 2.14.1 and 2.14.2 above apply.

2.14.4 If a contract for construction is amended to change the ship type, the date of “contract for construction” of this modified vessel, or vessels, is the date on which revised contract or new contract is signed between the Owner, or Owners, and the shipbuilder.

2.15 Date of build

2.15.1 The date of completion of the special survey inspection will normally be taken as the date of build to be entered in the Register Book.

Where there is a substantial delay between completion of construction survey and the ship commencing service, the date of commissioning may be specified on the classification certificate.

When modifications are carried out on a ship, the initial date of build remains assigned to the ship.

2.15.2 When a complete replacement or addition of a major portion of the ship (e.g. fwd.section, midship section or aft section) is involved, the following applies:

- Date of build assigned to each portion of the ship will be indicated on the classification certificate, and the date of modification will be indicated in the Register Book.

- Survey requirements shall be based on the date of build associated with each major portion of the ship.

2.16 Appeal from Surveyors' recommendations

2.16.1 If the recommendations of the Surveyors are considered in any case to be unnecessary or unreasonable, appeal may be made to IRS, who may direct a special examination to be held.

2.17 Certificates

2.17.1 Certificates of Class will be issued to Builders or Owners when the required reports on completion of Special Surveys of new ships or of existing ships submitted for classification have been received from the Surveyors and approved by IRS.

2.17.2 Certificates of class maintenance in respect of completed periodical special surveys of hull and machinery will also be issued to Owners.

2.17.3 The Surveyors are permitted to issue Interim Certificates to enable a ship, classed with IRS, to proceed on her voyage provided that, in their opinion, she is in a fit and efficient condition. Such Certificates will contain Surveyors' recommendations for continuance of Class, but in all cases are subject to confirmation by IRS.

2.17.4 Individual Certificates can also be issued for propelling machinery, boilers, equipments and fittings which have been manufactured under IRS Survey and in accordance with these Regulations.

2.18 Suspension, withdrawal and deletion of class

2.18.1 Suspension

2.18.1.1 The class of a vessel will be automatically suspended from the expiry date of the Certificate of Class or by the expiry date of any extension granted, if the special survey has not been completed by the due date and an extension (See Ch.2, 1.11) has not been agreed to, or the vessel is not under attendance by the Surveyor with a view to complete the surveys prior to resuming service.

2.18.1.2 The class of a vessel will also be automatically suspended if the annual, intermediate survey become overdue. (See Pt.1 Ch.2, Table 1.1.1 for due dates and window period).

2.18.1.3 When the surveys relating to specific additional notations of hull or equipment or machinery have not been complied with and thereby the ship is not entitled to retain that notation, then the specific notation will be suspended till the related surveys are completed.

2.18.1.4 The class of a vessel will be subject to a suspension procedure if an item of continuous survey is overdue at the time of annual survey, unless the item is dealt with or postponed by agreement.

2.18.1.5 The class of the vessel will also be subject to a suspension procedure if recommendations and/or conditions of class are not dealt with by the due date or postponed by agreement, by the due date.

2.18.1.6 The class of a ship is liable to be withheld or, if already granted, may be withdrawn in case of any non-payment of fees or expenses chargeable for the service rendered.

2.18.1.7 Where any ship proceeds to sea with less freeboard than that approved by IRS or when the freeboard marks are placed higher on the ship's sides than the position assigned or approved by IRS, the ship's class will be suspended.

2.18.1.8 When it is found that a ship is being operated in a manner contrary to that agreed at the time of classification, or is being operated in conditions or in areas more onerous than those agreed, the class will be suspended.

2.18.1.9 The class of a vessel will be liable to be suspended if the Owner fails to notify IRS of any damage to the ship‘s hull, machinery or equipment, which may adversely affect classification of the vessel or subsequently fails to arrange for the survey as may be advised by IRS.

2.18.1.10 The class of a vessel will be suspended after a major casualty to the ship, such as grounding, sinking or breaking up, if the Owner is unable to arrange for the ship’s survey by IRS and commence repairs within a reasonable period of the occurrence of the casualty, unless otherwise agreed to with IRS.

2.18.1.11 Vessels laid up in accordance with the Rules prior to surveys becoming overdue will not be suspended when surveys addressed above become overdue.

However, ships which are laid up after being suspended as a result of surveys becoming overdue, will remain suspended until the overdue surveys are completed.

2.18.1.12 When a vessel is intended for a demolition voyage with any periodical survey overdue, the vessel's class will not be suspended till completion of a single direct ballast voyage from the lay up or final discharge port to the demolition yard.

2.18.1.13 Force Majeure : If, due to circumstances defined in Chapter 2, 1.11.3, the vessel is in a port where the overdue surveys cannot be completed at the expiry of the periods allowed above, IRS may allow the vessel to sail, in class, directly to an agreed discharge port, and if necessary, thereafter in ballast, to an agreed port at which the survey will be completed, provided:

a) Re-examination of the ship's record is carried out by IRS,

b) IRS carries out the due and/or overdue surveys and examination of Recommendations / Conditions of Class at the first port of call when there is an unforeseen inability of IRS to attend the vessel in the present port, and

c) IRS is satisfied that the vessel is in condition to sail for one trip to a discharge port and subsequent ballast voyage to a repair facility if necessary (where there is unforeseen inability of IRS to attend the vessel in the present port, the master is to confirm that the ship is in condition to sail to the nearest port of call).

The scope of the overdue surveys will be based on the survey requirements applicable to the vessel at the original due date and not based on the age of the vessel when the survey is carried out. Such surveys will be credited from the date originally due.

If class has already been automatically suspended in such cases, it may be reinstated subject to the conditions prescribed above.

2.18.1.14 When a vessel is intended for a single voyage from laid-up position to repair yard with any periodical survey overdue, the vessel's class suspension may be held in abeyance and consideration may be given to allow the vessel to proceed on a single direct ballast voyage from the site of lay up to the repair yard, upon agreement with the Flag Administration, provided IRS finds the vessel in satisfactory condition after surveys, the extent of which are to be based on surveys overdue and duration of lay-up. A short-term Class Certificate with conditions for the intended voyage may be issued. This is not applicable to vessels whose class was already suspended prior to being laid-up.

2.18.1.15 Classification will be reinstated upon satisfactory completion of overdue survey. The scope of the overdue surveys will be based on the survey requirements applicable to the vessel at the original due date and not based on the age of the vessel when the survey is carried out. Such surveys will be credited from the date originally due. Such surveys will be credited from the date originally due. However, the vessel will remain dis-classed from the date of suspension until the date class is reinstated.

2.18.1.16 The Owners and the Flag State, where applicable, would be informed in writing, of the suspension and reinstatement of Classification.

2.18.2 Withdrawal

2.18.2.1 Ship's class will be withdrawn, at the end of six months of suspension, if the Owner has not commenced any action to reinstate the ship's class. A longer suspension period may be granted when the vessel is not trading or in cases of lay-up awaiting attendance for reinstatement or disposition, in the event of a casualty.

2.18.2.2 When the class of a ship holding IRS class, is withdrawn by IRS in consequence of a request from the Owners, the notation "Class withdrawn at Owners' request" (with date) will be made in the subsequent reprints of the Register Of Ships. This entry will continue till the ship's class is reinstated or deleted.

2.18.2.3 When the Regulations as regards surveys on the hull or equipment or machinery have not been complied with and the ship thereby is not entitled to retain her class, the class will be withdrawn and the notation "Class withdrawn" (with date) will be made in the subsequent reprints of the Register Of Ships. This entry will continue till the ship's class is reinstated or deleted.

2.18.2.4 The withdrawal of a vessel will be confirmed in writing to the Owner and the Flag State, where applicable.

2.18.3 Deletion of Class

2.18.3.1 A ship will be considered to “cease to exist” when it is destroyed by scrapping or by sinking to unsalvageable depths or abandoned by the owner.

2.18.3.2 A ship can also be considered to “cease to exist” when it is broken up either by grounding or due to structural failure or due to actions of war or sabotage.

2.18.3.3 Ship’s class will be deleted when it ceases to exist.

2.19 Reclassification of ships

2.19.1 When Owners request for reclassification of a ship for which the class previously assigned has been withdrawn, IRS will require a Special Survey for Reclassification to be held by the Surveyors. The extent of the survey will depend upon the age of the ship and the circumstances of each case.

2.19.2 If the ship is found or placed in good and efficient condition in accordance with the requirements of the Rules and Regulations at the Special Survey for Reclassification, IRS may decide to reinstate her original class or assign such other class as considered appropriate.

2.19.3 The date of reclassification will appear in the supplement to the Register Of Ships and the subsequent issue of Register Of Ships.

2.20 Condition improvement program

2.20.1 The Condition Improvement Program (CIP) of IRS classed ships is aimed at improving fleet quality and safety and reducing the risk of Port State Control detentions.

Under this program vessels requiring special attention are identified based on multiple risk criteria and study of the recent history of the vessel such as survey status, conditions of class, recommendations, detentions etc. and the shipowner so informed.

2.20.2 Vessels identified for condition improvement would be subject to additional surveys over and above the normal classification surveys. For this purpose, surveyors are to be given necessary access to the ship for identification of deficiencies and recommendation of repairs. Deficiencies requiring immediate attention as indicated by the Surveyor are to be repaired promptly and thoroughly.

2.21 Transparency of classification and statutory information

2.21.1 The classification and statutory information which may be released to Shipowners, Flag State, Port state, Insurance company and Shipyards as relevant and the conditions for their release are indicated in Table 2.21.1. For oil tankers and bulk carriers subject to SOLAS Chapter II-1, Part A-1, Regulation 3-10, refer to IRS Rules for Bulk Carriers and Oil Tankers, Volume 1, Part 1, Chapter 1.

Section 3

Classification of Ships not Built under the Survey of Indian Register of Shipping

3.1 General procedure for classification of ships not built under survey of IRS

3.1.1 Plans of hull and machinery in duplicate, together with torsional vibration calculations, where applicable, as specified in 3.2.5 are to be submitted for approval. It is preferable to have the plans approved before the classification survey is commenced.

3.1.2 Full special classification surveys would require to be carried out by IRS Surveyors in order to satisfy themselves regarding the workmanship and condition of the ship and to verify the approved scantlings and arrangements. The scope of these surveys may, however, be modified in the case of vessels built under the Special Survey and holding valid certificates of class of established classification societies or equivalent, if prior to commencement of survey by IRS, documentary evidence of all hull and machinery classification surveys held by the other society subsequent to last special survey carried out by them could be produced. In such cases, a special survey notation will not be assigned in conjunction with the classification survey. The next special survey therefore would become due five years from the special survey held by the other society and not five years from classification with IRS.

In cases of transfer of class from another society to single class of IRS, the interim certificate of class or any other documents enabling the ship to trade, can be issued :

a) In case of vessels less than 15 years of age

   – only after IRS has completed all overdue surveys and overdue recommendations / conditions of class issued earlier, as specified to the Owner by the previous society.

b) In case of vessels 15 years of age and over

   – only after the previous society has completed all overdue surveys and all overdue recommendations / conditions of class issued earlier.

3.1.3 For vessels not built under survey of IRS but subsequently taken in class with the above procedure, the mark signifying the survey during construction will be omitted.

3.1.4 Once a vessel has been taken into IRS class, periodical surveys are subsequently to be held as per these rules.

3.2 Plans and data to be furnished as required in 3.1.1

3.2.1 Plans of hull and equipment showing the main scantlings and arrangements of the actual ship and any proposed alterations are to be submitted for approval. These should normally comprise of the following plans:

For information

- General arrangement
- Capacity plan
- Hydrostatic Curves
- Loading Manual
- Loading Instrument Details
- Lightweight Distribution

For approval

- Midship section
- Longitudinal section and decks
- Shell expansion plan
- Transverse Bulkheads
- Fore body
- Aft body
- Sternframe
- Rudder and Rudder Stock
- Hatch Covers

- Fire detection, fighting and extinction and such other plans as may be requested.

3.2.2 It would normally be expected that particulars of the process of manufacture and testing of material of construction are furnished. Consideration will however be given to waiving this where such particulars are not readily available, provided it can be established that the relevant vessel has been originally built under special survey of an established classification society and continues to be so classed with an established classification society. In the case of vessels which have been originally built under the special survey of an established classification society but subsequently not maintaining class, it should additionally be possible to reasonably ascertain that no changes that would significantly affect the material specifications have taken place.

3.2.3 Following machinery plans together with the particulars of the materials used in the construction of the boilers, air receivers and important forgings should be furnished:

For information

- General machinery lay-out

For approval

- Thrust, intermediate and propeller shafting
- Propeller
- Main engines, propulsion gears and clutch systems (or manufacturer make, model and rating information)
- For steam turbine engines, main boilers, superheaters and economisers (or manufacturer make, model and rating information) and steam piping
- Bilge and ballast piping system
- Wiring diagram
- Steering gear systems, piping and arrangements and steering gear manufacturer make and model information
- Additional plans for oil tankers
    - Pumping arrangements at the forward and after ends and drainage of cofferdams and pump rooms
    - General arrangement of cargo piping in tanks and on decks
- Additional plans for vessels with Unattended Machinery Spaces
    - Description and/or block diagram of method of operation of the control system
    - Line diagrams of the control system for :

      main propelling machinery and essential auxiliaries

      bilge level systems

      cargo pumping for tankers

      boiler controls

      fire detection

      fire prevention, including details in way of fuel oil pressure pipes

      overall alarm system including test schedule
- Additional plans for vessels with Ice Class notations:
    - Plans for flexible couplings and/or torque limiting shafting devices in the propulsion line shafting (or manufacturer make, model and rating information)

3.2.4 Calculations of torsional vibration characteristics of the main propelling machinery are to be furnished specially for ships which have been in service for less than about 2 years.

3.2.5 In addition to the requirements of 3.2.1 to 3.2.4, additional plans would require to be submitted in accordance with applicable Chapters of Pt.5 of the Rules for vessels with additional class notations.

Section 4

Alternative Certification Scheme based upon Quality Management Systems

4.1 General

4.1.1 Alternative Certification Scheme (ACS) is a certification scheme involving a manufacturer (and associated sub-suppliers, if needed) in the inspection, testing and certification of the manufacturer's products.

4.1.2 An ACS will clarify:

- The extent of the required inspection and testing;

- To which extent and under which conditions the manufacturer may perform all or parts of the required inspection and testing without the presence of a Surveyor from IRS when an IRS Certificate is required.

4.1.3 The extent to which the manufacturer is given permission to carry out inspections and testing without the presence of a Surveyor would be agreed on a case by case basis, e.g. for a specific product production line or for specific parts.

4.2 Scope

4.2.1 An ACS may be arranged with product manufacturers and/ or sub-suppliers.

4.2.2 An ACS with a manufacturer would define the handling of subcontracted parts (those that require IRS or work certificates or in any other way are addressed in the Rules). The sub-supplier may be included in the ACS of the manufacturer or have his own ACS or deliver parts that are inspected and certified by the IRS.

4.2.3 An ACS that permits the manufacturer to carry out all or parts of required inspection and testing without the presence of a Surveyor may be arranged in two versions with regard to traceability:

- The ACS describes inspection, testing and certification additional to the manufacturer's standard quality control procedures in order to meet the Rules. The components are to be stamped with a special stamp supplied by IRS or identified as required by IRS.

- The manufacturer has a standard quality control that covers all required inspection, testing and certification in compliance with the Rules. Traceability and the required type of product document for components or products will be defined in the ACS.

4.3 Conditions for approval

4.3.1 The conditions for the manufacturer to be granted the permission to carry out inspection and testing without the presence of a Surveyor are as follows:

- The manufacturer has an implemented Quality System according to a national or international standard (like ISO 9000 series of standards) approved by an accredited certification body or recognized by IRS.

- The manufacturer has a quality control system, current drawings, and Rules and standards that cover the product to be certified.

- The inspection and testing required by the Rules are either standard procedures in the Quality System and recognized by IRS or specified in detail in the ACS.

- The manufacturer is to demonstrate that the firm has experience consistent with technology and complexity of the product for which approval is sought and that firm's products have been of a consistently high standard.

- IRS would initially ascertain the manufacturer's compliance with the ACS requirements by verifying the required product and process approvals and performing an initial audit. Follow-up and renewal audits would be conducted by IRS on a regular basis to verify that conditions of the ACS are continuously maintained by the manufacturer.

- If work certificates (W) or test reports (TR) are found not to fulfill the standards agreed with IRS, the component may not be accepted.

- The agreed ACS may be suspended or cancelled when/ if found justified by IRS.

- IRS may carry out unscheduled inspections at the manufacturer and/or subcontractor at its own discretion.

- The manufacturers (and designers, if producing under license) are to commit themselves to involve IRS when changes to the design, manufacturing process or testing are made as well as when any major production problems or any major product delivery problems have occurred.

4.4 Information to be submitted

4.4.1 For admission to an alternative certification scheme for a product, the manufacturer is to submit an application enclosing the following documentation/ information:

- Description of the products for which certification is required including, where applicable, model or type number;

- Applicable plans, details of materials used and procedures relevant to the manufacturing process;

- An outline description of all important manufacturing equipment and plant;

- A list of suppliers of materials with an indication of their class approval (as far as required by the Rules) and the type of material certification in each case;

- The list of main components of the product, including certificates.

- Existing class approvals of the manufacturer's products as far as required;

- Quality control plans relevant to the products and relevant components to be certified through the alternative certification scheme. Said plans are to detail the inspections and tests required by the Rules with an indication of which inspections and tests are delegated to the manufacturer and which are to be done in the presence of an IRS Surveyor.

- The procedures relevant to the quality control and inspections, their methods, frequency and certification;

- The quality system details;

- The system used for identification and traceability;

- List of nominated personnel for:

  - Marking/stamping of products;

  - Tests and Inspection (responsible);

  - Provision of data and information (e.g. declaration of conformity, test reports etc.).

- Any other additional documents that IRS may require in order to evaluate the manufacturing processes and product quality control.

4.5 Approval and maintenance of approval

4.5.1 After receipt and appraisal of the information required by 4.4, an initial audit of the Works would be carried out by the Surveyors. This audit is to verify that the manufacture of the product and the relevant controls are performed in accordance with the documents submitted and are in compliance with the requirements laid down in the Rules.

4.5.2 The ACS validity is for 5 years. At least one intermediate audit would be carried out by IRS during the validity of the ACS. Annual surveillance audits would be carried out as necessary, depending upon the complexity of the products and experience with the firms. The ACS may be renewed subject to an audit. The scope of the renewal audit would be as follows:

- verify the conditions of the ACS are still met;

- verify that the current products and processes are appropriately controlled.

4.5.3 A Quality Assurance Certificate would be issued by IRS on satisfactory completion of the initial/ renewal audit.

Appendix 1

Table of characters of class and type notations of IRS, their expanded form and significance

Abbreviation	Expanded Form	Significance
Characters of Class		
SUL	SARVOUTAM LANGER	Denotes vessels which are classed with Indian Register of Shipping where the hull and its appendages and equipment (i.e. anchors, chain cables, hawsers) meet the Rule requirements.
SU-	SARVOUTAM	Denotes vessels which are classed with IRS where the hull and its appendages meet the rule requirements but when the equipment of ship is not supplied or maintained as per the relevant Rules but is considered by IRS to be acceptable for particular service
SU	SARVOUTAM	Denotes vessels which are classed with IRS where the hull and its appendages meet the rule requirements but where for reason of their particular purpose or service normal equipment may be unnecessary
IY	INDIAN YANTRA	Denotes that for self propelled seagoing vessels, the machinery installation complies with the applicable requirements of Indian Register of Shipping
卐	SWASTIKA	This distinguishing mark inserted before a Character of Class is assigned to new ships where the hull and its appendages, equipment and the machinery as appropriate, are constructed under special survey of IRS in compliance with the Rules to the satisfaction of IRS
[ ]		When a Class Notation is enclosed within brackets, it indicates that applicable arrangements exist on board but the notation has been temporarily suspended
Class Notations - Hull		
Sheltered Water Service		Service in sheltered water adjacent to sand banks, reefs, breakwaters or other coastal features, and in sheltered water between islands
Restricted Water Service		Service in sheltered waters and also for short distances (generally less than 15 nautical miles) beyond sheltered waters in 'reasonable weather'
Specified Coastal Service		Service along a coast, during the course of which the vessel does not go more than 20 nautical miles from the nearest land and may cross gulfs or similar features recognised by the local Administration as a part of the coastal service. The geographical limits will form part of the Class Notation, e.g. "Indian Coastal Service"
Specified Route Service		Service between two or more points or other geographical features which will form part of the Class Notation
Specified Operating Area Service		Service within one or more geographical area(s) which will form part of the Class Notation

Abbreviation	Expanded Form	Significance
HAT(B)	HIMA ATITIVRA (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 1.0 metre
HT(B)	HIMA TIVRA (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 0.8 metre
HM(B)	HIMA MADHYAM (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 0.6 metre
Ha(B)	HIMA ALPA (B)	Denotes that the ship is strengthened for first year ice conditions in Northern Baltic in winter or areas of similar ice with condition equivalent to unbroken level ice with a maximum thickness of 0.4 metre
Ha	HIMA ALPA	Denotes that the ship is strengthened for light first year ice conditions in areas other than Northern Baltic
PC1	Polar Class 1	Denotes that the ship is strengthened for year-round operation in all polar waters according to Pt.5, Ch.32
PC2	Polar Class 2	Denotes that the ship is strengthened for year-round operation in moderate multi-year ice conditions according to Pt.5, Ch.32
PC3	Polar Class 3	Denotes that the ship is strengthened for year-round operation in second-year ice which may include multi-year ice inclusions according to Pt.5, Ch.32
PC4	Polar Class 4	Denotes that the ship is strengthened for year-round operation in thick first-year ice which may include old ice inclusions according to Pt.5, Ch.32
PC5	Polar Class 5	Denotes that the ship is strengthened for year-round operation in medium first-year ice which may include old ice inclusions according to Pt.5, Ch.32
PC6	Polar Class 6	Denotes that the ship is strengthened for summer / autumn operation in medium first-year ice which may include old ice inclusions according to Pt.5, Ch.32
PC7	Polar Class 7	Denotes that the ship is strengthened for summer / autumn operation in thin first-year ice which may include old ice inclusions according to Pt.5, Ch.32
ESP		Vessel complies with requirements of enhanced survey programme
STS	SAMATARANA STHIRATVA	Denotes that the ship complies with the requirements for survival capability (floatability in damaged condition) in accordance with Chapter 3 of IMO Resolution MSC 235(82)
"Strengthened for heavy cargoes"		This will be entered in the Register of Ships where the scantlings and arrangements have been approved for heavier cargo loadings in any hold filled up to the top of the hatch coaming with cargo at a stowage rate of ≤ 1 [m^3/tonne], when the draught in way of the hold is 80 per cent of the maximum permissible draught or more

Abbreviation	Expanded Form	Significance
"Hold(s) ...(to be specified)......... may be empty"		This will be entered in the Register of Ships when in association with the carriage of heavy cargoes, specified holds are permitted to be empty with the ship in the fully loaded condition
HELDK		This will be entered in the Register Of Ships for vessels with erected platforms or landing area designed for helicopter landings in accordance with applicable requirements of Part 5, Chapter 27 of the Rules
ETA	EMERGENCY TOWING ARRANGEMENT	Denotes that the ship is equipped with emergency towing arrangements in accordance with the requirements given in Part.5, Chapters 2, 3 or 4 of the Rules
Load Comp (1)	LOADING COMPUTER (1)	Denotes that the ship is equipped with a loading computer capable of ascertaining and comparing with the permissible limits, the hull girder loads in still water in any loading condition as required by Pt.3, Ch.5 and Pt.5, as applicable, of the Rules
Load Comp (2)	LOADING COMPUTER (2)	Denotes that in addition to the requirements for Load Comp (1) mentioned above, the ship's loading computer is capable of performing intact stability calculations for any loading condition to verify compliance with the applicable requirements indicated in Pt.3, Ch.1 of the Rules
Load Comp (3)	LOADING COMPUTER (3)	Denotes that in addition to the requirements for Load Comp (2) mentioned above, the ship's loading computer is capable of performing the stability calculations in damaged condition
Load Comp (4)	LOADING COMPUTER (4)	Denotes that in addition to the requirement for Load Comp (2) mentioned above, the ship's loading computer is capable of performing both stability and strength calculations in damaged condition
INWATER SURVEY		Denotes that the examination of the ship's bottom and related items may be carried out while the ship is afloat in accordance with the applicable requirements indicated in Pt.1, Ch.2, Sec.7.2
"For carriage of cement in bulk"		This will be entered in the Register of Ships for vessels which are designed and constructed solely for carriage of cement in bulk and the scantlings and arrangements have been approved accordingly
SPM	SINGLE POINT MOORING	Denotes that the vessel is fitted with standard arrangements for single point mooring as per Pt.5, Ch.28 of the Rules
DOUBLE HULL		When bulk carriers, oil tankers, oil or ore carriers and oil or bulk carriers are of double hull construction, in the entire cargo area (See Ch.2, Sec.1), the main class notations described above will be appended by notation 'DOUBLE HULL'

Abbreviation	Expanded Form	Significance
Class Notations - Machinery		
CCS	CENTRALIZED CONTROL STATION	Denotes that the propulsion and auxiliary machinery can be controlled and monitored with continuous supervision from a Centralized Control Station as detailed in Pt.4, Ch.7. It also denotes that the control engineering equipment has been arranged, installed and tested in accordance with Rules.
SYJ	SWACHALIT YANTRIK JAHAZ	Denotes that the ship can be operated with the machinery spaces unattended in accordance with the applicable requirements of Part 5, Chapter 22 of the Rules
HY	HIMIKAR YANTRA	Denotes that the refrigerated cargo installation of a ship complies with the applicable requirements of Part 5, Chapter 23 of the Rules
HY*	HIMIKAR YANTRA*	Denotes that the refrigerated cargo installation is capable of cooling down fruit in general or a catch of fish and complies with the applicable requirements of Part 5, Chapter 23 of the Rules
HY(LGC)	HIMIKAR YANTRA (LGC)	Denotes that the reliquefaction or refrigeration installation fitted on a classed liquefied gas carrier for cargo temperature and pressure control complies with the applicable requirements of Part 5, Chapter 4 of the Rules
NV	NIPRABHAV VASHPA	This notation is assigned to ships classed with Indian Register of Shipping intended for (i) carriage of oil in bulk or (ii) carriage of liquid chemicals in bulk. It denotes that the cargo spaces can be inerted by means of an inert gas system which has been approved, installed and tested in accordance with the relevant Rules
AGNI 1	AGNI SHAMAK	Denotes that the ship is equipped for early stage fire fighting and rescue operations close to structures including means for self protection of the vessel
AGNI 2		Denotes that the ship is equipped for continuous fighting of large fires and for cooling of structures on fire including means for self protection of the vessel
AGNI 3		Denotes that the ship is equipped for continuous fighting of large fires and for cooling of structures on fire and of greater capacity than for "AGNI 2"
DP (1)	DYNAMIC POSITIONING (1)	Denotes that the ship is fitted with automatic controls for position keeping as Pt.5, Ch.24 of the Rules
DP (2)	DYNAMIC POSITIONING (2)	Denotes that the ship is fitted with automatic controls of position keeping with automatic standby controls and redundancy in design and equipment as required by Pt.5, Ch.24 of the Rules
DP (3)	DYNAMIC POSITIONING (3)	Denotes that the ship is fitted with automatic controls for position keeping with automatic standby controls, redundancy in design and equipment and physical separation of components in different compartments as per Pt.5, Ch.24 of the Rules

Abbreviation	Expanded Form	Significance
IBS	Integrated Bridge System	The additional class notations 'IBS' will be assigned to ships fitted with an Integrated Bridge System in accordance with the requirements given in Pt.5, Ch.31. Integrated Bridge System allows simplified and centralized bridge operation of the main functions of navigation, manoeuvring and communication, as well as monitoring from the bridge of other functions such as: - Passage execution - Communication system - Monitoring of the machinery installation - Pollution monitoring - Monitoring of HVAC for passenger ships - Safety and security.
JUS	JALAJJAN UPAKARANA SAJJITA	Denotes that the ship is equipped with diving equipment
COW	CRUDE OIL WASHING	Denotes that the ship is equipped with crude oil washing system in accordance with Part 5, Chapter 2 of the Rules
PMS	PLANNED MAINTENANCE SYSTEM	Denotes that the machinery is subject to a system of planned maintenance and surveys as per Pt.1, Ch.2, Sec.14 of the Rules
Pollution Prevention Notations		
VCS1 VCS2	VAPOUR CONTROL SYSTEM	The additional notation VCS1 will be assigned to oil tankers, combination carriers (ore or oil/oil or bulk) and chemical tankers equipped with vapour control system meeting the requirements of IMO MSC/CIRC.585. The additional notation VCS2 will be assigned to oil tankers and chemical tankers equipped with vapour control system meeting the requirements of USCG's regulations CFR46 Part 39. The requirements for the assignment of this notation are given in Part 5, Chapter 29

<table>
<tr><th>Abbreviation</th><th>Expanded Form</th><th>Significance</th></tr>
<tr><td>CLEAN-SEA</td><td></td><td> The additional class notation CLEAN-SEA is assigned to ships provided with construction and procedural means to prevent pollution of sea. This is achieved by complying with the applicable requirements of Annexes I, II, III, IV, V of MARPOL Convention, as well as additional requirements related to prevention of sea pollution as follows:

Prevention of accidental pollution by locating fuel and lub.oil tanks above the double bottom and away from side shell.
Prevention of operational pollution by means of bilge water separation and filtering, holding tanks for treated sewage and grey water
Prevention of transfer of harmful organisms and pathogens in the ballast water
Prevention of pollution by tributyltin by means of TBT free antifouling paints
Prevention of pollution by solid garbage (resulting from the compacting device and incinerators) by means of proper storage of such waste

The requirements for the assignment of this notation are given in Part 5, Chapter 30 of Rules. </td></tr>
<tr><td>CLEAN-AIR</td><td></td><td> The additional class notation CLEAN-AIR is assigned to ships provided with construction and procedural means to prevent pollution of the air. This is achieved by complying with the applicable requirements of Annex VI of MARPOL convention as well as following additional requirements related to emissions to the air:

Prevention of air pollution by exhaust gas (NOx, SOx, etc.) by means of low emission engines
Use of low sulphur content fuels and incinerators
Use of refrigerants and fixed fire fighting means with zero ozone depleting potential and low global warming potential
Control of release of refrigerants to the atmosphere by means of leak detection and evacuation systems
Recovery of vapours emitted from cargo systems of ships carrying dangerous liquid cargoes in bulk

Note 1 : For ships with the service notation of oil tanker, oil or bulk carrier, ore or oil carrier, chemical tanker or liquefied gas carrier, the assignment of the notation VCS1 or VCS2 is a pre-requisite for assigning the notation CLEAN-AIR.
The requirements for the assignment of this notation are given in Part 5, Chapter 30 of Rules. </td></tr>
</table>

Abbreviation	Expanded Form	Significance
EP	Environmental Protection	The additional class notation EP is assigned to ships provided with equipment and procedural means to prevent pollution of the sea and of air. This is achieved by complying with the requirements of Annexes I to VI of MARPOL Convention and additional requirements relevant to ship's liquid, solid and gas releases as detailed in Part 5, Chapter 30 of Rules. Additionally the vessel should have developed an Environmental Management Plan considering the IMO requirements for recycling. Note 1 : For ships with the service notation of oil tanker, oil or bulk carrier, ore or oil carrier, chemical tanker or liquefied gas carrier, the assignment of the notation VCS1 or VCS2 is a prerequisite for assigning the notation Environment Protection – EP. The requirements for the assignment of this notation are given in Part 5, Chapter 30 of Rules.

Ship Type Notation

Ship Type Notation	Significance
BULK CARRIER	This notation will be assigned to ships designed primarily for the carriage of dry cargo in bulk and built in accordance with the applicable requirements of Part 5, Chapter 1 of the Rules for carriage of cargoes of density of at least 0.8 t/m^3
ORE CARRIER	This notation will be assigned to ships specially designed primarily to carry ore and built in accordance with applicable requirements of Part 5, Chapter 1 of the Rules
OIL TANKER	This notation will be assigned to tankers intended primarily to carry oil in bulk and built in accordance with applicable requirements of Part 5, Chapter 2 of the Rules. Where the scantlings and arrangements have been approved for the carriage of oil having a flash point of 60°C or above (closed cup test) or other liquid cargoes in bulk, the class notation will be suitably modified to show the nature of the cargo
ORE OR OIL CARRIER OIL OR BULK CARRIER	These notations will be assigned to combination carriers specially designed primarily to carry dry bulk cargoes (bulk carriers and ore carriers) and alternatively, oil in bulk, in accordance with Pt.5, Ch.2, Sec.12 of the Rules. In such ships, simultaneous carriage of dry bulk cargo and oil is prohibited.
CHEMICAL TANKER	This notation will be assigned to ships specially designed primarily to carry chemicals in bulk and built in accordance with applicable requirements of Part 5, Chapter 3 of the Rules
LIQUEFIED GAS CARRIER	This notation will be assigned to ships specially designed for the carriage of liquefied petroleum, natural or other gases and built in accordance with applicable requirements of Part 5, Chapter 4 of the Rules
CONTAINER SHIP	This notation will be assigned to vessels built for the exclusive carriage of containers in holds and on deck in accordance with the applicable requirements of Part 5, Chapter 5 of the Rules
PASSENGER SHIP	This notation will be assigned to vessels intended for carrying more than 12 passengers and built in accordance with Part 5, Chapter 6 of the Rules

Ship Type Notation	Significance
FERRY	This notation will be assigned to vessels intended for carriage of passengers and/or vehicles on regular scheduled service and built in accordance with Part 5, Chapter 6 of the Rules
Ro-Ro FERRY	This notation will be assigned to ferries intended for carriage of passengers, vehicles and cargo in pallet form or in containers and loaded/unloaded by wheeled vehicles and built in accordance with Part 5, Chapter 6 of the Rules
TUG	This notation will be assigned to all ships built in accordance with applicable requirements of Part 5, Chapter 7 of the Rules
ANCHOR HANDLING TUG	This notation will be assigned to tugs designed for anchor handling operations and built according to the requirements for this purpose given in Pt.5, Ch.7 and Pt.5, Ch.8 of the Rules.
SUPPLY VESSEL	This notation will be assigned to all ships built in accordance with applicable requirements of Part 5, Chapter 8 of the Rules
STERN TRAWLER	This notation will be assigned to ships built in accordance with applicable requirements of Part 5, Chapter 9 of the Rules and engaged in stern trawling
TRAWLER	This notation will be assigned to ships built in accordance with applicable requirements of Part 5, Chapter 9 of the Rules and engaged in side trawling
FISHING VESSEL	This notation will be assigned to ships built in accordance with applicable requirements of Part 5, Chapter 9 of the Rules and not equipped with trawling gear
DREDGER, HOPPER DREDGER, RECLAMATION CRAFT, HOPPER BARGE, SPLIT HOPPER BARGE	These notations will be assigned to self propelled or non self propelled vessels engaged in dredging or reclamation operation in accordance with applicable requirements of Part 5, Chapter 10 of the Rules
BARGE	This notation will be assigned to non self- propelled, manned or unmanned ships carrying dry cargo in cargo holds and built in accordance with applicable requirements of Part 5, Chapter 11 of the Rules. For special purpose vessels, the Notation will be suitably modified, e.g. Shipborne Barge
OIL BARGE	This notation will be assigned to non self- propelled, manned or unmanned ships intended to carry oil in bulk and built in accordance with the applicable requirements of Part 5, Chapters 2 & 11 of the Rules. Where the scantlings and arrangements have been approved by IRS for the carriage of oil having a flash point of 60°C or above (closed cup test), or for other liquid cargoes in bulk, the class notation affixed to the Character will be suitably modified to show the nature of the cargo (e.g. water barge, molasses barge, etc.)
PONTOON	This notation will be assigned to non self- propelled, manned or unmanned ships designed specifically for the carriage of non-perishable cargo or equipment on deck and built in accordance with the applicable requirements of Part 5, Chapter 11 of the Rules. For special purpose vessels, the Notation will be suitably modified, e.g. Crane Pontoon
FLOATING DOCK	This notation will be assigned to floating dry docks built in accordance with the applicable requirements of Part 5, Chapter 12 of the Rules.

Ship Type Notation	**Significance**
WELL STIMULATION VESSEL	This notation will be assigned to well stimulation vessels built in accordance with the applicable requirements of Part 5, Chapter 33.
OIL RECOVERY VESSEL	This notation will be assigned to oil recovery vessels built in accordance with the applicable requirements of Part 5, Chapter 34.

End of Chapter

Chapter 2

Periodical Surveys

Contents

Section 1

General Requirements

1.1 General

1.1.1 All vessels are to be subjected to Periodical Surveys for the purpose of maintenance of class. Survey notations and Survey intervals are given in Table 1.1.1 for main class Surveys. Where additional class notations have been assigned, Surveys are to be carried out at intervals given in Table 1.1.2.

1.1.2 Vessels with additional class notations for which there are no specific Survey requirements defined in this Chapter are to have the equipment and/or construction related to this additional class notation examined to the Surveyor's satisfaction at each Special Survey. However, at the time of Annual Surveys the continued effectiveness, of operational features, safety devices and control systems are to be verified.

1.1.3 Annual, intermediate and special surveys are to be held concurrently with the relevant statutory surveys under the various IMO conventions, in accordance with the Harmonised System of Survey and Certification of IMO.

1.1.4 Special consideration may be given in the application of relevant requirements of this chapter to commercial vessels owned or chartered by Governments, which are utilized in support of military operations or service.

Table 1.1.1 : Periodical survey intervals for class survey notations

(Any specific requirements of the flag Administration are also to be complied with)

Survey	Class survey notation	Survey interval in years
Hull : Special Survey	SSH	5
Hull : Continuous Survey	CSH	5^5
Machinery : Special Survey	SSM	5
Machinery : Continuous Survey	CSM	5
Intermediate Survey	IS	2 or 3^4
Annual Survey	AS	1^1
Docking Survey	DS	2.5^2
Shaft Survey Oil Lubricated Fresh Water Lubricated Closed Loop System Single Shaft Fresh Water Lubricated Open System Single Shaft Corrosion Protected or Corrosion Resistant Material Water Lubricated Open System Multiple Shaft, Water Lubricated Open System Single Shaft, Water Lubricated Open System	 SH (OL) SH (FW-C) SH (S-FW-O) SH (S-CP-O) SH (M-O) SH (S-O)	See Note 3, 7
Directional propellers, water jet units, or athwartship thrust propellers	DPROP	5^3
Main boilers	MBS	2.5^6
Auxiliary boilers	ABS	2.5^6
Thermal oil heating systems	TOH	2.5^6
Exhaust gas steam generators and economisers	EGES	2.5^6
Steam pipe survey 1st Survey 2nd and subsequent surveys	SPS	 10 5

Notes:

1	Survey may be carried out within 3 months on either side of the anniversary date.
2	At least 2 Surveys are to be carried out within any 5 year special survey cycle, but the interval between two consecutive surveys is not to exceed 3 years and one of these two docking surveys should coincide with the Special Survey. Proposals for alternative means for providing underwater inspection equivalent to drydocking survey would be considered by IRS as detailed in Sec.7. However, for vessels operating solely in fresh-water only one docking survey coinciding with the special survey need be carried out till special survey no. IV provided the interval between consecutive docking surveys does not exceed 5 years.
3	Upon request, IRS may extend the survey period to harmonise with docking survey and in accordance with the requirements of Section 11.
4	Survey may be carried out either at or between the second or third Annual Survey.
5	At the request of the Owner, IRS may agree that the special survey of the hull, for ships other than bulk carriers, oil tankers, combination carriers, chemical tankers, liquefied gas carriers and general dry cargo ships, be carried out on the continuous basis.
6	At least 2 surveys are to be carried out within any 5 year special survey cycle. The interval between two consecutive surveys is not to exceed 3 years.
7	See Tables 11.2.3 and 11.3.3 for survey intervals of closed and open systems respectively.

Table 1.1.2 : Periodical survey intervals for additional class notations

Survey of	Additional class notation / corresponding class survey notation	Survey interval in years
Planned Maintenance System of Machinery	**PMS**	
Annual Audit	AA(PMS)	1[3]
Diving system	**JUS**	
Annual Survey	AS(JUS)	1[1]
Special Survey	SS(JUS)	5
Cargo refrigerating plant	**HY**	
Annual Survey	AS(HY)	1[1]
Special Survey	SS(HY)	5
Continuous Survey	CS(HY)	5
Dynamic positioning system	DP(1), (2) and (3)	
Annual Survey	AS(DP)	1[1]
Special Survey	SS(DP)	5
External fire fighting	**AGNI 1, 2 & 3**	
Annual survey	AS(AGNI)	1[1]
Special survey	SS(AGNI)	5
Inert gas installation	**NV**	
Annual Survey	AS(NV)	1[1]
Special Survey	SS(NV)	5
Un-attended Machinery Spaces	**SYJ**	
Annual Survey	AS(SYJ)	1[1]
Special Survey	SS(SYJ)	5

Notes:

1 May be carried out within 3 months on either side of anniversary date.

2 Survey may be carried out either at or between the second or third annual survey.

3 To be carried out in conjunction with annual survey.

1.2 Definitions

1.2.1 A **Ballast tank** is a tank which is being used for the carriage of salt water ballast.

In the case of oil tankers and chemical tankers, combined cargo/ballast tanks which are used for the carriage of cargo or ballast water as a routine part of the vessel's operation, are to be treated as ballast tanks. Cargo tanks in which water may be carried only in exceptional cases as per MARPOL I/18(3), are to be treated as cargo tanks. In any case, when substantial corrosion is found in a tank used for both cargo and ballast, the tank is to be considered as a ballast tank for the purpose of application of survey requirements

In the case of bulk carriers, a space used for both cargo and salt water ballast is to be treated as a ballast tank for the purpose of application of survey requirements when substantial corrosion is found in that space. Further in the case of double skin bulk carrier a double side tank is to be considered as a separate tank even if it is in connection to either the topside tank or the hopper side tank.

1.2.2 A **Close-up survey** is a survey where the details of structural components are within the close visual inspection range of the Surveyor, i.e. normally within reach of hand.

1.2.3 An **Overall survey** is a survey intended to report on the overall condition of the hull structure and determine the extent of additional Close-up Surveys.

1.2.4 A **Transverse section** includes all longitudinal members such as plating, longitudinals and girders at the deck, side, bottom, inner bottom and hopper side plating, longitudinal bulkheads and bottom plating in top wing tanks. Where transversely framed, the transverse section is to include adjacent transverse stiffeners and their end connections.

1.2.5 **Representative spaces/tanks** are those which are expected to reflect the condition of other spaces/tanks of similar type and service and with similar corrosion prevention systems. When selecting Representative Spaces/Tanks account is be taken of the service and repair history onboard and identifiable Critical Structural Areas and/or Suspect Areas.

1.2.6 **Suspect areas** are locations showing Substantial Corrosion and/or considered by the Surveyor to be prone to rapid wastage.

1.2.7 **Critical structural areas** are locations which have been identified from calculations to require monitoring or from the service history of the subject ship or sister ships (if available) to be sensitive to cracking, buckling or corrosion which would impair the structural integrity of the ship.

1.2.8 **Substantial corrosion** is an extent of corrosion such that assessment of corrosion pattern indicates a wastage in excess of 75 per cent of allowable margins, but within acceptable limits.

For vessels built under the IACS Common Structural Rules, substantial corrosion is an extent of corrosion such that the assessment of the corrosion pattern indicates a gauged (or measured) thickness between t_{ren} + 0.5 [mm] and t_{ren}.

't_{ren}' is the renewal thickness, which is defined as the minimum allowable thickness [mm], below which renewal of structural members is to be carried out.

1.2.9 **Corrosion prevention system** is normally to be of a full hard protective coating. Hard protective coatings are to usually be epoxy coating or equivalent. Soft or semi-hard coatings are not acceptable. Other coating systems may be considered acceptable as alternatives provided they are applied and maintained in compliance with the manufacturer's specifications.

1.2.10 **Coating condition** is defined as follows :
GOOD - Condition with only minor spot rusting;
FAIR - Condition with local breakdown at edges and weld connections and/or light rusting over 20 per cent or more of areas under consideration, but less than as defined for POOR condition;
POOR - Condition with general breakdown of coating over 20 per cent or more of areas or hard scale at 10 per cent or more of areas under consideration.

1.2.11 **Cargo area** in case of oil tankers and chemical tankers is that part of the ship which contains cargo tanks, slop tanks and cargo/ballast pump rooms, cofferdams, ballast tanks and void spaces adjacent to cargo tanks and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

In the case of liquefied gas carriers, cargo area is that part of the ship which contains the cargo containment system, cargo/ballast pump rooms and compressor rooms, cofferdams, ballast tanks and void spaces adjacent to the cargo containment spaces and also deck areas throughout the entire length and breadth of the part of the ship over the above mentioned spaces.

In the case of bulk carriers and general dry cargo ships, cargo area is that part of the ship which contains all cargo holds and adjacent areas including fuel tanks, cofferdams, ballast tanks and void spaces etc. within the longitudinal extent from the aft bulkhead of the aft-most cargo hold to the fwd bulkhead of the foremost cargo hold.

Note: The definitions for cargo area given above are applicable only for the purpose of identifying spaces for examination during hull surveys as required by this chapter of the Rules. For the purpose of design and construction requirements, the definitions given in respective chapters of Part 5 of the rules would apply.

1.2.12 **Spaces** are separate compartments including holds, tanks, cofferdams and void spaces bounding cargo holds, decks and the outer hull.

1.2.13 **A prompt and thorough repair** is a permanent repair completed at the time of survey to the satisfaction of the Surveyor, therein removing the need for the imposition of any associated condition of classification, or recommendation.

1.2.14 **Anniversary date** means the day and month of each year corresponding to the expiry date of the classification certificate.

1.2.15 **A Double Hull Oil Tanker** is a ship which is constructed primarily for the carriage of oil (See Pt.5, Ch.2, for list of oils) in bulk, which has the cargo tanks protected by a double hull which extends for the entire length of the cargo area, consisting of double sides and double bottom spaces for the carriage of water ballast or as void spaces.

1.2.16 For the purpose of application of these requirements, a '**double skin bulk carrier'** is a ship which is constructed generally with single deck, top side tanks, hopper side tanks & double bottom in cargo spaces and is intended primarily to carry dry cargo in bulk, including such types as ore carriers and combination carriers, in which all cargo holds are bounded by double-side skin (regardless of the width of the wing space).

1.2.17 'General dry cargo ship' means ships carrying solid cargoes other than:

- bulk carriers and ore carriers which are subject to the requirements of Sec.2;
- dedicated Container carriers;
- ro-ro cargo ships;
- refrigerated cargo ships;
- dedicated wood chip carriers;
- dedicated Cement carriers;
- livestock carriers;
- ships carrying exclusively deck cargo;
- General dry cargo ships of double skin construction, with double skin extending for the entire length of the cargo area and for the entire height of the cargo hold to the upper deck.

1.2.18 **Special consideration or specially considered** (in connection with close-up surveys and thickness measurements) means that sufficient close-up inspection and thickness measurements are to be taken to confirm the actual average condition of the structure under the coating.

1.2.19 **Air pipe heads** installed on the exposed decks are those extending above the freeboard deck or superstructure decks.

1.2.20 A **ro-ro Ship** is a ship which utilizes a loading ramp to enable wheeled vehicles to be rolled-on and rolled-off the ship,

1.2.21 **Pitting corrosion** is defined as scattered corrosion spots/areas with local material reductions which are greater than the general corrosion in the surrounding area.

1.2.22 **Edge corrosion** is defined as local corrosion at the free edges of plates, stiffeners, primary support members and around openings. An example of edge corrosion is shown in Fig.1.2.22.

1.2.23 **Grooving corrosion** is typically local material loss adjacent to weld joints along abutting stiffeners and at stiffener or plate butts or seams. An example of groove corrosion is shown in Fig.1.2.23.

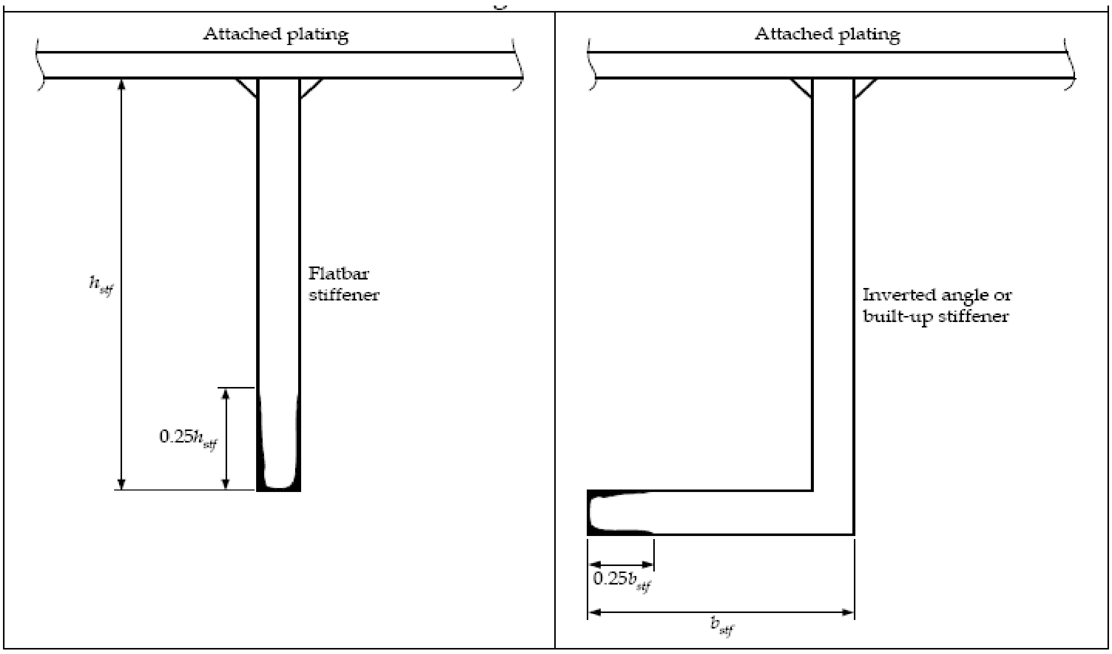

Fig. 1.2.22 : Edge corrosion

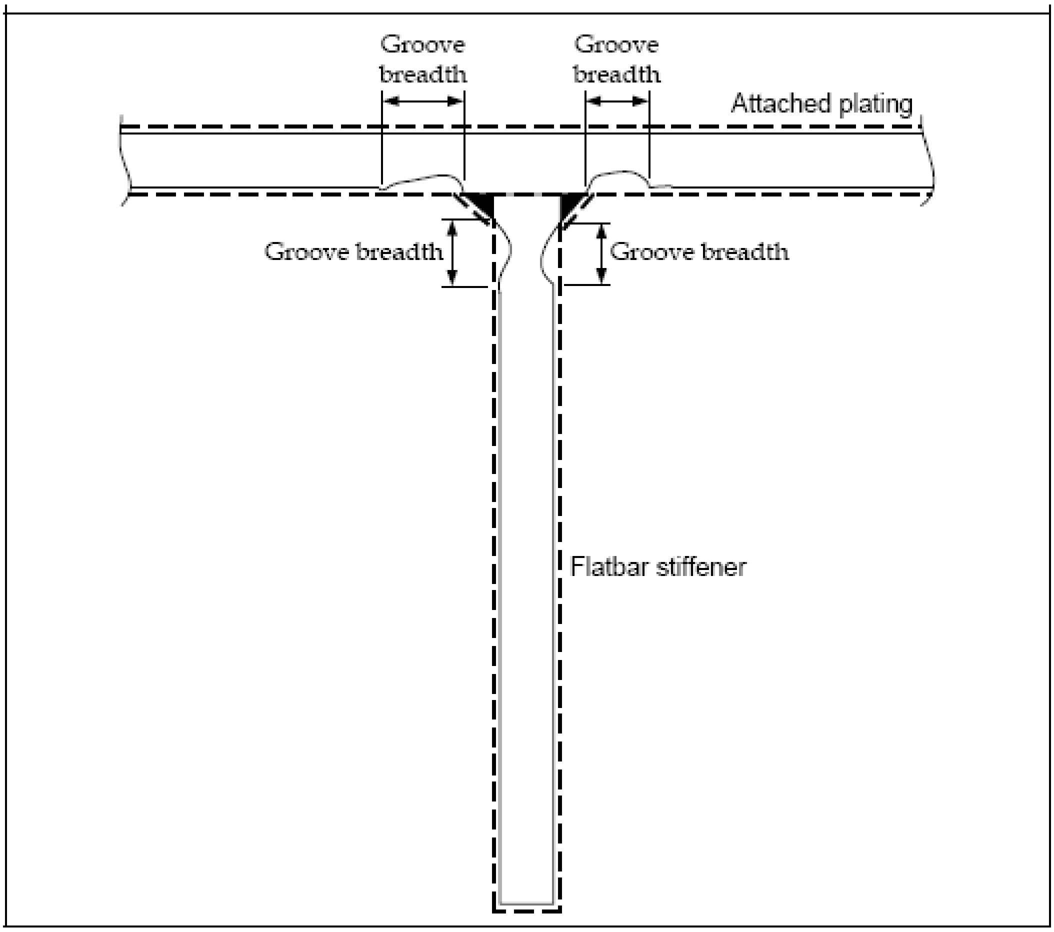

Fig. 1.2.23 : Grooving corrosion

1.3 Laid up vessels

1.3.1 Survey during lay-up

1.3.1.1 When a vessel is laid up and IRS is so informed, the periodical surveys required by 1.1.1, except Annual Surveys, may be postponed at the discretion of IRS depending upon the vessel's lay-up location, the maintenance and preservative measures taken during the lay-up. During lay-up, the vessel is to comply with the following:-

a) The vessel is to be adequately manned in accordance with the statutory requirements prevailing at the location of lay-up.

b) Adequate power is to be available on board to meet the following requirements:-

- fire fighting;
- bilge pumping;
- lighting;
- communication with shore;
- needs of crew on board, and
- operating anchor and mooring winches within a reasonable time.

1.3.1.2 During lay-up, vessels are to be subjected to a general examination every year.

1.3.2 Survey at re-activation

1.3.2.1 Vessels are to be surveyed and tested before re-entering service. The extent of the surveys and tests will be considered in each case by IRS depending upon the time out of commission, the maintenance and preservative measures taken during lay-up and the extent of surveys carried out during this time but will at least include a sea trial for function testing of the machinery installation.

1.3.2.2 Attention is drawn to the requirements of the Flag Administration regarding International Safety Management Code (ISM Code) compliance at the time of re-activation.

1.4 Surveys by Chief Engineers

1.4.1 Continuous machinery Surveys of some machinery items may be carried out, subject to certain conditions, under the supervision of the Chief Engineer of the ship at ports where IRS is not represented and where practicable, at sea.

1.4.2 A limited confirmatory Survey should be carried out at the next port of call by an exclusive Surveyor of IRS. Where IRS Surveyor is not available, such Survey may be carried out by the exclusive Surveyor of a Society with whom IRS has collaboration agreement in force with prior information given to IRS.

1.4.3 Detailed procedure of this scheme may be obtained from IRS.

1.5 Surveys for damage or alteration

1.5.1 At any time when a ship is undergoing alterations or damage repairs, any exposed parts of the structure normally difficult for access are to be specially examined by the Surveyor.

1.6 Unscheduled surveys

1.6.1 In the event that IRS has reason to believe that its Rules and Regulations are not being complied with, IRS reserves the right to perform unscheduled surveys of the hull or machinery.

1.7 Provision for surveys

1.7.1 The Surveyors are to be provided with necessary facilities for a safe execution of survey.

In order to enable the attending surveyors to carry out the survey, provisions for proper and safe access, are to be agreed between the owner and IRS in accordance with confined space safe entry procedure of IRS and IMO Resolution A1050(27) 'Revised recommend-dations for entering enclosed spaces abroad ships', as amended.

Details of the means of access are to be provided in the survey planning questionnaire.

In cases where the provisions of safety and required access are judged by the attending surveyor(s) as not adequate, the survey of the spaces concerned would not be carried out.

1.7.2 The surveys at sea or at anchorages may be carried out provided necessary precautions are taken while carrying out the survey and adequate assistance is provided.

1.7.3 Cargo holds, tanks and spaces are to be safe for access. Cargo holds, tanks and spaces are to be gas free and properly ventilated. Prior to entering a tank, void or enclosed space, it is to be verified that the atmosphere in the tank is free from hazardous gas and contains sufficient oxygen. All spaces are to be cleaned and loose accumulated corrosion scale is to be removed from all surfaces. They are to be sufficiently clean and free from water, scale, dirt, oil residues, etc. to reveal any significant corrosion, deformation, fractures, damages and other structural deterioration as well as the condition of the coating. However, those areas of structure whose renewal has already been decided by the owner need only be cleaned and descaled to the extent necessary to determine the limits of the renewal areas.

1.7.4 Sufficient illumination is to be provided to reveal corrosion, deformation, fractures, damages or other structural deterioration as well as the condition of the coating.

1.7.5 Where soft coatings have been applied, safe access is to be provided for the Surveyor to verify the effectiveness of the coating and to carry out an assessment of the conditions of the internal structures which may include spot removal of the coating. When safe access cannot be provided, the soft coating is to be removed.

1.7.6 For overall examination, means are to be provided to enable the Surveyor to examine the structure in a safe and practical way.

1.7.7 For Close-up Examination of the hull structure, other than cargo hold shell frames of bulk carriers, one or more of the following means of access to Surveyors satisfaction is to be provided, in general:

- Permanent staging and passages through structures
- Temporary staging and passages through structures
- Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms
- Portable ladders
- Boats or rafts
- Other equivalent means.

1.7.8

a) For close-up surveys of the cargo hold shell frames of bulk carriers less than cape size (i.e. less than 100,000 dwt) one or more of the following means for access, acceptable to the Surveyor, is to be provided:

    - Permanent staging and passage through structures;
    - Temporary staging and passages through structures;
    - Portable ladder restricted to not more than 5 [m] in length may be accepted for surveys of lower section of a shell frame including bracket;
    - Hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms;
    - Boats or rafts, provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water;
    - Other equivalent means.

b) For close-up surveys of the cargo hold shell frames of cape size bulk carriers (100,000 dwt and above), the use of portable ladders is not accepted and one or more of the following means for access, acceptable to the surveyor, is to be provided:

    i) Annual surveys, intermediate survey under 10 years of age and Special Survey No.1

        - permanent staging and passage through structures;
        - temporary staging and passages through structures;
        - hydraulic arm vehicles such as conventional cherry pickers, lifts and movable platforms;
        - boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water;
        - other equivalent means.

    ii) Subsequent intermediate surveys and special surveys:

        - either permanent or temporary staging and passage through structures for close-up surveys of at least the upper part of hold frames;
        - hydraulic arm vehicles such as conventional cherry pickers for surveys of lower and middle part of shell frames as alternative to staging:
        - lifts and moveable platforms;
        - boats or rafts provided the structural capacity of the hold is sufficient to withstand static loads at all levels of water;
        - other equivalent means.

Notwithstanding the above requirements, the use of a portable ladder fitted with a mechanical device to secure the upper end of the ladder is acceptable for the “close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating of the forward cargo hold" at annual survey, required in 2.2.2.9b) and the "one other selected cargo hold" required in 2.2.2.10.b).

1.7.9 For bulk carriers and oil tankers constructed on or after 1 Jan 2005, the access requirements for surveys in the cargo area and forward spaces are given in Pt.5, Ch.1, Sec.1.6 & 1.7 and Pt.5, Ch.2, Sec.2.3 & 2.4 respectively. The means of access are to be surveyed prior to, or in conjunction with its use for carrying out surveys.

1.7.10 During surveys of oil tankers, ore or oil carriers, oil or bulk carriers, chemical tankers and liquefied gas carriers, explosimeter, oxygen-meter, breathing apparatus, life line and whistles are to be at hand during the survey.

1.7.11 In order to ascertain the structural strength of ship's hull and machinery, thickness measurements as specified in subsequent sections, as applicable, are to be carried out normally by means of ultrasonic equipment. The accuracy of the equipment is to be proven to the Surveyor as required.

1.7.12 One or more of the following fracture detection procedures may be required if deemed necessary by the Surveyor:

- radiographic equipment
- ultrasonic equipment
- magnetic particle equipment
- dye penetrant.

1.7.13 Explosimeter, oxygen-meter, breathing apparatus, lifelines, riding belts with rope and hook and whistles together with instructions and guidance on their use are to be made available during the survey. A safety check-list should be provided.

1.7.14 Adequate and safe lighting is to be provided for the safe and efficient conduct of the survey.

1.7.15 Adequate protective clothing is to be made available and used (e.g. safety helmet, gloves, safety shoes, etc.) during the survey.

1.7.16 If breathing apparatus and/or other equipment is used as "Rescue and emergency response equipment" then the equipment is to be suitable for the configuration of the space being surveyed.

1.8 Surveys at sea or at anchorage

1.8.1 Survey at sea or at anchorage may be accepted provided the Surveyor is given the necessary assistance from the personnel onboard. Necessary precautions and procedures for carrying out the survey are to be in accordance with 1.7.

1.8.2 A communication system is to be arranged between the survey party in the tank and the responsible officer on deck. This system must also include the personnel in charge of ballast pump handling if boats or rafts are used.

1.8.3 Surveys of tanks or applicable holds by means of boats or rafts may only be undertaken with the agreement of the Surveyor, who is to take into account the safety arrangements provided, including weather forecasting and ship response under foreseeable conditions and provided the expected rise of water within the tank due to ship motion does not exceed 0.25 [m].

1.8.4 When rafts or boats will be used for close-up survey the following conditions are to be observed:

a) Only rough duty, inflatable rafts or boats, having satisfactory residual buoyancy and stability even if one chamber is ruptured, are to be used;

b) The boat or raft is to be tethered to the access ladder and an additional person is to be stationed down the access ladder with a clear view of the boat or raft;

c) Appropriate lifejackets are to be available for all participants;

d) The surface of water in the tank or hold is to be calm (under all foreseeable conditions the expected rise of water within the tank should not exceed 0.25 m) and the water level stationary. On no account is the level of the water to be rising while the boat or raft is in use;

e) The tank, hold or space must contain clean ballast water only. Even a thin sheen of oil on the water is not acceptable; and

f) At no time is the water level to be allowed to be within 1 m of the deepest under deck web face flat so that the survey team is not isolated from a direct escape route to the tank hatch. Filling to levels above the deck transverses is only to be contemplated if a deck access manhole is fitted and open in the bay being examined, so that an escape route for the survey party is available at all times. Other effective means of escape to the deck may be considered.

g) If the tanks (or spaces) are connected by a common venting system, or inert gas system, the tank in which the boat or raft is used should be isolated to prevent a transfer of gas from other tanks (or spaces).

   The tank being examined is to be isolated also to prevent transfer of liquids/gas through cargo or ballast piping.

1.8.5 For the under deck areas in tanks, survey by means of boats or rafts will be allowed if the depth of the webs is 1.5 [m] or less.

If the depth of the webs is more than 1.5 [m], boats or rafts may be allowed only when:

i) the coating of the under deck structure is in GOOD condition and there is no evidence of wastage; or

ii) a permanent means of access is provided in each bay to allow safe entry and exit, which means the following:

   a) access direct from the deck via a vertical ladder and a small platform fitted approximately 2 [m] below the deck in each bay; or

   b) access to deck from a longitudinal permanent platform having ladders to deck in each end of the tank. The platform shall, for the full length of the tank, be arranged in level with, or above, the maximum water level needed for rafting of under deck structure. For this purpose, the ullage corresponding to the maximum water level is to be assumed not more than 3 [m] from the deck plate measured at the midspan of deck tranverses and in the middle length of the tank.

If neither of the above conditions are met, then staging or an “other equivalent means” is to be provided for the survey of the under deck areas.

See also IRS Classification Notes “Guidelines for approval / acceptance of alternative means of access to spaces in oil tankers, bulk carriers, ore carriers and combination carriers”.

1.8.6 The requirements regarding the usage of boats or rafts in 1.8.5 does not preclude their use for moving about within a tank during a survey.

1.9 Repairs

1.9.1 Any damage in association with wastage over the allowable limits (including buckling, grooving, detachment or fracture), or extensive areas of wastage over the allowable limits, which affects or, in the opinion of the Surveyor, will affect the vessel's structural, watertight or weathertight integrity, is to be repaired promptly and thoroughly as defined in 1.2.13. Areas to be considered as relevant, include:

- side structure and side plating;
- deck structure and deck plating;
- bottom structure and bottom plating;
- inner bottom structure and inner bottom plating;
- inner side structure and inner side plating;
- longitudinal bulkhead(s) plating and structure;
- transverse watertight or oiltight bulkheads, plating and structure; and
- hatch covers and hatch coamings.
- weld connection between air pipes and deck plating;
- air pipe heads;
- ventilators including closing devices;
- bunker and vent piping systems in bulk carriers, ore carriers and combination carriers.

Where adequate repair facilities are not available, consideration may be given to allow the vessel to proceed directly to a repair facility. This may require discharging the cargo and/or temporary repairs for the intended voyage.

1.9.2 Additionally, when a survey results in the identification of corrosion or structural defects, either of which, in the opinion of the Surveyor, will impair the vessel's fitness for continued service, remedial measures are to be implemented before the ship continues in service.

1.9.3 Where the damage found on structure mentioned in 1.9.1 is isolated and of a localized nature which does not affect the ship’s structural integrity, consideration may be given by the surveyor to allow an appropriate temporary repair to restore watertight or weather tight integrity and impose a Recommendation / Condition of Class with a specific time limit.

1.9.4 Extended thickness measurements when required by the rules are to be carried out and necessary repairs completed before the survey is credited as complete.

1.10 Thickness measurements and close-up surveys

1.10.1 In any kind of survey, i.e. special, intermediate, annual or any other surveys having the scope of the foregoing ones thickness measurements (when required, in accordance with relevant tables of subsequent sections) of structures in areas where close-up surveys are required are to be carried out simultaneously with close-up surveys.

1.11 Extension of special surveys

1.11.1 Under “exceptional circumstances”, IRS may grant an extension not exceeding three (3) months to allow for completion of the special survey provided that the vessel is attended and the attending surveyor(s) so recommend(s) after the following has been carried out:

a) Annual Survey;
b) Re-examination of Recommendations / Conditions of Class;
c) In the case where dry docking is due prior to the end of the class extension, an underwater examination is to be carried out by an approved diving company. An underwater examination by an approved company may be dispensed with in the case of extension of dry-docking survey not exceeding 36 months interval provided the ship is without outstanding Recommendation / Condition of Class regarding underwater parts.

“Exceptional circumstances” means unavailability of dry-docking facilities; unavailability of repair facilities; unavailability of essential materials, equipment or spare parts; or delays incurred by action taken to avoid severe weather conditions.

1.11.2 In the case that the Class Certificate will expire when the vessel is expected to be at sea, an extension to allow for completion of the Special Survey may be granted provided there is documented agreement to such an extension prior to the expiry date of the certificate and provided that positive arrangements have been made for attendance of the Surveyor at the first port of call and provided that IRS is satisfied that there is technical justification for such an extension. Such an extension is to be granted only until arrival at the first port of call after the expiry date of the certificate. However, if owing to “exceptional circumstances” the special survey cannot be completed at the first port of call, 1.11.1 may be followed, but the total period of extension shall in no case be longer than three months after the original due date of the special survey.

1.11.3 In case of force majeure as defined below, the completion of survey may be specially considered.

“Force Majeure” means damage to the ship; unforeseen inability of IRS to attend the vessel due to the governmental restrictions on right of access or movement of personnel; unforeseeable delays in port or inability to discharge cargo due to unusually lengthy periods of severe weather, strikes or civil strife; acts of war; or other similar circumstances.

Section 2

Surveys - Bulk Carriers and Ore Carriers

2.1 Scope

2.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the class notations :

Bulk Carrier ESP
BC-A, B or C ESP (from July 2003)
Ore Carrier ESP

2.1.2 The requirements that are applicable only to double skin bulk carriers and those applicable only to other bulk carriers have been indicated in the relevant clauses. For bulk carrier with hybrid cargo hold arrangements, e.g. with some cargo holds of single side skin and others of double side skin, the appropriate requirements are to applied to the individual cargo holds depending on their type of side skin construction.

2.2 Annual surveys

2.2.1 General

2.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

2.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

2.2.1.3 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

2.2.2 Hull

2.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, weather decks; hatch coamings, hatch covers including their securing arrangement, other closing appliances, equipment and related piping are maintained in satisfactory and efficient condition. Special attention is to be paid to the following :

a) Weather deck, shipside plating above waterline.

b) Hatchways on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); flame screens on vents to all bunker tanks; ventilators and closing devices.

d) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

e) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines, fittings and appliances for timber deck cargo.

f) Watertight bulkheads and their penetrations as far as practicable.

2.2.2.2 Cargo hatch covers and coamings are to be examined to ensure that no alterations have been made to the approved arrangements :

A thorough survey of cargo hatch covers and coamings is to be carried out by examination in the open as well as closed positions and should include verification of proper opening and closing operation. The hatch cover sets within the forward 25% of the ship’s length and at least one additional set, such that all sets on the ship are assessed at least once in every 5-year period, are to be surveyed open, closed and in operation to the full extent on each direction at each annual survey, including:

i) stowage and securing in open condition;

ii) proper fit and efficiency of sealing in closed condition; and

iii) operational testing or hydraulic and power components, wires, chains and link drives.

The closing of the covers is to include the fastening of all peripheral and cross joint cleats or other securing devices. Particular attention is to be paid to the condition of the hatch covers in the forward 25% of the ship’s length, where sea loads are normally greatest.

2.2.2.3 If there are indications of difficulty in operating and securing hatch covers, sets in addition to those required by 2.2.2.2, at the discretion of the surveyor, are to be tested in operation.

Where the cargo hatch securing system does not function properly, repairs are to be carried out under the supervision of the Surveyors.

2.2.2.4 For each cargo hatch cover set the following items are to be surveyed:

a) Cover panels, including side plates and stiffener attachments that may be accessible in the open position by close-up survey (for corrosion, cracks, deformation);

b) Sealing arrangements of perimeter and cross joints (gaskets for condition and permanent deformation, flexible seals on combination carriers, gasket lips, compression bars, drainage channels and non return valves);

c) Clamping devices, retaining bars, cleating (for wastage, adjustment and condition of rubber components);

d) Closed cover locating devices (for distortion and attachments);

e) Chain or rope pulleys;

f) Guides;

g) Guide rails and track wheels;

h) Stoppers;

i) Wires, chains, tensioners and gypsies;

j) Hydraulic system, electrical safety devices and interlocks; and

k) End and interpanel hinges, pins and stools where fitted.

2.2.2.5 At each hatchway the coamings, with panel stiffeners and brackets are to be subjected to a close-up survey and checked for corrosion, cracks and deformation, especially of the coaming tops.

2.2.2.6 Where considered necessary, the effectiveness of sealing arrangements may be proved by hose or chalk testing supplemented by dimensional measurements of seal compressing components.

2.2.2.7 Cargo hatch covers of the portable type (i.e. wood or steel pontoons) are to be examined to confirm the satisfactory condition of:

- wooden covers and portable beams, carriers or sockets for the portable beams and their securing devices;

- steel pontoons;

- tarpaulins;

- cleats, battens and wedges;

- hatch securing bars and their securing devices;

- loading pads/bars and the side plate edge;

- guide plates and chocks;

- compression bars, drainage channels and drain pipes, if any.

2.2.2.8 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

2.2.2.9 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken of the area of substantial corrosion identified at previous surveys.

For vessels built under the IACS Common Structural Rules, the annual thickness gauging may be omitted where a protective coating has been applied in accordance with the coating manufacturer's requirements and is maintained in good condition. In this case, it is recommended that the necessary documentation of coating is available on board.

Where annual gauging is required as per 2.4.12.3, thickness measurement of aft bulk-head of the forward cargo hold is to be carried out.

2.2.2.10 Examination of ballast tanks is to be carried out when required as a consequence of the results of the special and intermediate surveys. (See 2.4.5.1, 2.4.5.2 and 2.3.2.1). When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion additional thickness measurements are to be carried out to the extent given in Table 2.4.10.2(a) or Table 2.4.10.2(b).

2.2.2.11 Anchoring and mooring equipment is to be examined as far as is practicable.

2.2.2.12 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

2.2.2.13 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual is available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

2.2.2.14 On bulk carriers of over 10 years of age the following are to be carried out in addition to the requirements in 2.2.2.1 to 2.2.2.13:

a) Overall survey of two selected cargo holds in double skin bulk carriers and all cargo holds in the case of other bulk carriers.

b) For single side skin bulk carriers, close-up survey of sufficient extent, minimum 25 per cent of frames, to establish the condition of the lower region of the shell frames including approximately lower one third length of side frame at side shell and side frame end attachment and the adjacent shell plating in a forward cargo hold. Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining holds.

c) When considered necessary by the Surveyor, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion additional thickness measurements are to be carried out to the extent given in Table 2.4.10.2(a) or Table 2.4.10.2(b).

d) Where a hard protective coating in cargo holds is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

e) All piping and penetrations in cargo holds, including overboard piping are to be examined.

2.2.2.15 On bulk carriers of over 15 years of age the following are to be carried out in addition to the requirements given in 2.2.2.1 to 2.2.2.14:

a) Overall survey of all cargo holds.

b) Close-up examination of a selected cargo hold in addition to the forward cargo hold as required in 2.2.2.14b) and c).

c) Examination of all piping and penetrations in cargo holds, including overboard piping.

d) Where a hard protective coating in cargo holds is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

2.2.2.16 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

2.2.2.17 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

2.2.2.18 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

2.2.2.19 Davits and fittings on the ship’s deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

2.2.2.20 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

2.2.2.21 When examining internal spaces as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

2.2.2.22 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6), it is to be confirmed that the maintenance, repair and partial recoating of dedicated ballast tanks and double side skin spaces, as appropriate, are recorded in the coating technical file.

2.2.3 Additional annual survey requirements for ships subject to SOLAS XII/9:

2.2.3.1 For ships subject to SOLAS XII/9 i.e.:

- Bulk Carriers of 150 [m] in length and upwards of single side skin construction as defined in Pt.5, Ch.1, 1.1.4; and
- Carrying solid bulk cargoes having a density of 1780 [kg/m3] and above; and
- Contracted for construction before 1 July, 1999 and
- Constructed with an insufficient number of transverse watertight bulkheads to enable them to withstand flooding of the foremost cargo hold in all loading conditions and remain afloat in a satisfactory condition of equilibrium as specified in SOLAS XII/4.3.

2.2.3.2 In accordance with SOLAS XII/9.1 for the foremost cargo hold of such ships, the additional survey requirements listed in 2.2.3.3 to 2.2.3.6 shall apply.

2.2.3.3 For bulk carriers of 5 - 15 years of age:

a) An overall survey of the foremost cargo hold, including close-up survey of sufficient extent, minimum 25% of frames, is to be carried out to establish the condition of:

    - Shell frames including their upper and lower end attachments, adjacent shell plating, and transverse bulkheads.
    - Suspect areas found at the previous special survey.

b) Where considered necessary by the surveyor as a result of the overall and close-up survey as described in a) above, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of the cargo hold.

2.2.3.4 For bulk carriers exceeding 15 years of age:

a) An overall survey of the foremost cargo hold, including close-up survey is to be carried out to establish the condition of:

    - All shell frames including their upper and lower end attachments, adjacent shell plating and transverse bulkheads.
    - Suspect areas found at the previous special survey.

2.2.3.5 Extent of thickness measurement:

a) Thickness measurement is to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey, as described in 2.2.3.3a) and 2.2.3.4a) above. The minimum requirement for thickness measurements are areas found to be suspect areas at the previous special survey.

    Where substantial corrosion is found, the extent of thickness measurements is to be increased with the requirements of Table 2.4.10.2(a) or Table 2.4.10.2(b).

b) The thickness measurement may be dispensed with provided the surveyor is satisfied by the close-up survey, that there is no structural diminution and the protective coating where provided remains effective.

2.2.3.6 Where the protective coating in the foremost cargo hold is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

For existing bulk carriers, where owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a surveyor.

2.2.3.7 Bilge well alarms to all cargo holds and conveyor tunnels are to be verified to confirm their functionality.

2.2.4 Machinery and systems

2.2.4.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

2.2.4.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

2.2.4.3 Confirm that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

2.2.4.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

2.2.4.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

2.2.4.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

2.2.4.7 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

2.2.4.8 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

2.2.4.9 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

2.2.4.10 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

2.2.4.11 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

2.2.4.12 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

2.2.4.13 Confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

2.2.4.14 The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

2.2.4.15 Examining visually the condition of any expansion joints in sea water system.

2.2.4.16 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

2.2.4.17 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

2.2.4.18 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

2.2.4.19 A General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

2.2.4.20 Examination of bunker and vent piping systems.

2.2.4.21 For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors (See 2.4.14), the annual survey is to include an examination and a test, at random, of the water ingress detection systems and of their alarms.

2.2.4.22 For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems (See 2.4.15), the annual survey is to include an examination and a test, of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold and of their controls.

2.2.4.23 Confirmation that machinery space ventilation systems are in good working condition.

2.2.5 Fire protection, detection and extinction

2.2.5.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible of the fire and/or smoke detection system(s);

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fixed fire fighting system controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery and shutting off fuel supplies in machinery spaces are in working order;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged.

j) examination of any manual and automatic fire doors and proving their operations.

k) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

l) examination of the fire safety requirements of any helicopter facilities;

m) examination of the fire protection arrangements in cargo spaces, as far as practicable;

n) examination, when appropriate of the special arrangements for carrying dangerous goods, including checking the electrical equipment and wiring, ventilation, provision of protective clothing and portable appliances and testing of the water supply, bilge pumping and any water spray system.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

2.2.5.2 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

2.2.5.3 Examination of the arrangements for gaseous fuel for domestic purposes.

2.3 Intermediate Surveys

2.3.1 General

2.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey.

However, only those items which are additional to the requirements of annual survey may be examined between the second or third Annual Survey.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

2.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

2.3.1.3 For vessels over 10 years of age a specific survey program is to be worked out by the owner in cooperation with the Surveyors considering the requirements of the previous special survey, executive hull summary of that survey, later relevant survey records and taking account of any amendments to the survey requirements after the last special survey. The survey program is to be submitted in written format for approval and kept on board until the intermediate survey has been completed. (See 2.4.2 for guidance on preparation of the survey program).

2.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

2.3.2 Vessels of between 5 and 10 years of age

2.3.2.1 Ballast tanks

a) An overall survey of representative ballast tanks is to be carried out. The selection of representative tanks is to include the fore and aft peak tanks and a number of other tanks, taking into account the total number and type of ballast tanks. When extensive corrosion is found, thickness measurements are to be carried out. If the overall survey reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remains efficient.

b) Where POOR coating condition, corrosion or other defects are found in ballast tanks or where a hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast tanks of the same type.

c) For ballast tanks other than double bottom tanks, where a hard protective coating is found to be in POOR condition and is not renewed or where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined and thickness measurements carried out as necessary at subsequent annual surveys.

   When such breakdown of hard coating is found in double bottom ballast tanks, or where a soft or semi-hard coating has been applied or where a hard protective coating has not been applied, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor, or where extensive corrosion exists, thickness measurements are to be carried out.

d) Suspect areas identified at previous surveys are to be overall and close-up surveyed.

2.3.2.2 Cargo holds

a) Overall survey of all cargo holds. For single side skin bulk carriers, close-up survey of sufficient extent, minimum 25 per cent of frames, is to be carried out to establish the condition of :

- Shell frames including their end attachments, adjacent shell plating and transverse bulkheads in the forward cargo hold and one other selected cargo hold.

- Areas found suspect at the previous Special Survey.

b) For single side skin bulk carriers, where considered necessary by the Surveyor as a result of the overall and close-up survey, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of that cargo hold as well as a close-up survey of sufficient extent of all remaining cargo holds.

For double skin bulk carriers, as a result of overall survey, the survey may be extended to include a close-up survey of those areas of structure in the cargo holds selected by the Surveyor.

2.3.2.3 Extent of thickness measurements

a) Thickness measurements are to be carried out to an extent sufficient to determine both general and local corrosion levels at areas subject to close-up survey as per 2.3.2.2a). The minimum requirements for thickness measurement are the areas found to be suspect areas at the previous survey. The extent of thickness measurement may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coatings are found to be in GOOD condition.

b) Where substantial corrosion is found, the extent of thickness measurements is to be increased in accordance with the requirements of Table 2.4.10.2. Suspect areas identified at previous surveys are to be examined. Areas of substantial corrosion identified at previous surveys are to have thickness measurements taken.

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas may be:

i) protected by coating applied in accordance with the coating manufacturer's requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively

ii) required to be gauged at annual intervals.

In this case of i) above, it is recommended that the necessary documentation of coating is available on board.

c) Where the hard protective coating in cargo holds is found to be in GOOD condition, the extent of close-up surveys may be specially considered.

For existing bulk carriers, where owners may elect to coat or recoat cargo holds as noted above, consideration may be given to the extent of the close-up and thickness measurement surveys. Prior to the coating of cargo holds of existing ships, scantlings should be ascertained in the presence of a surveyor.

2.3.3 Vessels of between 10 and 15 years of age

2.3.3.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.4 for hull structure and piping systems in way of the cargo holds cofferdams, pipe tunnels, void spaces and fuel oil tanks in the cargo area and all ballast tanks. However, tank testing specified in 2.4.8, survey of automatic air pipe heads specified in 2.4.6.9 and internal examination of fuel oil, lub.oil and fresh water tanks specified in Table 2.4.6.1 need not be carried out unless deemed necessary by the attending Surveyor. Thickness measurement is to be carried out for items 1) to 6) of Table 2.4.10.1.

A survey programme as per 2.4.2 is to be worked out prior to commencement of survey.

2.3.3.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 2.4.1.4.

2.3.3.3 An in-water survey complying with the requirements of Sec.7.2 may be accepted in lieu of docking survey required by 2.4.1.9.

2.3.4 Vessels of over 15 years of age

2.3.4.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 2.4 for hull structure and piping systems in way of the cargo holds cofferdams, pipe tunnels, void spaces and fuel oil tanks in the cargo area and all ballast tanks. However, tank testing specified in 2.4.8, survey of automatic air pipe heads specified in 2.4.6.9 and internal examination of fuel oil, lub.oil and fresh water tanks specified in Table 2.4.6.1 need not be carried out unless deemed necessary by the attending Surveyor. Thickness measurement is to be carried out for items 1) to 6) of Table 2.4.10.1.

A survey programme as per 2.4.2 is to be worked out prior to commencement of survey.

2.3.4.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 2.4.1.4.

2.3.4.3 A survey in dry dock is to be part of the intermediate survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo holds and ballast tanks (i.e. parts below light ballast water line), are to be completed in the dry-dock.

2.4 Special Surveys - Hull

2.4.1 General

2.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

2.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

2.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

2.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

2.4.1.5 As part of the preparation for Special Survey, the proposed Survey Programme (See 2.4.2) including the schedule for thickness measurements (See 2.4.10) are to be submitted at least 3 months in advance of the intended commencement of the Special Survey.

2.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

2.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey. In addition a notation "ESP" will be entered for bulk carriers, ore carriers and combination carriers.

2.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping as indicated in 2.4.6.3 are in satisfactory condition and that the ship is fit for its intended purpose for the new period of class of five years to be assigned subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

2.4.1.9 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo holds and ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

2.4.2 Planning and preparation for survey

2.4.2.1 A specific Survey Programme is to be worked out in advance of the Survey by the Owner in cooperation with the Surveyors and submitted to IRS for approval. The Survey Programme is to be in a written format based on IMO Resolution MSC197(80). The survey is not to commence until the survey programme has been agreed. Prior to the development of the survey programme, the survey planning questionnaire based on IMO Resolution MSC197(80) is to be completed by the owner and forwarded to IRS. The Survey Programme at Intermediate Survey may consist of the Survey Programme at the previous Special Survey supplemented by the Executive Hull Summary of that Special Survey and later relevant survey reports. The survey program is to be worked out taking into account any amendments to the survey requirements after the last special survey.

2.4.2.2 In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural areas for examination :

- Survey status and basic ship information
- Documentation on board as per 2.4.3
- Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel
- Relevant previous survey and inspection reports of IRS and the Owners
- Information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data
- Information regarding corrosion prevention level at the time of construction
- Information regarding the relevant maintenance level during operation.

2.4.2.3 The Survey Programme submitted for approval is to account for and comply, as a minimum, with the requirements of close-up survey, thickness measurement and tank testing respectively, and to include relevant information including at least :

- Basic ship information and particulars
- Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel
- Plan of holds and tanks
- List of holds and tanks with information on use, corrosion prevention and condition of coating
- Conditions for survey (e.g. information like holds and tank cleaning, gas freeing, ventilation, lighting, etc.)
- Provisions and methods of access to structures
- Equipment for survey
- Nomination of holds and tanks and areas for close-up survey (As per Table 2.4.9.1)
- Nomination of sections for thickness measurement (As per Table 2.4.10.1)
- Nomination of tanks for testing
- Damage experience related to the ship in operation.

2.4.2.4 IRS will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

2.4.2.5 The ship is to be prepared for overall survey in accordance with the requirements of Table 2.4.2.5. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

2.4.2.6 Proper preparation and the close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

Table 2.4.2.5 : Survey preparation

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
1) The holds, deep tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with
2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.			

2.4.2.7 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement company representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

2.4.2.8 The following is an indicative list of items that are to be addressed in the meeting:

a) Schedule of the vessel (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.);

b) Provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety);

c) Extent of the thickness measurements;

d) Acceptance criteria (refer to the list of minimum thicknesses);

e) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion;

f) Execution of thickness measurements;

g) Taking representative readings in general and where uneven corrosion / pitting is found;

h) Mapping of areas of substantial corrosion; and

i) Communication between attending surveyor(s) the thickness measurement company operator(s) and owner representative(s) concerning findings.

2.4.3 Documentation on board

2.4.3.1 The Owners are to obtain, supply and maintain on board documentation as specified in 2.4.3.3, which is to be readily available for the Surveyor.

2.4.3.2 The documentation is to be kept on board for the life time of the ship.

2.4.3.3 A Survey Report File is to be a part of the documentation on board consisting of

- Reports of structural surveys
- Executive Hull Summary
- Thickness measurement reports.

2.4.3.4 The Survey Report File is to be available also in the Owners and the Classification Society's management offices.

2.4.3.5 The following additional supporting documentation is to be available on board:

Main structural plans of cargo holds and ballast tanks (for CSR ships these plans are to include for each structural element both the as-built and renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for hold transverse section in all cargo holds)

- Previous repair history
- Cargo and ballast history
- Inspection by ship's personnel with reference to
  - structural deterioration in general
  - leakages in bulkheads and piping
  - condition of coating or corrosion prevention system, if any
- Any other information that will help identify critical structural areas and/or Suspect Areas requiring inspection.
- Survey Programme as required by 2.4.2 until such time as the Special Survey has been completed.

2.4.3.6 Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

2.4.4 Surveys at sea or at anchorage

2.4.4.1 See Sec.1.8.

2.4.5 Space protection

2.4.5.1 Where provided, the condition of coating or corrosion protection of cargo holds and ballast tanks is to be examined. For ballast tanks excluding double bottom tanks where a hard protective coating is found in POOR condition and it is not renewed or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the tanks in question are to be examined at annual surveys. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

2.4.5.2 When such breakdown of hard protective coating is found in double bottom ballast tanks and it is not renewed, where a soft or semi-hard coating has been applied, or where a hard protective coating has not been applied from the time of construction, the tanks in question may be examined at annual intervals. When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurements are to be carried out.

2.4.5.3 Areas in spaces where a hard protective coating is provided and found in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

Areas in tanks where a hard protective coating is provided and found in GOOD condition, the extent of thickness measurements may be specially considered.

2.4.6 Survey and examination

2.4.6.1 All spaces within the hull and superstructure are to be examined.

2.4.6.2 All tanks other than water ballast tanks are to be examined internally in accordance with the requirements of Table 2.4.6.1.

Table 2.4.6.1 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks - Engine room - Cargo area	 None None	 None One	 One Two	 One Half the number of tanks, minimum 2
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.
2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.
3) Peak tanks (all uses) are subject to internal examination at each special survey.
4) At special survey No.III and subsequent special surveys, one deep tank for fuel oil in the cargo area is to be included, if fitted.

2.4.6.3 An overall survey of all cargo holds, ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull is to be carried out. This examination is to be supplemented by thickness measurement and testing as required by 2.4.10 and 2.4.8 to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required.

All piping systems within the above spaces are to be examined and operationally tested to working pressure to attending Surveyors satisfaction to ensure that the tightness and condition remains satisfactory.

2.4.6.4 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

2.4.6.5 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

2.4.6.6 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

2.4.6.7 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

2.4.6.8 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 2.4.6.8. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

Table 2.4.6.8 : Requirements for internal examination of automatic air pipe heads

Location	**Special survey No.I** **Age ≤ 5**	**Special survey No.II** **5 < Age ≤ 10**	**Special survey No.III and subsequent** **Age > 10**
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

2.4.6.9 The Surveyor should satisfy himself regarding the efficient condition of the following :

– Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

2.4.6.10 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

2.4.6.11 The windlass is to be examined.

2.4.6.12 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

2.4.6.13 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals of repairs made when wastage exceeds allowable limits.

2.4.6.14 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

2.4.6.15 For ships complying with the requirements of SOLAS XII/12 for hold, ballast and dry space water level detectors, the special survey is to include an examination and a test of the water ingress detection systems and of their alarms.

2.4.6.16 For ships complying with the requirements of SOLAS XII/13 for the availability of pumping systems, the special survey is to include an examination and a test of the means for draining and pumping ballast tanks forward of the collision bulkhead and bilges of dry spaces any part of which extends forward of the foremost cargo hold and of their controls.

2.4.6.17 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

2.4.7 Hatch covers and coamings

The hatch covers and coamings are to be surveyed as follows:

2.4.7.1 A thorough inspection of the items listed in 2.2.2.2 is to be carried out in addition to all hatch covers and coamings.

2.4.7.2 Checking of the satisfactory operation of all mechanically operated hatch covers is to be made, including:

- stowage and securing in open condition;

- proper fit and efficiency of sealing in closed condition;

- operational testing of hydraulic and power components, wires, chains and link drives.

2.4.7.3 Checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

2.4.7.4 Close up survey and thickness measurement of the hatch cover and coaming plating and stiffeners is to be carried out as given in the relevant tables.

2.4.8 Tank testing

2.4.8.1 Boundaries of double bottom, deep, ballast, peak and other tanks including holds adapted for the carriage of water ballast, are to be tested with a head of liquid to the top of air pipes or nearabout to the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results.

2.4.8.2 The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

2.4.9 Close-up surveys

2.4.9.1 The minimum requirements for Close-up survey are given in Table 2.4.9.1(a) or Table 2.4.9.1(b) or Table 2.4.9.1(c).

Table 2.4.9.1a : Requirements of close-up survey - Dry bulk cargo ships other than double skin bulk carriers

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
A) 25% of frames in the forward cargo hold at representative positions A) Selected frames in all cargo holds	A) All shell frames in the forward cargo hold and 25% of frames in remaining cargo holds including upper and lower end attachments and adjacent shell plating For bulk carriers of 100,000 dwt and above all shell frames in the forward cargo hold and 50% of shell frames in each of the remaining cargo holds, including upper and lower end attachments and adjacent shell plating	A) All shell frames in the forward cargo hold and one other selected cargo hold and 50% of frames in remaining cargo holds including upper and lower end attachments and adjacent shell plating	A) All shell frames including their upper and lower end attachments and adjacent shell plating in all cargo holds.
B) One transverse web with associated plating and longitudinals in two representative ballast tanks of each type (i.e. topside or hopper side tank)	B) One transverse web with associated plating and longitudinals in each ballast tank B) Forward and aft transverse bulkhead in one ballast tank, including stiffening system	B) All transverse webs with associated plating and longitudinals in each ballast tank B) All transverse bulkheads in ballast tanks, including stiffening system	B) All transverse webs with associated plating and longitudinals in each ballast tank B) All transverse bulkheads in ballast tanks, including stiffening system
C) Two selected cargo hold transverse bulk-heads including internal structure of upper and lower stools, where fitted	C) All cargo hold trans-verse bulkheads including internal structure of upper and lower stools, where fitted	C) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted	C) All cargo hold transverse bulkheads including internal structure of upper and lower stools, where fitted
D) All cargo hold hatch covers and coamings (plating and stiffeners)	D) All cargo hold hatch covers and coamings (plating and stiffeners)	D) All cargo hold hatch covers and coamings (plating and stiffeners)	D) All cargo hold hatch covers and coamings (plating and stiffeners)
	E) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches	E) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches	E) All deck plating and underdeck structure inside line of hatch openings between all cargo hold hatches

A) Cargo hold transverse frames

B) Transverse web frame or watertight transverse bulkhead in ballast tanks

C) Cargo hold transverse bulkheads plating, stiffeners and girders

D) Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

E) Deck plating and underdeck structure inside line of hatch openings, between cargo hold hatches

Table 2.4.9.1a : (Contd.)	
Note : Close-up survey of transverse bulkheads to be carried out at four levels -	
Level (a)	Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
Level (b)	Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools) and immediately above the line of the shedder plates.
Level (c)	About mid-height of the bulkhead.
Level (d)	Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

Table 2.4.9.1b : Minimum requirements for close-up survey at special hull survey of double skin bulk carriers other than ore carriers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
One transverse web with associated plating and longitudinals in two representative ballast tanks of each type (This is to include the foremost topside and double side ballast tanks on either side) **(A)**	One transverse web with associated plating and longitudinals as applicable in each ballast tank **(A)**	All transverse webs with associated plating and longitudinals as applicable in each ballast tank **(A)**	All transverse webs with associated plating and longitudinals as applicable in each ballast tank **(A)**
	Forward and aft transverse bulkheads including stiffening system in the topside, hopper side and double side ballast tanks on one side of the ship (i.e. port or starboard) that fall in one transverse section **(A)**	All transverse bulkheads including stiffening system in each ballast tank **(A)**	All transverse bulkheads including stiffening system in each ballast tank **(A)**
	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts,in the foremost double side tanks **(B)**	25% of ordinary transverse frames for transverse framing system or 25% of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts,in all double side tanks **(B)**	All ordinary transverse frames for transverse framing system or all of longitudinals for longitudinal framing system on side shell and inner side plating at forward, middle and aft parts,in all double side tanks **(B)**
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted **(C)**	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	Areas **(C)** - **(E)** as for SS No.III

Table 2.4.9.1c : Minimum requirements for close-up survey at special hull survey of ore carriers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
One web frame ring complete including adjacent structural members in a ballast wing tank **(A)** One transverse bulkhead lower part – including girder system and adjacent structural members – in a ballast tank **(A)**	All web frame rings complete including adjacent structural members in a ballast wing tank **(A)** One deck transverse including adjacent deck structural members in each remaining ballast tank **(A)** Forward and aft transverse bulkheads complete – including girder system and adjacent structural members – in a ballast wing tank **(A)**	All web frame rings complete including adjacent structural members in each ballast wing tank **(A)** All transverse bulkheads complete – including girder system and adjacent structural members – in each ballast tank **(A)** One web frame ring complete including adjacent structural members in each wing void space **(A)**	As for special survey for age from 10 to 15 years
	One transverse bulkhead lower part – including girder system and adjacent structural members – in each remaining ballast tank **(A)**	Additional web frame rings in void spaces as deemed necessary by the Surveyor **(A)**	
Two selected cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	One transverse bulkhead in each cargo hold, including internal structure of upper and lower stools, where fitted **(C)**	All cargo hold transverse bulkheads, including internal structure of upper and lower stools, where fitted **(C)**	Areas **(C) – (E)** as for age interval 10 to 15 years
All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	All cargo hold hatch covers and coamings (plating and stiffeners) **(D)**	
	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches **(E)**	All deck plating and under deck structure inside line of hatch openings between all cargo hold hatches **(E)**	

(A), (C), (D) and **(E)** are areas to be subjected to close-up surveys and thickness measurements

(A) :	Transverse web frame or watertight transverse bulkhead in ballast wing tanks and void spaces. In fore and aft peak tanks transverse web frame means a complete transverse web frame ring including adjacent structural members
(C) :	Cargo hold transverse bulkheads plating, stiffeners and girders
(D) :	Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.
(E) :	Deck plating and under deck structure inside line of hatch openings between cargo hold hatches

Table 2.4.9.1c (Contd.)	
Note : Close-up survey of transverse bulkheads to be carried out at four levels:	
Level (a) :	Immediately above the inner bottom and immediately above the line of gussets (if fitted) and shedders for ships without lower stool.
Level (b) :	Immediately above and below the lower stool shelf plate (for those ships fitted with lower stools) and immediately above the line of the shedder plates.
Level (c) :	About mid-height of the bulkhead.
Level (d) :	Immediately below the upper deck plating and immediately adjacent to the upper wing tank and immediately below the upper stool shelf plate for those ships fitted with upper stools, or immediately below the topside tanks.

2.4.9.2 The Surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

2.4.9.3 For areas in tanks and cargo holds where hard protective coatings are found in GOOD condition, the extent of Close-up survey may be specially considered.

2.4.10 Thickness measurement

2.4.10.1 The minimum requirement for thickness measurement at special survey are given in Table 2.4.10.1.

2.4.10.2 Provisions for extended measurements for areas with Substantial Corrosion in case of dry bulk cargo ships are given in Table 2.4.10.2(a) and Table 2.4.10.2(b) and may be additionally specified in the survey programme as required by 2.4.2. Areas of substantial corrosion identified at the previous surveys are to have thickness measurements taken.

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas may be:

a) Protected by coating applied in accordance with the coating manufacturer’s requirements and examined at annual intervals to confirm the coating in way is still in good condition, or alternatively

b) Required to be gauged at annual intervals.

In this case of a) above, it is recommended that the necessary documentation of coating is available on board.

The Surveyor may further extend the thickness measurements as deemed necessary.

2.4.10.3 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements, one of which is to be in the amidships area.

2.4.10.4 Representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and ballast tanks is to be carried out.

Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating.

The extent of thickness measurements may be specially considered provided the Surveyor is satisfied by the close-up survey, that there is no structural diminution and the hard protective coating where applied remains efficient.

Table 2.4.10.1 : Thickness measurement at special hull survey of dry bulk cargo ships (including double skin bulk carriers)

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) Within the cargo area: a) 2 transverse sections of deck plating outside line of cargo hatch opening b) Wind and water strakes in way of the transverse sections considered in item (a) above	2) Within the cargo area: a) Each deck plate outside line of cargo hatch openings b) 2 transverse sections, one in the amidship area, outside line of cargo hatch openings c) All wind and water strakes	2) Within the cargo area: a) Each deck plate outside line of cargo hatch openings b) 3 transverse sections, one in the amidship area, outside line of cargo hatch openings c) All wind and water strakes d) Each bottom plate e) Duct keel or pipe tunnel plating and internals
	3) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to Table 2.4.9.1(a) or Table 2.4.9.1(b), as applicable	3) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to Table 2.4.9.1(a) or Table 2.4.9.1(b), as applicable	3) Measurement, for general assessment and recording of corrosion pattern, of those structural members subject to Close-up Survey according to Table 2.4.9.1(a) or Table 2.4.9.1(b), as applicable
	4) For vessels where UR S31 applies as mentioned in Table 2.4.13.1, additional thickness measurement of side shell frames and brackets for verifying compliance with UR S31.	4) Same as for special survey II	4) Same as for special survey II
	5) Selected wind and water strakes outside the cargo area	5) Selected wind and water strakes outside the cargo area	5) All wind and water strakes outside the cargo area
		6) For vessels subject to compliance of IMO standards as mentioned in 2.4.12 thickness measurement applicable to the vertically corrugated aft transverse bulkhead of the foremost cargo hold is to be carried out as per Table 2.4.12 and Fig.2.4.12	6) Same as for Special Survey III

Table 2.4.10.1 (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
		7) Internals in forepeak and after peak tanks	7) Internals in forepeak and after peak tanks
			8) All exposed main deck plating outside cargo area
			9) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			10) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			11) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.

Table 2.4.10.2a : Requirements for extent of thickness measurement on areas of substantial corrosion in dry bulk cargo ships other than double skin bulk carriers			
Structural Member		**Extent of Measurement**	**Pattern of Measurement**
Deck Structure including Cross Strips, Main Cargo Hatchways, Hatch Covers, Coamings and Topside Tanks			
1	Cross deck strip plating	Suspect cross deck strip plating	5 point pattern between underdeck stiffeners over 1 metre in length
2	Underdeck stiffeners	Transverse members	5 point pattern at each end and mid span
		Longitudinal members	5 point pattern on both web and flange
3	Hatch covers	Side and end skirts, each 3 locations	5 point pattern at each location
		3 longitudinal bands, 2 outboard strakes and centreline strake	5 point measurement each band
4	Hatch coaming	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5 point measurement of each band, i.e. end or side coaming
5	Topside ballast tanks	a) Watertight transverse bulkheads	
		i) lower 1/3 of bulkhead	i) 5 point pattern over 1 sq. metre of plating
		ii) upper 2/3 of bulkhead	ii) 5 point pattern over 1 sq. metre of plating
		iii) stiffeners	iii) 5 point pattern over 1 metre length
		b) 2 Representative swash transverse bulkheads	
		i) lower 1/3 of bulkhead	i) 5 point pattern over 1 sq. metre of plating
		ii) upper 2/3 of bulkhead	ii) 5 point pattern over 1 sq. metre of plating
		iii) stiffeners	iii) 5 point pattern over 1 metre length
		c) 3 Representative bays of slope plating	
		i) lower 1/3 of tank	i) 5 point pattern over 1 sq. metre of plating
		ii) upper 2/3 of tank	ii) 5 point pattern over 1 sq. metre of plating
		d) Longitudinals, suspect and adjacent areas	5 point pattern both web and flange over 1 metre length
6	Main deck plating	Suspect plates and adjacent areas	5 point pattern over 1 metre length of plating
7	Main deck longitudinals	Minimum of 3 longitudinals where plating measured	5 point pattern both web and flange over 1 metre length
8	Web frames/transverses	Suspect plates	5 point pattern over 1 sq. metre
Double Bottom and Hopper Structure			
1	Inner/double bottom plating	Suspect plates plus all adjacent plates	5 point pattern for each panel between longitudinals over 1 metre length
2	Inner/double bottom longitudinals	Three longitudinals where plates measured	3 measurements in line across web and 3 measurements on flange
3	Longitudinal girders or transverse floors	Suspect plates	5 point pattern over about 1 sq. metre
4	Watertight bulkheads (WT floors)	a) lower 1/3 of tank	a) 5 point pattern over 1 sq. metre of plating
		b) upper 2/3 of tank	b) 5 point pattern alternate plates over 1 sq. metre of plating
5	Web frames	Suspect plates	5 point pattern over 1 sq. metre of plating
6	Bottom/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web
			3 measurements on flange

Table 2.4.10.2a (Contd.)

Structural Member		**Extent of Measurement**	**Pattern of Measurement**
Cargo Holds			
1	Side shell frames	Suspect stiffener and each adjacent area	a) At each end and mid span: 5 point pattern of both web and flange
			b) 5 point pattern within 25 mm of welded attachment to both shell and lower slope plate
Shell Structures			
1	Bottom and side shell plating	a) Suspect plate, plus four adjacent plates	a) 5 point pattern for each panel between longitudinals
		b) See other tables for particulars on gauging in way of tanks and cargo holds	
2	Bottom/side shell longitudinals	Minimum of three longitudinals in way of suspect areas	3 measurements in line across web 3 measurements on flange
Transverse Bulkheads in Cargo Holds			
1	Lower stool	a) Transverse band within 25 mm of welded connection to inner bottom	a) 5 point between stiffeners over 1 metre length
		b) Transverse band within 25 mm of welded connection to shelf plate	b) 5 point between stiffeners over 1 metre length
2	Transverse bulkhead	a) Transverse band at approximately mid height	a) 5 point between stiffeners over 1 sq. metre of plating
		b) Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	b) 5 point between stiffeners over 1 sq. metre of plating

Table 2.4.10.2b : Requirements for extent of thickness measurements on areas of substantial corrosion of double skin bulk carriers

Structural member	**Extent of measurement**	**Pattern of measurement**
Bottom, inner bottom and hopper structure		
Bottom, inner bottom and hopper structure plating	Minimum of three bays across double bottom tank, including aft bay	5-point pattern for each panel between longitudinals and floors
	Measurements around and under all suction bell mouths	
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across flange and three measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener or a minimum of three measurements
Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square meter area
Hopper structure web fame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange

Table 2.4.10.2b : (Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Hopper structure transverse watertight bulkhead or swash bulkhead	Lower 1/3 of bulkhead	5-point pattern over one square metre of plating
	Upper 2/3 of bulkhead	5-point pattern over two square metre of plating
	Stiffeners (minimum of three)	For web, 5-point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
Panel stiffening	Where applicable	Single measurements
Deck structure including cross strips, main cargo hatchways, hatch covers, coamings and topside tanks		
Structural member	**Extent of measurement**	**Pattern of measurement**
Cross deck strip plating	Suspect cross deck strip plating	5 point pattern between underdeck stiffeners over 1 metre length
Underdeck stiffeners	Transverse members	5 point pattern at each end and mid span
	Longitudinal members	5 point pattern on both web and flange
Hatch covers	Side and end skirts, each 3 locations	5 point pattern at each location
	3 longitudinal bands, 2 outboard strakes and centerline strake	5 point measurement each band
Hatch coamings	Each side and end of coaming, one band lower 1/3, one band upper 2/3 of coaming	5 point measurement each band i.e. end or side coaming
Topside ballast tanks	a) watertight transverse bulkheads:	
	- Lower 1/3 of bulkhead	5 point pattern over 1 sq. metre of plating
	- Upper 2/3 of bulkhead	5 point pattern over 1 sq. metre of plating
	- Stiffeners	5 point pattern over 1 metre length
	b) two representative swash transverse bulkheads:	
	- Lower 1/3 of bulkhead	5 point pattern over sq. metre of plating
	- Upper 2/3 of bulkhead	5 point pattern over 1 sq. metre of plating
	- stiffeners	5 point pattern over 1 metre length
	c) three representative bays of slope plating:	
	- Lower 1/3 of tank	5 point pattern over 1 sq. metre of plating
	- Upper 2/3 of tank	5 point pattern over 1 sq. metre of plating
	d) Longitudinals, suspect and adjacent	5 point pattern on both web and flange over 1 metre length

Table 2.4.10.2b (Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Main deck plating	Suspect plates and four adjacent plates	5 point pattern over 1 sq. metre of plating
Main deck longitudinals	Suspect plates	5 point pattern on both web and flange over 1 metre length
Web frames / transverses	Suspect plates	5 point pattern over 1 sq. metre
Structure in double side spaces of double skin bulk carriers including wing void spaces of ore carriers		
Structural member	**Extent of measurement**	**Pattern of measurement**
Side shell and inner side plating:	a) upper strake and strakes in way of horizontal girders plating between each pair of transverse frames / longitudinals in a minimum of three bays (along the tank)	single measurement
	b) all other strakes plating between every third pair of longitudinals in same three bays	single measurement
Side shell and inner side transverse frames / longitudinals on:	a) upper strake each transverse frame / longitudinal in same three bays	3 measurements across web and 1 measurement on flange
	b) all other strakes every third transverse frame / longitudinal in same three bays	3 measurements across web and 1 measurement on flange
Transverse frames / longitudinals – brackets	Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of brackets
Vertical web and transverse bulkheads:	a) strakes in way of horizontal girders minimum of two webs and both transverse bulkheads	5-point pattern over approx. two square metre area
	b) other strakes minimum of two webs and both transverse bulkheads	two measurements between each pair of vertical stiffeners
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements

Table 2.4.10.2b (Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Transverse bulkheads in cargo holds		
Structural member	**Extent of measurement**	**Pattern of measurement**
Lower stool, where fitted	Transverse band within 25 [mm] of welded connection to inner bottom	5-point pattern between stiffeners over one metre length
	Transverse band within 25 [mm] of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
Transverse bulkheads	Transverse band at approximately mid height	5-point pattern over one square metre of plating
	Transverse band at part of bulkhead adjacent to upper deck or below upper stool shelf plate (for those ships fitted with upper stools)	5-point pattern over one square metre of plating

2.4.10.5 The thickness measurements are to be carried out by a qualified company certified by IRS.

2.4.10.6 In order to ensure necessary control during the process of thickness measurements, these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

2.4.10.7 In all cases the extent of thickness measurements is to be sufficient as to represent the actual average condition.

2.4.10.8 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measuring equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

2.4.11 Reporting and evaluation of survey

2.4.11.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

2.4.11.2 For CSR bulk carriers, the ship’s longitudinal strength is to be evaluated by using the thickness of structural members measured, renewed and reinforced, as appropriate, during the special surveys carried out after the ship reached 15 years of age (or during the special survey No.3, if this is carried out before the ship reaches 15 years) in accordance with the criteria for longitudinal strength of the ship’s hull girder for CSR bulk carriers specified in Ch.13 of CSR.

2.4.11.3 The final result of evaluation of the ship’s longitudinal strength required in 2.4.11.2 after renewal or reinforcement work of structural members, if carried out as a result of initial evaluation, is to be reported as a part of the Executive Hull Summary.

2.4.11.4 An Executive Hull Summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The Executive Hull Summary is to be endorsed by IRS Head Office.

2.4.12 Compliance with IMO standards for scantlings of aft transverse bulkhead of the foremost cargo hold and allowable hold loading for foremost cargo hold

2.4.12.1 These requirements apply to all bulk carriers of 150 [m] in length and above, intending to carry cargoes having bulk density of 1.78 [t/m^3] or above where:

a) The foremost hold is bounded by the side shell only in ships which were contracted for construction prior to 1 July 1998 and

b) The foremost hold is of double skin construction of less than 760 [mm] in breadth, measured perpendicular to the side shell, in ships, the keel of which were laid or were at a similar stage of construction, before 1 July 1999.

2.4.12.2 For existing bulk carriers of the type as mentioned in 2.4.12.1 a) and b) above which have not yet complied with the IMO standards, the compliance is to be achieved within the following time limits:

i) for ships which were 15 years of age or more on 1 July 1998, immediately before continuance in service;

ii) for ships which were 10 years of age or more but less than 15 years of age on 1 July 1998, by the due date of the first intermediate or special survey to be held after the date on which the ship reaches 15 years of age but not later than the date on which the ship reaches 17 years of age;

iii) for ships which were 5 years of age or more but less than 10 years of age on 1 July 1998, on or before the due date, after 1 July 2003, of the first intermediate or special survey after the date on which the ship reaches 10 years of age; and

iv) for ships which were less than 5 years of age on 1 July 1998, on or before the date on which the ship reaches 10 years of age.

Completion prior to 1 July 2003 of an intermediate or special survey with a due date after 1 July 2003, can not be used to postpone compliance.

2.4.12.3 For bulkcarriers described in 2.4.12.2, thickness measurement of vertically corrugated aft transverse bulkhead of the foremost cargo hold is to be carried out to determine the general condition of the structure and to define the extent of possible repairs and/or reinforcements required to meet the above mentioned IMO standards. As a minimum, the thickness measurement is to be carried out at the critical locations given in Table 2.4.12 and Fig.2.4.12.

In addition, thickness measurement is to be carried out at subsequent intermediate surveys (for ships over 10 years of age) and special surveys for the purpose of verifying continuing compliance with the above standards.

Where annual gauging has been adopted as an alternative to steel renewal in accordance with the IMO standards, thickness measurement is also to be carried out at subsequent annual surveys.

2.4.13 Compliance with IACS requirements for existing vessels

2.4.13.1 Compliance with the standards mentioned in Table 2.4.13.1, as applicable, is to be achieved by the due date indicated in 2.4.13.2.

2.4.13.2 Compliance with the requirements indicated in Table 2.4.13.1, as applicable is to be achieved within the following time limits:

i) For ships which will be 15 years of age or more on 1 January 2004 by the due date of the first intermediate or special survey after that date;

ii) For ships which will be 10 years of age or more on 1 January 2004 by the due date of the first special survey after that date;

iii) For ships which will be less than 10 years of age on 1 January 2004 by the date on which the ship reaches 10 years of age.

Completion prior to 1 January 2004 of an intermediate or special survey with a due date after 1January 2004 cannot be used to postpone compliance. However, completion prior to 1 January 2004 of an intermediate survey the window for which straddles 1 January 2004 can be accepted.

2.4.13.3 Ships which are required to comply with UR S31 as indicated in Table 2.4.13.1 are subject to additional thickness measurements with respect to the side shell frames and brackets for the purpose of determining compliance, prior to the due dates as mentioned in 2.4.13.2 and at subsequent intermediate and special surveys for verifying continuing compliance with UR S31.

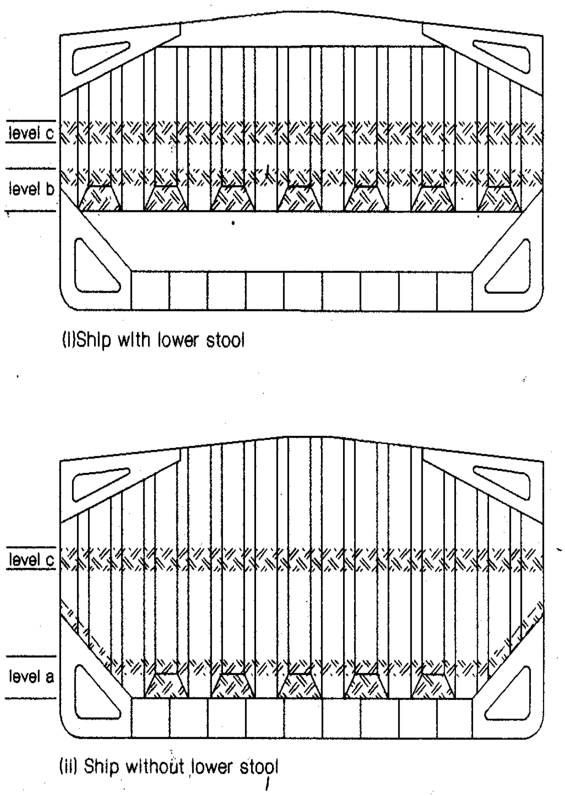

Fig.2.4.12 : Locations for thickness measurement for verification of IMO standard compliance

Table 2.4.12 : Critical levels at which thickness measurement is to be carried out for the vertically corrugated aft transverse bulkhead of the foremost cargo hold of existing bulk carriers to determine compliance with IMO standard	
Level as per Fig.2.4.12	**Locations where thickness is to be measured in Zone 2 (P&S) and Zone 1** **Ships with or without lower stool**
Level (a) OR Level (b)	1) mid breadth of each corrugation flange at about 200 [mm] above line of shedder plates
	2) middle of gusset plates between corrugation flanges, where fitted
	3) middle of each shedder plate
	4) mid breadth of each corrugation web at approximately 200 [mm] above the line of each shedder plate
Level (c)	1) mid breadth of each corrugation flange and web at about the mid-height of the corrugation

Notes:

1. To adequately assess the scantlings of each individual vertical corrugation, each corrugation flange, web, shedder plate and gusset plate within each of the levels given above are to be gauged.
2. Where the thickness changes within the horizontal levels, the thinner plate is to be gauged.
3. Steel renewal/reinforcement is to comply with IMO standard.

2.4.14 Compliance with SOLAS regulation 12, Ch.XII : Hold, ballast and dry space water level detectors

Bulk carriers constructed before 1st July, 2004 are to be fitted with water level detectors as described in Pt.5, Ch.1, 2.13 of the Rules, not later than the date of the annual, intermediate or special survey of the ship to be carried out after 1st July, 2004, whichever comes first.

2.4.15 Compliance with SOLAS regulation 13, Ch.XII : Availability of pumping systems (for dewatering of forward spaces)

Bulk carriers constructed before 1st July, 2004 are to comply with this SOLAS regulation in accordance with details given in Pt.5, Ch.1, 2.14 of the Rules, not later than the date of the first intermediate or special survey of the ship to be carried out after 1st July, 2004, but in no case later than 1st July, 2007.

2.5 Special Surveys – Machinery

2.5.1 Requirements for examination of machinery and piping are given in Sec.8.

Table 2.4.13.1 : Compliance with new IACS unified requirements

Item	Applicable types of vessels	Reference IACS unified requirement	Applicable locations on the ship
Renewal criteria for side shell frames and brackets	Bulk carriers with side frames and/or brackets not meeting the requirements of Pt.5, Ch.1 of the 1998 or subsequent rules	S31	Cargo holds bounded by single side shell
Cargo hatch cover securing arrangements (except for pontoon type hatchcover)	Bulk carriers where cargo hatch covers do not meet the requirements of Pt.3, Ch.12 of the January, 2004 Rules	S30	Securing devices and stoppers for the fore most and the second foremost cargo hold hatchways located wholly or partially within 0.25L of the fore perpendicular
Fore deck fittings: Air pipes and ventilators and their closing devices	Bulk carriers, ore carriers, general dry cargo ships and combination carriers of $L \geq 100$ m contracted for construction prior to 1 January, 2004	S27	Located on the exposed deck and serving spaces wholly or partially forward of the collision bulkhead
Strength of small hatches on the fore deck and their securing devices (See Pt.3, Ch.12, 7.2 for definition of small hatches)	Bulk carriers, ore carriers, general dry cargo ships and combination carriers of $L \geq 100$ m contracted for construction prior to 1 January, 2004.	S26	Located on the exposed deck giving access to spaces wholly or partially forward of the collision bulkhead

Section 3

Surveys - Oil Tankers, Ore or Oil Carriers, Oil or Bulk Carriers

3.1 Scope

3.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned class notations:

Oil Tanker ESP
Ore or Oil Carrier ESP
Oil or Bulk Carrier ESP

3.1.2 For vessels with class notation Ore or Oil Carrier ESP and Oil or Bulk Carrier ESP, the relevant requirements given in Sec.2 are also to be applied.

3.2 Annual surveys

3.2.1 General

3.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

3.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

3.2.1.3 Access to cargo tanks or other spaces within the cargo area, necessitating gas freeing will normally not be required unless necessary for checking items of equipment and installations for correct functioning.

3.2.1.4 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

3.2.2 Hull and weather deck

3.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, closing appliances and related piping are maintained in satisfactory and efficient condition. Special attention is to be paid to the following:

a) Weather deck, ship side plating above water line.

b) Openings on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); ventilators and closing devices.

d) Watertight bulkheads and their penetrations as far as practicable.

e) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

f) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines.

g) Cargo tank openings including gaskets, covers, coamings and flame screens.

h) Cargo tanks pressure/vacuum valves, secondary means to prevent over or under pressure and devices to prevent passage of flame.

i) Flame screens on vents to all bunker tanks.

j) Examination of cargo, crude oil washing, bunker and vent piping systems, including vent masts and headers.

3.2.2.2 Examination of pump room and pipe tunnel, if fitted, is to be carried out including:

a) Examination of all pump room bulkheads for signs of oil leakage or fractures and, in particular, the sealing arrangements of all penetrations of pump room bulkheads.

b) Examination of the condition of all piping systems.

3.2.2.3 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

3.2.2.4 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

3.2.2.5 Examination of Ballast Tank is to be carried out when required as a consequence of the results of the Special Survey or Intermediate Survey. (See 3.4.5.1 and 3.3.3.3 respectively). When considered necessary by the Surveyor or where extensive corrosion is found, thickness measurement is to be carried out. When examination of ballast tanks reveals substantial corrosion, additional thickness measurements are to be carried out to the extent given in Table 3.4.9.2a) or Table 3.4.9.2b).

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

3.2.2.6 Anchoring and mooring equipment is to be examined as far as is practicable. A general examination of emergency towing arrangements is to be carried out to ensure their ready availability.

For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following are to be generally examined:

a) Components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans), to verify their satisfactory condition.

b) Hull structures supporting and adjacent to the components of the single point mooring system, to verify that there is no deformation or fracture.

3.2.2.7 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

3.2.2.8 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

3.2.2.9 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

3.2.2.10 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

3.2.2.11 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

3.2.2.12 Davits and fittings on the ship’s deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

3.2.2.13 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

3.2.2.14 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

3.2.2.15 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks when appropriate are recorded in the coating technical file.

3.2.3 Machinery and systems

3.2.3.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

3.2.3.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

3.2.3.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

3.2.3.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

3.2.3.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

3.2.3.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

3.2.3.7 Confirming, when appropriate, that requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.

3.2.3.8 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

3.2.3.9 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

3.2.3.10 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

3.2.3.11 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

3.2.3.12 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

3.2.3.13 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

3.2.3.14 Confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

3.2.3.15 The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

3.2.3.16 Examining visually the condition of any expansion joints in sea water system.

3.2.3.17 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

3.2.3.18 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

3.2.3.19 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

3.2.3.20 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

3.2.3.21 Confirmation that machinery space ventilation systems are in good working condition.

3.2.3.22 Examination so far as is possible of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and operation of pump room bilge system, and checking that pump foundations are intact.

3.2.3.23 Checking the protection of cargo pump room and in particular:

a) Checking temperature sensing devices for bulkhead glands and alarms;

b) Checking interlock between lighting and ventilation.

c) Checking gas detection system.

d) Checking bilge level monitoring devices and alarms.

3.2.3.24 Verification that installed pressure gauges on cargo discharge lines and level indicating systems are operational.

3.2.3.25 Examination of emergency lighting in all cargo pump rooms of tankers constructed after 1 July 2002.

3.2.4 Fire protection, detection and extinction

3.2.4.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible of the fire and/or smoke detection system(s);

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fixed fire fighting system controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery and shutting off fuel supplies in machinery spaces are in working order;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits and emergency escape breathing devices (EEBDS) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged;

j) examination of any manual and automatic fire doors and proving their operations;

k) verification that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean;

l) external examination of piping and cut-out valves of cargo tank and cargo pump room fixed fire fighting system;

m) verification that the deck foam system and deck sprinkler system are in good operating condition so far as is practicable;

n) verification that all electrical equipment in dangerous zones is in good condition and has been properly maintained so far as is practicable;

o) checking the deck foam system, including the supplies of foam concentrate and testing that minimum number of jets of water at the required pressure in the fire main is obtained when the system is in operation;

p) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

q) examination of the fire safety requirements of any helicopter facilities.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

3.2.4.2 For tankers fitted with inert gas system, examination of the inert gas system as detailed in Section 12, Para 12.2.1 is to be carried out.

3.2.4.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

3.2.4.4 Examination of the arrangements for gaseous fuel for domestic purposes.

3.3 Intermediate Surveys

3.3.1 General

3.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. However, only those items which are additional to the requirements of annual survey may be examined between the second or third annual survey.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

3.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

3.3.1.3 For vessels over 10 years of age a specific survey program is to be worked out by the owner in cooperation with the Surveyors considering the requirements of the previous special survey, executive hull summary of that survey, later relevant survey records and taking account of any amendments to the survey requirements after the last special survey. The survey program is to be submitted in written format for approval and kept on board until the intermediate survey has been completed. (See 3.4.2 for guidance on preparation of survey program).

3.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

3.3.2 Examination and testing

3.3.2.1 The following are to be carried out:

a) The survey to the extent specified in 3.3.3 to 3.3.5 depending on the age and type of the tanker.

b) For weather decks, an examination as far as applicable of cargo, crude oil washing, bunker, ballast, steam and vent piping systems as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the piping may be required to be pressure tested, thickness measured or both.

c) For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out.

d) A general examination of electrical equipment in dangerous zones and testing of insulation resistance of the circuits. In cases where a proper record of testing is maintained, consideration may be given to accepting recent readings. These measurements are not to be attempted until the ship is in gas free condition and are to be carried out within an acceptable time period.

3.3.3 Oil tankers between 5 and 10 years of age

3.3.3.1

a) Single hull oil tankers:

All ballast tanks are to be examined. When considered necessary by the Surveyor, thickness measurement and testing are to be carried out to ensure that the structural integrity remains effective.

b) Double hull oil tankers:

For tanks used for water ballast, an Overall Survey of Representative Tanks selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard Protective Coating remains in GOOD condition.

3.3.3.2 In addition to the requirements above, suspect areas identified at previous surveys are to be close-up surveyed.

3.3.3.3 A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or

b) a soft or semi-hard coating has been applied, or

c) substantial corrosion is found within the tank, or

d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

3.3.4 Oil tankers between 10 and 15 years of age

3.3.4.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 3.4 for hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, pressure testing of cargo and ballast tanks, survey of automatic air pipe heads and specified in 3.4.6.10 and the requirements for longitudinal strength evaluation of hull girder required in 3.4.10.2 are not required unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 3.4.9.1.

3.3.4.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 3.4.1.4.

3.3.4.3 An in-water survey complying with the requirements of Sec.7.2 may be accepted in lieu of the requirements of 3.4.1.9.

3.3.5 Oil tankers exceeding 15 years of age the following is to apply:

3.3.5.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 3.4 for hull structure and piping systems in way of cargo tanks, pump rooms, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, pressure testing of cargo and ballast tanks, survey of automatic air pipe heads as specified in 3.4.6.10 and the longitudinal strength evaluation of hull girder required in 3.4.10.2 need not be carried out unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 3.4.9.1.

3.3.5.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion by the third annual survey in lieu of the application of 3.4.1.4.

3.3.5.3 A survey in dry dock is to be part of the intermediate survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

3.4 Special Surveys - Hull

3.4.1 General

3.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

3.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

3.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

3.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

3.4.1.5 As part of the preparation for Special Survey, the proposed Survey Programme (See 3.4.2) including the schedule for thickness measurements (See 3.4.9) are to be submitted in advance of the Special Survey.

3.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

3.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey. In addition a notation "ESP" will be entered for oil tankers.

3.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in satisfactory condition and that the ship is fit for its intended purpose for the next five (5) year class period, subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

3.4.2 Planning and preparation for survey

3.4.2.1 A specific Survey Programme is to be worked out in advance of the Survey by the Owner in cooperation with the Surveyors and submitted to IRS for approval. The Survey Programme is to be in a written format based on IMO Resolution MSC197(80). The survey is not to commence until the survey programme has been agreed. Prior to the development of the survey programme, the survey planning questionnaire based on IMO Resolution MSC197(80) is to be completed by the owner and forwarded to IRS. The Survey Programme at Intermediate Survey may consist of the Survey Programme at the previous Special Survey supplemented by the Executive Hull Summary of that Special Survey and later relevant survey reports. The survey program is to be worked out taking into account any amendments to the survey requirements after the last special survey.

3.4.2.2 In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural areas for examination :

a) Survey status and basic ship information;

b) Documentation on board as per 3.4.3;

c) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel;

d) Executive Hull Summary;

e) Relevant previous damage and repair history;

f) Relevant previous survey and inspection reports of IRS and the Owners;

g) Cargo and ballast history for the last 3 years, including carriage of cargo under heated conditions;

h) Details of the inert gas plant and tank cleaning procedures;

i) Information and other relevant data regarding conversion or modification of the ship’s cargo and ballast tanks since the time of construction.

j) Description and history of the coating and corrosion protection system (including previous class notations), if any;

k) Inspections by the Owner's personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion protection system if any;

l) Information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies. Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s); and

m) Any other information that will help identify suspect areas and critical structural areas.

3.4.2.3 The Survey Programme submitted for approval is to account for and comply, as a minimum, with the requirements of close-up survey, thickness measurement and tank testing respectively, and to include relevant information including at least :

a) Basic ship information and particulars;

b) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel;

c) Plan of tanks;

d) List of tanks with information on use, extent of coatings and corrosion protection systems;

e) Conditions for survey (e.g. information like tank cleaning, gas freeing, ventilation, lighting, etc.);

f) Provisions and methods of access to structures;

g) Equipment for survey; and

h) Identification of tanks and areas for close-up survey (As per Table 3.4.8.1a or Table 3.4.8.1b)

i) Identification of sections for thickness measurement (As per Table 3.4.9.1)

j) Identification of tanks for testing

k) Identification of the thickness measurement company.

l) Damage experience related to the ship in question.

m) Critical structural areas and suspect areas, where relevant.

3.4.2.4 IRS will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

3.4.2.5 The ship is to be prepared for overall survey in accordance with the requirements of Table 3.4.2.5. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

3.4.2.6 Proper preparation and the close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly

3.4.2.7 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement company representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

3.4.2.8 The following is an indicative list of items that are to be addressed in the meeting:

a) Schedule of the vessel (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations, etc.);

b) Provisions and arrangements for thickness measurements (i.e. access, cleaning/de-scaling, illumination, ventilation, personal safety);

c) Extent of the thickness measurements;

d) Acceptance criteria (refer to the list of minimum thicknesses);

e) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas/areas of substantial corrosion;

f) Execution of thickness measurements;

g) Taking representative readings in general and where uneven corrosion / pitting is found;

h) Mapping of areas of substantial corrosion; and

Communication between attending surveyor(s) the thickness measurement company operator(s) and owner representative(s) concerning findings.

Table 3.4.2.5 : Survey preparation

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) All tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating 2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with

3.4.3 Documentation on board

3.4.3.1 The Owners are to obtain supply and maintain on board documentation as specified in 3.4.3.3, which is to be readily available for the Surveyor.

3.4.3.2 The documentation is to be kept on board for the life time of the ship.

3.4.3.3 A Survey Report File is to be a part of the documentation on board consisting of

- Reports of structural surveys
- Executive Hull Summary
- Thickness measurement reports.

3.4.3.4 The Survey Report File is to be available also in the Owners management offices and with IRS.

3.4.3.5 The following additional supporting documentation is to be available on board:

- Main structural plans of cargo and ballast tanks (for CSR ships these plans are to include for each structural element both the as-built and renewal thickness. Any thickness for voluntary addition is also to be clearly indicated on the plans. The midship section plan to be supplied on board the ship is to include the minimum allowable hull girder sectional properties for the tank transverse section in all cargo tanks)
- Previous repair history
- Cargo and ballast history
- Extent of use of inert gas plant and tank cleaning procedures
- Inspection by ship's personnel with reference to
  - structural deterioration in general
  - leakages in bulkheads and piping
  - condition of coating or corrosion prevention system, if any
- Any other information that will help identify critical structural areas and/or Suspect Areas requiring inspection.
- Survey Programme as required by 3.4.2 until such time as the Special Survey has been completed.

3.4.3.6 Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

3.4.4 Surveys at sea or at anchorage

3.4.4.1 See Sec.1.8.

3.4.5 Space protection

3.4.5.1 Where provided, the condition of coating or corrosion protection of cargo tanks and ballast tanks is to be examined.

A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or

b) a soft or semi-hard coating has been applied, or

c) substantial corrosion is found within the tank, or

d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

3.4.5.2 Where the hard protective coating in tanks is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

3.4.6 Survey and examination

3.4.6.1 All spaces within the hull and superstructure are to be examined.

3.4.6.2 All tanks other than cargo and water ballast tanks are to be examined internally in accordance with the requirements of Table 3.4.6.2.

3.4.6.3 An overall survey of all cargo tanks, ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull is to be carried out. This examination is to be supplemented by thickness measurement and testing as required by 3.4.9 and 3.4.7 to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial

Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required.

3.4.6.4 Cargo piping on deck including crude oil washing (COW) piping and cargo and ballast piping systems within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and cargo piping in Ballast Tanks and void spaces and Surveyors are to be advised on all occasions when the piping, including valves and fittings are open during repair periods and can be examined internally.

3.4.6.5 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

3.4.6.6 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

3.4.6.7 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

3.4.6.8 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

3.4.6.9 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 3.4.6.10. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

Table 3.4.6.2 : Requirements for internal examination of tanks

Tank	**Special Survey No. I Age ≤ 5**	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequent Age > 15**
Fuel oil bunker tanks - Engine room - Other area	 None None	 None One	 One Two	 One Half the number of tanks, minimum 2
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special survey No.III and subsequent special surveys, one deep tank for fuel oil is to be included, if fitted.

3.4.6.10 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

3.4.6.11 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

3.4.6.12 The windlass is to be examined.

3.4.6.13 A thorough examination of aft and forward emergency towing arrangements is to be carried out to ensure its ready availability and satisfactory condition.

- examination of pick-up gear, towing pennant and chafing gear for possible deterioration;

- examination of strong points, fairleads, pedestal roller and their attachment to hull structure.

The survey is to confirm that one of the towing arrangements (aft or forward) are pre-rigged.

3.4.6.14 For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following is to be carried out:

a) A thorough examination of the components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition.
b) A close-up examination of the hull structures supporting and adjacent to the components of the single point mooring system to verify that there is no deformation or fracture. Thickness determination and non-destructive tests are to be carried out if required by the Surveyor.

3.4.6.15 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

Table 3.4.6.10 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

3.4.6.16 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals of repairs made when wastage exceeds allowable limits.

3.4.6.17 The attachment to the structure and condition of anodes in tanks is to be examined.

3.4.6.18 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

3.4.6.19 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

3.4.6.20 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

3.4.7 Extent of tank testing

3.4.7.1 The minimum requirements for tank testing for oil tankers (including ore/oil and ore/bulk/oil ships) in the cargo area are given in Table 3.4.7.1.

3.4.7.2 All double bottom and peak tanks are to be tested in addition. The Surveyor may extend the tank testing as deemed necessary.

3.4.7.3 Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

Table 3.4.7.1 : Table of minimum requirements for tank testing at special survey of oil tankers, ore/oil ships and ore/bulk/oil ships (including double hull oil tankers)

Special Survey No. I Age ≤ 5	Special Survey No. II and subsequent Age > 5
1 All ballast tank boundaries	1 All ballast tank boundaries
2 Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	2 All Cargo tank bulkheads

3.4.7.4 Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results

3.4.7.5 For double hull oil tankers the testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

3.4.7.6 Cargo tank testing carried out by the vessel's crew under the direction of the Master may be accepted by the surveyor subject to the approval of the Administration, provided the following conditions are complied with:

a) a tank testing procedure, specifying fill heights, tank being filled and bulkheads being tested, taking into account the guidelines provided in the ESP Planning document, has been submitted by the owner and reviewed by IRS prior to the testing being carried out;

b) there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

c) the tank testing has been satisfactorily carried out, in accordance with the reviewed procedure and the guidelines mentioned in a) above, within special survey window not more than 3 months prior to the date of the survey on which the overall or close up survey is completed;

d) the satisfactory results of the testing is recorded in the vessel's logbook;

e) the internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

3.4.8 Close-up survey requirements

3.4.8.1 The minimum requirements for Close-up Surveys at Special Survey are given in Table 3.4.8.1a and Table 3.4.8.1b as applicable.

3.4.8.2 The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

a) In particular, tanks having structural arrangements or details which have suffered defects on similar tanks or on similar ships according to available information.
b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

3.4.8.3 For areas in tanks where coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to Tables 3.4.8.1a and Table 3.4.8.1b may be specially considered by the Surveyor.

Table 3.4.8.1a : Minimum requirements to close-up surveys at special survey of oil tankers, ore/oil ships, ore/bulk/oil ships other than double hull oil tankers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
A) One Web Frame Ring - in a ballast wing tank, if any, or a cargo wing tank used primarily for water ballast	**A) All Web Frame Rings** - in a ballast wing tank, if any, or a cargo wing tank, used primarily for water ballast	**A) All Web Frame Rings** - in all ballast tanks	As Special Survey No.3
B) One Deck Transverse - in a cargo oil tank	B) **One Deck Transverse** - in each of the remaining ballast tanks, if any	**A) All Web Frame Rings** - in a cargo wing tank	Additional transverses as deemed necessary by the Surveyor
D) **One Transverse Bulkhead** - in a ballast tank	B) **One Deck Transverse** - in a cargo wing tank	**A)**. A minimum of 30% of web frame rings [1)] in each remaining cargo wing tank	
D) **One Transverse Bulkhead** - in a cargo oil wing tank	B) **One Deck Transverse** - in two cargo centre tanks	**C) All Transverse Bulkheads** - in all cargo and ballast tanks	
D) **One Transverse Bulkhead** - in a cargo oil centre tank	C) **Both Transverse Bulkheads** - in a wing ballast tank, if any, or a cargo wing tank used primarily for water ballast	**E**) A minimum of 30% of deck and bottom transverses [1)] including adjacent structural members in each cargo centre tank	
	D) **One Transverse Bulkhead** - in each remaining ballast tank	**F)** As considered necessary by the Surveyor	
	D) **One Transverse Bulkhead** - in a cargo oil wing tank D) **One Transverse Bulkhead** - in two cargo centre tanks		

A) Complete transverse web frame ring including adjacent structural members

B) Deck transverse including adjacent deck structural members

C) Transverse bulkhead complete - including girder system and adjacent members

D) Transverse bulkhead lower part - including girder system and adjacent structural members

E) Deck and bottom transverse including adjacent structural members

F) Additional complete transverse web frame ring

Note : 1) The 30% is to be rounded up to the next whole integer.

</table>

(1), (2), (3), (4), (5), (6) and **(7)** are areas to be subjected to close-up surveys and thickness measurements (see Fig.3.4.8).

(1) : Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.

(2) : Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable).

(3) : Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.

(4) : Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.

(5) : Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.

(6) : The knuckle area and the upper part (5 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, upto 2 metres from the corners both on the bulkhead and the double bottom.

(7) : Web frame in a cargo oil tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.

Note 1 : Complete ballast tank : means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

Note 2 : Where no centre cargo tanks are fitted (as in the case of centre longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

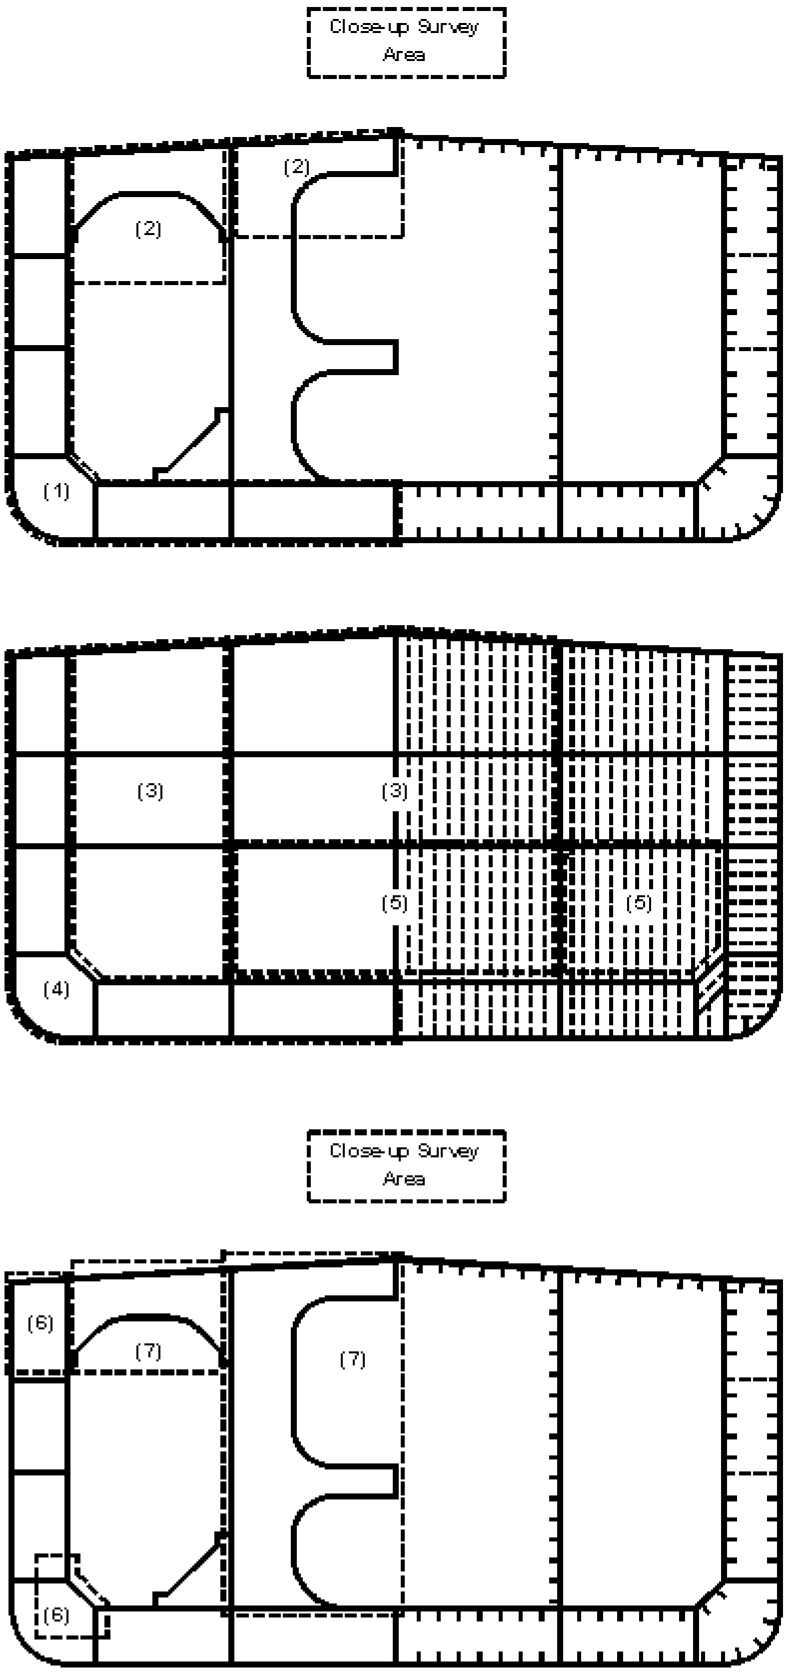

Fig.3.4.8 : Close-up survey requirements for double hull oil tankers areas (1) to (7)

3.4.9 Thickness measurement

3.4.9.1 The minimum requirements for thickness measurements at Special Survey are given in Table 3.4.9.1.

3.4.9.2 Provisions for extended measurements for areas with Substantial Corrosion in case of Oil Tankers, Ore/oil and Ore/Bulk/Oil Ships are given in Table 3.4.9.2a) and Table 3.4.9.2b).

For vessels built under IACS Common Structural Rules, the identified substantial corrosion areas are required to be examined and additional thickness measurements are to be carried out at annual and intermediate surveys.

The Surveyor may further extend the thickness measurements as deemed necessary.

3.4.9.3 In cases where two or three sections are to be measured in Oil Tankers, Ore/oil and Ore/Bulk/Oil Ships at least one is to include a Ballast Tank within 0.5L amidships.

Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

3.4.9.4 The thickness measurements are to be carried out by a qualified company certified by IRS.

3.4.9.5 In order to ensure necessary control during the process of thickness measurements these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

3.4.9.6 In all cases the extent of thickness measurements is to be sufficient as to represent the actual average condition.

3.4.9.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measuring equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

Table 3.4.9.1 : Table of minimum requirements to thickness measurements at special survey of oil tankers, ore/oil ships and ore/bulk/oil ships (including double hull oil tankers)

			7) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.

Table 3.4.9.2a : Requirements for extent of thickness measurement on areas of substantial corrosion in oil tankers, ore/oil ships and ore/bulk/oil ships other than double hull oil tankers

Structural Member		Extent of Measurement	Pattern of Measurement
Bottom Structure			
1	Bottom plating	Minimum of 3 bays across tank including aft bay. Measurements around and under all bell mouths	5 point pattern between stiffeners over 1 metre in length
2	Bottom longitudinal	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertically web
3	Bottom girders and brackets	At fore and after transverse bulkhead bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat. 5 point pattern on girder/bulkhead brackets
4	Bottom transverse webs	3 webs in bays where bottom plating measured, with measurements at both ends and middle	5 point pattern over 2 square metre area. Single measurements on face flat
5	Panel stiffening	Where provided	Single measurements

Table 3.4.9.2a (Contd.)

Structural Member		Extent of Measurement	Pattern of Measurement
Deck Structure			
1	Deck plating	Two bands across tank	Minimum of three measurements per plate per band
2	Deck longitudinals	Minimum of 3 longitudinals in each of two bays	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
3	Deck girders and brackets	At fore and after transverse bulkhead bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat. 5 point pattern on girder/bulkhead brackets
4	Deck transverse webs	Minimum of two webs with measurements at middle and both ends of span	5 points pattern over 2 square metre area. Single measurements on face flat
5	Panel stiffening	Where provided	Single measurements
Shell and Longitudinal Bulkheads			
1	Deckheads and bottom strakes and strakes in way of stringer platforms	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2	All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
3	Longitudinals - deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4	Longitudinals - all others	Every 3rd longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
5	Longitudinals - brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
6	Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5 points pattern over about 2 sq. metre area, plus single measurements on web frame and across tie face flats
Transverse Bulkheads and Swash Bulkheads			
1	Deckhead and bottom strakes and strakes in way of stringer platforms	Plating between pair of stiffeners at three locations - approx. 1/4, 1/2 and 3/4 width of tank	5 points pattern between stiffeners over 1 metre length
2	All other strakes	Plating between pair of stiffeners at middle location	Single measurement
3	Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange or fabricated connection	5 point pattern over about 1 sq. metre of plating
4	Stiffeners	Minimum of three typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
5	Brackets	Minimum of three at top, middle and bottom of tank	5 point pattern over areas of bracket
6	Deep webs and girders	Measurements at toe of bracket and at centre of span	For web, 5 point pattern over about 1 sq. metre. 3 measurements across face flat
7	Stringer platforms	All stringers with measurements at both ends and middle	5 point pattern over 1 sq. metre of area plus single measurements near bracket toes and on face flats

Table 3.4.9.2b : Requirements for extent of thickness measurements at those areas of substantial corrosion - Special Survey of Double Hull Oil Tankers

Structural Member		Extent of Measurement	Pattern of Measurement
Bottom, Inner Bottom and Hopper Structure			
1	Bottom, inner bottom and hopper structure plating	Minimum of 3 bays across double bottom tank including aft bay.	5 point pattern for each panel between longitudinals and floors
		Measurements around and under all suction bell mouths	
2	Bottom, inner bottom and hopper structure longitudinals	Minimum of 3 longitudinals in each bay where bottom plating measured	3 measurements in line across flange and 3 measurements on vertical web
3	Bottom girders, including the watertight ones	At fore and aft watertight floors and in centre of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements
4	Bottom floors, including the watertight ones	3 floors in bays where bottom plating measured, with measurements at both ends and middle	5 points pattern over 2 square metre area
5	Hopper structure web frame ring	3 floors in bays where bottom plating measured	5 point pattern over one square metre of plating. Single measurements on flange
6	Hopper structure transverse watertight bulkhead or swash bulkhead	Lower 1/3 of bulkhead	5 point pattern over two square metre of plating
		Upper 2/3 of bulkhead	5 point pattern over two square metre of plating
		Stiffeners (minimum of three)	For web, 5 point pattern over span (two measurements across web at each end and one at centre of span). For flange, single measurements at each end and centre of span
7	Panel stiffening	Where provided	Single measurements
Deck Structure			
1	Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
2	Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	3 measurements in line vertically on webs and 2 measurements on flange (if fitted)
3	Deck girders and brackets (usually in cargo tanks only)	At fwd and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange. 5 point pattern on girder/bulkhead brackets
4	Deck transverse webs	Minimum of two webs with measurements at both ends and middle of span	5 points pattern over one square metre area. Single measurements on face flat
5	Vertical web and transverse bulkhead in wing ballast tank (two metres from deck)	Minimum of two webs and both transverse bulkheads	5 point pattern over one square metre area
6	Panel stiffening	Where applicable	Single measurements

Table 3.4.9.2b (Contd.)			
Structural Member		**Extent of Measurement**	**Pattern of Measurement**
Structure in Wing Ballast Tanks			
1	Side shell and longitudinal bulkhead plating: - Upper strake and strakes in way of horizontal girders - All other strakes	- Plating between each pair of longitudinals in a minimum of 3 bays (along the tank) - Plating between every third pair of longitudinals in same 3 bays	- Single measurement - Single measurement
2	Side shell and longitudinal bulkhead longitudinals on: - Upper strake - All other strakes	- Each longitudinal in same 3 bays - Every third longitudinal in same 3 bays	- 3 measurements across web and 1 measurement one flange - 3 measurements across web and 1 measurement on flange
3	Longitudinals - brackets	Minimum of three at top, middle and bottom of tank in same three bays	5 point pattern over area of bracket
4	Vertical web and transverse bulkheads (excluding deckhead area): - Strakes in way of horizontal girders - Other strakes	- Minimum of two webs and both transverse bulkheads - Minimum of two webs and both transverse bulkheads	- 5 point pattern over approx. two square metre area - two measurements between each pair of vertical stiffeners
5	Horizontal girders	Plating on each girder in a minimum of three bays	2 measurements between each pair of longitudinal girder stiffeners
6	Panel stiffening	Where applicable	Single measurements
Longitudinal Bulkheads in Cargo Tanks			
1	Deckheads and bottom strakes and strakes in way of the horizontal stringer of transverse bulkheads	Plating between each pair of longitudinals in a minimum of 3 bays	Single measurement
2	All other strakes	Plating between every 3rd pair of longitudinals in same 3 bays	Single measurement
3	Longitudinals on deckhead and bottom strakes	Each longitudinal in same 3 bays	3 measurements across web and 1 measurement on flange
4	All other longitudinals	Every third longitudinal in same three bays	3 measurements across web and 1 measurement on flange
5	Longitudinals - brackets	Minimum of 3 at top, middle and bottom of tank in same 3 bays	5 point pattern over area of bracket
6	Web frames and cross ties	3 webs with minimum of three locations on each web, including in way of cross tie connections	5 points pattern over approximately 2 sq. metre area of webs, plus single measurements on flanges of web frame and cross ties
7	Lower end brackets (opposite side of web frame)	Minimum of three brackets	5 points pattern over approximately 2 sq. metre area of brackets, plus single measurements on bracket flanges
Transverse Watertight and Swash Bulkheads in Cargo Tanks			
1	Upper and lower stool, where fitted	- Transverse band within 25 mm of welded connection to inner bottom/deck plating - Transverse band within 25 mm of welded connection to shelf plate	5 point pattern between stiffeners over one metre length
2	Deckhead and bottom strakes and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations - approx. 1/4, 1/2 and 3/4 width of tank	5 points pattern between stiffeners over 1 metre length
3	All other strakes	Plating between pair of stiffeners at middle location	Single measurement
4	Strakes in corrugated bulkheads	Plating for each change of scantling at centre of panel and at flange of fabricated connection	5 point pattern over about 1 sq. metre of plating

Table 3.4.9.2b (Contd.)			
Structural Member		Extent of Measurement	Pattern of Measurement
5	Stiffeners	Minimum of three typical stiffeners	For web, 5 point pattern over span between bracket connections (2 measurements across web at each bracket connection and one at centre of span). For flange, single measurements at each bracket toe and at centre of span
6	Brackets	Minimum of three at top, middle and bottom of tank	5 point pattern over areas of bracket
7	Horizontal stringer	All stringers with measurements at both ends and middle	5 point pattern over 1 sq. metre of area plus single measurements near bracket toes and on flange

3.4.10 Reporting and evaluation of survey

3.4.10.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

3.4.10.2 In case of oil tankers of 130 [m] in length and upwards (as defined in ILLC), the ship's longitudinal strength is to be evaluated using the thickness of the structural members measured, renewed, reinforced, as appropriate, during the renewal survey of cargo ship safety construction certificate or the cargo ship safety certificate carried out after the ship reached 10 years of age in accordance with the criteria for longitudinal strength of the ship's hull girder

3.4.10.3 Where any structural renewal or reinforcement work is carried out as a result of the initial evaluation of the ship's longitudinal strength as required by 3.4.10.2, the final result of the evaluations is to be included as a part of the Executive hull summary.

3.4.10.4 An Executive Hull Summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The Executive Hull Summary is to be endorsed by IRS Head Office.

3.5 Special Surveys - Machinery

3.5.1 Requirements for examination of machinery and systems are given in Sec.8.

Section 4

Surveys - Chemical Tankers

4.1 Scope

4.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the class notation:

Chemical Tanker ESP

For vessels which also carry products covered by the IGC Code it may be necessary in accordance with Pt.5, Ch.4, Sec.1 to apply the survey requirements given in Sec.5 of this chapter.

4.2 Annual surveys

4.2.1 General

4.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

4.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

4.2.1.3 Access to cargo tanks or other spaces within the cargo area, necessitating gas freeing will normally not be required unless necessary for checking items of equipment and installations for correct functioning.

4.2.1.4 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

4.2.2 Hull and weather deck

4.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, closing appliances and related piping are maintained in satisfactory and efficient condition. Special attention is to be paid to the following:

a) Weather decks, ships side plating above waterline.

b) Openings on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); ventilators and closing devices.

d) Watertight bulkheads and their penetrations as far as practicable.

e) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

f) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines.

g) Examination of cargo tank openings including gaskets, covers, coamings and flame screens.

h) Examination of cargo tank pressure/vacuum valves, secondary means to prevent over or under pressure and devices to prevent passage of flame.

i) Examination of flame screens on vents to all bunker, tanks.

j) Examination of cargo, bunker and vent piping systems, including vent masts and headers.

k) Verification that wheelhouse doors and windows, side scuttles and windows in superstructure and deckhouse ends facing the cargo area are in good condition.

4.2.2.2 Examination of pump room and pipe tunnel, if fitted:

a) Examination of all pump room bulkheads for signs of chemical leakage or fractures and in particular, the sealing arrangements of all penetrations of pump room bulkheads.

b) Examination of the condition of all piping systems.

4.2.2.3 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

4.2.2.4 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

4.2.2.5 Examination of Ballast Tanks is to be carried out when required as a consequence of the results of the Special Survey or Intermediate Survey. (See 4.4.5.1 and 4.3.3.3 respectively). When considered necessary by the Surveyor or where extensive corrosion is found, thickness measurement is to be carried out. When examination of ballast tanks reveals substantial corrosion, additional thickness measurements is to be carried out to the extent given in Table 4.4.9.2.

4.2.2.6 Anchoring and mooring equipment is to be examined as far as is practicable. A general examination of the emergency towing arrangements is to be carried out to ensure their ready availability.

For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following are to be generally examined:

a) Components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans), to verify their satisfactory condition.

b) Hull structures supporting and adjacent to the components of the single point mooring system, to verify that there is no deformation or fracture.

4.2.2.7 Where applicable, Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

4.2.2.8 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

4.2.2.9 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

4.2.2.10 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;

b) side stringers, cross-members, decking, deck plates, etc.;

c) all support points such as wheel, roller, etc.;

d) stanchions, rigid handrails, hand ropes.

4.2.2.11 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;

b) remote control system, and

c) power supply system for electric motor.

4.2.2.12 Davits and fittings on the ship’s deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

4.2.2.13 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

4.2.2.14 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

4.2.2.15 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks, as appropriate, are recorded in the coating technical file.

4.2.3 Machinery and systems

4.2.3.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

4.2.3.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

4.2.3.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

4.2.3.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

4.2.3.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

4.2.3.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

4.2.3.7 Confirming, when appropriate, that requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.

4.2.3.8 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

4.2.3.9 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

4.2.3.10 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

4.2.3.11 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

4.2.3.12 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

4.2.3.13 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

4.2.3.14 Confirmation that the engineer's alarm is clearly audible in the engineer's acco-mmodation.

4.2.3.15 The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

4.2.3.16 Examining visually the condition of any expansion joints in sea water system.

4.2.3.17 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

4.2.3.18 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

4.2.3.19 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

4.2.3.20 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

4.2.3.21 Examination so far as is possible of cargo, bilge, ballast and stripping pumps for excessive gland seal leakage, verification of proper operation of electrical and mechanical remote operating and shutdown devices and remote operation of pump room bilge system, and checking that pump foundations are intact.

4.2.3.22 Verification that installed pressure gauges on cargo discharge lines including those fitted outside the cargo pump room and level indicating systems are operational.

4.2.3.23 Verification that pumps, valves and pipelines are identified and distinctively marked.

4.2.3.24 Confirmation that machinery space ventilation systems are in good working condition.

4.2.4 Fire protection, detection and extinction

4.2.4.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible of the fire and/or smoke detection system(s);

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fixed fire fighting system controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery and shutting off fuel supplies in machinery spaces are in working order;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged;

j) examination of any manual and automatic fire doors and proving their operations;

k) Verification that the pump room ventilation system is operational, ducting intact, dampers operational and screens are clean;

l) External examination of piping and cut-out valves of cargo tank and cargo pump room fixed fire fighting system;

m) Verification that all electrical equipment in dangerous zones is in good condition and has been properly maintained so far as is practicable;

n) Checking the deck foam system, including the supplies of foam concentrate and testing that minimum number of jets of water at the required pressure in the fire main is obtained when the system is in operation;

o) Examining the fixed fire fighting system for the cargo pump room and the deck foam system for the cargo area and confirming that their means of operation are clearly marked;

p) Confirming that potential sources of ignition in or near the cargo pump room are eliminated, such as loose gear, combustible materials etc., that there are no signs of undue leakage and that access ladders are in satisfactory condition;

q) Confirming that the condition of portable fire fighting equipment for the cargoes to be carried in the cargo area is satisfactory;

r) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

s) examination of the fire safety requirements of any helicopter facilities;

t) Confirming, as far as practicable, that the intrinsically safe systems and circuits used for measurement, monitoring, control and communication purposes in all hazardous locations are being properly maintained.

u) Confirming that the system for continuous monitoring of the concentration of flammable vapours is satisfactory. (Refer Pt.5, Ch.3, Cl. 11.1.4).

v) Confirming that sampling points or detector heads are located in suitable positions in order that potentially dangerous leakages are readily detected. (Refer Pt.5, Ch.3, Cl. 11.1.4).

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

4.2.4.2 For tankers fitted with inert gas system, examination of the inert gas system as detailed in Section 12, Para 12.2.1 is to be carried out.

4.2.4.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

4.2.4.4 Examination of the arrangements for gaseous fuel for domestic purposes.

4.2.5 Other safety arrangements related to cargo

4.2.5.1 The following are to be dealt with where applicable:

a) Examination of gauging devices, high level alarms and valves associated with overflow control.

b) Verification that any devices provided for measuring the temperature of the cargo and any associated alarms are satisfactory.

c) Examination of the cargo heating/cooling system sampling arrangements where fitted.

d) Verification that removable pipe lengths or other approved equipment necessary for cargo separation are available, and satisfactory.

e) Verification that the ventilation system including portable equipment, if any, of all spaces in the cargo area is operational.

f) Verification that arrangements are made for sufficient inert/padding/drying gas to be carried to compensate for normal losses and that means are provided for monitoring of ullage spaces.

g) Verification that arrangements are made for sufficient medium to be carried where drying agents are used on air inlets to cargo tanks.

h) Examining the cargo transfer arrangements and confirming that any hoses are suitable for their intended purpose.

i) Verification that any special arrangements made for bow or stern loading and unloading are in good condition and testing the means of communication and remote shutdown of the cargo pump.

j) Verification that, if applicable, the provisions made for chemicals which have special requirements listed in relevant Ch.3 of Pt.5 of the Rules are in order.

4.2.6 Personnel protection

a) Verification that cargo pump room rescue arrangements are in order.

b) Verification that suitable protective clothing is available for crew engaged in loading and discharging operations and that suitable storage is maintained.

c) Verification that the requisite safety equipment and associated breathing apparatus with requisite air supplies and emergency escape respiratory and eye protection, if required, are in good condition and are properly stowed.

d) Verification that medical first aid equipment including stretchers and oxygen resuscitation is in good condition and that satisfactory arrangements are made for antidotes for cargoes actually carried to be on board.

e) Verification that decontamination arrange-ments are operational.

f) Verification that the requisite gas detection instruments are on board and that satisfactory arrangements are made for the supply of any required vapour detection tubes.

g) Verification that the cargo sample stowage arrangements are in good condition.

4.3 Intermediate Surveys

4.3.1 General

4.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. However, only those items which are additional to the requirements of annual survey may be examined between the second or third annual survey.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

4.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

4.3.1.3 For vessels over 10 years of age a specific survey program is to be worked out by the owner in cooperation with the Surveyors considering the requirements of the previous special survey, executive hull summary of that survey, later relevant survey records and taking account of any amendments to the survey requirements after the last special survey. The survey program is to be submitted in written format for approval and kept on board until the intermediate survey has been completed. (See 4.4.2 for guidance on preparation of survey program).

4.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

4.3.2 Examination tanks and spaces

4.3.2.1 The survey of integral cargo tanks and ballast tanks depending on the age of the vessel is to be carried out as specified in 4.3.3 to 4.3.5.

4.3.3 Chemical tankers between 5 and 10 years of age

4.3.3.1 The following are to be carried out:

For ballast tanks, an Overall Survey of Representative Tanks selected by the Surveyor is to be carried out. If such inspections reveal no visible structural defects, the examination may be limited to a verification that the hard Protective Coating remains in GOOD condition.

4.3.3.2 In addition to the requirements above, suspect areas identified at previous surveys are to be examined.

4.3.3.3 A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or
b) a soft or semi-hard coating has been applied, or
c) substantial corrosion is found within the tank, or
d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

4.3.4 Chemical tankers between 10 and 15 years of age

4.3.4.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 4.4 for hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, testing of cargo and ballast tanks and survey of automatic air pipe heads specified in 4.4.6.2 are not required unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 4.4.9.1.

4.3.4.2 The intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 4.4.1.4.

4.3.4.3 An in-water survey complying with the requirements of Sec.7.2 may be accepted in lieu of the requirements of 4.4.1.10.

4.3.5 Chemical tankers exceeding 15 years of age the following is to apply:

4.3.5.1 The requirements of the intermediate survey are to be to the same extent as the previous special survey as required in 4.4 for hull structure and piping systems in way of cargo holds, cofferdams, pipe tunnels, void spaces within the cargo area and all ballast tanks. However, testing of cargo and ballast tanks is not required unless deemed necessary by the attending surveyor. Thickness measurement is to be carried out for items 1) to 4) of Table 4.4.9.1.

4.3.5.2 For the application of 4.3.5.1 the intermediate survey may be commenced at the second annual survey and be progressed during the succeeding year with a view to completion at the third annual survey in lieu of the application of 4.4.1.4.

4.3.5.3 A survey in dry dock is to be part of the intermediate survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and water ballast tanks (i.e. parts below light ballast waterline) are to be completed in the dry-dock.

4.3.6 Safety arrangements related to cargo

4.3.6.1 The following are to be dealt with as applicable:

a) Examination of vent line drainage arrangements.

b) Verification that the cargo heating/cooling system is in good condition.

c) Verification that the ship's cargo hoses are approved and in good condition.

d) Verification that where applicable, pipelines and independent cargo tanks are electrically bonded to the hull.

e) An examination of cargo, cargo washing, bunker, ballast, steam and vent piping on the weather decks, as well as vent masts and headers. If upon examination there is any doubt as to the condition of the piping, the pipe may require to be pressure tested, gauged or both.

f) A General Examination of the electrical equipment and cables in dangerous zones such as cargo pump-rooms, and areas adjacent to cargo tanks for defective certified safe type equipment, improperly installed wiring, non-approved lighting and fixtures and dead end wiring. Testing insulation resistance of the circuits except in cases where a proper record of the testing is maintained, consideration is to be given to accepting recent readings by the crew. If any of the readings are marginal or if the condition of the cables, fixtures or equipments appears defective in any way, verification measurements may be required. These measurements are not to be attempted until the ship is in a gas free condition and are to be carried out within an acceptable time period.

g) Confirmation that spares are provided for cargo area mechanical ventilation fans.

h) Examining the equipment for personal protection.

i) Examining externally and confirming that the pumping and piping systems, including a stripping system if fitted and associated equipment remain as approved.

j) Examining externally the tank washing piping and confirming that the type, capacity, number and arrangement of the tank washing machines are as approved.

k) Examining externally the wash water heating system.

l) Examining externally, as far as practicable the underwater discharge arrangement.

m) Confirming that the means of controlling the rate of discharge of the residue is as approved.

n) Confirming that flow rate indicating device is operable.

o) Confirming that the ventilation equipment for residue removal is as approved and satisfactory.

p) Examining externally, as far as is accessible, the heating system required for solidifying and high viscosity substances.

q) Confirming that any cargo tank high level alarms are operable.

r) Verifying from the Cargo Record Book that the pumping and stripping arrangements have been emptying the tanks efficiently and all are in working order.

s) Confirming, if possible, that the discharge outlets are in good condition.

t) Confirming the satisfactory operation of the recording device, as fitted and verifying by an actual flow test that it has an accuracy of $\pm$ 15% or better.

Surveys carried out by the National Authority of the country in which the ship is registered may be accepted at the discretion of the Surveyor as meeting these additional requirements.

4.4 Special Surveys - Hull

4.4.1 General

4.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

4.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

4.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

4.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

4.4.1.5 As part of the preparation for Special Survey, the proposed Survey Programme (See 4.4.2) including the schedule for thickness measurements (See 4.4.9) are to be submitted at least 3 months in advance of the intended commencement of the Special Survey.

4.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

4.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey. In addition a notation "ESP" will be entered for chemical tankers.

4.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in satisfactory condition and that the ship is fit for its intended purpose for the next five (5) year class period, subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

4.4.1.9 The special survey requirements to be applied in respect of independent cargo tanks are given in 4.4.11.

4.4.1.10 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of cargo tanks and water ballast tanks (i.e. parts below light ballast water line) are to be completed in the dry-dock.

4.4.2 Planning and preparation for survey

4.4.2.1 A specific Survey Programme is to be worked out in advance of the Survey by the Owner in cooperation with the Surveyors and submitted to IRS for approval. The Survey Programme shall be in a written format prior to the development of survey programme, the survey planning questionnaire in prescribed format is to be completed by the owner and forwarded to IRS. The survey program is to be worked out taking into account any amendments to the survey requirements after the last special survey.

4.4.2.2 In developing the Survey Programme, the following documentation is to be collected and consulted with a view to selecting tanks, areas and structural areas for examination :

a) Survey status and basic ship information

b) Documentation on board as per 4.4.3

c) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel

d) Executive hull summary

e) Relevant previous damage and repair history

f) Relevant previous survey and inspection reports of IRS and the Owners

g) Information regarding the use of the ship's holds and tanks, typical cargoes and other relevant data

h) Details of the inert gas plant and tank cleaning procedures

i) Information and other relevant data regarding conversion or modification of the ship's cargo and ballast tanks since the time of construction

j) Description and history of the coating and corrosion protection system (previous class notations), if any

k) Inspections by the Owner's personnel during the last 3 years with reference to structural deterioration in general, leakages in tank boundaries and piping and condition of the coating and corrosion protection system, if any

l) Information regarding the relevant maintenance level during operation including port state control reports of inspection containing hull related deficiencies. Safety Management System non-conformities relating to hull maintenance, including the associated corrective action(s); and

m) Any other information that will help identify suspect areas and critical structural areas.

4.4.2.3 The Survey Programme submitted for approval is to account for and comply, as a minimum, with the requirements of close-up survey, thickness measurement, tank testing and pipe testing respectively, and to include relevant information including at least :

a) Basic ship information and particulars

b) Main structural plans (scantling drawings), including information regarding use of high strength steels, clad steel and stainless steel

c) Plan of tanks

d) List of tanks with information on use, corrosion prevention and condition of coating

e) Conditions for survey (e.g. information like tank cleaning, gas freeing, ventilation, lighting, etc.)

f) Provisions and methods of access to structures

g) Equipment for survey

h) Nomination of tanks and areas for close-up survey (As per Table 4.4.8.1a) and Table 4.4.8.1b))

i) Nomination of sections for thickness measurement (As per Table 4.4.9.1)

j) Nomination of tanks for testing and the pipes that are to undergo pipe testing as per 4.4.10

k) Identification of the thickness measurement company

l) Damage experience related to the ship in operation.

m) Critical structural areas and suspect areas, where relevant.

4.4.2.4 IRS will advise the Owner of the maximum acceptable structural corrosion diminution levels applicable to the vessel.

4.4.2.5 The ship is to be prepared for overall survey in accordance with the requirements of Table 4.4.2.5. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

4.4.2.6 Proper preparation and close co-operation between the attending surveyor(s) and the owner's representatives onboard prior to and during the survey are an essential part in the safe and efficient conduct of the survey. During the survey on board safety meetings are to be held regularly.

4.4.2.7 Prior to the commencement of any part of the Special and Intermediate Survey a survey planning meeting is to be held between the attending Surveyor(s), the Owner's representative in attendance and the thickness measurement company representative, where involved, and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose of ascertaining that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

4.4.2.8 The following is an indicative list of items that are to be addressed in the meeting:

a) Schedule of the vessel (i.e. the voyage, docking and undocking manoeuvres, periods alongside, cargo and ballast operations etc.);

b) Provisions and arrangements for thickness measurements (i.e. access, cleaning / de-scaling, illumination, ventilation, personal safety);

c) Extent of the thickness measurements;

d) Acceptance criteria (refer to the list of minimum thicknesses);

e) Extent of close-up survey and thickness measurement considering the coating condition and suspect areas / areas of substantial corrosion;

Table 4.4.2.5 : Survey preparation

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) All tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating 2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with

f) Execution of thickness measurements;

g) Taking representative readings in general and where uneven corrosion / pitting is found;

h) Mapping of areas of substantial corrosion; and

i) Communication between attending surveyor(s) the thickness measurement, company operator(s) and owners representative(s) concerning findings.

4.4.3 Documentation on board

4.4.3.1 The Owners are to obtain supply and maintain on board documentation as specified in 4.4.3.3, which is to be readily available for the Surveyor.

4.4.3.2 The documentation is to be kept on board for the life time of the ship.

4.4.3.3 A Survey Report File is to be a part of the documentation on board consisting of

- Reports of structural surveys
- Executive Hull Summary
- Thickness measurement reports.

4.4.3.4 The Survey Report File is to be available also in the Owners management offices and with IRS.

4.4.3.5 The following additional supporting documentation is to be available on board:

- Main structural plans of cargo holds, cargo and ballast tanks
- Previous repair history
- Cargo and ballast history
- Extent of use of inert gas plant and tank cleaning procedures
- Inspection by ship's personnel with reference to

    - structural deterioration in general
    - leakages in bulkheads and piping
    - condition of coating or corrosion prevention systems, if any

- Any other information that will help identify critical structural areas or Suspect Areas requiring inspection

- Survey Programme as required by 4.4.2 until such time as the Special Survey has been completed.

4.4.3.6 Prior to survey, the Surveyor is to examine the completeness of the documentation on board, and its contents as a basis for the survey.

4.4.4 Surveys at sea or at anchorage

4.4.4.1 See Sec.1.8.

4.4.5 Space protection

4.4.5.1 Where provided, the condition of the corrosion prevention system of cargo tanks is to be examined.

A ballast tank is to be examined at subsequent annual intervals where:

a) a hard protective coating has not been applied from the time of construction, or
b) a soft or semi-hard coating has been applied, or
c) substantial corrosion is found within the tank, or
d) the hard protective coating is found to be in less than GOOD condition and the hard protective coating is not repaired to the satisfaction of the Surveyor.

4.4.5.2 Where the hard protective coating in cargo tanks is found to be in GOOD condition, the extent of close-up surveys and thickness measurements may be specially considered.

4.4.6 Survey and examination

4.4.6.1 All spaces within the hull and superstructure are to be examined.

4.4.6.2 All tanks other than cargo and ballast tanks are to be examined internally in accordance with the requirements of Table 4.4.6.2.

4.4.6.3 An overall survey of all cargo tanks, ballast tanks including double bottom tanks, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull is to be carried out. This examination is to be supplemented by thickness measurement and testing as required by 4.4.9 and 4.4.7 to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required.

Table 4.4.6.2 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks - Engine room - Other area	 None None	 None One	 One Two	 One Half the number of tanks, minimum 2
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.
2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.
3) Peak tanks (all uses) are subject to internal examination at each special survey.
4) At special survey No.III and subsequent special surveys, one deep tank for fuel oil is to be included, if fitted.

4.4.6.4 Cargo piping on deck and cargo and ballast piping systems within the above tanks and spaces are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory. Special attention is to be given to ballast piping in cargo tanks and cargo piping in Ballast Tanks and void spaces and Surveyors are to be advised on all occasions when this piping, including valves and fittings are open during repair periods and can be examined internally.

4.4.6.5 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

4.4.6.6 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

4.4.6.7 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

4.4.6.8 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

4.4.6.9 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 4.4.6.9. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

4.4.6.10 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;
- Means of communication between bridge and engine room and between bridge and alternative steering position;
- Helm indicator;
- Protection to the aft steering wheel and the gear.

Table 4.4.6.9 : Requirements for internal examination of automatic air pipe heads			
Location	**Special survey No.I Age ≤ 5**	**Special survey No.II 5 < Age ≤ 10**	**Special survey No.III and subsequent Age > 10**
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

4.4.6.11 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

4.4.6.12 The windlass is to be examined.

4.4.6.13 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

4.4.6.14 A thorough examination of aft and forward emergency towing arrangements is to be carried out to ensure its ready availability and satisfactory condition.

- examination of pick-up gear, towing pennant and chafing gear for possible deterioration;

- examination of strong points, fairleads, pedestal roller and their attachment to hull structure.

The survey is to confirm that one of the towing arrangements (aft or forward) are pre-rigged.

4.4.6.15 For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following is to be carried out:

a) A thorough examination of the components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition.

b) A close-up examination of the hull structures supporting and adjacent to the components of the single point mooring system to verify that there is no deformation or fracture. Thickness determination and non-destructive tests are to be carried out if required by the Surveyor.

4.4.6.16 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals of repairs made when wastage exceeds allowable limits.

4.4.6.17 The attachment to the structure and condition of anodes in tanks is to be examined.

4.4.6.18 Where fitted, the strums of the cargo suction pipes are to be removed or lifted to facilitate examination of the shell plating and bulkheads in the vicinity, unless other means for visual inspection of these parts are provided.

4.4.6.19 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

4.4.6.20 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

4.4.7 Extent of tank testing

4.4.7.1 The minimum requirements for tank testing for chemical tankers are given in Table 4.4.7.1.

4.4.7.2 All double bottom and peak tanks are to be tested in addition. The Surveyor may extend the tank testing as deemed necessary.

Table 4.4.7.1 : Table of minimum requirements for tank testing at special survey of chemical tankers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II and subsequent** **Age > 5**
1. All ballast tank boundaries	1. All ballast tank boundaries
2. Cargo tank boundaries facing ballast tanks, void spaces, pipe tunnels, pump rooms or cofferdams	2. All cargo tank bulkheads

4.4.7.3 Boundaries of ballast tanks are to be tested with a head of liquid to the top of air pipes. Boundaries of cargo tanks are to be tested to the highest point that liquid will rise under service conditions.

4.4.7.4 Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results.

4.4.7.5 The testing of double bottom tanks and other spaces not designed for the carriage of liquid may be omitted, provided a satisfactory internal examination together with an examination of the tank top is carried out.

4.4.7.6 Cargo tank testing carried out by the vessel's crew under the direction of the Master may be accepted by the surveyor subject to the approval of the Administration, provided the following conditions are complied with:

a) a tank testing procedure, specifying fill heights, tanks being filled and bulkheads being tested, taking into account the guidelines provided in the ESP Planning document, has been submitted by the owner and reviewed by IRS prior to the testing being carried out;

b) there is no record of leakage, distortion or substantial corrosion that would affect the structural integrity of the tank;

c) the tank testing has been satisfactorily carried out, in accordance with the reviewed procedure and the guidelines mentioned in a) above, within special survey window not more than 3 months prior to the date of the survey on which the overall or close up survey is completed;

d) the satisfactory results of the testing is recorded in the vessel's logbook;

e) the internal and external condition of the tanks and associated structure are found satisfactory by the surveyor at the time of the overall and close up survey.

4.4.8 Close-up survey requirements

4.4.8.1 The minimum requirements for Close-up Surveys at Special Survey are given in Table 4.4.8.1a) and Table 4.4.8.1b).

The survey of stainless steel tanks may be carried out as an overall survey supplemented by close-up survey as deemed necessary by the Surveyor.

4.4.8.2 The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion protection system and also in the following cases:

a) In particular, tanks having structural arrangements or details which have suffered defects on similar tanks or on similar ships according to available information.

b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

4.4.8.3 For areas in tanks where coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to Table 4.4.8.1a) and Table 4.4.8.1b) may be specially considered by the Surveyor.

4.4.9 Thickness measurement

4.4.9.1 The minimum requirements for thickness measurements at Special Survey are given in Table 4.4.9.1.

4.4.9.2 Provisions for extended measurements for areas with Substantial Corrosion in case of Chemical Tankers are given in Table 4.4.9.2.

The Surveyor may further extend the thickness measurements as deemed necessary.

4.4.9.3 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

In cases where two or three sections are to be measured at least one is to include a Ballast Tank within 0.5L amidships.

4.4.9.4 The thickness measurements are to be carried out by a qualified firm certified by IRS.

Table 4.4.8.1a) : Minimum requirements for close-up survey at special survey of single skin chemical tankers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
A) **One Web Frame Ring** - in a ballast wing tank	A) **All Web Frame Rings** - in a ballast wing tank or double bottom ballast tank	A) **All Web Frame Rings** - in all ballast tanks	As Special Survey No.3
B) **One Deck Transverse** - in a cargo tank or on deck	B) **One Deck Transverse** - in each of the remaining ballast tank or on deck	A) **All Web Frames Rings** - in a cargo wing tank	Additional transverse areas as deemed necessary by the Surveyor
D) **One Transverse Bulkhead** – lower part in a ballast tank	B) **One Deck Transverse** - in a cargo wing tank or on deck	A) **One Web Frames Rings** - in each remaining cargo tank	
D) **One Transverse Bulkhead** - lower part in a cargo wing tank	B) **One Deck Transverse** – in two cargo center tanks or on deck	C) **All Transverse Bulkheads** - in all cargo and tanks	
D) **One Transverse Bulkhead** – lower part in a cargo center tank (See Note 1)	C) **Both Transverse Bulkhead** - in a ballast wing tank	C) **All Transverse Bulkheads** – in all ballast tanks	

Table 4.4.8.1a) : (Contd.)			
	D) **One Transverse Bulkhead** – lower part in each remaining ballast tank D) **One Transverse Bulkhead** - lower part in a cargo wing tank D) **One Transverse Bulkhead** - lower part in two cargo centre tanks (See Note 1)		
Note 1) Where no center cargo tanks are fitted (as in the case of center longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.			

A-D are areas subjected to close-up surveys and thickness measurements (See Fig.4.4.8.1 to 4.4.8.3)

A) Complete transverse web frame ring including adjacent structural members
B) Deck transverse including adjacent deck structural members
C) Transverse bulkhead complete - including girder system and adjacent members
D) Transverse bulkhead lower part - including girder system and adjacent structural members

Table 4.4.8.1b) : Minimum requirements for close-up survey at special survey of double skin chemical tankers

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
1) **One Web Frame Ring** – in a ballast double hull tank (See Note 1)	1) **All Web Frame Rings** – in a ballast wing tank or ballast double hull tank (See Note 1)	1) **All Web Frame Rings** – in all ballast tanks	As special survey No.3
2) **One Deck Transverse** – in a cargo tank or on deck	6) **The Knuckle Area and the Upper Part** (3 metres approx.) of one web frame in each remaining ballast tank	7) **All Web Frame Rings** – in a cargo wing tank	Additional transverse areas as deemed necessary by the Surveyor
4) **One Transverse Bulkhead** – in a ballast tank (See Note 1)		7) **One Web Frame Ring** – in each remaining cargo tank	
5) **One transverse bulkhead** – in a cargo wing tank	2) **One Deck Transverse** – in two cargo tanks	3) **All Transverse Bulkheads** – in all cargo tanks	
5) **One Transverse Bulkhead** – in a cargo center tank (See Note II)	4) **One Transverse Bulkhead** – in each ballast tank (See Note I)	4) **All Transverse Bulkheads** – in all ballast tanks	

Table 4.4.8.1b) : (Contd.)

	5) **One Transverse Bulkhead** – in two cargo centre tanks (See Note II)		
	5) **One Transverse Bulkhead** – in cargo wing tank		

(1), (2), (3), (4), (5), (6) and (7) are areas to be subjected to close-up surveys and thickness measurements (See Figs. 4.4.8.1 to 4.4.8.3).

(1) Web frame in a ballast tank means vertical web in side tank, hopper web in hopper tank, floor in double bottom tank and deck transverse in double deck tank (where fitted), including adjacent structural members. In fore and aft peak tanks web frame means a complete transverse web frame ring including adjacent structural members.

(2) Deck transverse, including adjacent deck structural members (or external structure on deck in way of the tank, where applicable).

(3) Transverse bulkhead complete in cargo tanks, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower and upper stools, where fitted.

(4) Transverse bulkhead complete in ballast tanks, including girder system and adjacent structural members, such as longitudinal bulkheads, girders in double bottom tanks, inner bottom plating, hopper side, connecting brackets.

(5) Transverse bulkhead lower part in cargo tank, including girder system, adjacent structural members (such as longitudinal bulkheads) and internal structure of lower stool, where fitted.

(6) The knuckle area and the upper part (3 metres approximately), including adjacent structural members. Knuckle area is the area of the web frame around the connections of the slope hopper plating to the inner hull bulkhead and the inner bottom plating, upto 2 metres from the corners both on the bulkhead and the double bottom.

(7) Web frame in a cargo tank means deck transverse, longitudinal bulkhead structural elements and cross ties, where fitted, including adjacent structural members.

Note I : Ballast double hull tank : means double bottom tank plus double side tank plus double deck tank, as applicable, even if these tanks are separate.

Note II : Where no center cargo tanks are fitted (as in the case of center longitudinal bulkhead), transverse bulkheads in wing tanks are to be surveyed.

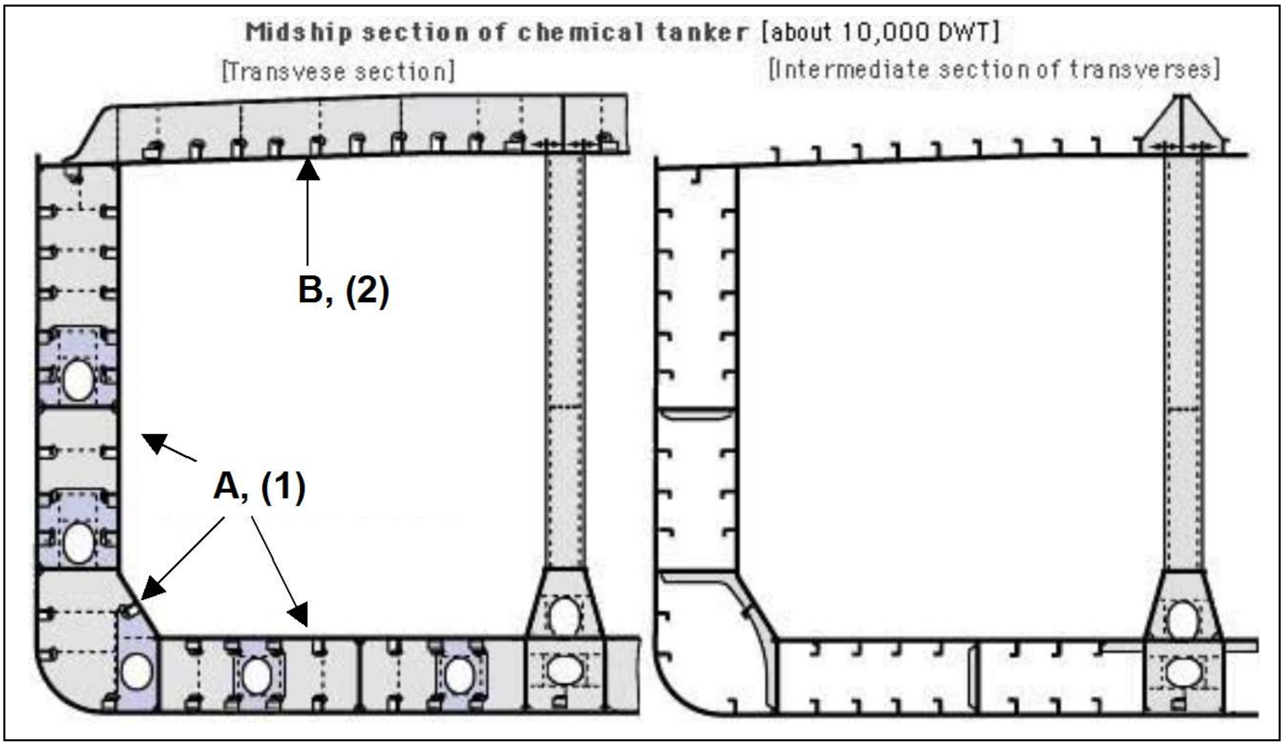

Fig. 4.4.8.1 : Representative transverse section of chemical tanker. Areas 1 and 2

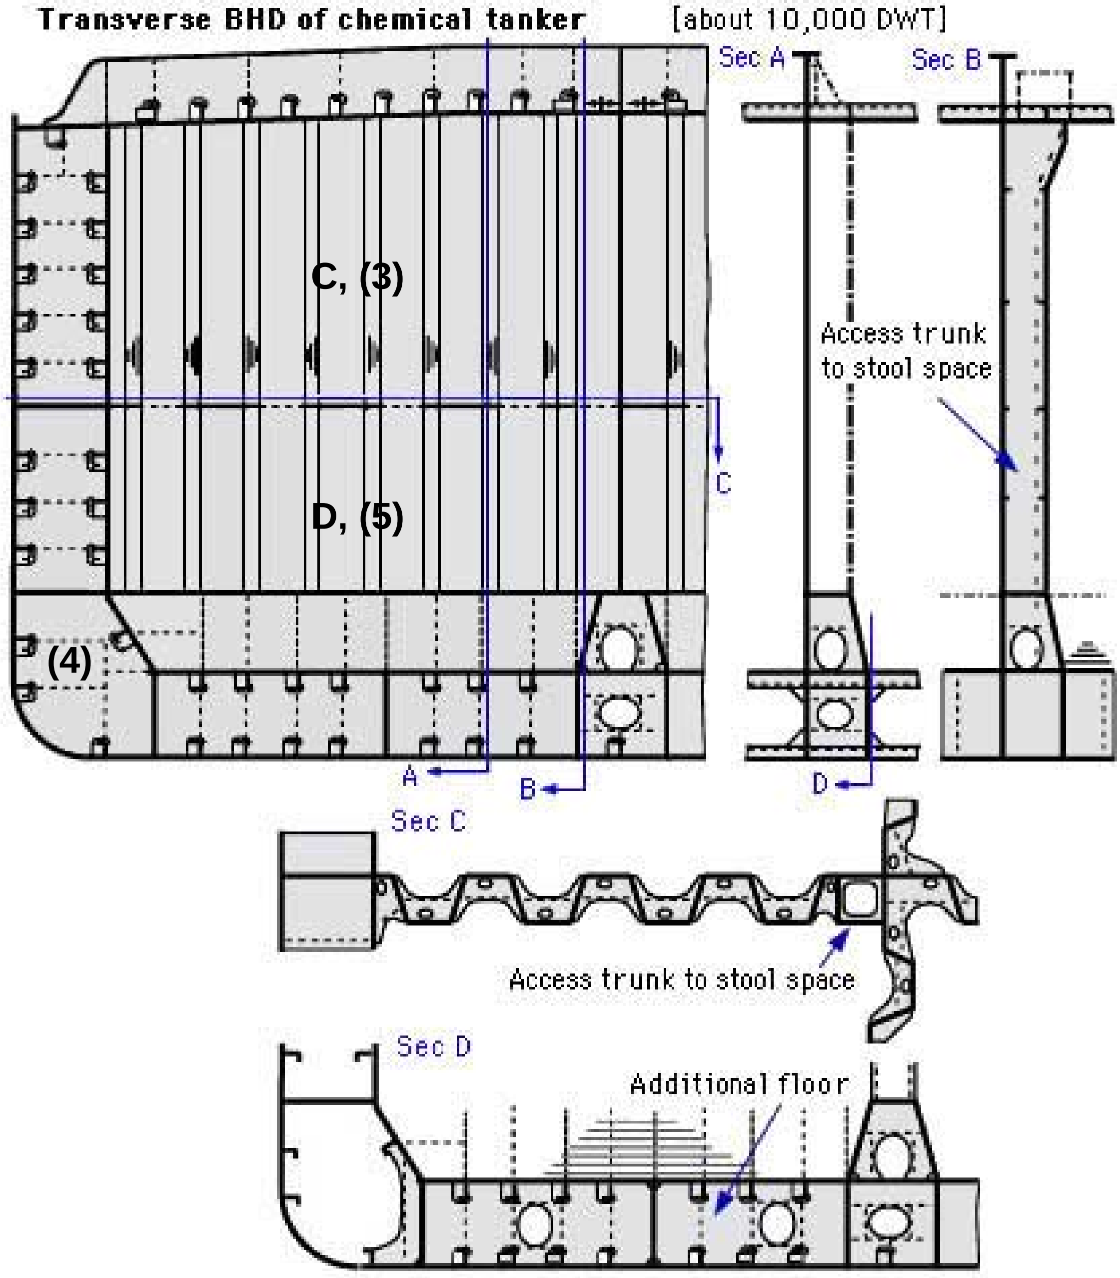

Fig. 4.4.8.2 : Representative transverse section of chemical tanker. Areas 3, 4 and 5

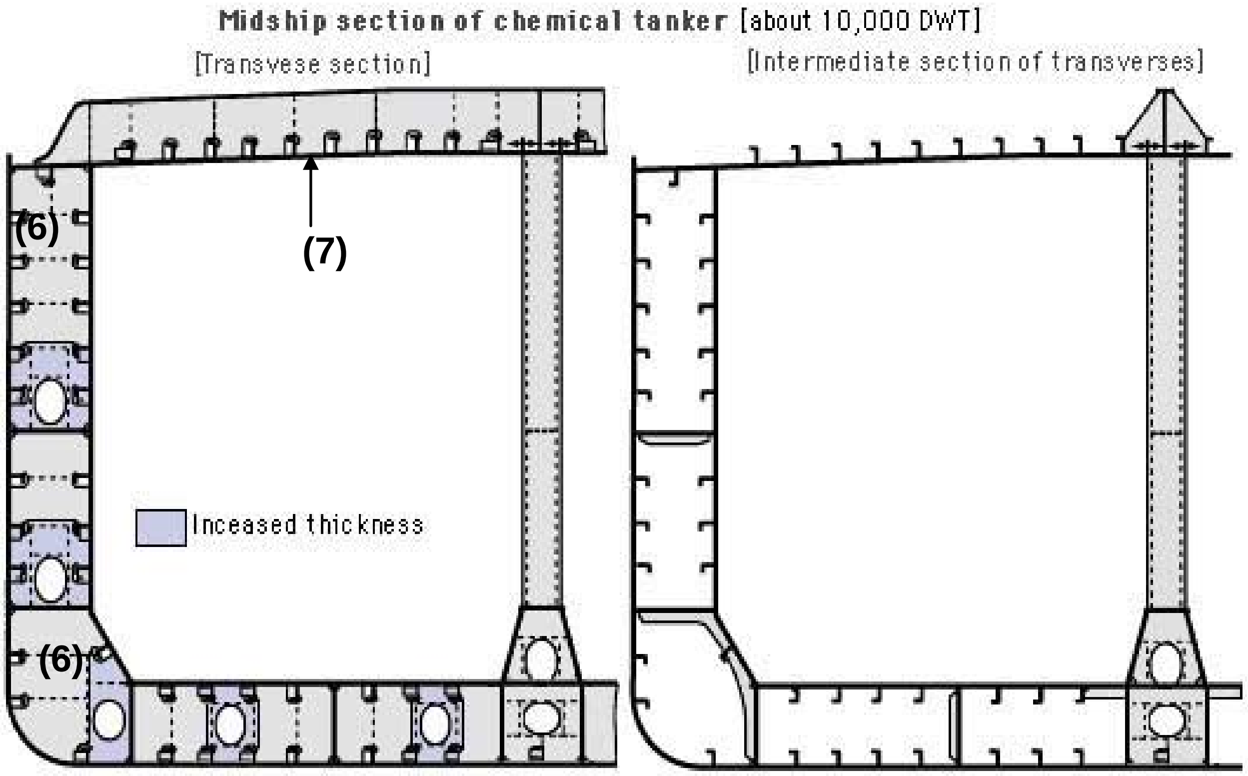

Fig. 4.4.8.3 : Representative transverse section of chemical tanker. Areas 6 and 7

Table 4.4.9.1 : Table of minimum requirements for thickness measurements at special survey of chemical tankers			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
2) Within the cargo area : One section of deck plating for the full beam of the ship (in way of a ballast tank, if any, or a cargo tank used primarily for water ballast)	2) Within the cargo area: a) Each deck plate b) One Transverse section	2) Within the cargo area: a) Each deck plate b)Two Transverse sections(1) c) All wind and water strakes	2) Within the cargo area: a) Each deck plate b) Three Transverse sections(1) c) All wind and water strakes d) Each bottom plate
3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 4.4.8.1a) and Table 4.4.8.1b), for general assessment and recording of corrosion pattern

Table 4.4.9.1 : (Contd.)

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
	4) All wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area
		5) Internals in forepeak and after peak tanks	5) Internals in forepeak and after peak tanks
			6) All exposed main deck plating outside cargo area
			7) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.
(1) At least one section is to include a ballast tank within 0.5L amidships			

Table 4.4.9.2 : Requirements for extent of thickness measurements at those areas of substantial corrosion, special survey of chemical tankers within the cargo area length

Structural member	Extent of measurement	Pattern of measurement
Bottom, inner bottom and hopper structure		
Bottom, inner bottom and hopper structure plating	Minimum of three bays across tank, including aft bay Measurements around and under all suction bell mouths	5-point pattern for each panel between longitudinals and floors
Bottom, inner bottom and hopper structure longitudinals	Minimum of three longitudinals in each bay where bottom plating measured	Three measurements in line across the flange and three measurements on vertical web
Bottom girders, including the watertight ones	At fore and aft watertight floors and in center of tanks	Vertical line of single measurements on girder plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across face flat where fitted
Bottom floors, including the watertight ones	Three floors in bays where bottom plating measured, with measurements at both ends and middle	5-point pattern over two square metre area

Table 4.4.9.2 : Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Hopper structure web frame ring	Three floors in bays where bottom plating measured	5-point pattern over one square metre of plating. Single measurements on flange
Hopper structure transverse watertight bulkhead or swash bulkhead	- Lower 1/3 of bulkhead	- 5-point pattern over one square metre of plating
	- Upper 2/3 of bulkhead	- 5-point pattern over two square metre of plating
	- Stiffeners (minimum of three)	- For web, 5-point pattern over span (two measurements across web at each end and one at center of span). For flange, single measurements at each end and center of span
Panel stiffening	Where applicable	Single measurements
Deck structure		
Deck plating	Two transverse bands across tank	Minimum of three measurements per plate per band
Deck longitudinals	Every third longitudinal in each of two bands with a minimum of one longitudinal	Three measurements in line vertically on webs and two measurements on flange (if fitted)
Deck girders and brackets	At fore and aft transverse bulkhead, bracket toes and in centre of tanks	Vertical line of single measurements on web plating with one measurement between each panel stiffener, or a minimum of three measurements. Two measurements across flange, 5-point pattern on girder/bulkhead brackets
Deck transverse webs	Minimum of two webs, with measurements at both ends and middle of span	5-point pattern over one square metre area. Single measurements on flange
Vertical web and transverse bulkhead in wing ballast tank for double hull design (two metres from deck)	Minimum of two webs and both transverse bulkheads	5-point pattern over one square metre area
Panel stiffening	Where applicable	Single measurements
Side shell and longitudinal bulkheads		
Side shell and longitudinal bulkhead plating: - Deckhead and bottom strakes and strakes in way of horizontal girders - All other strakes	- Plating between each pair of longitudinals in a minimum of three bays (along the tank) - Plating between every third pair of longitudinals in same three bays	Single measurement

Table 4.4.9.2 : Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Side shell and longitudinal bulkhead longitudinals on: - Deckhead and bottom strakes - All other strakes	- Each longitudinal in same three bays - Every third longitudinal in same three bays	3 measurements across web and 1 measurement on flange
Longitudinals – brackets	- Minimum of three at top, middle and bottom of tank in same three bays	5-point pattern over area of brackets
Vertical web and transverse bulkheads of double side tanks (excluding deck area): - Strakes in way of horizontal girders - Other strakes	- Minimum of two webs and both transverse bulkheads - Minimum of two webs and both transverse bulkheads	- 5-point pattern over approx. two square metre area - Two measurements between each pair of vertical stiffeners
Web frames and cross ties for other tanks than double side tanks	Three webs with minimum of three locations on each web, including in way of cross tie connections and lower end brackets	5-point pattern over approximately two square metre area of webs, plus single measurements on flanges of web frame and cross ties
Horizontal girders	Plating on each girder in a minimum of three bays	Two measurements between each pair of longitudinal girder stiffeners
Panel stiffening	Where applicable	Single measurements
Transverse watertight and swash bulkheads		
Upper and lower stool, where fitted	- Transverse band within 25 [mm] of welded connection to inner bottom / deck plating - Transverse band within 25 [mm] of welded connection to shelf plate	5-point pattern between stiffeners over one metre length
Deckhead and bottom strakes and strakes in way of horizontal stringers	Plating between pair of stiffeners at three locations: approximately ¼, ½ and ¾ width of tank	5-point pattern between stiffeners over one metre length
All other strakes	Plating between pair of stiffeners at middle location	Single measurement
Strakes in corrugated bulkheads	Plating for each change of scantling at center of panel and at flange of fabricated connection	5-point pattern between stiffeners over one metre length
Stiffeners	Minimum of three typical stiffeners	For web, 5-point pattern over span between bracket connections (two measurements across web at each bracket connection and one at center of span). For flange, single measurements at each bracket toe and at center of span

Table 4.4.9.2 : Contd.)		
Structural member	**Extent of measurement**	**Pattern of measurement**
Brackets	Minimum of three at top, middle and bottom of tank	5-point pattern over areas of bracket
Horizontal stringers	All stringers with measurements at both ends and middle	5-point pattern over one square metre areas, plus single measurements near bracket toes and on flanges
Deep webs and girders	Measurements at toe of bracket and at center of span	For web, 5 point pattern over about 1 square metre, 3 measurements across face flat

4.4.9.5 In order to ensure necessary control during the process of thickness measurements, these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

4.4.9.6 In all cases the extent of the thickness measurements are to be sufficient as to represent the actual average condition.

4.4.9.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measuring equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

4.4.10 Additional requirements for cargo and ballast piping

4.4.10.1 For chemical tankers exceeding 10 years of age selected steel cargo pipes outside cargo tanks and ballast pipes passing through cargo tanks are to be:

- Thickness measured at random or selected pipe lengths to be opened for internal inspection.

- Pressure tested to the maximum working pressure. Special attention is to be given to cargo/slop discharge piping through ballast tanks and void spaces.

4.4.11 Survey of independent tanks

4.4.11.1 All independent cargo tanks are to be surveyed internally and externally together with tank supports and the adjacent hull structure.

4.4.11.2 Thickness gauging of the independent cargo tanks is to be carried out as found necessary by the Surveyor.

4.4.11.3 All independent cargo tanks are to be hydraulically pressure tested to their MARVS (Maximum Allowable Relief Valve Setting). However, testing of gravity type tanks may be omitted if the tanks are found without corrosion and other damages and otherwise acceptable.

4.4.12 Reporting and evaluation of survey

4.4.12.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

4.4.12.2 An Executive Hull Summary of the survey and results is to be issued to the Owner and placed on board the vessel for reference at future surveys. The Executive Hull Summary is to be endorsed by IRS Head Office.

4.5 Special Surveys - Machinery

4.5.1 Requirements for examination of machinery and systems are given in Sec.8.

Section 5

Surveys - Liquefied Gas Carriers

5.1 Scope

5.1.1 This section gives the requirements for periodical surveys of vessels which have been assigned the class notation:

Liquefied gas carrier.

5.2 Annual surveys

5.2.1 General

5.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

5.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

5.2.1.3 The annual survey is preferably to be carried out during a loading or unloading operations.

5.2.1.4 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

5.2.2 Hull and weather deck

5.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, closing appliances and related piping are maintained in satisfactory/efficient condition. Special attention is to be paid to the following:

a) Weather deck, shipside plating above waterline.

b) Openings on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating; air pipe heads on exposed decks (external examination); flame screens on vents to all bunker tanks; ventilators and closing devices.

d) Watertight bulkheads and their penetrations as far as practicable.

e) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

f) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines.

g) Examining the cargo, bunker, ballast and vent piping systems, including vent masts and protective screens, as far as practicable.

h) Confirming that the wheel house doors and windows, non-opening type side scuttles and windows in superstructure and deck house ends facing the cargo area are in a satisfactory gastight condition.

i) Confirming that any special arrangements to survive conditions of damage are in order.

5.2.2.2 Examining the cargo compressor rooms and electrical motor rooms.

Examination of the electric motor room and compressor room bulkheads for signs of leakage or fractures and in particular, the sealing arrangements of all penetrations on bulkheads.

5.2.2.3 Confirming that the sealing arrangements at the gas domes are satisfactory.

5.2.2.4 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

5.2.2.5 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

5.2.2.6 Examination of ballast tanks is to be carried out when required as a consequence of the results of the Special Survey or Intermediate Survey. (See 5.4.3.5, 5.4.3.6, 5.3.2.1 and 5.3.2.2). When considered necessary by the Surveyor or where extensive corrosion is found, thickness measurement is to be carried out. When examination of ballast tanks reveals substantial corrosion, additional thickness measurements are to be carried out to determine the extent of the areas of substantial corrosion in accordance with Table 5.4.4.2.

5.2.2.7 Anchoring and mooring equipment is to be examined as far as is practicable. A general examination of the emergency towing arrangements is to be carried out to ensure their ready availability.

For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following are to be generally examined:

a) Components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans), to verify their satisfactory condition.

b) Hull structures supporting and adjacent to the components of the single point mooring system, to verify that there is no deformation or fracture.

5.2.2.8 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

5.2.2.9 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, See Pt.3, Ch.5. It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

5.2.2.10 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

5.2.2.11 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

5.2.2.12 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

5.2.2.13 Davits and fittings on the ship’s deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

5.2.2.14 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

5.2.2.15 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

5.2.2.16 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks, as appropriate, are recorded in the coating technical file.

5.2.3 Machinery and systems

5.2.3.1 A general examination of the machinery, boilers, all pressurised systems (steam, hydraulic, pneumatic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

5.2.3.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

5.2.3.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

5.2.3.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

5.2.3.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

5.2.3.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

5.2.3.7 Confirming, when appropriate, that requisite arrangements to regain steering capability in the event of the prescribed single failure are being maintained.

5.2.3.8 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

5.2.3.9 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

5.2.3.10 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

5.2.3.11 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

5.2.3.12 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

5.2.3.13 Confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

5.2.3.14 The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed spaces in cargo areas situated on freeboard deck is satisfactory.

5.2.3.15 Examining visually the condition of any expansion joints in sea water system.

5.2.3.16 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

5.2.3.17 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

5.2.3.18 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

5.2.3.19 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

5.2.3.20 Confirmation that machinery space ventilation systems are in good working condition.

5.2.4 Fire protection, detection and extinction

5.2.4.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible of the fire and/or smoke detection system(s);

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants; testing the remote means for starting one main fire pump;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fixed fire fighting system controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery and shutting off fuel supplies in machinery spaces are in working order;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged;

j) examination of any manual and automatic fire doors and proving their operations;

k) Examining the fixed fire fighting system for the cargo pump room and confirming that its means of operation is clearly marked;

l) Examining the water spray system for cooling, fire protection and crew protection and confirming that its means of operation is clearly marked;

m) Confirming that electrical equipment in gas dangerous spaces and zones is in satisfactory condition and properly maintained;

n) Examining the dry chemical powder fire extinguishing system for the cargo area and confirming that its means of operation is clearly marked;

o) Examining the fixed fire fighting system for the cargo pump room and the deck foam system for the cargo area and confirming that their means of operation are clearly marked.

p) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

q) examination of the fire safety requirements of any helicopter facilities.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

5.2.4.2 On ships where inert gas systems are installed, the requirements of Sec.12 are to be complied with.

5.2.4.3 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

5.2.4.4 Examination of the arrangements for gaseous fuel for domestic purposes.

5.2.5 Other safety arrangements related to cargo / cargo area

5.2.5.1 The ship's log and operational records for the cargo containment system covering the period from the previous survey are to be examined taking into consideration hours per day of the reliquefaction plant or the boil-off rate. Any malfunction of the system entered in the log is to be investigated, the cause ascertained, and that part of the system at fault is to be found or placed in good order.

5.2.5.2 Cargo liquid level indicating devices are to be generally examined. The low level, high level, and overfill alarms are to be examined and tested to ascertain that they are in working order. Consideration will be given to the acceptance of simulated tests, provided that they are carried out at the cargo temperature, or comprehensive maintenance records, including details of tests held, in accordance with the cargo plant instrumentation maintenance manual. The calibration status of the measuring instruments may also be verified.

5.2.5.3 Cargo gas leakage detection systems are to be examined and tested to ascertain that they are in working order and calibrated using sample gas.

The gas detection arrangements for cargo control rooms and the measures taken to exclude ignition sources where such spaces are not gas safe, are to be examined.

5.2.5.4 The correct functioning of the cargo containment system temperature and pressure indicating equipment, together with any associated alarms, is to be verified.

5.2.5.5 Control devices for the cargo containment systems and cargo handling equipment, together with any associated shutdown and/or interlock, are to be checked under simulated working conditions and, if necessary, recalibrated.

5.2.5.6 The arrangements for manually operated emergency shutdown system together with the automatic shut down of the cargo pumps and compressors are to be checked to ascertain they are in working order.

Alternatively, the log books may be examined for verification that the emergency shutdown system has been tested.

5.2.5.7 Ventilation systems and air locks in working spaces are to be checked for satisfactory operation.

5.2.5.8 Cargo pipeline, valves and fittings are to be generally examined, with special reference to expansion bellows, supports and vapour seals on insulated pipes.

5.2.5.9 Examining the process piping including the expansion arrangements, insulation from hull structure, pressure relief and drainage arrangements.

5.2.5.10 Portable and/or fixed drip trays, or insulation for deck protection in the event of cargo leakage, are to be examined for condition.

5.2.5.11 Examining when applicable bow or stern loading and unloading arrangements with particular reference to the electrical equipment, fire- fighting arrangements and means of communications between the cargo control room and the shore location.

5.2.5.12 Confirming that the cargo tank and interface pressure and relief valves, including safety systems and alarms are satisfactory.

5.2.5.13 Confirming that all liquid and vapour hoses are suitable for their intended purpose.

5.2.5.14 Confirming that any air drying system and any inter barrier and hold space purging inert gas system are satisfactory.

For membrane containment systems, normal operation of the nitrogen control system for insulation and inter barrier spaces is to be confirmed by the Master.

5.2.5.15 Confirming that two sets of portable gas detection equipment suitable for the cargoes to be carried and a suitable instrument for measuring oxygen levels have been provided.

5.2.5.16 Electrical bonding of the cargo pipes and tanks to the hull is to be verified.

5.2.5.17 Confirming that when applicable arrangements are made for sufficient inert gas to be carried to compensate for normal losses and that means are provided for monitoring the spaces.

5.2.5.18 Confirming that the use of inert gas has not increased beyond that needed to compensate for normal losses by examining records of inert gas usage.

5.2.6 Reliquefaction/refrigeration equipment

5.2.6.1 Where reliquefaction or refrigeration equipment for cargo temperature and pressure control is fitted and notation HY(LGC) assigned, the following are to be examined, so far as is practicable:

a) The machinery under working conditions.

b) The shells of all pressure vessels in the system, externally, insulation need not be removed for this examination, but any deterioration of insulation or evidence of dampness which could lead to external corrosion of the vessels of their connections, is to be investigated.

c) Primary refrigerant gas and liquid pipes, cargo vapour and liquid condensate pipes and condenser cooling water pipes. Insulation need not be removed, but any deterioration or evidence of dampness is to be investigated.

d) The reliquefaction/refrigeration plant spare gear.

5.2.7 Methane burning equipment and other equipment components

5.2.7.1 The following components are to be generally examined externally. If insulation is fitted, this need not be removed, but any deterioration of insulation, or evidence of dampness which could lead to external corrosion of the vessels or their connections, is to be investigated.

a) Heat exchangers and pressure vessels for use with methane burning in boilers or machinery.

b) Cargo heaters, vaporizers, masthead heaters and other miscellaneous pressure vessels.

5.2.7.2 Controls and interlocks are to be checked.

5.2.7.3 Alarm systems are to be checked to ascertain they are in working order.

5.2.7.4 Exhaust fans and/or pressurizing system for gas trunking are to be tested.

5.2.7.5 The relevant instruction and information material such as cargo handling plans, filling limit information, cooling down procedures etc. are to be verified as being onboard.

5.2.8 Cargo containment systems

5.2.8.1 At the first Annual Survey after initial commissioning of the ship, the operating records of the primary gas detection system are to be examined.

5.2.8.2 Where the insulation arrangement is such that the insulation cannot be examined during special surveys (See 5.4.6.9) the surrounding structures of wing tanks, double bottom tanks and cofferdams are to be examined for cold spots, prior to the survey. This examination is to be held at a convenient cargo discharge operation with the cargo tanks loaded at approximately the minimum notation temperature.

5.2.8.3 On application by the Owner, consideration will be given to the cold spot examination, where applicable, being carried out by the ship's staff.

5.2.8.4 When tests are required after repairs, independent cargo tanks, other than independent tanks, type C, are to be tested by hydraulic or hydropneumatic means as appropriate. Test heads and pressures should be as defined in Pt.5, Ch.4. Cargo tanks of the membrane or semi-membrane type are to be tested by means of a detectable gas in the inter-barrier spaces and discolouring paint on the weld seams of the cargo tanks wall, or other suitable means. Independent cargo tanks of type C are to be tested hydraulically at 1.25 times the approved maximum vapour pressure.

5.2.9 Personnel protection

a) Verification that the requisite safety equipment and associated breathing apparatus with requisite air supplies and emergency escape respiratory and eye protection, if required, are in good condition and are properly stowed.

b) Verification that medical first air equipment including stretchers and oxygen resuscitation is in god condition and that satisfactory arrangements are made for antidotes for cargoes actually carried to be on board.

c) Verification that decontamination arrangements are operational.

5.3 Intermediate Surveys

5.3.1 General

5.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey. However, only those items which are additional to the requirements for annual surveys may be examined between the second or third annual surveys.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

5.3.1.2 The following requirements are applicable for vessels over five years of age. For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

5.3.1.3 For ships carrying liquefied gases in bulk the intermediate survey is preferably to be carried out with the ship in a gas free condition. The purpose of the intermediate survey is to supplement the annual survey by testing the cargo handling installations with related automatic control, alarm and safety systems for their correct functioning. The extent of the testing required for the intermediate survey will normally be such that the survey cannot be carried out during loading or discharging operation.

5.3.1.4 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

5.3.2 Ballast tanks

5.3.2.1 Vessels of age more than 5 years but not exceeding 10 years

a) An overall survey of representative ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) Where POOR coating condition, corrosion or other defects are found in ballast spaces or where hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast spaces of the same type.

c) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

d) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

5.3.2.2 Vessels of age more than 10 years

a) An internal general examination of all ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

c) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

d) The Surveyor is to carry out a Close-up survey and thickness measurement of structure identified at the previous Special Survey as having substantial corrosion. The minimum requirements for close-up surveys at intermediate survey are given in Table 5.3.2.2.

5.3.3 Safety arrangements related to cargo

5.3.3.1 The following are to be dealt with as applicable:

a) Examination of means for draining the vent piping system.

b) Verification that the heating arrangements, if any, for steel structures are satisfactory.

c) With regard to the Cargo containment systems examination of the items in accordance with 5.2.8.1 and 5.2.8.2.

d) Cargo tank and inter-barrier space pressure and vacuum relief valve settings are to be checked and adjusted as required. Cargo tank pressure relief valve harbour settings are also to be checked, if applicable. A check is to be made that cargo tank pressure relief valves will lift at a pressure not more than the percentage given below, above the maximum vapour pressure for which the tanks have been approved.

For 0 to 1.5 bar - 10 per cent.
For 1.5 to 3.0 bar - 6 per cent.
For pressure exceeding 3.0 bar - 3 per cent.

Valves may be removed from the tanks for the purpose of checking.

Table 5.3.2.2 : Table of the minimum requirements for close-up survey of hull at intermediate surveys of liquefied gas carriers

10 < age ≤ 15	**age > 15**
Close-up survey of: - all web frames and both transverse bulkheads in a representative ballast tank (1) and (2) - the upper part of one web frame in another representative ballast tank - one transverse bulkhead in another representative ballast tank (2)	Close-up survey of : - all web frames and both transverse bulkheads in two representative ballast tanks (1) and (2)
(1) Complete transverse web frame including adjacent structural members	
(2) Transverse bulkhead complete, including girder system and adjacent members and adjacent longitudinal bulkhead structure	
Note 1 : Ballast tanks include topside, double hull side, double bottom, hopper side or any combined arrangement of the aforementioned and peak tanks where fitted.	
Note 2 : For areas in tanks where protective coating is found to be in good condition, the extent of close-up survey may be specially considered.	
Note 3 : For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered.	
Note 4 : The extent of close-up surveys may be extended by the Surveyor as deemed necessary, taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases: - in particular, in tanks having structural arrangements or details which have suffered defects in similar tanks, or on similar ships according to available information; - in tanks having structures approved with reduced scantlings.	

e) Generally examining the electrical equipment and cables in dangerous zones such as cargo pump rooms and areas adjacent to cargo tanks to check for defective equipment, fixtures and wiring. The insulation resistance of the circuits is to be tested and in cases where a proper record of testing is maintained, consideration should be given to accepting recent readings. Examination with reference to the following is to be carried out:

- Protective earthing (spot check).
- Integrity of flame proof enclosures.
- Damage of outer sheath of cables.
- Function testing of pressurized equipment and associated alarms.
- Testing of systems for de-energizing non-certified safe electrical equipment located in spaces protected by air locks, such as electrical motor-rooms, cargo control rooms, etc.

f) Confirming that spares are provided for cargo area mechanical ventilation fans.

g) Checking the provision of equipment for personnel protection.

h) Examining when applicable, the arrangements for the use of cargo as fuel and testing as far as practicable, that the gas supply to the machinery space is cut off should the exhaust ventilation not be functioning correctly and that the master gas fuel valve may be remotely closed from within the machinery space.

i) The emergency shutdown system is to be tested without flow in the pipelines, to verify that the trip system stops the cargo pumps and compressors.

5.4 Special Surveys - Hull

5.4.1 General

5.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5^{th} year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

5.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

5.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

5.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

5.4.1.5 For the purpose of special survey, results of thickness measurement carried out during or after the fourth annual survey only would be considered.

5.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

5.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey.

5.4.1.8 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping are in satisfactory condition and that the ship is fit for its intended purpose for the new period of class of five years to be assigned subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

5.4.1.9 The examinations of the hull are to be supplemented by thickness measurements (See 5.4.4) and testing as deemed necessary, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

5.4.1.10 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements and repairs applicable to the lower portions of ballast tanks (i.e. parts below light ballast waterline) are to be completed in the dry dock

5.4.2 Planning and preparation for survey

5.4.2.1 The ship is to be prepared for overall survey in accordance with the requirements of Table 5.4.2.1. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

5.4.2.2 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner's representative in attendance, the thickness measurement company representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

5.4.3 Examination and testing

5.4.3.1 All spaces within the hull and superstructure are to be examined.

5.4.3.2 All tanks other than cargo and ballast tanks are to be examined internally in accordance with the requirements of Table 5.4.3.2.

All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness remains satisfactory.

5.4.3.3 An overall survey of all water ballast tanks including double bottom tanks, cargo compressor and electrical motor rooms, pipe tunnels, cofferdams and void spaces bounding cargo tanks, decks and outer hull is to be carried out. This examination is to be supplemented by thickness measurement and testing as deemed necessary, to ensure that the structural integrity remains effective. The aim of the examination is to discover Substantial Corrosion, significant deformation, fractures, damages or other structural deterioration and if deemed necessary by the Surveyor, a suitable non-destructive examination may be required.

Table 5.4.2.1 : Survey preparation

Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequently Age > 15
1) All tanks, peaks, bilges and drain wells, engine and boiler spaces and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating 2) The steelwork is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes. 3) All tanks are to be cleaned as necessary to permit examination. 4) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor.	1) Requirements of Special Survey I to be complied with 2) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection.	1) Requirements of Special Survey II to be complied with 2) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating.	1) Requirements of Special survey III to be complied with

Table 5.4.3.2 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks - Engine room - Other area	 None None	 None One	 One Two	 One Half the number of tanks, minimum 2
Lub.oil	None	None	None	One
Fresh water	None	One	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special surveys No.III and subsequent special surveys one deep tank for fuel oil is to be included, if fitted.

5.4.3.4 Where ballast tanks have been converted to void spaces, the survey extent is to be based upon ballast tank requirements.

5.4.3.5 For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in POOR condition and it is not renewed, where soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the space in question is to be internally examined at Annual Surveys. Thickness measurement is to be carried out as deemed necessary by the Surveyor.

5.4.3.6 For double bottom ballast tanks where a protective coating is found in POOR condition and it has not been renewed or where soft or semi-hard coating has been applied, or where a protective coating was not applied from the time of construction, the spaces in question may be examined at Annual Surveys. When considered necessary by the Surveyor, thickness measurement is to be carried out.

5.4.3.7 All watertight bulkheads and watertight doors are to be examined. All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

5.4.3.8 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

5.4.3.9 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

5.4.3.10 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

Automatic air pipe heads are to be internally examined at special surveys as indicated in Table 5.4.3.10. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

5.4.3.11 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

5.4.3.12 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

Table 5.4.3.10 : Requirements for internal examination of automatic air pipe heads

Location	**Special survey No.I Age ≤ 5**	**Special survey No.II 5 < Age ≤ 10**	**Special survey No.III and subsequent Age > 10**
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

Notes:

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

5.4.3.13 The windlass is to be examined.

5.4.3.14 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

5.4.3.15 A thorough examination of aft and forward emergency towing arrangements is to be carried out to ensure its ready availability and satisfactory condition.

- examination of pick-up gear, towing pennant and chafing gear for possible deterioration;
- examination of strong points, fairleads, pedestal roller and their attachment to hull structure.

The survey is to confirm that one of the towing arrangements (aft or forward) are pre-rigged.

5.4.3.16 For vessels with single point mooring arrangements where 'SPM' notation is assigned, the following is to be carried out:

a) A thorough examination of the components of the single point mooring system (bow chain stoppers, bow fairleads, pedestal roller fairleads, winches and capstans) to verify their satisfactory condition.

b) A close-up examination of the hull structures supporting and adjacent to the components of the single point mooring system to verify that there is no deformation or fracture. Thickness determination and non-destructive tests are to be carried out if required by the Surveyor.

5.4.3.17 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals or repairs made when wastage exceeds allowable limits.

5.4.3.18 Boundaries of double bottom, deep, ballast, peak and other tanks are to be tested with a head of liquid to the top of air pipes. Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil, lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the Master stating that the pressure testing has been carried out according to the requirement with satisfactory results.

5.4.3.19 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

5.4.3.20 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

5.4.4 Thickness measurement

5.4.4.1 The minimum requirements for thickness measurement are given in Table 5.4.4.1. The surveyor may extend the thickness measurements as deemed necessary.

Table 5.4.4.1 : Table of minimum requirements to thickness measurements of liquefied gas carriers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
2) Within the cargo area : One section of deck plating for the full beam of the ship within 0.5L amidships in way of a ballast tank, if any.	2) Within the cargo area: a) Each deck plate b) One Transverse section within 0.5L amidships in way of a ballast tank, if any	2) Within the cargo area: a) Each deck plate b) Two Transverse sections (1) c) All wind and water strakes	2) Within the cargo area: a) Each deck plate b) Three Transverse sections (1) c) All wind and water strakes d) Each bottom plate e) Duct keel or pipe tunnel plating and internals
3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern	3) Measurements of structural members subject to close-up survey according to Table 5.4.5.1, for general assessment and recording of corrosion pattern
	4) Selected wind and water strakes outside the cargo area	4) Selected wind and water strakes outside the cargo area	4) All wind and water strakes outside the cargo area
		5) Internals in forepeak and after peak tanks	5) Internals in forepeak and afterpeak tanks
			6) All exposed main deck plating outside cargo area
			7) Representative exposed superstructure deck plating (poop, bridge, forecastle deck)

Table 5.4.4.1 : (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor.
(1) at least one section is to include a ballast tank within 0.5L amidships, if any.			

Table 5.4.4.2 : Guidance for additional thickness measurements in way of substantial corrosion

Structural Member	Extent of Measurement	Pattern of Measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

5.4.4.2 Where thickness measurements indicate substantial corrosion, the number of thickness measurements are to be increased to determine the extent of substantial corrosion. Table 5.4.4.2 may be used as guidance for additional measurements.

5.4.4.3 For areas in tanks where coating are found to be in a GOOD condition, the extent of thickness measurements may be specially considered, by the Surveyor.

5.4.4.4 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

5.4.4.5 The thickness measurements are to be carried out by a qualified firm certified by IRS.

5.4.4.6 In order to ensure necessary control during the process, thickness measurements are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

5.4.4.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

5.4.5 Close-up survey requirements

5.4.5.1 The minimum requirements for Close-up Surveys at Special Survey are given in Table 5.4.5.1.

5.4.5.2 The Surveyor may extend the Close-up Survey as deemed necessary taking into account the maintenance of the tanks under survey, the condition of the corrosion prevention system and also in the following cases:

a) In particular, tanks having structural arrangements or details which have suffered defects on similar tanks or on similar ships according to available information.

b) In tanks which have structures approved with reduced scantlings due to an approved corrosion control system.

5.4.5.3 For areas in tanks where hard protective coatings are found to be in a GOOD condition, the extent of Close-up Surveys according to Table 5.4.5.1 may be specially considered by the Surveyor.

Table 5.4.5.1 : Table of minimum requirements for close-up surveys at special surveys of liquefied gas carriers

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **subsequent age > 10**
One web frame in a representative ballast tank of the topside, hopper side and double hull side type (1) One transverse bulkhead in a ballast tank (3)	All web frames in a ballast tank, which is to be a double hull side tank or a topside tank. If such tanks are not fitted, another ballast tank is to be selected (1) One web frame in each remaining ballast tank (1) One transverse bulkhead in each ballast tank (2)	All web frames in all ballast tanks (1) All transverse bulkheads in all ballast tanks (2)

(1) Complete transverse web frame including adjacent structural members.
(2) Transverse bulkhead complete, including girder system and adjacent members and adjacent longitudinal bulkhead structure.
(3) Transverse bulkhead lower part including girder system and adjacent structural members.

Notes :

a) Ballast tanks include topside, double hull side, double bottom, hopper side, or any combined arrangement of the aforementioned and peak tanks where fitted.

b) For ships having independent tanks of type C, with a midship section similar to that of a general cargo ship, the extent of close-up surveys may be specially considered by the Surveyor.

5.4.6 Cargo containment and systems

5.4.6.1 All cargo tanks are to be examined internally, also externally so far as is practicable, particular attention being paid to the plating in way of supports of securing arrangements, tower structures, seatings and pipe connections. Attention is also to be paid to the sealing arrangements in way of the deck penetrations and the antiflotation arrangements for independent tanks. The tightness of all cargo tanks is to be verified by an appropriate procedure. The ships gas detection equipment may be used for tightness test of independent tanks below deck. Provided that the structural examination is satisfactory, that the gas leakage monitoring systems have been found to be operating satisfactorily and that the voyage records have not shown any abnormal operation, cargo tanks do not require to be hydraulically tested.

5.4.6.2 Non-destructive testing is to supplement cargo tank inspection with special attention to be given to the integrity of the main structural members, tank shell and highly stressed parts, including welded connections as deemed necessary by the Surveyor. However, for Type C independent tanks non-destructive testing can not be dispensed with totally. The following items are, inter alia, considered as highly stressed parts:

- Cargo tank supports and anti-rolling/anti-pitching devices.

- Web frames or stiffening rings.

- Swash bulkhead boundaries.

- Dome and stump connections to tank shell.

- Foundations for pumps, towers, ladders etc.

- Pipe connections.

- Y-connections between tank shell and a longitudinal bulkhead of bilobe tanks.

5.4.6.3 For independent tanks of type B, the extent of non-destructive testing is to be given in a programme specially prepared for cargo tank design.

5.4.6.4 If findings of 5.4.6.1 to 5.4.6.2 or examination of voyage records do not reveal a satisfactory structural integrity of the cargo tanks, a hydraulic or hydro-pneumatic test is to be carried out. For integral tanks and for independent tanks of type A and B, the test pressure is to be atleast equal to MARVS. It is to be ensured that the maximum primary membrane stress or maximum bending stress in a primary membrane under the test conditions does not exceed 90% of the yield strength of the material (as fabricated) at the test temperature.

5.4.6.5 At every other special survey (i.e. 2nd, 4th, 6th etc.) independent cargo tanks of type C are to be either:

- hydraulically or hydro-pneumatically tested to 1.25 MARVS followed by non-destructive testing in accordance with para 5.4.6.2;

OR

- subjected to a thorough planned non-destructive testing. The testing programme is to be specially prepared for the tank design. Alternatively the items detailed in para 5.4.6.2 are to be subjected to non-destructive testing. The extent of radiographic examination with insulation removed as necessary is to be atleast 10% of the welded connections in each of the above mentioned areas, internally and externally as applicable.

5.4.6.6 Deck mounted cargo storage tanks are to be examined in the same manner as main cargo tanks.

5.4.6.7 Secondary barriers are to be examined for their effectiveness, visually whenever possible, or by means of pressure/vacuum tests on the inter-barrier spaces over a period of 36 hours. Alternative means of checking the secondary barriers will be considered. For membrane and semi-membrane tank systems, inspection and testing are to be carried out in accordance with programmes specially prepared in accordance with an approved method for the actual tank system.

For membrane containment systems, a tightness test of the primary and secondary barrier is to be carried out in accordance with the system designers procedures and acceptance criteria as approved by IRS. Low differential pressure may be used for monitoring the cargo containment system performance, however, is not considered an acceptable test for the tightness of the secondary barrier.

For membrane containment systems with glued secondary barriers if the designer’s threshold values are exceeded, an investigation is to be carried out and additional testing such as thermographic or acoustic emissions testing is to be carried out.

5.4.6.8 Where cargo containment systems have secondary barriers which cannot be examined or tested and have been approved on the basis of extensive prototype testing, the barriers will be considered to remain efficient provided a cold spot examination of the adjacent steel work is satisfactory and records of the steel work temperature readings are verified as acceptable.

5.4.6.9 Where a cargo tank or the hull structure is insulated and the insulation is accessible, the insulation should be examined externally, together with any vapour or protective barrier, and sections removed for examination, if considered necessary by the Surveyor. Special attention should be given to insulation in way of chocks, supports and keys. Portions of the insulation are also to be removed, if required by the Surveyor, to enable the condition of the plating to be ascertained. Where the insulation is not accessible, see 5.2.8.2.

5.4.6.10 Cargo tank internal pipes and fittings are to be examined, and all valves and cocks in direct communication with the interiors of the tanks are to be opened out for inspection and the connection pipes are to be examined internally, so far as is practicable.

5.4.6.11 Pressure relief valves and vacuum relief valves on cargo tanks and inter-barrier spaces are to be opened out for inspection. Pressure relief valves are subsequently to be adjusted to lift at a pressure in accordance with 5.3.3d). Relief valve harbour settings are to be checked, if applicable. Valves may be removed from the shell for the purpose of making this adjustment under pressure of air or other suitable gas. Relief valves on cargo gas and liquid pipelines are to have their pressure settings checked. The valves may be removed from the pipelines for the purpose.

If the cargo tanks are equipped with relief valves with non-metallic membranes in the main or pilot valves, then such non-metallic membranes are to be replaced. If a proper record of continuous overhaul and retesting of individually identifiable relief valves is maintained, then consideration will be given to acceptance on the basis of opening, internal examination and testing of a representative sampling of valves, including each size and type of liquefied gas or vapour relief valve in use, provided there is a logbook evidence that the remaining valves have been overhauled and tested since crediting of the previous special survey.

5.4.6.12 All cargo pumps, cargo booster pumps and cargo vapour pumps are to be opened out for examination. If requested by the Owner, these items may be examined on a Continuous Survey basis provided the interval between examination of each item does not exceed five years. Pumping systems for inter-barrier spaces are to be checked and verified to be in good working order.

5.4.6.13 Where considered necessary, insulated cargo gas and liquid pipelines are to have sections of insulation removed to ascertain the condition of the pipes. If visual examination raises doubt as to the integrity of the pipe lines, then the pipe lines are to be pressure tested to 1.25 times MARVS. Care is to be taken that in the replacement of insulation the outer vapour seal is made good.

5.4.6.14 Equipment for the production of inert gas is to be examined and shown to be operating satisfactorily within the gas specification limits. Pipelines, valves, etc., for the distribution of the inert gas are to be generally examined. Pressure vessels for the storage of inert gas are to be examined internally and externally and the securing arrangements are to be specially examined. Pressure relief valves are to be demonstrated to be in good working order. Liquid nitrogen storage vessels are to be examined, so far as is practicable, and all control equipment, alarms and safety devices are to be verified as operational.

5.4.6.15 Gas tight bulkhead shaft seals are to be opened out so that the sealing arrangements may be checked.

5.4.6.16 Sea connections associated with the cargo handling equipment are to be opened out when the ship is in dry-dock.

5.4.6.17 The arrangements for discharging the cargo overboard in an emergency are to be checked.

5.4.6.18 Special Survey I (Ships five years old)-reliquefaction / refrigeration equipment

a) Each reciprocating compressor is to be opened out. Cylinder bores, pistons, piston rods, connecting rods, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankshafts are to be examined but crankcase glands and the lower half of main bearings need not be exposed if the Surveyor is satisfied with the alignment and wear.

b) Where other than reciprocating type compressors are fitted, or where there is a program of replacement instead of surveys on board, alternative survey arrangements will be considered. Each case will be given individual consideration.

c) The water end covers of condensers are to be removed for examination of the tubes, tube plates and covers.

d) Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened out for examination.

e) Where a pressure vessel is insulated, sufficient insulation is to be removed, especially in way of connections and supports, to enable the vessel's condition to be ascertained.

f) Insulated pipes are to have sufficient insulation removed to enable their condition to be ascertained. Vapour seals are to be specially examined for condition.

g) The Surveyor is to satisfy himself that all pressure relief valves and/or safety discs throughout the system are in good order. No attempt, however, is to be made to test primary refrigerant pressure relief valves on board ship.

h) The items covered by (a) to (d) may, at the request of the Owner, be examined on a Continuous Survey basis provided the interval between examination of each item does not exceed five years.

5.4.6.19 Special Survey I (ships five years old)- Methane burning equipment

a) Where methane is used as fuel for main propulsion purposes, the associated compressors and heat exchangers are to be opened out and examined as for reliquefaction/refrigeration equipment. The steam side of steam heaters is to be hydraulically tested to 1.5 times the design pressure.

b) Methane gas pipe trunks or casings are to be generally examined and the exhaust or inerting arrangements for these trunks are to be verified.

c) All alarms associated with the methane burning systems are to be verified.

5.4.6.20 Special Survey II and Special Surveys thereafter (ships 10 years old and over)

a) The requirements of 5.4.6.1 to 5.4.6.19 are to be complied with.

b) Water cooled condensers in which the primary refrigerant is in contact with the shell are to have the end covers removed and the shell pneumatically tested to a pressure equal to the designed working pressure.

c) All other pressure vessels in the reliquefaction/refrigeration system, methane burning system and other handling systems are to be pneumatically tested to a pressure equal to the designed working pressure.

d) Liquid cargo pipes are to be tested by approved means, to a pressure equal to 1.25 times the working pressure. Alternatively, selected representative lengths may be removed for internal examination and hydraulic testing.

e) At Special Survey III and at each alternate Special Survey thereafter, plating of independent cargo tanks, and also the hull structural plating surrounding cargo tanks, where it is insulated on one side, is to be measured for thickness by a non-destructive method.

5.5 Special Surveys - Machinery

5.5.1 Requirements for examination of machinery and systems are given in Sec.8.

Section 6

Surveys - Other Ship Types

6.1 Scope

6.1.1 This section gives the requirements for periodical surveys of all ship types other than bulk carriers, oil tankers, chemical tankers and liquefied gas carriers which are covered in Sections 2 to 5 of this chapter. The requirements for general dry cargo ships defined in 1.2.17, are also included.

6.2 Annual surveys

6.2.1 General

6.2.1.1 Annual Surveys are to be carried out within 3 months before or after the anniversary date each year. These should be held concurrently with statutory annual or other relevant statutory Surveys, where practicable.

6.2.1.2 At Annual Surveys, the Surveyor is to examine the hull and machinery, so far as necessary and practicable, in order to be satisfied as to their general condition.

6.2.1.3 It is to be confirmed that no new installation of material containing asbestos was carried out since last survey.

6.2.2 Hull - General

6.2.2.1 The survey is to consist of an examination for the purpose of ensuring, as far as practicable, that the hull, equipment, hatch coamings, hatch covers including their securing arrangement, other closing appliances and related piping are maintained in satisfactory/efficient condition.

a) Weather deck, shipside plating above water line.

b) Hatchways on freeboard and superstructure decks; exposed casings; skylights and fiddley openings; deck houses; companionways and superstructure bulkheads; side, bow and stern doors; side scuttles and dead lights; flush deck scuttles; ash shoots and other openings.

c) Weld connection between air pipes and deck plating, air pipe heads on exposed decks (external examination), flame screens on vents to all bunker tanks; ventilators and closing devices.

d) Scuppers and sanitary discharges as far as practicable together with valves and their controls.

e) Guard rails, bulwarks, freeing ports, gangways, walkways and life lines, fittings and appliances for timber deck cargo.

f) Watertight bulkheads and their penetrations as far as practicable.

6.2.2.2 Cargo hatch covers and coamings are to be examined to ensure that no alterations have been made to the approved arrangements :

a) Mechanically operated hatch covers are to be examined for satisfactory condition of:

- hatch covers;
- tightness devices of longitudinal, transverse and intermediate cross junctions, gaskets, gasket lips, compression bars, drainage channels;
- clamping devices, retaining bars, cleating;
- chain or rope pulleys;
- guides;
- guide rails and track wheels;
- stoppers, etc.;
- wires, chains, gypsies, tensioning devices;
- hydraulic system essential to closing and securing;
- safety locks and retaining devices.

b) Cargo hatch covers of the portable type (i.e. wood or steel pontoons) are to be examined to confirm the satisfactory condition of:

- wooden covers and portable beams, carriers or sockets for the portable beams and their securing devices;
- steel pontoons;
- tarpaulins;
- cleats, battens and wedges;
- hatch securing bars and their securing devices;
- loading pads/bars and the side plate edge;
- guide plates and chocks;
- compression bars, drainage channels and drain pipes, if any.

c) Checking the satisfactory condition of hatch coamings plating and their stiffeners.

d) Random checking of the satisfactory operation of mechanically operated hatch covers :

- stowage and securing in open position;
- proper fit, locking and efficiency of sealing in closed condition;
- operational testing of hydraulic and power components, wires, chains and link drives.

In the case of hatch covers / steel pontoons of general dry cargo ships, a close-up survey of hatch cover plating is to be carried out.

6.2.2.3 All watertight doors in watertight bulkheads, to be examined and tested (locally and remotely) as far as practicable.

6.2.2.4 Anchoring and mooring equipment is to be examined as far as is practicable.

6.2.2.5 Where applicable Surveyor should satisfy himself regarding the freeboard marks on the ship's side.

6.2.2.6 Suspect areas identified at previous special or intermediate surveys are to be close-up surveyed. Thickness measurements are to be taken in the area of substantial corrosion identified at previous surveys.

6.2.2.7 Examination of Ballast Tanks when required as a consequence of the results of the

Special Survey or Intermediate Survey (See 6.4.3.1, 6.4.3.2 and 6.3.2, 6.3.3 respectively). When extensive corrosion is found, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion then the extent of thickness measurements are to be increased to determine the extent of areas of substantial corrosion in accordance with Table 6.4.8.2.

6.2.2.8 The Surveyor is to confirm that, where required, an approved loading instrument together with its operation manual are available on board, (See Pt.3, Ch.5). It is to be verified by the Surveyor that the loading instrument is checked for accuracy at regular intervals by the ship's staff by applying test loading conditions.

6.2.2.9 Accommodation ladders are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) steps;
b) platforms;
c) all support points such as pivots, rollers, etc.;
d) all suspension points such as lugs, brackets, etc.;
e) stanchions, rigid handrails, hand ropes and turntables;
f) davit structure, wire and sheaves, etc.

6.2.2.10 Gangways are to be examined at annual surveys. Satisfactory condition of the following items is to be checked, in particular :

a) treads;
b) side stringers, cross-members, decking, deck plates, etc.;
c) all support points such as wheel, roller, etc.;
d) stanchions, rigid handrails, hand ropes.

6.2.2.11 Winches of accommodation ladders and gangways are to be examined to verify the satisfactory condition of the following items:

a) brake mechanism including condition of brake pads and band brake, if fitted;
b) remote control system, and
c) power supply system for electric motor.

6.2.2.12 Davits and fittings on the ship’s deck associated with accommodation ladders and gangways are to be examined for satisfactory condition at annual surveys. Fittings or structures for means of access to deck such as handholds in a gateway or bulwark ladder and stanchions are also to be examined.

6.2.2.13 The maintenance and inspection records of accommodation ladders and gangways are to be verified. It is to be confirmed that supporting wires are being renewed at intervals not exceeding 5 years.

6.2.2.14 When examining internal spaces, as far as practicable, the permanent means of access where appropriate, are to be verified that they remain in good condition.

6.2.2.15 For vessels subject to IMO PSPC (See Pt.3, Ch.2, 3.6) it is to be confirmed that the maintenance, repair and partial re-coating of dedicated ballast tanks, as appropriate, are recorded in the coating technical file.

6.2.3 Examination of cargo holds of general dry cargo ships.

6.2.3.1 For cargo ships of 10 – 15 years of age:

a) Overall survey of one forward and one after cargo hold and their associated tween deck spaces.

b) When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion, then the extent of thickness measurements is to be increased to determine the extent of areas of substantial corrosion in accordance with Table 6.4.8.2.

6.2.3.2 For cargo ships over 15 years of age:

a) Overall survey of all cargo holds and tween deck spaces.

b) In a forward lower cargo hold and one other selected lower cargo hold:

   - Close-up examination of sufficient extent, minimum 25% of frames, to establish the condition of the lower region of the shell frames including approx. lower one third length of side frame at side shell, side frame end attachment and the adjacent shell plating.

   - Where this level of survey reveals the need for remedial measures, the survey is to be extended to include a close-up survey of all of the shell frames and adjacent shell plating of those cargo holds and associated tween deck spaces (as applicable) as well as a close-up survey of sufficient extent of all remaining cargo holds and tween deck spaces (as applicable).

c) When considered necessary by the surveyor, or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion, then the number of thickness measurements are to be increased to determine the extent of substantial corrosion in accordance with Table 6.4.8.2.

d) Where the protective coating in cargo holds, as applicable, is found to be in a GOOD condition, the extent of close-up surveys may be specially considered.

e) All piping and penetrations in cargo holds, including overboard piping are to be examined.

6.2.4 Machinery and systems

6.2.4.1 A general examination of the machinery, boilers, all pressurised systems (steam, pneumatic, hydraulic) and their associated fittings, propulsion system and auxiliary machinery to see whether they are being properly maintained and with particular attention to the fire and explosion hazards.

6.2.4.2 Confirmation that machinery, boilers and other pressure vessels, associated piping systems and fittings are so installed and protected as to reduce to a minimum any danger to persons on board, due regard being given to moving parts, hot surfaces and other hazards.

6.2.4.3 Confirmation that Periodical Surveys of boilers and other pressure vessels have been carried out as required by the Rules and the safety devices have been tested.

6.2.4.4 Confirmation that the normal operation of the propulsion machinery can be sustained or restored even though one of the essential auxiliaries becomes inoperative.

6.2.4.5 Confirmation that means are provided so that machinery can be brought into operation from the dead ship condition without external aid.

6.2.4.6 All main and auxiliary steering arrangements and their associated equipment and control systems are to be examined and tested. Where applicable, Surveyors are to verify that log entries have been made in accordance with statutory requirements.

6.2.4.7 Steering chains are to be cleaned for ascertaining wear and tear and lengths of chain worn in mean diameter by more than 12 per cent of the original rule diameter are to be renewed.

6.2.4.8 All the means of communication between the navigating bridge and the machinery control positions, as well as the bridge and the main alternative steering position, if fitted, are to be tested. It is to be confirmed that means of indicating the angular position of the rudder are operating satisfactorily.

6.2.4.9 Confirmation that with ships having emergency steering positions there are means of relaying heading information and, when appropriate, supplying visual compass readings to the emergency steering positions.

6.2.4.10 Confirmation that various alarms required for hydraulic power operated, electric and electro-hydraulic steering gears are, operating satisfactorily and that the recharging arrangements for hydraulic power operated steering gears are being maintained.

6.2.4.11 Examining the means for the operation of the main and auxiliary machinery essential for propulsion and the safety of the ship, including when applicable, the means of remotely controlling the propulsion machinery from the navigating bridge and the arrangements to operate the main and other machinery from a machinery control room.

6.2.4.12 Confirmation that the engine room telegraph, the second means of communication between the navigation bridge and the machinery space and the means of communication with any other positions from which the engines are controlled are operating satisfactorily.

6.2.4.13 Confirmation that the engineer's alarm is clearly audible in the engineer's accommodation.

6.2.4.14 The bilge pumping systems and bilge wells including operation of each bilge pump, extended spindles and level alarms, where fitted, are to be examined as far as is practicable. It is also to be confirmed that bilge pumping system for each watertight compartment is satisfactory.

It is also to be confirmed that drainage from enclosed cargo spaces situated on freeboard deck is satisfactory.

6.2.4.15 Examining visually the condition of any expansion joints in sea water system.

6.2.4.16 General examination visually and in operation, as feasible, of the main electrical machinery, the emergency sources of electrical power, the switch gear, other electrical equipment including the lighting system is to be carried out.

6.2.4.17 Confirmation as far as practicable, the operation of the emergency source(s) of electrical power, including their starting arrangement, the systems supplied, and when appropriate, their automatic operation.

6.2.4.18 Examining in general, that the precautions provided against shock, fire and other hazards of electrical origin are being maintained.

6.2.4.19 General Examination of automation equipment is to be carried out. Satisfactory operation of safety devices, bilge level detection and alarm systems and control systems is to be verified.

6.2.4.20 For single hold cargo ships which require fitment of hold water level detectors as per Pt.4, Ch.3, Sec.3.6, the annual survey is to include an examination and a test of the water ingress detection system and their alarms.

6.2.4.21 Confirmation that machinery space ventilation systems are in good working condition.

6.2.5 Fire protection, detection and extinction

6.2.5.1 The arrangements for fire protection, detection and extinction are to be examined and are to include confirmation that no changes have been made in the structural fire protection. Following are to be examined / verified:

a) verification that fire control plans are properly posted;

b) examination as far as possible and testing as feasible of the fire and/or smoke detection system(s);

c) examination of the fire main system and verification that each fire pump including the emergency fire pump can be operated separately so that the two required powerful jets of water can be produced simultaneously from different hydrants;

d) verification that fire hoses, nozzles, applicators and spanners are in good working condition and situated at their respective locations;

e) examination of fixed fire fighting system controls, piping, instructions and marking, checking for evidence of proper maintenance and servicing including date of last systems tests;

f) verification that all semi-portable and portable fire extinguishers are in their stowed positions, checking for evidence of proper maintenance and servicing, conducting random check for evidence of discharged containers;

g) verification, as far as practicable, that the remote controls for stopping fans and machinery and shutting off fuel supplies in machinery spaces are in working order;

h) examination of the closing arrangements of ventilators, funnel annular spaces, skylights, doorways and tunnel, where applicable;

i) confirmation that the fire fighters' outfits and emergency escape breathing devices (EEBDs) are complete and in good condition and that the cylinders, including the spare cylinders, of any required self-contained breathing apparatus are suitably charged;

j) examination of any manual and automatic fire doors and proving their operations;

k) examination of the fire-extinguishing systems for spaces containing paint and/or flammable liquids and deep fat cooking equipment in accommodation and service spaces;

l) examination of the fire safety requirements of any helicopter facilities;

m) examination of the fire protection arrangement in cargo, vehicle and ro-ro spaces and confirmation, as far as practicable and as appropriate, the operation of the means of control provided for closing the various openings;

n) Examination, when appropriate, of the special arrangements for carrying dangerous goods, including checking the electrical equipment and wiring, the ventilation, protective clothing and portable appliances and testing of water supply, bilge pumping and any water spray system.

Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

6.2.5.2 Confirmation that the means of escape from accommodation, machinery spaces and other spaces are satisfactory.

6.2.5.3 Examination of the arrangements for gaseous fuel for domestic purposes.

6.2.6 Shell and inner doors of ro-ro ships

6.2.6.1 The survey is to consist of an examination to verify, as far as is practicable, that the bow, inner, side shell and stern doors are maintained in a satisfactory condition.

6.2.6.2 Confirmation is to be obtained that no unapproved changes have been made to the bow, inner, side shell and stern doors since the last survey.

6.2.6.3 Documents

If an Operating and Maintenance Manual (OMM) is required, it is to be verified that a copy approved by IRS is on board and any possible modifications are included. It is to be verified that documented operating procedures for closing and securing doors are kept on board and posted at an appropriate place. The OMM is to be examined with special attention to the register of inspections and its contents as a basis for the survey.

6.2.6.4 Structural examination

Bow, inner, side shell and stern doors are to be examined with particular attention paid to:

- Structural arrangement of doors including plating, secondary stiffeners, primary structure, hinging arms and welding;

- Shell structure surrounding the opening of the doors and the securing, supporting and locking devices (refer Pt.3, Ch.12, Sections 5 and 6) including shell plating, secondary stiffeners, primary structure and welding;

- Hinges and bearings, thrust bearings;

- Hull and door side supports for securing, supporting and locking devices;

- Close-up survey of securing, supporting and locking devices including welding, refer to Table 6.2.6.4 for minimum requirements.

Whenever a crack is found, an examination with NDT is to be carried out in the surrounding areas and for similar items as considered necessary by the Surveyor.

6.2.6.5 Measurement of clearances

Clearances of hinges, bearings and thrust bearings are to be taken, where no dismantling is required. Where the function test is not satisfactory, dismantling may be required to measure the clearances. If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out. Clearances of securing, supporting and locking devices are to be measured, where indicated in the OMM

Table 6.2.6.4 : Minimum requirements for close-up surveys of doors, locking, securing and supporting devices and fittings	
List of the devices and fittings and associated welding to be subject to close-up survey by the attending Surveyor:	
i)	Cylinder securing pins, supporting brackets, back-up brackets (where fitted) and their welding connections;
ii)	Hinge pins, supporting brackets, back-up brackets (where fitted) and their welded connections;
iii)	Locking hooks, securing pins, supporting brackets, back-up brackets (where fitted) and their welded connections;
iv)	Locking pins, supporting brackets, back-up brackets (where fitted) and their welded connections;
v)	Locating and stopper devices and their welded connections.

6.2.6.6 Sealing arrangement

An examination of packing material / rubber gaskets and retaining bars or channels, including welding is to be carried out.

6.2.6.7 Drainage arrangement

An examination of drainage arrangement, including bilge wells and drain pipes is to be carried out.

6.2.6.8 Function test of doors

Checking of the satisfactory operation of the bow, inner, side shell and stern doors during a complete opening and closing operation is to be carried out, as applicable, including:

- Proper working of the hinging arms and hinges;
- Proper engagement of the thrust bearings;
- Device for locking the door in the open position;
- Securing, supporting and locking devices;
- Proper sequence of the interlock system for the opening / closing system and the securing and locking devices;
- Mechanical lock of the securing devices;
- Proper locking of hydraulic securing devices in the event of a loss of the hydraulic fluid, according to the procedure provided by the OMM;
- Correct indication of open / closed position of doors and securing / locking devices at navigation bridge and other control stations;
- Isolating of the hydraulic securing / locking devices from other hydraulic systems;
- Confirmation that the operating panels are inaccessible to unauthorized persons;
- Verification that a notice plate giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour is placed at each operating panel and supplemented by warning indicator lights;
- Examination of electrical equipment for opening, closing and securing the doors.

6.2.6.9 Function test of the indicator system

Checking of the satisfactory operation of the indicator system, where fitted, is to be carried out, as applicable, including:

- Proper visible indication and audible alarm on the navigation bridge panel, according to the selected function “harbour / sea voyage” and on the operating panel;
- Lamp test function on both panels;
- Verification that it is not possible to turn off the indicator light on both panels;
- Verification of fail safe performance, according to the procedure provided by the OMM;
- Confirmation that power supply for indicator system is supplied by the emergency source or other secure power supply and independent of the power supply for operating the doors;
- Verification of proper condition of sensors and protection from water, ice formation and mechanical damage.

6.2.6.10 Test of water leakage detection system (where fitted)

The water leakage detection system is to be tested including proper audible alarm on the navigation bridge panel and on the engine control room panel, according to the procedure provided by the OMM.

6.2.6.11 Test of television surveillance system (where fitted)

The television surveillance system is to be tested including proper indication on the navigation bridge monitor and on the engine control room monitor.

6.2.6.12 Tightness test

A hose test or equivalent is to be carried out. If the visual examination and function test have shown satisfactory results, the tightness test of shell doors on ro-ro cargo ships need not be carried out unless considered necessary by the attending surveyor.

6.2.6.13 NDT and thickness measurements

When considered necessary by the Surveyor, NDT and thickness measurements may be required after visual examination and function test.

6.3 Intermediate surveys

6.3.1 General

6.3.1.1 Intermediate surveys are to be carried out at or between the second or third Annual Survey.

Those items which are additional to the requirements of annual survey may be examined at or between the second and third annual survey.

6.3.1.2 The following requirements are applicable for vessels over five years of age.

For vessels below 5 years of age additional examination over and above the requirements of Annual survey may be required at the discretion of the Surveyors.

6.3.1.3 Prior to the commencement of any part of the intermediate survey, a survey planning meeting is to be held between the attending Surveyor(s), the owner's representative in attendance and where involved, the thickness measurement company representative and the master of ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

6.3.1.4 Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

6.3.2 Vessels of age between 5 and 10 years

6.3.2.1 Ballast tanks

a) An internal general examination of representative ballast tanks is to be carried out as required by (c) and (d). When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) Where POOR coating condition, corrosion or other defects are found in ballast spaces or where hard protective coating was not applied from the time of construction, the examination is to be extended to other ballast spaces of the same type.

c) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

d) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

6.3.2.2 Cargo hold of general dry cargo ships

a) An overall survey of one forward and one after cargo hold and their associated tween deck spaces.

b) Areas found suspect at previous surveys are to be surveyed in accordance with 6.2.2.6.

6.3.3 Vessels of age between 10 and 15 years

6.3.3.1 Ballast tanks:

a) An overall survey of all ballast tanks is to be carried out. When extensive corrosion is found, thickness measurements are to be carried out. If such examination reveals no visible structural defects, the examination may be limited to a verification that the corrosion prevention system remain efficient.

b) For ballast tanks, other than double bottom tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question are to be examined at subsequent annual surveys.

c) For double bottom ballast tanks, where a protective coating is found to be in POOR condition and is not renewed, where a soft or semi-hard coating has been applied or where a hard protective coating was not applied from the time of construction, the tank(s) in question may be examined at subsequent Annual surveys.

6.3.3.2 Cargo holds of general dry cargo ships:

a) An overall survey of all cargo holds and tween deck spaces.

b) Areas found suspect at previous surveys are to be surveyed in accordance with 6.2.2.6.

c) When considered necessary by the Surveyor or where extensive corrosion exists, thickness measurement is to be carried out. If the results of these thickness measurements indicate substantial corrosion, then the extent of thickness measurements are to be increased to determine the extent of areas of substantial corrosion in accordance with Table 6.4.8.2.

6.3.3.3 In the case of ships other than those engaged in the carriage of dry cargoes only, an internal examination of selected cargo spaces is to be carried out.

6.3.4 Vessels of age more than 15 years

a) For vessels other than general dry cargo ships, in addition to the requirements given in 6.3.3, an internal examination of selected cargo holds is to be carried out.

b) For general dry cargo ships, the requirements of the intermediate survey is to be to the same extent as the previous special survey as required in 6.4 for hull structure and piping systems in way of the cargo holds, cofferdams, pipe tunnels, void spaces and fuel oil tanks in the cargo area and all ballast tanks. However, tank testing specified in 6.4.6, survey of automatic air pipe heads specified in 6.4.4.7 and internal examination of fuel oil, lub.oil and freshwater tanks specified in Table 6.4.4.1 need not be carried out unless deemed necessary by the Surveyor. In water survey complying with the requirements of 7.2 may be accepted in lieu of docking survey required by 6.4.1.11. Thickness measurement is to be carried out for items 1 to 4 of Table 6.4.8.1b except for item 2d).

In lieu of the application of 6.4.1.4, the intermediate survey may be commenced at the second annual survey and be progressed with a view to completion at the third annual survey.

6.4 Special surveys - Hull

6.4.1 General

6.4.1.1 All ships classed with IRS are to undergo Special Surveys at 5 yearly intervals. The first Special Survey is to be completed within 5 years from the date of the initial classification survey and thereafter 5 years from the assigned date of the previous Special Survey. However, an extension of class of 3 months maximum beyond the 5th year may be granted in exceptional circumstances in accordance with 1.11. In such cases, the next period of class will start from the expiry date of the Special Survey before extension was granted.

6.4.1.2 The interval between the Special Surveys may be reduced at the request of the parties concerned or by IRS if considered appropriate.

6.4.1.3 For surveys completed within 3 months before the expiry date of the Special Survey, the next period of class will start from the expiry date of the Special Survey. For surveys completed more than 3 months before the expiry date of the Special Survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date. Any requirement of the Flag Administration in this regard is also to be complied with.

6.4.1.4 The Special Survey may be commenced at the 4th Annual Survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the fourth annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey and in this case the next period of class will start from the survey completion date.

Concurrent crediting to both Intermediate survey and Special survey for surveys and thickness measurements of spaces is not acceptable.

6.4.1.5 For the purpose of special survey, results of thickness measurement carried out during or after the fourth annual survey only would be considered.

6.4.1.6 Record of Special Survey will not be assigned until the Machinery Survey has been completed or postponed in agreement with IRS.

6.4.1.7 Ships which have satisfactorily passed a Special Survey will have a record entered in the Supplement to the Register Book indicating the assigned date of Special Survey.

6.4.1.8 For vessels other than general dry cargo ships, IRS may, at the request of the Owners, accept a Special Survey of the hull on a continuous basis spread over a period of 5 years. Proposals for such continuous Surveys are to be submitted for the consideration of IRS. In general, approximately one-fifth of the Special Survey is to be completed every year. All compartments of the hull should be opened for Survey and testing in rotation such that not more than 5 years elapse between consecutive examination of each part.

The Surveyor may extend the inspection at his discretion, to other items if the inspections carried out reveal any defects.

The agreement for surveys to be carried out on a continuous survey system basis may be withdrawn at the discretion of IRS or on the request of Owners.

Ships on continuous survey system are not exempt from other periodical survey requirements. For ships more than 10 years of age, the ballast tanks are to be internally examined twice in each five-year class period, i.e. once within the scope of the intermediate survey and once within the scope of the continuous system for the hull special survey.

Ships which have completed satisfactorily the Survey of all the items on such basis will have a record entered in the supplement to the Register Of Ships indicating the date of completion of the Survey.

6.4.1.9 The special survey is to include, in addition to the requirements of the Annual Survey, examination, tests and checks of sufficient extent to ensure that the hull, equipment and related piping as required in 6.4.4.2 and 6.4.4.3 are in satisfactory condition and that the ship is fit for its intended purpose for the new period of class of five years to be assigned subject to proper maintenance and operation and the periodical surveys being carried out at the due dates.

6.4.1.10 The examinations of the hull are to be supplemented by thickness measurements (See 6.4.8) and testing as deemed necessary, to ensure that the structural integrity remains effective. The aim of the examination is to discover substantial corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

6.4.1.11 A Docking Survey in accordance with the requirements of Sec.7 is to be carried out as part of the Special Survey. Any remaining work in respect of the overall and close-up surveys and thickness measurements, as applicable, of the lower portions of cargo holds and ballast tanks (i.e. parts below light ballast water line) are to be completed in dry dock.

6.4.2 Preparation for survey

6.4.2.1 The ship is to be prepared for overall survey in accordance with the requirements of Table 6.4.2.1. The preparation is to be of sufficient extent to facilitate an examination to ascertain any excessive corrosion, deformation, fractures, damages and other structural deterioration.

6.4.2.2 Prior to commencement of any part of the special survey, a survey planning meeting is to be held between the attending surveyor(s), the owner’s representative in attendance, the thickness measurement company representative and the master of the ship or an appropriately qualified representative appointed by the master or Company for the purpose to ascertain that all the arrangements envisaged in the survey programme are in place, so as to ensure the safe and efficient conduct of the survey work to be carried out.

Table 6.4.2.1 : Survey preparation

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) The holds, tween decks, deep tanks, peaks, bilges and drain wells, engine and boiler spaces, coal bunkers and other spaces are to be cleared out and cleaned as necessary for examination. Floor plates in engine and boiler spaces are to be lifted as may be necessary for examination of the structure underneath. Where necessary ceiling, lining, casings and loose insulation are to be removed as required by the Surveyor for examination of the structure. Compositions on the plating are to be examined and sounded, but need not be disturbed if found satisfactorily adhering to the plating.	1) Requirements of Special Survey I to be complied with	1) Requirements of Special Survey II to be complied with	1) Requirements of Special survey III to be complied with
2) In ships with single bottom, a sufficient amount of close ceiling is to be lifted to enable examination of the structure below. The ceilings to be lifted is to comprise of at least two strakes on each side of centreline fore and aft and one of these strakes is to be in way of the bilges	2) In ships having a single bottom, a sufficient amount of ceiling is to be lifted to allow the examination of the structure underneath. The lifting of the ceiling is to comprise of at least three strakes all fore and aft on each side and one such strake one each side to be in way of the bilges. Where the ceiling is fitted in hatches, the whole of the hatches and at least one strake of planks in way of the bilges on each side are to be lifted. If the Surveyor considers it necessary the whole of the ceiling and the limber boards are to be lifted	2) Ceiling in the holds is to be removed in order to ascertain that the steel work is in good condition, free from rust and coated. If the Surveyor is satisfied, after removal of portions of the ceiling, than it need not all be removed	2) Where holds are insulated for the purpose of carrying refrigerated cargoes, limbers and hatches are to be lifted and a sufficient additional amount of insulation is to be removed in each compartment to enable the Surveyor to ascertain the condition of the structure in way and to enable the thickness of the shell plating to be ascertained

Table 6.4.2.1 : (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
3) In ships having double bottom, a sufficient amount of ceiling is to be lifted from the tank top and the bilges to enable the condition of plating underneath to be ascertain. If the condition of the plating is found to be satisfactory, lifting of the remainder of the ceiling may be dispensed with. All bilges are to be cleaned for examination. Where the inner bottom plating is covered with cement or asphalt the removal of such covering may be dispensed with provided it is found to be adhering properly to the plating when carefully examined by hammering and chipping	3) In ships with double bottom, a sufficient amount of ceiling in the holds and other spaces is to be removed from the bilges and the inner bottom to enable the condition of the structure in the bilges, the inner bottom plating, pillar feet and the bottom plating of bulkheads and tunnel sides to be examined. If the Surveyor considers it necessary, the whole of the ceiling is to be removed	3) Portions of wood sheathing, or other covering, on steel decks are to be removed, as considered necessary by the Surveyor, in order to ascertain the condition of the plating	
4) Where holds are insulated for the carriage of refrigerated cargoes and the hull in way was examined by IRS Surveyors prior to the fitting of the insulation, it will be sufficient to remove the limbers and hatches for examination of the structure in way. In all other cases additional insulation will require to be removed as considered necessary to enable the Surveyor to satisfy himself regarding condition of the structure	4) The chain locker is to be cleaned internally. The chain cables are to be ranged for inspection. The anchors are to be cleaned and placed in an accessible position for inspection	4) Where the holds are insulated for the purpose of carrying refrigerated cargoes, the limbers and hatches are to be lifted and sufficient insulation is to be removed in each of the chambers to enable the Surveyor to satisfy himself of the condition of the framing and plating	
5) The steel work is to be exposed and cleaned as may be required for its proper examination by the Surveyor and close attention is to be paid to the parts of the structure which are particularly liable to excessive corrosion or to deterioration due to other causes			
6) All tanks are to be cleaned as necessary to permit examination required by Table 6.4.3.1			
7) Casings or covers of air, sounding, steam and other pipes, spar ceiling and lining in way of the side scuttles are to be removed, as required by the Surveyor			

Table 6.4.2.1 : (Contd.)			
Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
8) In refrigerated cargo spaces the condition of the coating behind the insulation is to be examined at representative locations. The examination may be limited to verification that the protective coating remains effective and that there are no visible structural defects. Where POOR coating condition is found, the examination is to be extended as deemed necessary by the Surveyor. The condition of the coating is to be reported. If indents, scratches, etc., are detected during surveys of shell plating from the outside, insulations in way are to be removed as required by the Surveyor, for further examination of the plating and adjacent frames.			

6.4.3 Space protection

6.4.3.1 For ballast tanks, excluding double bottom tanks, where a hard protective coating is found in POOR condition and it is not renewed or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, space in question is to be internally examined at annual surveys. Thickness measurements are to be carried out as deemed necessary by the Surveyor.

6.4.3.2 For double bottom ballast tanks where a hard protective coating is found in POOR condition and it has not been renewed or where soft or semi-hard coating has been applied, or where a hard protective coating was not applied from the time of construction, the spaces in question may be examined at Annual Surveys. When considered necessary by the surveyor, thickness measurements are to be carried out.

6.4.4 Survey and examination

6.4.4.1 All spaces within the hull and superstructure are to be examined.

6.4.4.2 All tanks are to be examined internally in accordance with the requirements of Table 6.4.4.1.

All bilge and ballast piping systems are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remain satisfactory.

6.4.4.3 For general dry cargo ships, the following requirements are also to be applied:

- An overall survey of all cargo holds, pipe tunnels, cofferdams and void spaces bounding cargo holds, decks and outer hull is to be carried out.

- All piping systems within the above spaces and in ballast tanks are to be examined and operationally tested to working pressure to attending Surveyor's satisfaction to ensure that tightness and condition remains satisfactory.

- The survey extent of ballast tanks converted to void spaces is to be based on the requirement for ballast tanks.

Table 6.4.4.1 : Requirements for internal examination of tanks

Tank	Special Survey No. I Age ≤ 5	Special Survey No. II 5 < Age ≤ 10	Special Survey No. III 10 < Age ≤ 15	Special Survey No. IV and subsequent Age > 15
Fuel oil bunker tanks - Engine room - Cargo area	 None None	 None One	 One Two	 One Half the number of tanks, minimum 2
Lub.oil	None	None	None	One
Fresh water	None	One	All	All
Water ballast	All	All	All	All

Notes:

1) These requirements apply to tanks of integral (structural) type.

2) If a selection of tanks is accepted to be examined, then different tanks are to be examined at each special survey, on a rotational basis.

3) Peak tanks (all uses) are subject to internal examination at each special survey.

4) At special survey No.III and subsequent special surveys one deep tank for fuel oil in the cargo area is to be included, if fitted.

6.4.4.4 All watertight bulkheads and watertight doors are to be examined.

6.4.4.5 All decks, casings and superstructures are to be examined. Attention is to be given to the corners of openings and other discontinuities in way of the strength decks and top sides.

Wooden decks or sheathings are to be examined and if decay or rot is found or the wood is excessively worn, the wood should be renewed.

Attention is to be given to the condition of the plating under wood decks, sheathing or other deck coverings. Removal of such coverings may be dispensed with if they are found to be sound and adhering satisfactorily to the plating.

6.4.4.6 Engine room structure is to be examined. Particular attention being given to tank tops, shell plating in way of tank tops, brackets connecting side shell frames and tank tops and engine room bulkheads in way of tank tops and bilge wells. Where excessive areas of wastage are found, thickness measurements are to be carried out and renewals or repairs made when wastage exceeds allowable limits.

6.4.4.7 The hand pumps and suctions, air and sounding pipes are to be examined. The Surveyors are to ensure that striking plates are fitted under the sounding pipes whilst examining the tanks internally.

For vessel other than passenger ships, automatic air pipe heads are to be internally examined at special surveys as indicated in Table 6.4.4.7. For designs where the inner parts cannot be properly inspected from outside, the head is to be removed from the air pipe. Particular attention is to be paid to the condition of the zinc coating in heads constructed from galvanised steel.

6.4.4.8 The steering gear, and its connections and control systems (main and alternative) are to be examined. The auxiliary steering gear with its various parts are to be examined in working condition.

Table 6.4.4.7 : Requirements for internal examination of automatic air pipe heads

Location	Special survey No.I Age ≤ 5	Special survey No.II 5 < Age ≤ 10	Special survey No.III and subsequent Age > 10
forward 0.25L	Two air pipe heads[1,2] one port and one starboard on exposed decks	All air pipe heads on exposed decks	All air pipe heads[3] on exposed decks
aft of 0.25L from the forward perpendicular	Two air pipe heads[1,2] one port and one starboard on exposed decks	At least 20% of air pipe heads[1,2] on exposed decks	

1. Preferably air pipes serving ballast tanks.
2. The selection of air pipe heads is to be made by the attending Surveyor. According to the results of the inspection, the Surveyor may require additional air pipe heads to be examined.
3. When there is substantiated evidence of replacement within the previous five years, individual air pipe heads may not be examined.

6.4.4.9 The Surveyor should satisfy himself regarding the efficient condition of the following :

- Means of escape from machinery spaces, crew and passenger spaces and spaces in which crew are normally employed;

- Means of communication between bridge and engine room and between bridge and alternative steering position;

- Helm indicator;

- Protection to the aft steering wheel and the gear.

6.4.4.10 The masts, standing rigging and anchors are to be examined.

The Surveyor should satisfy himself that there are sufficient mooring ropes on board and also that a tow line is provided when this is a Rule requirement.

6.4.4.11 The chain cables are to be ranged and the anchors and the chain cables are to be examined. At special survey no. II and subsequent special surveys, the chain cables are to be gauged. Any length of chain cable which is found to have reduced in mean diameter at its most worn part by more than 12 per cent of its original rule diameter is to be renewed.

6.4.4.12 The windlass is to be examined.

6.4.4.13 The chain locker, hold fasts, hawse pipes and chain stoppers are to be examined and pumping arrangements of the chain locker tested.

6.4.4.14 The loading instrument is to be checked for accuracy by applying test load conditions in presence of the Surveyor.

6.4.4.15 For single hold cargo ships which require fitment of hold water level detectors as per Pt.4, Ch.3, Sec.3.6, the special survey is to include an examination and a test of the water ingress detection system and their alarms.

6.4.4.16 Examination of accommodation ladders, gangways and their winches are to be carried out as required for annual surveys. In addition, the accommodation ladders and gangways are to be operationally, tested with the specified maximum operation load.

The tests are to be carried out with the load applied as uniformly as possible along the length of the accommodation ladder or gangway, at an angle of inclination corresponding to the maximum bending moment on the accommodation ladder or gangway.

Accommodation ladder winch is to be operationally tested at special surveys. The brake system of the winch is to be tested for holding the maximum operational load on the ladder.

For existing installations on board ships constructed prior to 01 Jan 2010 where the maximum operational load is not known, load nominated by the shipowner or operator may be considered as the test load.

6.4.5 Hatch covers and coamings

6.4.5.1 In addition to the requirements of annual survey, the following examination/testing is to be carried out:

a) checking of the satisfactory operation of the mechanically operated hatch covers:

   - stowage and securing in open condition;

   - proper fit, locking and efficiency in closed condition;

   - operational testing of hydraulic and power components, wires, chains and link drives.

b) checking the effectiveness of sealing arrangements of all hatch covers by hose testing or equivalent.

c) checking the residual thickness of coamings, steel pontoon or hatch cover plating and stiffening members as deemed necessary by the Surveyor.

For general dry cargo ships, close-up survey and thickness measurement of plating and stiffeners of hatch cover and coaming is to be carried out as required by Table 6.4.7.1 and Table 6.4.8.1b. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

6.4.6 Tank testing

6.4.6.1 Boundaries of double-bottom, deep, ballast, peak and other tanks, including holds adapted for the carriage of water ballast are to be tested with a head of liquid to the top of air pipes or to near the top of hatches for ballast/cargo holds. Boundaries of fuel oil, lub.oil and fresh water tanks are to be tested with a head of liquid to the highest point that liquid will rise under service conditions. Tank testing of fuel oil lub.oil and fresh water tanks may be specially considered based on a satisfactory external examination of the tank boundaries and a confirmation from the master stating that the pressure testing has been carried out according to the requirements with satisfactory results.

6.4.6.2 The Surveyor may extend the tank testing as may be necessary.

6.4.7 Close-up surveys of general dry cargo ships

6.4.7.1 The minimum requirements for close-up survey for general dry cargo ships are given in Table 6.4.7.1.

The surveyor may extend the close-up survey as deemed necessary taking into account the maintenance of the spaces under survey, the condition of the corrosion prevention system and where spaces have structural arrangements or details which have suffered defects in similar spaces or on similar ships according to available information.

6.4.7.2 For areas in tanks and cargo holds where coatings are found in GOOD condition, the extent of close-up examination may be specially considered.

Table 6.4.7.1 : Requirements of close-up survey – General dry cargo ships

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequent** **Age > 15**
(A) Selected shell frames in one forward and one aft cargo hold and associated tween deck spaces. (B) One selected cargo hold transverse bulkhead. (D) All cargo hold hatch covers and coamings (plating and stiffeners).	(A) Selected shell frames in all cargo holds and tween deck spaces. (B) One transverse bulkhead in each cargo hold. (B) Forward and aft transverse bulkhead in one side ballast tank, including stiffening system. (C)One transverse web with associated plating and framing in two representative ballast tanks of each type (i.e. topside, hopper side, side tank or double bottom tank). (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) Selected areas of all deck plating and underdeck structure inside line of hatch openings between cargo hold hatches. (F) Selected areas of inner bottom plating.	(A) All shell frames in the forward lower cargo hold and 25% frames in each of the remaining cargo holds and tween deck spaces including upper and lower end attachments and adjacent shell plating. (B) All cargo hold transverse bulkheads. (B) All transverse bulkheads in ballast tanks, including stiffening system. (C) All transverse webs with associated plating and framing in each ballast tank (D) All cargo hold hatch covers and coamings (plating and stiffeners). (E) All deck plating and underdeck structure inside line of hatch openings between cargo hold hatches. (F) All areas of inner bottom plating.	(A) All shell frames in all cargo holds and tween deck spaces including upper and lower end attachments and adjacent shell plating. Areas (B—F) as for Special Survey No.III

(A) Cargo hold transverse frames.

(B) Cargo hold transverse bulkhead plating, stiffeners and girders.

(C) Transverse web frame or watertight transverse bulkhead in ballast tanks.

(D) Cargo hold hatch covers and coamings. Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

(E) Deck plating and underdeck structure inside line of hatch openings between cargo hold hatches.

(F) Inner bottom plating.

Note : Close-up survey of cargo hold transverse bulkheads to carried out at the following levels:

- Immediately above the inner bottom and immediately above the tween decks, as applicable.
- Mid-height of the bulkheads for holds without tween decks.
- Immediately below the main deck plating and tween deck plating.

6.4.8 Thickness measurement

6.4.8.1 The minimum requirements for thickness measurement are given in Table 6.4.8.1a and Table 6.4.8.1b.

The Surveyor may extend the thickness measurements as deemed necessary.

Where thickness measurements indicate substantial corrosion, the number of thickness measurements are to be increased to determine the extent of substantial corrosion. Table 6.4.8.2 may be used as guidance for additional measurements.

Table 6.4.8.1a : Thickness measurement : General Ship Types (other than general dry cargo ships)

Special Survey No. I Age ≤ 5	**Special Survey No. II 5 < Age ≤ 10**	**Special Survey No. III 10 < Age ≤ 15**	**Special Survey No. IV and subsequently Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) One transverse section of deck plating in way of cargo space within the amidships 0.5L	2) Two transverse sections in way of cargo spaces within the amidships 0.5L	2) A minimum of three transverse sections in way of cargo spaces within the amidships 0.5L
		3) Internals in forepeak and after peak tanks	3) Internals in forepeak and after peak tanks
		4) All cargo hold hatch covers and coamings (plating and stiffeners)	4) All cargo hold hatch covers and coamings (plating and stiffeners)
			5) All exposed main deck plating full length
			6) Representative exposed superstructure deck plating (poop, bridge and forecastle deck)
			7) Lowest strake and strakes in way of tween decks of all transverse bulkheads in cargo spaces together with internals in way
			8) All wind and water strakes, port and starboard, full length
			9) All keel plates full length. Also additional bottom plates in way of cofferdams, machinery space and aft end of tanks
			10) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor

Table 6.4.8.1a - **Notes**:

1) Thickness measurement locations are to be selected to provide the best representative sampling of areas likely to be most exposed to corrosion considering cargo and ballast history and arrangement and condition of protective coatings.
2) Thickness measurements of internals may be specially considered by the Surveyor if the hard protective coating is in GOOD condition.
3) For ships less than 100 [m] in length, the number of transverse sections required at Special Survey No.III may be reduced to one (1) and the number of transverse sections required at Subsequent Special Surveys may be reduced to two (2).
4) For ships equal to or more than 100 [m] in length, at special survey No.III, additional thickness measurements of exposed main deck plating within amidship 0.5L may be required.
5) Close up survey/thickness measurement is to be carried out for accessible parts of hatch cover structures. For cargo hold hatch covers of approved design which have no access to internal structures, close up survey/thickness measurements of such inaccessible structural members need not be carried out.

Table 6.4.8.1b : Thickness measurement : General dry cargo ships

Special Survey No. I **Age ≤ 5**	**Special Survey No. II** **5 < Age ≤ 10**	**Special Survey No. III** **10 < Age ≤ 15**	**Special Survey No. IV and subsequently** **Age > 15**
1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel	1) Suspect areas throughout the vessel
	2) Within the cargo area: One transverse section of deck plating in way of cargo space within the amidships 0.5L	2) Within the cargo area: a) Two transverse sections within the amidships 0.5L in way of two different cargo spaces b) Each deck plate outside line of cargo hatch openings c) All wind and water strakes	2) Within the cargo area: a) A minimum of three transverse sections within the amidships 0.5L b) Each deck plate c) All wind and water strakes d) Each bottom plate, including lower turn of bilge. e) Duct keel or pipe tunnel plating and internals
	3) Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 6.4.7.1	3) Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 6.4.7.1	3) Measurement for general assessment and recording of corrosion pattern of those structural members subject to close-up survey according to Table 6.4.7.1
		4) Selected wind and water strakes outside the cargo length area	4) All wind and water strakes outside cargo area
		5) Internals in forepeak tank	5) Internals in forepeak tank
			6) All exposed main deck plating outside cargo area
			7) Representative exposed super structure deck plating (poop, bridge and fore castle deck)
			8) All keel plates, additional bottom plates in way of machinery space, aft end of tanks and cofferdams outside cargo area
			9) a) Plating of sea chests. b) Shell plating in way of overboard discharges as considered necessary by the Surveyor

Table 6.4.8.1b - **Notes**:

1. Thickness measurement locations should be selected to provide the best representative sampling of areas likely to be most exposed to corrosion, considering cargo and ballast history and arrangement and condition of protective coatings.
2. For ships less than 100 metres in length, the number of transverse sections required at Special Survey No. III may be reduced to one and the number of transverse sections at Special Survey No. IV and subsequent surveys may be reduced to two.

6.4.8.2 For general dry cargo ships, representative thickness measurement to determine both general and local levels of corrosion in the shell frames and their end attachments in all cargo holds and ballast tanks is to be carried out.
Thickness measurement is also to be carried out to determine the corrosion levels on the transverse bulkhead plating.

The thickness measurements may be dispensed with provided the surveyor is satisfied by the close-up examination, that there is no structural diminution and the hard protective coating where applied remains efficient.

6.4.8.3 For areas in tanks where coating are found to be in a GOOD condition, the extent of thickness measurements may be specially considered by the Surveyor.

6.4.8.4 Transverse sections are to be chosen where the largest reductions are suspected to occur or are revealed from deck plating measurements.

6.4.8.5 The thickness measurements are to be carried out by a qualified firm certified by IRS.

6.4.8.6 In order to ensure necessary control during the process of thickness measurements, these are normally to be carried out under the supervision of the Surveyor. The Surveyor has the right to re-check the measurements as deemed necessary to ensure acceptable accuracy.

Table 6.4.8.2 : Guidance for additional thickness measurements in way of substantial corrosion

Structural Member	Extent of Measurement	Pattern of Measurement
Plating	Suspect area and adjacent plates	5 point pattern over 1 square meter
Stiffeners	Suspect area	3 measurements each in line across web and flange

6.4.8.7 A thickness measurement report is to be prepared. The report is to give the location of measurements, the thickness measured as well as corresponding original thickness. Furthermore, the report is to give the date when the measurements were carried out, type of measurement equipment, names of personnel and their qualifications and has to be signed by the operator. The Surveyor is to review the report of the final thickness measurement after repairs have been carried out and countersign the cover page.

6.4.9 Reporting and evaluation of survey of general dry cargo ships

6.4.9.1 The data and information on the structural condition of the vessel collected during the survey is to be evaluated for acceptability and continued structural integrity of the vessel.

6.4.9.2 The survey report would be issued to the owner and the same along with a copy of the thickness measurement report, verified and countersigned by the surveyor, is to be placed on board the vessel for reference at future surveys.

6.4.10 Shell and inner doors of ro-ro ships

6.4.10.1 The special survey is to include, in addition to the requirements of the Annual Survey as required in 6.2.6, examination, tests and checks of sufficient extent to verify that the bow, inner, side shell and stern doors, are in satisfactory condition and considered able to remain in compliance with applicable requirements, subject to proper maintenance and operation in accordance with the Operation and Maintenance Manual (OMM) or manufacturer's recommendations and the periodical surveys being carried out at the due dates for the five year period until the next Special Survey.

6.4.10.2 The examinations of the doors are to be supplemented by thickness measurements and testing to verify compliance with applicable requirements so that the structural and weathertight integrity remain effective. The aim of the examination is to identify corrosion, significant deformation, fractures, damages or other structural deterioration, that may be present.

6.4.10.3 The bow, inner, side shell and stern doors are to be surveyed as follows:

i) A survey of the items listed in 6.2.6.4, including close-up survey of securing, supporting and locking devices, together with welding, according to Table 6.2.6.4.

ii) Non-destructive testing and thickness measurements are to be carried out on securing, supporting and locking devices, including welding, to the extent considered necessary by the Surveyor. Whenever a crack is found, an examination with NDT is to be carried out in the surrounding area and for similar items as considered necessary by the Surveyor.

iii) The maximum thickness diminution of hinging arms, securing, supporting and locking devices is not to be more than 15% of the as-built thickness, in general.

iv) Effectiveness of sealing arrangements is to be verified by hose testing or equivalent.

v) Clearances of hinges, bearings and thrust bearings are to be taken. Unless otherwise specified in the OMM or by manufacturer's recommendation, the measurement of clearances on ro-ro cargo ships may be limited to representative bearings where dismantling is needed in order to measure the clearances.
If dismantling is carried out, a visual examination of hinge pins and bearings together with NDT of the hinge pin is to be carried out.

vi) The non-return valves of the drainage system are to be dismantled and examined.

6.4.11 For general dry cargo ships compliance with new IACS requirements for strength of air pipes, ventilators and their closing devices and of small hatches and their securing devices is to be achieved as indicated in 2.4.13.

6.5 Special surveys - Machinery

6.5.1 Requirements for examination of machinery and piping at special survey are given in Sec.8.

Section 7

Docking Surveys

7.1 General

7.1.1 The requirements for docking survey intervals are given in Table 1.1.1. Attention should also be given to any relevant statutory requirements of the National Authority of the country in which the ship is registered.

An extension of examination of the ship's bottom of 3 months beyond the due date can be granted in exceptional circumstances due to any of the following reasons:

a) Non-availability of drydocking facilities, repair facilities, essential materials, equipment or spare parts.

b) Delays incurred by action taken to avoid severe weather conditions or delays caused by severe weather conditions.

7.1.2 The ship is to be placed on blocks of sufficient height in a drydock or on a slipway and proper staging is to be erected as may be necessary. Shell plating, stern frame or stern post, rudder and sea inlet and discharge openings are to be examined. Particular attention is to be given to the bilge keels and their connection to the bilge strake, shell plating in way of side, bow and stern doors, ash shoots, and other openings and to parts of the structure particularly liable to excessive corrosion or to deterioration from causes such as chafing and lying on the ground and to any undue unfairness of the bottom plating. Important plate unfairness or other deterioration which do not necessitate immediate repairs are to be recorded.

Visible parts of rudder, rudder pintles, rudder shafts and couplings are to be examined. The clearances in the rudder bearings are to be ascertained. The rudder is to be lifted for examination of the pintles, if considered necessary by the Surveyor. Where applicable, pressure test of the rudder may be required as considered necessary by the Surveyor.

7.1.3 When the chain cables are ranged the anchors and cables should be examined by the Surveyor.

7.1.4 Sea chests and their gratings, sea connections and overboard discharge valves and cocks and their fastenings to the hull or sea chests are to be examined. Valves and cocks need not be opened up more than once in a special survey period unless considered necessary by the Surveyor.

7.1.5 The Surveyor should examine the ship so far as is practicable in order to satisfy himself as to her general condition.

7.1.6 The propeller should be examined for erosion, pitting, cracking of blades or possible contact damage. The clearance in the stern bush should be measured. In the case of approved oil glands, measurements by poker gauges or other devices for ascertaining the stern bush weardown may be accepted, provided the sealing arrangements appear satisfactory.

7.1.7 For controllable pitch propellers, the Surveyor is to be satisfied with the fastenings and tightness of hub and blade sealing. Dismantling need not be carried out unless considered necessary by the Surveyor.

7.1.8 Exposed parts of side thrusters are to be examined. Propulsion systems which also have maneuvering characteristics(such as directional propellers, vertical axis propellers, water jets) are to be examined externally with focus on the condition of gear housing, propeller blades, bolt locking and other fastening arrangements. Sealing arrangement of propeller blades, propeller shaft and steering column is to be verified.

7.2 In-water surveys

7.2.1 Eligibility

7.2.1.1 For ships less than 15 years in age the examination of the outside of ship's bottom and related items of ships may be carried out while the ship is afloat (inwater survey) in lieu of the required intermediate docking between special surveys provided following conditions are satisfied.

a) The ship has been assigned the class notation INWATER SURVEY as defined in Ch.1. However, on application by the owner and in special circumstances, such inwater survey may be considered for ships not assigned with the class notation INWATER SURVEY.

b) The ship does not have any outstanding recommendations which require repair work in dry dock to the underwater part of the shell plating, the rudder, the propeller or the propeller shaft.

7.2.1.2 Acceptance of inwater surveys as above may be specially considered for ships other than bulk carriers, oil tankers and chemical tankers which are 15 years of age and over.

7.2.2 Requirements for assignment of INWATER SURVEY notation

7.2.2.1 Detailed plans of the hull and hull attachments below the water line are to be submitted to IRS in triplicate for approval. These plans are to indicate the location and/or the general arrangement of:

- all shell openings
- stem
- rudder and fittings
- sternpost
- propeller, including the means used for identifying each blade
- anodes, including securing arrangements
- bilge keels
- welded seams and butts.

The plans are also to include the necessary instructions to facilitate the divers' work, especially for taking clearance measurements.

7.2.2.2 The plans for approval are also to include the procedure for measurement or verification, as the case may be, of the following:

- rudder pintle/bush clearance
- stern bush clearance
- pintle securing arrangement in the socket.

7.2.2.3 As far as practicable, a photographic documentation, used as a reference during the in-water surveys, of the following hull parts is to be submitted to IRS:

- propeller boss
- rudder pintles, where slack is measured
- typical connections to the sea
- directional propellers, if any
- other details, as deemed necessary by IRS on a case by case basis.

7.2.2.4 The Owner is to put on board the ship the plans and documents given in 7.2.2.1 and 7.2.2.2 and they are to be made available to the Surveyor and the divers when an in-water survey is carried out.

7.2.2.5 Protection for the underwater portion of the hull is to be provided by means of a suitable coating of adequate thickness to last more than the scheduled intervals between consecutive dry dockings and applied in accordance with the Manufacturer's recommendations.

7.2.3 Survey requirements

7.2.3.1 The in-water survey is to provide all the information normally obtained from a docking survey. However, special consideration may be given to ascertaining rudder bearing clearances and stern bush clearances of oil stern bearings based on a review of the operating history, on board testing and stern tube oil sample reports. These details are to be included in the proposals for in-water surveys which are to be submitted in advance of the survey so that satisfactory arrangements can be agreed with IRS.

7.2.3.2 The in-water survey is to be carried out with the ship in as light condition as possible in sheltered water preferably with weak tidal streams and currents. The in-water visibility and the cleanliness of the hull below the waterline is to be good enough to permit a meaningful examination which allows the Surveyor and diver to determine the condition of the plating, appendages and the welding. IRS is to be satisfied with the methods of orientation of the divers on the plating, which should make use where necessary of permanent markings on the plating at selected points.

7.2.3.3 The in-water survey is to be carried out by a person who is a skilled diver and trained to carry out in-water survey, or a qualified diver under surveillance of a Surveyor. The diver has to be employed by a firm approved by IRS.

The equipment, procedure for observing and reporting the survey are to be discussed with the parties involved prior to the in-water survey and suitable time is to be allowed to enable the diving company to test all equipment beforehand.

7.2.3.4 When professional divers are employed, the Surveyor is to be satisfied with the method of pictorial representation, and a good two-way communication between the Surveyor and divers is to be provided.

7.2.3.5 If the in-water survey reveals damage or a deterioration that requires early attention, the Surveyor may require that the ship to be drydocked in order that a detailed survey can be undertaken and the necessary repairs carried out.

7.2.3.6 The condition of the coating is to be confirmed at every drydocking for continuance of the INWATER SURVEY notation.

Section 8

Machinery - Special Surveys

8.1 General

8.1.1 Special surveys are to be carried out at 5 years intervals to renew the Class Certificate.

The first Special survey is to be completed within 5 years from the initial classification survey and thereafter 5 years from the assigned date of the previous special survey. However, an extension of class of 3 months maximum beyond the 5th year can be granted in exceptional circumstances.

In this case, the next period of class will start from the expiry date of the special survey before the extension was granted.

8.1.2 For surveys completed within 3 months before the expiry date of the special survey, the next period of class will start from the expiry date of the special survey. For surveys completed more than 3 months before the expiry date of the special survey, the period of class will start from the survey completion date. In cases where the vessel has been laid up or has been out of service for a considerable period because of a major repair or modification and the owner elects to only carry out the overdue surveys, the next period of class will start from the expiry date of the special survey. If the owner elects to carry out the next due special survey, the period of class will start from the survey completion date.

Any requirement of the Flag Administration in this regard is also to be complied with.

8.1.3 The special survey may be commenced at the 4th annual survey and be progressed with a view to completion by the 5th anniversary date. When the special survey is commenced prior to the 4th annual survey, the entire survey is to be completed within 15 months if such work is to be credited to the special survey.

8.1.4 Upon satisfactory completion of the Machinery Special Survey an appropriate record will be entered in the supplement of register of ships.

8.1.5 Further parts of machinery may require to be opened should any defects be found during the course of Survey of any item and the defects made good to the satisfaction of the Surveyor.

8.1.6 As part of the Special Survey of Machinery, a dock trial is to be carried out to attending Surveyor's satisfaction to confirm satisfactory operation of main and auxiliary machinery. If significant repairs are carried out to main or auxiliary machinery or steering gear, consideration should be given to a sea trial to attending Surveyor's satisfaction.

8.2 Continuous survey of machinery (CSM)

8.2.1 At the request of the Owners and upon approval of the proposed arrangement a system of continuous Survey of Machinery (CSM) may be undertaken whereby the requirements of Special Survey of machinery are completed within a five year period. The Survey cycle should be such as would ensure that the interval between consecutive examination of each item does not exceed five years and it is expected that approximately an equal proportion of the machinery would be subjected for Survey each year.

8.2.2 Upon satisfactory completion of the continuous Machinery Survey cycle, a record indicating the date of completion of the cycle will be shown in the supplement to the Register Of Ships.

8.3 Survey requirements: Auxiliary engines

8.3.1 All auxiliary engines driving the generators and other essential machinery together with their coolers and attached pumps are to be opened up and examined as considered necessary by the Surveyor. Alarms and safety devices fitted on these units are to be included in this Survey.

8.4 Survey requirements: Air compressors, receivers and starting air pipes

8.4.1 All air receivers and other pressure vessels for essential services together with their mountings and safety devices are to be cleaned internally and examined internally and externally. If an internal examination of an air receiver is not practicable it is to be tested hydraulically to 1.3 times the working pressure.

8.4.2 Air compressors are to be opened up and coolers tested as considered necessary by the Surveyor. Selected pipes in the starting air systems are to be removed for internal examination and hammer tested. If an appreciable amount of lubricating oil is found in the pipes the starting air system is to be thoroughly cleaned by steaming or other suitable means. Some of the pipes selected are to be those adjacent to the starting air valves at the cylinders and to the discharges from the air compressors.

8.5 Survey requirements: Fresh water generators and evaporators

8.5.1 To the extent applicable, these are to be opened up and examined. After such Survey their relief valves are to be checked under working conditions, where practicable.

8.6 Survey requirements: Fuel tanks

8.6.1 Fuel tanks which do not form part of the ship's structure are to be examined externally and, if considered necessary by the Surveyor also internally. All mountings, fittings and remote control devices are to be examined as far as practicable. All such tanks are to be tested by filling to maximum working level.

8.7 Survey requirements: Pumps, heat exchangers, forced draught fans, etc.

8.7.1 All pumps, heat exchangers, forced draught fans, etc. used for essential purposes are to be opened up and examined as considered necessary by the Surveyor.

8.8 Survey requirements: Pumping and piping system

8.8.1 The valves, cocks and strainers of the bilge system including bilge injection are to be opened up as considered necessary by the Surveyor and, together with pipes, are to be examined and tested under working conditions. If non-return valves are fitted in hold bilges, these be opened up for examination.

8.8.2 The oil fuel, feed and lubricating systems and ballast connections and blanking arrangements to deep tanks which may carry liquid or dry cargoes, together with all pressure filters, heaters and coolers used for essential service, are to be opened up and examined or tested as considered necessary by the Surveyor. All safety devices for the foregoing are to be examined.

8.8.3 Non-metallic expansion joints in piping systems, if located in system which penetrates the ship's side and both the penetration and the non-metallic expansion joint are located below the deepest load waterline, are to be examined and replaced as necessary or at an interval recommended by the manufacturer.

8.9 Survey requirements: Reduction gears, flexible couplings and clutch arrangements

8.9.1 Reduction gears, flexible couplings and clutch arrangements are to be opened as considered by the Surveyor in order to permit the examination of the gears, gear teeth, spiders, pinions, shafts and bearings, reversing gears, etc. Essential parts of other power transmission arrangements are to be opened up and examined as considered necessary by the Surveyor.

8.10 Survey requirements: Securing arrangements

8.10.1 Holding down bolts and chocks of main and auxiliary engines, gear cases, thrust blocks and tunnel bearings are to be checked.

8.11 Survey requirements: Shafting

8.11.1 Intermediate shafts and bearings, thrust bearings and their seating are to be examined. The lower halves of bearings need not be exposed if alignment and wear are found acceptable.

8.12 Survey requirements: Sea connections

8.12.1 All openings to the sea including sanitary and other overboard discharges in the machinery spaces and pump rooms together with valves and cocks are to be examined internally and externally. The fastenings of valves and cocks to the hull are to be examined and are to be renewed when considered necessary by the Surveyor. Particular attention is to be given to the sea suctions and sea water cooling pipes.

8.13 Survey requirements: Windlass and steering machinery

8.13.1 These are to be examined to ascertain that they are in good working order. Any relief valves fitted are to be included in the above examination.

8.14 Survey requirements: Internal combustion engines for propulsion

8.14.1 All working parts of the engines and their attached pumps are to be opened and examined. These should include all cylinders, cylinder heads, valves and valve gear, pistons, piston rods, cross heads, guides, connecting rods, crankshafts, vibration dampers and all bearings, camshafts and driving gear, fuel pumps and fittings, scavenge pumps, scavenge blowers and their prime movers, superchargers, air compressors, inter coolers, clutches, reverse gears, crankcase door fastenings and explosion relief devices and such other parts of the machinery as may be considered necessary. Integral piping systems are to be examined. The maneuvering of engines is to be tested under working condition.

8.15 Survey requirements: Steam turbines for propulsion

8.15.1 Upper halves of turbine casings are to be opened up rotors to be lifted up and inside of casings, rotors and bearings (including thrust) and governors to be examined.

8.15.2 At the first Special Periodical Survey only, for vessels having more than one main propulsion ahead turbine with emergency steam crossover arrangement, the turbine casings need not be opened provided approved vibration indicators and rotor position indicators are fitted and that the Surveyor considers the operating records to be satisfactory. An operational test of the turbines may be required if considered necessary by the Surveyor.

8.15.3 Essential valves attached to the turbines and flexible couplings are to be examined. The maneuvering of the turbines is to be tested under working conditions.

8.15.4 Exhaust steam turbines supplying power for main propulsion purposes in conjunction with reciprocating engines together with their gearing and appliances, steam compressors or electrical machinery are to be examined as far as practicable. Where cone connections to internal gear shafts are fitted, the coned ends are to be examined as far as practicable. The maneuvering of engines is to be tested under working conditions.

8.16 Survey requirements: Steam reciprocating engines for propulsion

8.16.1 Working parts of main engines and attached pumps including bulkhead stop valves, maneuvering valves, cylinders, pistons, valves and valve gear, piston rods, connecting rods, crankshaft and bearings and governor are to be opened up and examined. The maneuvering of engines is to be tested under working conditions.

8.17 Survey requirements: Gas turbines and free piston gas generators for propulsion

8.17.1 The Survey should include opening and examination of the following parts :-

- The blading, rotors, and casings of the turbines, the impellers or blading, rotors and casing of air compressors, the combustion chambers, burners, inter coolers, heat exchangers, gas and air pressure piping and fittings and reversing arrangements. When gas turbines operate in conjunction with free piston gas generators, the following parts of the free piston gas generators are to be opened and examined: the gas and air compressor cylinders and pistons and the compressor end covers, the valves and valve gear, fuel pumps and fittings, synchronising and control gear, cooling system explosion relief devices, gas and air piping, receivers and valves including by-pass. The maneuvering of engines is to be tested under working conditions.

8.18 Survey requirements: Unattended machinery spaces/Remote control systems

8.18.1 Where remote and/or automatic controls such as bridge controls, bilge controls and bilge level alarms, local hand controls, fire detection and prevention, alarms warning systems and shut-offs, electric supply, main controls station, are fitted for essential machinery, they are to be examined and tested to demonstrate that they are in good working order.

8.18.2 During such trials the proper operation of the safety devices will be checked, in particular, such as emergency stops, emergency astern movement, standby control of the propelling gear, fire alarm.

8.18.3 The log recording the operating conditions should be checked. If such scrutiny reveals that certain portion of the automated equipment has behaved abnormally the cause of such failure is to be investigated and appropriate remedies determined.

8.19 Survey requirements : Electrical equipment survey

8.19.1 Electrical installations including auxiliary and emergency equipment are to be examined in accordance with the following during each Survey cycle.

8.19.2 Switch boards (including for emergency use) and their accessories including section-boards and sub-division fuse boards are to be examined as far as possible and over current protective devices and fuses inspected to verify that they provide suitable protection for their respective circuits.

8.19.3 All generator circuit breakers are to be tested, as far as practicable, to verify that the protective devices including preference tripping relays, if fitted, operate satisfactorily. The generators are to be run under load either separately or in parallel, and the governing of the engines to be tested.

8.19.4 The insulation resistance of cables, switch gear, generators, motors, heaters, lighting and other fittings is to be tested and should not be less than 100,000 ohms between all insulated circuits and earth. The installation may be subdivided to any desired extent by opening switches, removing fuses or disconnecting appliances for the purpose of this test.

The electric cables are to be examined as far as possible without undue disturbance of fixtures or casings unless deemed necessary by the Surveyor.

8.19.5 Transformers are to be examined. Samples of oil are to be taken and tested for breakdown voltage, acidity and moisture in case of oil immersed transformers or electrical apparatus associated with supplies to essential services. The testing is to be carried out by a competent testing authority and a certificate giving the test results is to be furnished to the Surveyor.

8.19.6 Motors used for essential services including their starters are to be examined, and under working conditions if considered necessary by the Surveyors.

8.19.7 Generators and steering gear motors are to be examined under working conditions. Air gaps are to be checked for excessive wear down.

8.19.8 In the case of electromagnetic couplings, the air gaps are to be measured and reported and any excessive eccentricity corrected. Switch gear and couplings for same are to be examined and tested.

8.19.9 The emergency source of power and its associated circuits are to be tested. In the case of passenger ships, the temporary source of power and its automatic arrangements (if fitted) are also to be tested.

8.19.10 Navigation light indicators are to be tried under working conditions, and correct operation on the failure of supply or failure of navigation lights verified.

8.19.11 In tankers, a General examination of electrical equipment located in dangerous zones and spaces is to be made to ensure that the integrity of the safe type electrical equipment has not been impaired owing to corrosion, missing bolts, etc. Cable runs are to be examined for sheath and armouring defects, where practicable, and to ensure that the means of supporting the cable are in good order. Tests are to be carried out to demonstrate the effectiveness of earth bonding straps. Alarms and interlocks associated with pressurized equipment or spaces are to tested for correct operation.

Insulation resistance is to be measured for circuits terminating in, or passing through dangerous zones or spaces.

8.20 Survey requirements : Electrical propelling machinery

8.20.1 On ships which are electrically propelled, the main propulsion motors, generators, cables, together with all ancillary electrical gear, exciters and ventilating plant (including coolers) are to be examined and their insulation resistance to earth to be measured. Protective gear and alarm devices are to be checked as far as practicable and special attention should be given to windings, commutators and slip rings. Safety interlocks intended to prevent unsafe operation or unauthorised access are to be checked to verify that they are functioning correctly. Emergency over speed governors are to be tested. Where insulating oil is used, samples of oil are to be taken and tested for breakdown voltage, acidity and moisture by a competent testing authority and a certificate giving the test results is to be furnished to the Surveyor.

8.21 In service testing of large permanently installed breathing gas containers onboard diving vessels - Special Requirements

8.21.1 At the first special survey, following is to be carried out:

- External and internal survey, by intrascope if necessary.

- If internal survey is not possible or if corrosion or other items of concern are found, hydraulic test to 1.25 x design pressure to be carried out.

At subsequent special surveys, following to be carried out:

- External and internal survey, by intrascope if necessary.

- Hydraulic test to 1.25 x design pressure.

Section 9

Boiler Surveys

9.1 General

9.1.1 All main and auxiliary boilers, exhaust gas steam generators and economisers are to be surveyed at intervals specified in Sec.1 of this Chapter. An extension of examination of the boiler of up to 3 months beyond the due date can be granted in exceptional circumstances. “Exceptional Circumstances” means unavailability of repair facilities, unavailability of essential materials, equipment or spare parts, or delays incurred by action taken to avoid severe weather conditions.

9.1.2 At each Survey, the boilers, superheaters, economisers, air heaters, desuperheaters, and other equipment are to be examined internally (water/steam side) and externally (fire side) as considered necessary.

In exhaust gas heated economizers of the shell type, all accessible welded joints are to be subjected to a visual examination for detection of cracks. Nondestructive testing may be required for this purpose.

9.1.3 Boiler safety valve and its relieving gear are to be examined and tested to verify satisfactory operation. The adjustment of the safety valves is to be verified during each boiler internal survey. Safety valves are to be adjusted to a pressure not greater than 3 percent of the approved working pressure.

9.1.4 Review of the following records since the last boiler survey is to be carried out as part of the survey:

a) Operation
b) Maintenance
c) Repair history
d) Feed water chemistry

9.1.5 External survey of boilers including test of safety and protective devices and test of safety valve using its relieving gear, is to be carried out annually, within the window of the Annual Survey of a ship. For exhaust gas heated economizers, the safety valves are to be tested by the Chief Engineer at sea within the annual survey window. This test is to be recorded in the log book for review by the attending Surveyor prior to crediting the Annual Survey of Machinery.

9.1.6 Principal boiler mountings and safety valves are to be examined at each Survey. The remaining mountings are to be opened if considered necessary by the Surveyor. Manhole and hand hole doors, are to be examined to ensure that the joining faces are in good condition and that the clearances at the spigot are satisfactory.

9.1.7 In case where it is considered necessary, the parts subjected to pressure are to be hydraulically tested and the thickness of plates and size of stays ascertained to determine the safe working pressure. Collision chocks, rolling stays and boiler stools are to be examined and maintained in efficient condition. The shell plating in way of welded lugs or fabricated feet are to be carefully examined at each Survey. Insulation and sheathing in way are to be removed as considered necessary for this purpose.

In fired boilers employing forced circulation the pumps used for this purpose are to be opened and examined at each boiler Survey.

9.1.8 The proper operation of the water level indicators are to be confirmed at each Survey. The oil fuel burning system is to be examined under working conditions and a general examination made of the fuel tank valves, pipe, deck control gear and oil discharge pipes between pumps and burners.

GUIDANCE :

Every effort should be made to complete the boiler Survey once it has been commenced at the same port if possible or immediately afterwards on the first occasion when steam is raised.

9.1.9 An extension of survey may be granted by IRS, on the basis of 9.1.1, after the following is satisfactorily carried out:

a) External examination of the boiler

b) Boiler safety valve relieving gear (easing gear) is examined and operationally tested.

c) Boiler protective devices operationally tested.

d) Review of the records since the last boiler survey as mentioned in 9.1.4.

9.2 Steam heated steam generator

9.2.1 Steam heated steam generators are to be surveyed at two and half yearly intervals.

9.2.2 At each steam heated steam generator survey the mountings and the safety valves are to be examined. Manhole and hand hole doors are to be examined to ensure that joining faces are in good condition and that the clearances at the spigot are satisfactory.

9.2.3 Where it is considered necessary, parts subjected to pressure are to be hydraulically tested and the thickness of plates and the sizes of stays ascertained to determine the safe working pressure.

9.2.4 The proper operation of the water level indicators is to be confirmed at each Survey. The safety valves of the steam heated steam generator are to be adjusted to a pressure not greater than 3 per cent above the approved working pressure.

Section 10

Steam Pipes Surveys

10.1 General

10.1.1 Steam pipes are to be surveyed at intervals specified in Sec.1 of this Chapter.

10.1.2 At each Survey a selected number of main and auxiliary steam pipes over 75 [mm] bore supplying steam for essential services are to be examined internally and tested hydraulically to 1.5 times the working pressure. If these are found satisfactory, the remaining need not be tested. In cases of pipes having welded joints, the lagging in way of the welds is to be removed and the welds examined and if considered necessary crack detected.

10.2 Cylindrical boilers having smoke tube superheaters

10.2.1 Where the saturated steam pipes adjoining the saturated steam headers are situated partly in the boiler smoke boxes, all such pipes adjoining and cross connecting these headers in the smoke boxes are required to be included in the pipes required for examination and testing for the steam pipe Survey.

10.3 Copper pipes

10.3.1 At 10 years from the date of build, or of installation and thereafter at 5 yearly intervals, all copper pipes over 75 [mm] bore and supplying steam for essential services at sea are to be hydraulically tested to twice the working pressure. Pipes which are subjected to bending and/or vibration are to be annealed before testing.

Section 11

Surveys of Propeller Shafts, Tube Shafts and Propellers

11.1 General

11.1.1 At shaft surveys, propeller shafts and tube shafts, if any, are to be sufficiently drawn to permit entire examination at intervals as detailed in Sec.1 of this Chapter.

Unless alternative means are provided to ensure the condition of the propeller shaft assembly, these requirements apply to all vessels with conventional shafting fitted with a propeller as follows:

.1 from 1 Jan 2016 for ships delivered on or after 1 Jan 2016;

.2 after the first shaft survey scheduled on or after 1 Jan 2016, for ships delivered before 1 Jan 2016. Upon completion of the first shaft survey scheduled on or after 1 Jan 2016, the designation of dates for the next shaft survey is to be made based on the requirements in this section.

11.1.2 For the purpose of these requirements, the following definitions are applicable:

.1 Shaft is a general definition that could mean :

- Propeller shaft
- Tube shaft

The definition does not include the intermediate shaft(s) which is (are) considered part of the propulsion shafting inside the vessel.

.2 *Propeller Shaft.* Propeller shaft is the part of the propulsion shaft to which the propeller is fitted. It may also be called screwshaft or tailshaft. Where a separate tube shaft is not fitted, the propeller shaft runs through the stern tube and is connected to the intermediate shaft within the ship. In this case, only the propeller shaft and intermediate shaft are fitted and there is no tube shaft.

.3 *Tube Shaft.* Tube shaft is a shaft placed between the intermediate shaft and propeller shaft, normally arranged within a stern tube or running in open water. It may also be called Stern Tube Shaft.

.4 *Stern Tube*. Tube or pipe fitted in the shell of a ship at the stern (or rear part of the ship), below the water-line, through which passes the tube shaft or the propeller-shaft. Stern tube is the housing of the shaft bearings, generally two (one aft and one fore), that sustain the shaft and allows its rotation with less frictional resistance. The stern tube also accommodates the shaft sealing arrangement.

.5 *Close Loop (system) Oil Lubricated Bearing*. Closed loop oil lubricating systems use oil to lubricate the bearings and are sealed against the environment (seawater) by adequate sealing / gland devices.

.6 *Water Lubricated Bearing*. Water lubricated bearings are bearings cooled / lubricated by water (fresh or salt).

.7 *Closed Loop System Fresh Water Lubricated Bearing*. Closed loop water lubricating systems use fresh water to lubricate the bearings and are sealed against the environment (such as seawater) by adequate sealing / gland devices.

.8 *Open Systems (water)*. Open water lubricating systems use water to lubricate the bearings and are exposed to the environment.

.9 *Adequate means for protection against corrosion*. An adequate means for protection against corrosion is an approved means for full protection of the core shaft against sea water intrusion and subsequent corrosion attack. Such means are used for the protection of common steel material against corrosion particularly in combination with water lubricated bearings. Typical means are for example:

- continuous metallic, corrosion resistant liners,
- continuous cladding,
- multiple layer synthetic coating,
- multiple layer of fiberglass,
- combinations of above mentioned,
- rubber / elastomer covering coating.

The means for protection against corrosion are installed / applied according to IRS approved procedures.

.10 *Corrosion Resistant Shaft*. Corrosion resistant shaft is made in approved corrosion resistant steel as core material for the shaft.

.11 *Sterntube Sealing System*. Sterntube sealing system is the equipment installed on the inboard extremity and, for closed systems, at outboard extremity of the sterntube.

Inboard Seal is the device fitted on the fore part of the sterntube that achieve the sealing against the possible leakage of the lubricant media in to the ship internal.
Outboard seal is the device fitted on the aft part of the sterntube that achieve the sealing against the possible sea water ingress and the leakage of the lubricant media.

.12 *Service Records*. Service records are regularly recorded data showing in-service conditions of the shaft(s) and may include, as applicable: lubricating oil temperature, bearing temperature and oil consumption records (for oil lubricated bearings) or water flow, water temperature, salinity, pH, make-up water and water pressure (for closed loop fresh water lubricated bearings depending on design).

.13 *Oil sample examination*. An oil sample examination is a visual examination of the stern tube lubricating oil taken in presence of the surveyor with a focus on water contamination.

.14 *Lubricating oil analysis*. Lubricating oil analysis is to be carried out at regular intervals not exceeding six (6) months. The documentation on lubricating oil analysis is to be available on board.

Oil samples, to be submitted for the analysis, are to be taken under service conditions.

.15 *Fresh water sample test*. Fresh water sample test is to be carried out at regular intervals not exceeding six (6) months
Samples are to be taken under service conditions and are to be representative of the water circulating within the sterntube. Analysis results are to be retained on board and made available to the surveyor. At time of survey the sample for the test is to be taken in the presence of the surveyor.

Fresh water sample test is to include the following parameters:

- chlorides content,
- pH value,
- presence of bearing particles or other particles (only for laboratory analysis, not required for tests carried out in presence of the surveyor).

.16 *Keyless Connection*. Keyless connection is the forced coupling methodology between the shaft and the propeller without a key achieved through interference fit of the propeller boss on the shaft tapered end.

.17 *Keyed Connection*. Keyed connection is the forced coupling methodology between the shaft and the propeller with a key and keyway achieved through the interference fit of the propeller boss on the shaft tapered end.

.18 *Flanged Connection.* Flanged connection is the coupling methodology, between the shaft and the propeller, achieved by a flange, built in at the shaft aft end, bolted to propeller boss.

.19 *Alternative Means*. Alternative means are shafting arrangements with configuration other than those described in these requirements.

11.2 Oil Lubricated Shafts or Closed Loop System Fresh Water Lubricated Shafts (Closed System)

11.2.1 Shaft Survey Methods

11.2.1.1 **METHOD 1**

.1 The survey is to consist of:

- Drawing the shaft and examining the entire shaft, seals system and bearings;

- For keyed and keyless connections:

  - Removing the propeller to expose the forward end of the taper,

  - Performing a non-destructive examination (NDE) by an approved surface crack-detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted).
    For shaft provided with liners the NDE is to extend to the after edge of the liner.

- For flanged connection:

  - Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection method.

- Checking and recording the bearing clearances;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Verification of the satisfactory conditions of inboard and outboard seals during the re-installation of the shaft and propeller;

- Recording the bearing wear down measurements (after re-installation)

11.2.1.2 **METHOD 2**

.1 The following are to be verified and found satisfactory as a pre-requisite for application of Method 2:

- Review of service records;

- Review of test records of:

  - Lubricating Oil analysis (for oil lubricated shafts), or

  - Fresh water sample test (for closed system fresh water lubricated shafts);

- Oil sample examination (for oil lubricated shafts), or fresh water sample test (for closed system fresh water lubricated);

- Verification that there are no repairs by grinding or welding of shaft and/or propeller.

.2 The survey is to consist of:

- For keyed and keyless connections:

  - Removing the propeller to expose the forward end of the taper;
  - Performing a non-destructive examination (NDE) by an approved surface crack-detection Method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted).

- For flanged connection:

  - Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of a an approved surface crack detection Method.

- Checking and recording the bearing wear down measurements;

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Seal liner found to be or placed in a satisfactory condition;

- Verification of the satisfactory re-installation of the propeller including verification of satisfactory conditions of inboard and outboard seals.

11.2.1.3 **METHOD 3**

.1 The pre-requisites for application of Method 3, are the same as those given in 11.2.1.2.1

.2 The survey is to consist of

- Checking and recording the bearing wear down measurements;

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damage which may cause the propeller to be out of balance;

- Seal liner found to be or placed in a satisfactory condition;

- Verification of the satisfactory conditions of inboard and outboard seals.

11.2.2 Shaft Extension Surveys – Extension Types

11.2.2.1 *Extension up to 2.5 years*

.1 In addition to the pre-requisites listed in 11.2.1.2.1, the Chief Engineer is to confirm that the shafting arrangement is in good working condition, for extension up to 2.5 years to be applied.

.2 The survey is to consist of:

- Checking and recording the bearing wear down measurements, as far as practicable;
- Visual inspection of all accessible parts of the shafting system;
- Verification that the propeller is free of damages which may cause the propeller to be out of balance;
- Verification of the effectiveness of inboard seal and outboard seals.

11.2.2.2 *Extension up to 1 year*

.1 In addition to the pre-requisites listed in 11.2.2.1.1, the previous wear down and/ or clearance recordings are also to be reviewed, for extension up to 1 year to be applied.

.2 The survey is to consist of:

- Visual inspection of all accessible parts of the shafting system;
- Verification that the propeller is free of damage which may cause the propeller to be out of balance;
- Verification of the effectiveness of inboard seal and outboard seals.

11.2.2.3 *Extension up to 3 months*

.1 The pre-requisites listed in 11.2.2.2.1 above are to be verified and found satisfactory for extension up to 3 months to be applied.

.2 The survey is to consist of:

- Visual inspection of all accessible parts of the shafting system;

- Verification of the effectiveness of the inboard seal.

11.2.3 Methods for oil lubricated shafts and fresh water lubricated shafts (closed loop systems) and shaft survey intervals.

Details of the applicable methods for flanged propeller connection, keyless propeller connection and keyed propeller connection and survey intervals are listed in Table 11.2.3.The types of survey extensions applicable, are also listed in Table 11.2.3.

Table 11.2.3 Survey Intervals (Closed Systems)

Oil Lubricated [Survey Notation SH (OL)]			
	Flanged Propeller Coupling	Keyless Propeller Coupling	Keyed Propeller Coupling[c]
Every five years[a]	Method 1 or Method 2 or Method 3	Method 1 or Method 2 or Method 3[d]	Method 1 or Method 2
Extension 2.5 Y[b]	Yes[e]	Yes[e]	Yes[e]
Extension 1 Y[b]	Yes[f]	Yes[f]	Yes[f]
Extension 3 M[d]	Yes[g]	Yes[g]	Yes[g]
Fresh Water Lubricated [Survey Notation SH (FW-C)]			
	Flanged Propeller Coupling	Keyless Propeller Coupling	Keyed Propeller Coupling[c]
Every five years[a]	Method 1[h] or Method 2 or Method 3	Method 1[h] or Method 2 or Method 3	Method 1[h] or Method 2
Extension 2.5 Y[b]	Yes[e]	Yes[e]	Yes[e]
Extension 1 Y[b]	Yes[f]	Yes[f]	Yes[f]
Extension 3 M[d]	Yes[g]	Yes[g]	Yes[g]

General Notes :

For surveys (Method 1, or Method 2, or Method 3) completed within 3 months before the shaft survey due date, the next period is to start from the shaft survey due date.

The extension survey is normally to be carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension counts from the date on which the extension survey was completed.

Methods 1, 2 & 3 are described in 11.2.1.1, 11.2.1.2 and 11.2.1.3 respectively. The pre-requisites for each Method are to be satisfactorily verified, prior surveys.

Survey methods 1, 2 and 3 would normally require drydocking of the vessel. Extension surveys may be carried out without dry-docking by in water surveys.

Notes to Table 11.2.3

a) Unless an Extension type (Extension 2.5 Y, Extension 1 Y, Extension 3 M) is applied in between.

b) Only one Extension type can be applied in between of two Methods (Extension 2.5 Y, or Extension 1 Y) except for what concerns the Extension 3 M (see further note g).

c) Method 3 is not allowed.

d) Maximum of two consecutive Method 3 surveys. The maximum interval between two surveys carried out according to Method 1 or Method 2 is not to exceed 15 years, except in the case when one extension for no more than three months is granted.

e) No more than one extension can be granted. No further extension of other type can be granted.

f) No more than two consecutive "one year extensions" can be granted. No further extension of other type can be granted.

g) No more than one "three months extension" can be granted. In the event an additional extension is requested, the requirements of "one year extension" are to be carried out and the shaft survey due date prior to the previous extension is to be extended for a maximum of one year.

h) The maximum interval between two surveys carried out according to Method 1 is not to be more than 15 years. An extension for no more than three months can be granted.

11.3 Water Lubricated Shafts (Open Systems)

11.3.1 Shaft Survey Methods

11.3.1.1 **METHOD 4**

The survey is to consist of

- Drawing the shaft and examining the entire shaft (including liners, corrosion protection system and stress reducing features, where provided), inboard seal system and bearings.

- For keyed and keyless connections:

- removing the propeller to expose the forward end of the taper,

- performing a non-destructive examination (NDE) by an approved surface crack detection method all around the shaft in way of the forward portion of the taper section, including the keyway (if fitted). For shaft provided with liners the NDE is to be extended to the after edge of the liner

- For flanged connection:

- Whenever the coupling bolts of any type of flange-connected shaft are removed or the flange radius is made accessible in connection with overhaul, repairs or when deemed necessary by the surveyor, the coupling bolts and flange radius are to be examined by means of an approved surface crack detection method.

- Checking and recording the bearing clearances.

- Verification that the propeller is free of damage which may cause the propeller to be out of balance.

- Verification of the satisfactory conditions of inboard seal during re-installation of the shaft and propeller.

11.3.2 Shaft Extension Surveys – Extension Types

11.3.2.1 *Extension up to 1 year*

.1 Pre-requisites to be verified and found satisfactory in order to apply extension up to 1 year are as follows:

- Review of the previous clearance recordings;

- Service records;

- Verification that there are no repairs by grinding or welding of shaft and/or propeller;

- Confirmation from the Chief Engineer that the shafting arrangement is in good working condition.

.2 The survey is to consist of:

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damages which may cause the propeller to be out of balance;

- Checking and recording the clearances of bearing;

- Verification of the effectiveness of the inboard seal.

11.3.2.2 *Extension up to 3 months*

.1 The pre-requisites listed in 11.3.2.1.1 are to be satisfactorily verified, for extension up to 3 months to be applied.

.2 The survey is to consist of:

- Visual Inspection of all accessible parts of the shafting system;

- Verification that the propeller is free of damage which may cause the propeller to be out of balance;

- Verification of the effectiveness of the inboard seal.

11.3.3 Methods for water lubricated shafts (open loop systems) and shaft survey intervals, along with applicable details are given in Table 11.3.3.

11.3.3.1 For single shaft operating exclusively in fresh water, single shaft provided with adequate means of corrosion protection, corrosion resistant shafts and multiple shaft arrangements; survey intervals up to 5 years may be allowed. Applicable details along with maximum permissible survey intervals are given in Table 11.3.3.

11.3.3.2 Shaft arrangements, other than the configurations listed in 11.3.3.1, are to be surveyed according to Method 4, every 3 years. Applicable details along with maximum permissible survey intervals are also given in Table11.3.3.

Table 11.3.3 Survey Intervals (Open Systems)

Single shaft operating exclusively in fresh water [Survey Notation SH (S-FW-O)] **Single shaft provided with adequate means of corrosion protection, single corrosion resistant shaft** [Survey Notation SH (S-CP-O)] **All kinds of multiple shaft configurations** [Survey Notation SH (M-O)]		**Other Shaft Configurations** [Survey Notation SH (S-O)]	
All kinds of propeller couplings[d]			
Every five years[a]	Method 4	Every three years[a]	Method 4
Extension 1 Y	Yes[b]	Extension 1 Y	Yes[b]
Extension 3 M	Yes[c]	Extension 3 M	Yes[c]

General Notes :

For surveys (Method 4) completed within 3 months before the shaft survey due date, the next period will start from the shaft survey due date.

The extension survey is to be normally carried out within 1 month of the shaft survey due date and the extension counts from the shaft survey due date. If the extension survey is carried out more than 1 month prior to the shaft survey due date, then the period of extension is to count from the date on which the extension survey was completed.

Method 4 is described in 11.3.1.1. The pre-requisites for the Method are to be satisfactorily verified, prior survey.

Survey method 4 would normally require dry docking of the vessel. Extension surveys may be carried out without dry-docking by in water surveys.

In case of multiple shaft configurations, if there is a failure to one shaft system, vessel is to be dry-docked for carrying out surveys of all shaft systems, and repairs as necessary.

Notes :

a) Unless an Extension type (Extension 1 Y, Extension 3 M) is applied in between.

b) No more than one extension can be granted. No further extension, of other type, can be granted.

c) No more than one extension can be granted. In the event an additional extension is requested the requirements of the one year extension are to be carried out and the shaft survey due date prior to the previous extension is to be extended for a maximum of one year.

d) For keyless propeller connections the maximum interval between two consecutive dismantling and verifications of the shaft cone by means of non-destructive examination (NDE) is not to exceed 15 years

11.4 Steerable and azimuth thrusters

The survey is to normally comprise of examination of the following:

a) Exposed parts including attachment to the hull.

b) The following items upon removal of propeller:

   - propeller shaft threaded end and nut;
   - cone, key and keyway including examination by an efficient crack detection method of fore part of the shaft cone;
   - sealing glands.

c) Lubricating oil analysis (to include wear particle analysis) records to detect possible wear of internal gears and bearings.

d) Internal gears and control gears as far as practicable through hand holes or limited opening of controlling device.

If the above checks are not satisfactory, complete dismantling of the internal parts may be required.

11.5 Vertical axis propellers

The survey is to normally comprise of examination of the following:

a) Exposed parts.

b) Tightness of the oil glands and the backlash of the gears from outside by action on the blades.

c) Gears, as far as practicable through hand holes and observation ports.

d) Control gear for proper functioning.

e) Lubricating oil analysis (to include wear particle analysis) records to detect possible wear of internal gears and bearings.

If the above checks are not satisfactory, complete dismantling of the internal parts may be required.

11.6 Water jet systems

The survey is to normally comprise of examination of the following:

a) Impeller, shaft and bearing clearances.

b) Sealing glands.

c) Nozzle assembly.

d) Control and reversing gear.

e) Suction grids.

If the above checks are not satisfactory further dismantling may be required.

11.7 Controllable pitch propellers

Where controllable pitch propellers are fitted, in addition to the survey requirements of the shafts, the working parts and control gear are to be opened up sufficiently to enable Surveyors to examine them at each shaft survey. The survey is to include the following:

a) Analysis of hydraulic oil including wear particle analysis.

b) Propeller blades and hub including crack detection of blade root, flange and blade securing arrangements.

c) Examination of seals, carrier bearings, crank pin ring, fillets, blade openings in the boss and blade bolts, upon removal of at lest one blade.

d) Examination of distribution box seal and bearings.

e) Verification upon re-assembly of, servomechanism and hydraulic test of hub and hydraulic piping including pitch controls together with limit stops.

Section 12

Surveys of Inert Gas Systems

12.1 General

12.1.1 Inert gas systems installed on board ships intended for the carriage of oil or liquid chemicals in bulk or liquefied gases are to be surveyed periodically as detailed in Sec.1 of this Chapter.

12.2 Annual surveys

12.2.1 Following are to be examined at each Annual Survey:

a) external examination of the condition of all piping and components for signs of corrosion or gas/effluent leakage.

b) verification of the proper operation of both inert gas blowers.

c) checking the operation of scrubber room ventilation system.

d) checking of deck water seal for automatic filling and draining and checking for the presence of water carry over and checking the condition of non-return valve.

e) examination of the operation of all remotely or automatically operated valves and, in particular, the flue gas isolating valve(s).

f) checking the interlocking feature of soot blowers.

g) checking that the gas pressure regulation valve automatically closes when the inert gas blowers are secured.

h) checking as far as practicable, the following alarms and safety devices of the inert gas systems using simulated conditions where necessary:

- high oxygen content of gas in the inert gas main;
- low gas pressure in the inert gas main;
- low pressure in the supply to the deck water seal;
- high temperature of gas in the inert gas main;
- low water pressure to the scrubber;
- accuracy of portable and fixed oxygen measuring equipment by means of calibration gas;
- high water level in scrubber;
- failure of the inert gas blowers;
- failure of the power supply to the automatic control system for the gas regulating valve and to the instrumentation for continuous indication and permanent recording of pressure and oxygen content in the inert gas main;
- high pressure of gas in the inert gas main.
- Surveys carried out by the National Authority of the country in which the ship is registered would normally be accepted as meeting these requirements, at the discretion of the Surveyor.

12.2.2 Checking when practicable, the proper operation of the inert gas system on completion of the checks listed in 12.2.1 h).

12.3 Special surveys

12.3.1 At each Special Survey of the inert gas system, the inert gas generator, scrubber and blower are to be opened out as considered necessary and examined. Gas distribution lines and shut off valves, including soot blower interlocking devices are to be examined as considered necessary. The deck seal and non-return valve is to be examined. Cooling water systems including the effluent piping and overboard discharge from scrubbers are to be examined. All automatic shut down devices and alarms are to be tested. The complete installation is to be tested under working conditions on completion of Survey.

12.3.2 When, at the request of an Owner, it has been agreed by IRS that Complete Survey of the inert gas system may be carried out on the continuous basis, the various items of the system are to be opened up for survey in rotation, so far as practicable, to ensure that the interval between consecutive examinations of each item will not exceed five years. In general one-fifth of the machinery is to be examined each year.

12.3.3 If any examination during Continuous Survey reveals defects, further parts are to be opened up and examined as considered necessary by the Surveyor, and the defects are to be made good to his satisfaction.

Section 13

Surveys of Vessels with Refrigerated Cargo Installations

13.1 General

13.1.1 Refrigerated Cargo Installation, on ships which have been assigned the character HY, are to be surveyed periodically as indicated in Sec.1 of this Chapter.

13.1.2 Where a Refrigerated Cargo Installation holds dual classification with IRS, additional Periodical Survey requirements, if any, of the corresponding Society would also be applicable.

13.2 Periodical surveys

13.2.1 A Special Survey is to be held at 5 yearly intervals. When due to special circumstances a Special Survey is commenced prior to its due date, the Survey is to be completed within a period not exceeding 9 months and not later than the expiry date of the classification certificate including any postponement that may be granted by IRS.

13.2.2 If a vessel at the time classification certificate expires is not in a port in which it is to be surveyed, IRS may upon Owners request extend the validity of the classification certificate for a period not exceeding 3 months. Such requests will only be considered to enable the vessel to complete its voyage to the port of survey and only in cases where it is considered proper and reasonable to do so.

13.3 Continuous special survey of refrigerating installation

13.3.1 At the request of the Owners and upon receipt of a satisfactory proposed arrangement, IRS may give consideration to a system of Continuous Survey of refrigerating installation (CS HY) being carried out whereby the requirements of Special Surveys as detailed in 13.5 and 13.6 are completed within a five year period. In such case the various items of machinery should be opened out for Survey in rotation, so far as practicable, to ensure that the interval between consecutive examination of each item does not exceed five years and it is expected that approximately an equal proportion of the surveyable items would be subjected to Survey each year.

13.3.2 In case any defects are revealed during these examinations, further parts may have to be opened up as considered necessary by the Surveyor.

13.4 Annual survey requirements

13.4.1 Log Books or other records are to be examined to ascertain that the installation has been working satisfactorily. Any indications of breakdowns or defects, during the previous 12 months, are to be noted and reported. Whenever possible, an examination of the refrigerating plant is to be made upon arrival of the ship at the port of discharge before refrigerated cargo is unloaded.

13.4.2 Refrigerated chambers/holds are to be examined after careful cleaning. A detailed examination is to be made of these spaces. For this purpose, removable panels and covers are to be removed and if appropriate, spot checks of the insulation are to be carried out for condition and shrinkage. If there is trace of damp or leakage of the insulation from whatever source (fuel tank, pipe work, pipe coils, scuppers, etc.) or any trace of deterioration in the insulation or its lining, of the air ducts or air coolers, a more thorough examination is to be made and necessary measures taken to correct the defects thus ascertained.

13.4.3 Where the cargo is refrigerated by circulating air, the proper air tightness of the air ducts, air cooler casings, hatch covers, doors, butterfly dampers in ventilation ducts is to be checked. The insulation of the lining joints should also be carefully checked.

13.4.4 The bilges are to be cleaned and suction pipes, sounding pipes and scupper non-return valves examined. The Surveyor should satisfy himself that all scuppers draining the chambers and cooler trays are in good working order.

13.4.5 Air cooler coils, cooling grids and valves are to be examined and the Surveyor should satisfy himself that no pipe is partially or completely choked and that the valves are in good working order.

13.4.6 Brine coils are to be examined whilst under a pressure of 1.5 times working pressure or 3 bar whichever is greater.

13.4.7 Primary refrigerant cooler coils and grids are to be examined whilst under the refrigerant pressure prevailing in the system at the time of the Survey with the plant at rest and the regulating valves opened just sufficient to obtain an approximate balance of pressure throughout the system and to avoid accumulation of liquid in the coils or grids.

13.4.8 The shells of condensers, evaporators, separators, receivers, and other pressure vessels are to be examined as far as practicable. Any evidence of excessive corrosion of water end covers of "shell and tube" and "double-pipe" type condensers is to be investigated.

13.4.9 Primary refrigerant gas and liquid pipes, condenser cooling water piping and valves are to be examined as far as possible.

13.4.10 Any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or other parts mentioned, is to be investigated and necessary measures are to be taken to correct the defects thus ascertained.

13.4.11 A general examination is to be made of the fans, their motors, control gear and the insulation resistance is to be measured. The insulation resistance is not to be less than 100,000 ohms. The generating plant supplying electric power is to be examined generally with a view to ascertaining that the plant is being efficiently maintained.

13.4.12 The thermometers for measuring the chamber air suction and air delivery temperatures are to be examined. If repairs and renewals are carried out, the thermometers are afterwards to be checked for accuracy.

13.4.13 A Survey book or other permanent record is to be kept on board the ship to show the date of examination of various parts. This is to be available to the Surveyor at all times and is to be signed by the Surveyor on each occasion after the Survey.

13.5 Requirements of first special survey

13.5.1 Each reciprocating compressor, including those provided for sub- cooling the primary refrigerant, is to be opened up. Cylinder bores, pistons, piston rods, connecting rods, valves and seats, glands, relief devices, suction filters and lubricating arrangements are to be examined. Crankshafts are to be examined, but crankcase glands and the lower halves of main bearings need not be exposed if the Surveyor is satisfied as to alignment and wear.

13.5.2 For screw-type compressors, the period before opening up may be extended to 6 years or 25000 running hours, whichever is the earlier.

13.5.3 Where there is a programme of replacement instead of Surveys on board, alternative Survey arrangements will be considered. Each case will be given individual consideration.

13.5.4 Refrigerant condenser cooling water pumps, including standby pump(s) which may be used on other services, are to be opened up and their working parts exposed.

13.5.5 Brine and primary refrigerant pumps are to be opened up and their working parts exposed. Special consideration will be given to Survey requirements for primary refrigerant pumps of the hermetically sealed type.

13.5.6 The water end covers of "shell and tube" and "double-pipe" type condensers are to be removed for examination of the tubes, tube plates and covers.

13.5.7 The shells and connections of "shell-and-tube" and "double-pipe" type condensers and evaporators, separators, receivers, driers, filters and other pressure vessels, and the coil terminals of "coil-in-casing" type condensers and evaporators, are to be examined as far as practicable.

13.5.8 In the case of pressure vessels covered by insulation, any evidence of dampness or deterioration of the insulation which could lead to external corrosion of the vessels or their connections is to be investigated.

13.5.9 Sufficient insulation is to be stripped from insulated pressure vessels to allow the condition of the vessels and their connections to be ascertained. Care is to be taken that in replacement of the insulation, the vapour sealing of the outer covering is made good.

13.5.10 Sufficient insulation is to be stripped from pipes carrying the refrigerant at various points of the system both outside and inside the insulated chambers to permit the condition of the pipes to be ascertained. Sections of piping exposed are to include locations where lengths of piping have been connected by screwed couplings or butt welding. Care is to be taken that when ungalvanized portions of the piping in way of joints have been exposed they be suitably coated and taped, after pressure testing, to prevent corrosion. On replacement of the insulation, the vapour sealing of the outer covering is to be made good.

13.5.11 The Surveyor is to satisfy himself that all pressure relief valves and/or safety discs throughout the refrigerating plant are in good order. However, no attempt is to be made to test primary refrigerant pressure relief valves on board ship.

13.5.12 Sea connections to refrigerant condensers cooling water pumps are to be opened up on the occasion of the hull and/or main machinery Special Survey.

13.5.13 The electric motors driving refrigerant compressors, pumps and fans, together with their control gear and cables, are to have their insulation resistance tested and this is to be not less than100000 ohms between all insulated circuits and earth. The installation may be subdivided to any desired extent by opening switches, removing fuses or disconnecting appliances for the purpose of this test.

13.5.14 The fittings on switchboards and Section boards are to be examined, and over-current protective devices and fuses are to be inspected to verify that they provide suitable protection for their respective circuits.

13.5.15 Any arrangements fitted to disconnect automatically the excess non- essential load when the electrical generators are overloaded are to be examined to ascertain that the circuits for cargo refrigerating machinery are included in the last group to be disconnected.

13.5.16 All automatic controls and alarms are to be tested.

13.5.17 Sufficient air trunking and insulation lining is to be stripped from the chamber's overhead and vertical surfaces to allow the condition of the insulation, insulation linings, grounds, supports, hangers and fixtures which support the insulation, grids, meat rails, etc., to be ascertained. Care is to be taken that on replacement the ducts and linings are sealed against air blowing into the insulation, or against moisture ingress from refrigerated cell or space atmosphere.

13.5.18 Sufficient tank top insulation is to be stripped to allow the condition of the grounds and inner insulation lining to be ascertained.

13.5.19 Due consideration is to be given to the type of insulation used in the holds and chambers when determining the amount of insulation lining to be removed as detailed in 13.5.17 and 13.5.18. Where organic foam insulants have been used, including foamed "in situ", or other insulants in slab form, the Surveyor should use his discretion regarding the removal of linings if he is able to satisfy himself that the condition of the insulation is good by means of test bore holes.

13.5.20 Under normal circumstances, the condition of hold and chamber insulation, grounds, etc., can be ascertained when the Special Survey of the ship's steel structure is being held.

13.5.21 Arrangements made for defrosting air coolers, and for draining condensate from trays below coolers, are to be examined to ascertain that they are in working order.

13.5.22 Any air refreshing arrangements are to be examined.

13.6 Subsequent special surveys

13.6.1 In addition to the requirements for first Special Survey the following items, as mentioned in Table 13.6.1, are to be tested and examined.

13.7 Loading port surveys

13.7.1 Where the Owner or his authorised representative requests for a Loading Port Survey, a Survey as detailed below is to be carried out at the Loading Port.

13.7.2 In the case of ships engaged on voyages of less than two months duration, a loading port certificate will be considered as valid for two months, provided the cargoes carried are of such a nature as not to damage the insulation or appliances in the insulated chambers, nor to affect by taint or mould the refrigerated cargoes loaded during that period.

13.7.3 If a vessel loads at more than one port, Loading Port Survey at the first Loading Port would only be required provided all the chambers which are intended to be loaded with refrigerated cargo during the voyage are offered for examination and no general cargo is subsequently loaded in these chambers prior to loading of refrigerated cargo.

13.7.4 The refrigerated cargo spaces are to be examined in an empty state prior to loading the cargo. The Surveyor is to satisfy himself that the spaces are clean and free from odour which may adversely affect the cargo to be loaded.

The brine or other refrigerant pipe grids, cooler coils and connections should show no trace of leakage. The Surveyor should also satisfy himself that the fixed cargo battens on the vertical surfaces are in good order, that cargo gratings or dunnage battens are provided for the floors or decks and that no damage has been sustained to the insulation or its lining prior to the loading of the refrigerated cargo.

13.7.5 Any indication of defective insulation not considered to warrant immediate attention should be noted and specially reported.

13.7.6 The scuppers and bilges in the refrigerated cargo spaces are to be clean and dry and the liquid seals should be primed.

13.7.7 The Surveyor will check whether the entire refrigerated cargo installation operates satisfactorily and he will record the temperatures in the cargo spaces.

13.7.8 The proper operation of air duct couplings for connecting refrigerated containers on the ship's own refrigerating installation has to be checked. If refrigerated containers are coupled to the air ducts during the on board Survey, the tight sealing effect of the couplings is also to be checked.

13.7.9 It is to be clearly understood that the certificate issued for the carrying out of a Loading Port Survey is not in respect of the cargo to be loaded or the manner in which it is to be stowed.

Table 13.6.1 : The requirements of special surveys

Item	Dichlorodifluoro-methane (R12)	Ammonia (NH_3) or Monochlorodifluoro-methane R22)	Carbondioxide (CO_2)
"Shell and tube" type gas condensers or gas evaporators (brine coolers) (primary refrigerant in the shell)	7 bar	14 bar	-
	Water or brine end covers to be removed and shell pneumatically tested with the refrigerant or air or a mixture of inert gas and refrigerant to the above pressures		
"Coil in casing" type gas condensers	17 bar	70 bar	140 bar
	Where it is impracticable to remove the coils they may be examined and tested in place		
"Coil in casing" type gas evaporators (brine coolers)	14 bar	35 bar	105 bar
	Where it is impracticable to remove the coils they may be examined and tested in place		
Primary refrigerant chamber grids or air cooler coils	7 bar	10 bar	70 bar
"Shell and tube" type gas evaporators (brine coolers) (brine is in the shell)	Primary refrigerant end covers are to be removed and tested		
	Shell to be hydraulically tested to twice the design pressure but not less than 3 bar		

Section 14

Planned Maintenance System

14.1 General

14.1.1 An approved Planned Maintenance System on board a ship may be accepted in lieu of the regular surveys by IRS Surveyors on CSM basis provided the requirements of this section are complied with.

Any item not covered by PMS is to be surveyed and credited in the usual way. In general the intervals for PMS is not to exceed those specified for CSM survey. PMS is to be programmed and maintained by a computerised system.

14.1.2 A vessel complying with the requirements of section will be assigned the PMS survey notation.

14.1.3 The survey system (PMS) is to be approved by IRS before being implemented. When the system is implemented machinery inspection may be based on calendar or running hours calling for items to be opened for inspection and overhaul at specified periods, or the machinery may be monitored for condition and performance whereby items need only be opened for examination when readings indicate a deterioration. Schemes could be made up of a combination of two or more methods of maintenance control, such as:

- A switchboard is surveyed based on regular 5 yearly intervals.

- A diesel engine is surveyed based on running hours.

- A lubricating oil pump is surveyed based on calendar interval.

- A steam turbine driven pump may be surveyed based on condition monitoring.

14.1.4 When certain machinery and components are approved under PMS for condition monitoring and when their condition and performance is within acceptable limits, no overhaul is necessary, unless otherwise specified by the manufacturer.

14.1.5 Other items of machinery and components, which are not subjected to an approved condition monitoring system and part of PMS are required to be surveyed at intervals not greater than those specified for CSM.

14.1.6 Chief Engineer of the vessel will be responsible and in-charge of PMS and is to be approved by IRS as per Pt.1, Ch.2, 1.4.3.

14.1.7 The survey of machinery and components (defined at 14.2) & covered by the PMS may be carried out by the Chief Engineer. Survey of machinery and components defined in 14.3 is not eligible to be surveyed by the Chief Engineer.

14.1.8 At the time of the Annual Classification Survey an audit of the planned maintenance system will be carried out to ensure that the system is being correctly operated in accordance with the conditions of approval.

14.1.9 When the annual audit is held, a confirmatory survey will be carried out for those items to be credited which have been examined by the Chief Engineer under the planned maintenance system during the preceding year.

14.2 Machinery acceptable for survey by Chief Engineers under Planned Maintenance System

14.2.1 The following machinery may be surveyed by the Chief Engineer under PMS:

- Main engine cylinder covers.
- Main engine valves and valve gears.
- Main engine cylinder liners.
- Main engine pistons and piston rods.
- Main engine connecting rods, crossheads, top end bearings, guides, gudgeon pins and bushes.
- Main engine crankshafts and bearings (multiple engine installations only).

- Main engine fuel injection pumps and fuel booster pumps.
- M.E. Scavenge pumps, blowers and air coolers.
- Main engine detuners, dampers and balancer units.
- Main engine camshaft and camshaft drive.
- Main propulsion steam turbines (casing, rotor and blading) at alternate surveys provided the monitoring defined in 14.8.1.2 is provided and vibration measurements and full power trials are carried out at the time of the survey in the presence of a Surveyor.
- M.E. driven pumps, e.g. bilge, lubricating oil, cooling water.
- Independently driven pumps and associated motors and cables where insulation resistance readings are supplied e.g. bilge, ballast, fresh water cooling, sea water cooling, lubricating oil, oil fuel transfer.
- M.E. fresh water and lubricating oil coolers.
- Low pressure heaters used in fuel oil systems of internal combustion engines
- Main and auxiliary condensers/drain coolers.
- Air compressors including their safety devices.
- Windlass and windlass machinery.
- Forced or induced draught fans.
- Auxiliary oil and steam engines including their coolers and pumps (provided the number of generating sets is such that all services essential to the propulsion and safety of the ship, also the preservation of refrigerated cargo, can be supplied when any two sets are not working. One of these sets can be overhauled while the other remains as "stand-by").
- Intermediate shafts.
- Main engine thrust bearing.

Note : In cases where torsional vibration characteristics indicate that there is no susceptibility to damage as a result of uneven firing and the condition monitoring equipment defined in 14.8.1.1 is installed, a special arrangement may be granted whereby the Chief Engineer is permitted to survey the main engine crankshafts and bearings on single engine installations provided a modified confirmatory survey is carried out by IRS Surveyors at the time of the annual audit as follows:

- Check condition-monitoring records. (See 14.8.1.1)
- Check bearing clearances where possible.
- Check for signs of wiped or broken white metal in crankcase.
- Check witness marks of shrink fits.

- Check bed plate structure inside and outside.
- Obtain Chief Engineer's statements regarding crankpins, journals and bearings.

Ships fitted with Approved Inert Gas Systems

- Scrubber units
- Blowers
- Independent gas generators.

14.3 Machinery not acceptable for Survey by Chief Engineers

- Main engine crankshaft and bearings in single engine installations where special requirements in 14.2.1 are not complied with
- Reduction/increase gearing, flexible couplings and clutches.
- Holding down bolts and chocks
- Crankcase doors, crankcase and scavenge relief devices
- Boilers and all other pressure vessels
- Boiler fuel oil heaters
- Steam pipes and starting air pipes
- Maneuvering valves and bulkhead stop valves
- Steering machinery
- Pumping arrangements for Bilge/Ballast/ Fuel Oil/Fresh Water/Sea water/Lub.Oil/ Fire
- Electrical equipment other than that defined in 14.2.1
- Propellers
- Screwshafts
- Sea connections
- M.E. controls, bridge, centralised or automatic and controls in unmanned machinery spaces
- Engine trial
- First start arrangements trial.

Ships fitted with Approved Inert Gas Systems

- All other I.G. system components not listed in 14.2.1.

14.4 System Administration

14.4.1 The Owner is to make a formal request to IRS providing the documentation and information detailed in 14.4.2 below for approval of the system.

14.4.2 The documentation and information to be submitted is to include the following:

a) A description of the system and its application onboard and organizational interface identifying the areas of responsibility ashore and the people responsible for the PMS onboard.

b) The list of items of machinery, equipment and components to be considered for inclusion in the PMS. The list is to be same in terms of description and identification with the identification system adopted by IRS.

c) Time schedules and scope of the maintenance procedures for each item listed in b), including acceptable limit conditions of the parameters to be monitored on items of opened up machinery, based on the manufacturer's recommendations or recognized standards. These are to be laid down in appropriate PMS sheets.

d) For machinery identified to be maintained under condition monitoring, maintenance and condition monitoring methods to be used, the time intervals for monitoring and maintenance of each item, the original reference data where applicable, the list and specifications of the condition monitoring equipment.

   The acceptable limits of deteriorated condition should be stated and these are to be derived from manufacturer’s recommendations, applicable severity criteria as defined in applicable Standards, or the Owners requirements when these are more severe.

e) The documentation flow and filing procedure.

This is to include a system for reporting to Owners, records to be maintained onboard and at Owner's head quarters.

f) A list of all personnel likely to be in-charge of the PMS system.

14.4.3 Computerized system requirement

14.4.3.1 The access to and updating the maintenance documentation and the maintenance program is to be permitted by the Chief Engineer or other authorized person only.

14.4.3.2 The system is to be suitably protected by suitable password access w.r.t. alterations to maintenance schedules, list of items under PMS and noting of damages.

14.4.3.3 The computerized system is to include a backup procedure, which is activated at regular intervals.

14.4.3.4 The functional applications of these computerized systems are to be approved by IRS.

14.4.4 Information to be available onboard.

a) All the documentation listed in 14.4.2, duly updated.

b) Maintenance instructions for each machinery, as applicable (supplied by the manufacturer or the shipyard).

c) The condition monitoring data including all data since last opening of the machinery and where applicable the original reference data.

d) Reference documentation (trend investigation procedures etc.).

e) The records of the maintenance performed, including conditions found, repairs and renewals carried out.

14.5 System Implementation

14.5.1 After the PMS documentation has been approved, a confirmation survey is to be carried out by IRS Surveyors.

14.5.2 Upon successful completion of the Confirmatory Survey, the PMS is considered approved and the survey notation PMS is assigned to the vessel and entered in the Register of Ships.

14.5.3 The PMS is retained throughout the class period of the vessel provided that :

a) An annual report covering the year's service is submitted to IRS detailing the list of items of machinery and components which were subjected to preventive maintenance in the period under review, together with preventive maintenance sheets, the condition monitoring data including all data since last dismantling and any changes to PMS documentation.

b) An annual audit of the PMS is carried out.

c) Any change to the PMS is submitted to IRS for approval.

14.5.4 The survey agreement for machinery according to PMS will be withdrawn by IRS if the PMS is not satisfactorily operated in terms of improperly maintained records or unsatisfactory condition of machinery or failure to observe the agreed intervals between overhauls.

14.5.5 The Owner may discontinue the PMS at any time by informing IRS in writing. In such a case the items that have been inspected under the PMS since last annual audit may be credited for IRS records at the discretion of the attending surveyor carrying out confirmatory surveys.

14.5.6 In case of sale or change of management of the ship the PMS will require to be re-approved.

14.6 System Surveys

14.6.1 **Confirmation Survey** is to be carried out by an IRS Surveyor within one year from the date of the documentation approval. The scope of this survey is to verify that :

a) The PMS is implemented as per the approved documentation and is suitable to the type and complexity of machinery and systems onboard.

b) The documentation required for the annual audit is available and the adopted system is able to produce such a report.

c) The requirements of surveys and testing for continuing the class status are complied with.

d) The shipboard personnel are familiar with the PMS procedures including documentation.

14.6.2 **Annual Audit** is to be carried out once the PMS is implemented and approved, to verify the continued compliance with the documented PMS. The annual audit is carried out in conjunction with the annual class surveys. The scope of the audit is to be as given in the following :

a) The Surveyor is to verify that the PMS is correctly operated and that all items (due for survey in the relevant period) have actually been surveyed in due time.

b) The Surveyor is to verify that the machinery has been functioning satisfactorily upon review of the maintenance and performance records since the previous survey or audit and where needed necessary measures have been taken in response to machinery operating parameters exceeding acceptable limits and that the overhaul intervals have been observed.

c) A report detailing overhaul/repairs carried out and spare parts used on items in the list of surveyable items is to be presented by the Chief Engineer. Any machinery part or component, which has been replaced by a spare due to damage, is to be retained onboard and submitted to the attending surveyor's examination.

d) The attending surveyor after verification of records on board for the identification details of the Chief Engineers who have undertaken the maintenance activity and prepared the reports given in c), for compliance with the approved PMS, and upon satisfactory general examination and confirmatory surveys will credit the items for survey.

e) Where condition monitoring equipment is in use, function tests, confirmatory inspections and random check readings are to be carried out as far as practicable and reasonable at the discretion of the surveyor. Where the condition and performance of the items are within specified approved limits, these items can be credited for survey without opening up.

f) Written reports of break down or malfunction are to be made available.

g) If the surveyor is not satisfied with results of the PMS i.e. with degree of accuracy as regards the maintenance records and/or the general condition of the machinery, a report will be forwarded to IRS recommending that the special arrangements dealing with machinery surveys be suspended.

h) Upon satisfactory completion of the annual audit the surveyor confirms the validity of the PMS by crediting the PMS Annual audit.

14.7 Damage and repairs

14.7.1 Damage to components or items of machinery covered by the PMS which may affect the class is to be reported to IRS immediately. A surveyor will attend on board, survey the damage and on the basis of the survey results decide whether condition of class is to be recommended.

14.7.2 All parts of machinery or components, which need to undergo substantial repairs, are to be surveyed by IRS before, during and after the repairs, as deemed appropriate by the attending surveyor.

14.7.3 In the case of outstanding conditions of class or records of unrepaired damage, which may affect the PMS, the relevant items are to be taken out of the PMS until the conditions of class are dealt with or the repairs are carried out.

14.8 Guidelines for machinery items surveyed on the basis of condition monitoring

14.8.1 The extent of condition based maintenance and associated monitoring of equipment; to be included in the PMS is decided by the owner. The minimum parameters to be checked in order to monitor the condition of the various machinery for which this type of maintenance is accepted are indicated in 14.8.1.1 to 14.8.1.4.

14.8.1.1 For the main propulsion diesel engine the following parameters are to be monitored.

- Shaft horse power
- Engine and shaft RPM
- Indicator diagrams (both power and injection timing), where applicable
- Fuel oil temperature and/or viscosity
- Charge air pressure
- Exhaust gas temperatures for each cylinder and before and after turbochargers
- Engine cooling system temperatures and pressures
- Engine lubricating oil system temperatures and pressures
- Turbocharger RPM and vibration
- Lubricating oil analysis data

- Crankshaft deflections
- Main bearing temperatures.

14.8.1.2 For the main and auxiliary steam turbines the following parameters are to be monitored.

- Turbine rotor/bearing vibration
- Turbine rotor axial displacement
- Shaft horsepower
- Shaft and turbine rotor RPM
- Plant performance data i.e. steam conditions at the inlet and outlet of each turbine, boiler performance data, condenser vacuum, sea temperatures.

14.8.1.3 For the auxiliary diesel engines the following parameters are to be monitored.

- Exhaust gas temperatures for each cylinder and before and after turbochargers
- Engine cooling system temperatures and pressures
- Engine lubricating oil system temperatures and pressures
- Turbocharger RPM and vibration
- Lubricating oil analysis data
- Crankshaft deflections.

14.8.1.4 For other auxiliary machinery the following parameters are to be monitored.

- Cooler inlet and outlet temperatures and efficiencies
- Inlet and outlet temperatures of heaters
- Pumps and fans vibration and performance data
- Differential pressures across filters serving essential systems.

Section 15

Surveys - Vapour Control Systems

15.1 For tankers and combination carriers with notation VCS1

15.1.1 Annual Surveys

At each annual survey, the vapour emission control system is to be generally examined for ensuring its satisfactory condition. The survey is also to include:

a) Components and piping

External examination of all components and piping, including isolating / relief valves, means of collecting and draining condensate, means for separation of vapours from non-compatible cargoes and electrical continuity / bonding arrangements.

b) Manifold isolating valve

Confirmation of the proper operation of the vapour manifold isolating valve, including manual operation.

c) Vapour connection flanges

Confirmation of the continuing effectiveness of the “lug and hole” construction of the vapour connection flange(s), or other approved means of preventing misconnection of the loading hose to the vapour collection system.

d) Hoses

Confirmation that any hose used for the conveyance of vapour are in accordance with section 2.1.2 of Pt.5, Ch.29.

e) Inert gas piping

Where inert gas distribution piping is used for vapour collection, confirmation of the continuing effectiveness of the inert gas main isolating valve(s).

f) Cargo gauging system

Correct operation of the closed cargo gauging system for each tank, which is connected to the vapour collection system. Where portable gauging devices are used, the number of devices available are to be equal to the number of tanks that can be simultaneously loaded plus two (2) additional units.

g) Cargo tank venting system

Examination of the cargo tank venting system, including flame screens, where fitted.

h) Alarms and safety devices

Verification of the satisfactory operation of the following alarms and safety devices using simulated conditions, where necessary.

- High vapour pressure in main vapour collection line(s) (not required for tank barges).
- Low vapour pressure in main vapour collection line(s) (not required for tank barges).
- Cargo tank high liquid level.
- Cargo tank overfill (high-high liquid level), where fitted.
- Loss of power to alarm system or, alternatively, failure of tank level sensor circuitry.
- Automatic shutdown system, where fitted.

i) Operation and maintenance records

Examination of the permanent records to verify the satisfactory operation and maintenance of the system. Consideration may be given by the Surveyor for crediting certain items whose satisfactory operation has been properly documented and recorded.

15.1.2 Special surveys

At each Special Survey – Machinery, the following items of the vapour emission control system are to be examined for ensuring its satisfactory condition; in addition to the requirements of annual survey in 15.1.1:

a) Valves

All valves, including cargo tank isolating valves, main vapour line cross-over valves (where fitted for vapour segregation), condensate drain valves, manifold isolating valves, pressure / vacuum relief valves and spill valves / rupture disks (where fitted as additional overfill control devices) are to be examined.

b) Gauging system

The closed gauging system, including portable gauging devices where applicable, is to be examined.

c) Alarms

The independent cargo tank overfill alarms, where fitted, are to be examined.

d) Hoses

Vapour collection system hoses are to be tested for electrical continuity or non-conductivity, as applicable.

e) Inert gas piping

Where inert gas distribution piping is used for vapour collection, deck seals or double block and bleed assemblies are to be examined.

15.2 For tankers and combination carriers with notation VCS2

15.2.1 Annual surveys

At each annual survey, in addition to the requirements of 15.1.1, the following items of the vapour emission control system are to be examined for ensuring its satisfactory condition.

a) Detonation flame arrester

Confirmation that the detonation flame arrester (where fitted) is in satisfactory condition.

b) Vapour manifold

Confirmation that a means of electrical insulation (insulating flange or non-conductive hose, etc.) is provided for the vapour manifold connection.

c) Fixed oxygen analyzer

Confirmation of the accuracy of the fixed oxygen analyzer (required to be fitted within 3 [m] (10 feet) of the vessel's vapour manifold connection) by means of a calibration gas.

d) Vapour blowers / compressors

General examination of any devices (such as compressors or blowers) used to increase the vapour flow rate.

15.2.2 Special surveys

At each Special Survey – Machinery, in addition to the requirements of 15.1.2 and 15.2.1, the following items of the vapour emission control system are to be examined for ensuring its satisfactory condition:

a) Vapour Blowers / Compressors and detonation flame arresters

Vapour blowers / compressors and detonation flame arresters, where fitted, are to be examined, including isolating and relief valves, as applicable.

Section 16

Surveys of Thermal Oil Heating Systems

16.1 General

16.1.1 Thermal Oil Heating systems are to be surveyed at intervals specified in Sec.1, Table 1.1.1 of this Chapter.

16.1.2 At each Survey, the following components are to be examined as applicable.

- Oil fired thermal oil heater/s and Economiser/s are to be examined externally including the heat exchanger coils, insulation and fuel oil burning arrangement
- Circulating pumps
- Dump cooler
- Piping arrangement including control valves and insulation
- Expansion tank and temperature blocking pipe
- Alarms and safety devices
- Thermal oil (analysis results).

16.2 Oil fired thermal oil heater and Economiser

16.2.1 These are to be examined externally for condition of the insulation, cleanliness and their attachment to the ship's structure.

16.2.2 Heat exchanger coils are to be examined for any signs of overheating or corrosion and that they are in a state to ensure proper heat exchange.

16.2.3 Heat exchanger coils are to be subjected to a leakage test, at working pressure and with working fluid.

16.2.4 All mountings are to examined externally and internally, if considered necessary by the surveyor.

16.2.5 Fuel oil burning arrangements are to be examined for proper operation including operation of safety cut-outs.

16.3 Circulating pumps

16.3.1 Circulating pumps are to be examined externally and internally, if considered necessary by the surveyor. The pumps are to be examined for proper operation including automatic change over.

16.4 Dump cooler

16.4.1 Dump coolers are to be examined internally and externally including pressure relief devices.

16.5 Piping arrangement

16.5.1 Complete piping arrangement is to be externally examined including condition of insulation and tested for any leaks.

16.5.2 Pipe fittings and valves are to be examined externally and internally, if considered necessary by the surveyor.

16.6 Expansion tank

16.6.1 Expansion tank including associated save-alls is to be visually examined.

16.6.2 Arrangement to limit the temperature of thermal oil in the expansion tanks (in open vent systems) such as 'Temperature Blocking Pipe" are to be examined for proper operation.

16.6.3 De-aeration arrangement and vent is to be examined for proper operation.

16.7 Alarms and safety devices

16.7.1 Following alarms and safety devices are to be tested:

- Thermal oil high temperature alarm and safety cut out (both in Oil fired heater and Economiser)
- Minimum flow control device
- Minimum flow control alarm and safety cut out (both in Oil fired heater and Economiser)
- Flue gas high temperature alarm and safety cut out (both in Oil fired heater and Economiser)
- Thermal oil leakage alarm and safety cut out (both in Oil fired heater and Economiser)
- Expansion tank low level and low-low level alarm and safety cut out
- Fire Extinguishing arrangements.

16.8 Thermal oil analysis

16.8.1 Thermal oil is to be analysed at regular intervals – atleast annually.

16.8.2 The thermal oil shall be free from harmful contaminants and signs of oxidation or deterioration.

16.9 System operation test

16.9.1 On completion of survey the entire system is to be examined under working conditions with particular attention to signs of leakage and functioning of control and safety devices.

16.10 Repairs

16.10.1 Any defects to alarms and safety devices the proper operation of which may pose a fire risk are to be promptly repaired to the satisfaction of the surveyor.

16.10.2 When repairs or renewals are carried out to system parts or components, these are to be subjected to a pressure test to 1.5 times the working pressure, prior to putting them into service.

Section 17

Surveys of External Fire Fighting Systems

17.1 General

17.1.1 External Fire Fighting Systems on ships assigned with class notations **Agni 1, Agni 2** or **Agni 3** are to be surveyed at intervals specified in Sec. 1 Table 1.1.2 of this chapter.

17.2 Annual survey

17.2.1 The annual survey is to consist of general examination / verification of the items indicated in 17.2.2 to 17.2.7.

17.2.2 Hull

General examination of:

- Maneuvering arrangements including side thrusters and power management system, where fitted
- Floodlights.

17.2.3 Self Protection of the Vessel

Agni 1 :

- General examination and functional verification of fixed water-spraying system.

Agni 2 & Agni 3 :

- General examination of dead lights and external steel shutters
- General examination / functional verification of insulation / water spray system, where fitted.

17.2.4 Water monitors and controls

- General examination of water monitors and their securing arrangements
- Functional verification of water monitors
- General examination and functional verification of remote and local/manual controls.

Additional for Agni 3:

- General examination of foam monitors, foam concentrate tank and associated pumping and piping arrangements including their securing arrangements
- Condition of foam concentrate
- Functional test of the foam monitors
- General examination and functional verification of remote and local/manual controls.

17.2.5 Pumping and piping

- General examination of fire pumps and water spray pumps, associated piping from sea inlets to monitors and required instru-mentation.
- Examination and test of water spray piping over pressure preventing arrangement, where fire pumps also supply to water spray piping.
- Verification of arrangement for prevention of overheating of fire pumps at low delivery rates.

17.2.6 Portable fire fighting equipment

– General examination of hose stations and fire hydrants.
– Ensuring ready availability of hoses and nozzles for the hose stations and their condition.
– Examination of pressure reducing arrangement at hose stations.

Additional for Agni 2 & Agni 3:

– Examination of portable high expansion foam generator including condition of the foam forming liquid.

17.2.7 Fireman's Outfits

– Ensuring ready availability and condition of fireman's outfit including self contained breathing apparatus with spare air bottle.
– General examination of compressor for recharging air bottles.

17.3 Special survey

17.3.1 In addition to the requirements for annual survey the following need to be examined at each special survey.

17.3.2 Internal examination and testing of the following:

– Fire and water spray pumps
– Fire and water spray pump prime movers
– One section of fire and water spray piping to assess the condition of corrosion prevention measures
– Electrical equipment associated with the external fire fighting systems
– Foam tank to the extent possible.

Section 18

Surveys of Diving Systems

18.1 General

18.1.1 Survey requirements for diving systems permanently installed on diving support vessels, stand-alone diving systems and diving systems temporarily installed on diving support vessels are covered in the succeeding paragraphs.

18.1.2 Requirements for initial survey and classification of diving systems are laid down in Pt. 5, Ch. 26, Sec. 3.

18.1.3 The surveyor may require assistance of technically qualified personnel during surveys and repairs. Assistance may be required for the following:

- Life supports systems and monitoring equipment

- Hyperbaric Systems

- Electronic equipment and communication facilities

- Emergency operations after system malfunction due to following:

    - Failure of components;

    - Loss of breathing gas pressure;

    - Loss of power; etc.

18.1.4 All diving equipment/ systems and hyperbaric facilities are required to be maintained in conditions for which they were approved and installed.

18.1.5 A log book is to be maintained by responsible personnel detailing the dive depths, dates and times, dive durations and other details. The log book is to contain maintenance records based on inspections and checks by the crew/ other specialized personnel. Inspection procedures and check lists are also to be part of the log book. The log book is to be available for verification by the Surveyor.

18.2 Annual Surveys

18.2.1 Annual Surveys of the hull, machinery and equipment are to be made within three months either way of anniversary date each year.

18.2.2 The Surveyor is to review the Operating and Maintenance Manuals, operational and maintenance records, log books including all recorded malfunctions or repairs carried out since the last survey. Summarized procedures for normal and emergency operations are to be verified on board. The Surveyor is to record the date of last use and the extent of use of the facilities since last survey.

The Annual Survey is to include surveys/ examination/ verification of the following, as applicable:

18.2.2.1 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Structural integrity and corrosion status of chambers and bell are to be examined by internal and external survey. Special attention is to be paid to bilges (especially floor plating contact with shell), equipment locks, location of battery packs etc. for damage and possible corrosion. Examination with NDE may be carried out, as necessary. Condition of external anodes (if fitted) is to be reviewed;

- Shell penetrations are to be examined with special attention to hot water penetrations for sign of corrosion;

- External fairings are to be removed as far as practicable to provide better access to the entire surface of the pressure boundaries. Removal of protective coatings and insulation is not required unless deterioration or trace of rust or corrosion is evident or as otherwise required by the Surveyor for inspection or NDE;

- Careful examination of doors, safe locking mechanisms, appendages, attachments, framework, sealing surfaces, supporting structures for chambers and systems, bunk supports, insulation, paintwork; etc. Presence of safe locking mechanisms is to be checked on all hatches and function tested with the relevant chamber under pressure;

- The windows/ viewports are to be examined for de-colouration, possible deterioration, signs of damage, cracks or scratches; integrity of sealing arrangement and protective shield. Windows exceeding 10 years of age are normally to be replaced;

- Adequacy of over pressure-relief valve and alarm;

- Function testing of Built in Breathing Systems (BIBS) in chambers, bells and HES.

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Provision of hazard warning signs, Colour coding, marking and stamping of testing date on cylinders and pressure vessels is to be verified;

- Structural integrity and corrosion status of gas containers and pressure vessels is to be inspected, with NDE, if necessary. Attachments and framework, supporting steelwork are to be examined for signs of corrosion;

- In the case of gas storage compartments, high/ low Oxygen alarms fitted external to the door and in repeated position(s) are to be verified.

.3 Pumps and Compressors

- Verification that maintenance of equipment is being carried out in accordance with manufacturer’s instructions;

- Quality of breathing air and gas to be verified by specialist/ competent agency;

- Verification of solenoid switches for auto-stopping facility of compressors on overheating.

.4 System components including piping, umbilicals, hoses, valves, filters etc

- System cleanliness is to be examined by visual survey and checked for possible contamination;

- Verification of any possible chafing/ twisting of umbilicals and leaks in gas piping or in distribution boxes. Proof of pressure test of the system components by crew is to be verified.

18.2.2.2 Controls

.1 Gas Supply and Distribution

- System cleanliness to be examined by visual survey and checked for possible contamination by grease, oil, etc;

- Function test of gas-regeneration units and Oxygen make-up system to be carried out;

- Arrangements for each diver's gas supply line are to be confirmed such that if one fails, the failure does not interfere with another diver's supply.

.2 Depth / Pressure Controls

- Calibration of internal gauges, external gauges, depth and life support system gauges is to be verified;

- Life support system gauges (which indicate pressure critical to life support functions) are to be examined for functionality.

.3 Temperature and Humidity Control

- Calibration evidence of all available instrumentation is to be examined;

- Functional tests of the following is to be carried out:

  - Heaters in chambers, bells and HES;
  - Cooling systems for divers (if fitted);
  - Environment conditioning units (by temperature monitoring);
  - Standby power supply to the heating/ cooling system to maintain operations for the period of diver recovery (in case of main power failure);

.4 Gas Contamination Analysis

- Verification of calibration of gas analyzers and arrangements for monitoring of Carbon dioxide, Oxygen, temperature, relative humidity in chamber;

- Primary and secondary means of Carbon dioxide scrubbing arrangements are to be examined with special attention to check that the secondary Carbon dioxide scrubbing arrangement provided is independent of any surface power supply and has minimum endurance of 24 [hrs];

.5 Domestic/ Sanitary Systems

- Internal inspection of sewage tanks;

- Functional test of toilet flush (special attention to safe working under pressure) and bilge drains in chambers (special attention to chamber shell under deck plating. Ultrasonic measurements may be carried out at the discretion of the Surveyor).

.6 Auxiliary Services to Life Support Equipment

- Main and emergency power supplies for following are to be examined/ tested;

  - Lighting of chambers and bell;
  - Monitoring devices;
  - Control consoles;
  - Normal and emergency life support systems;
  - Alarm systems including fire loops;
  - DP alarms

- General condition of switchboards, breakers and cables including electrical hygiene, earth leakage detection systems and alarms is to be examined;

- Changeover from main to emergency supplies is to be tested.

18.2.2.3 Communication

.1 The listed alarms and record of their checks as part of their planned maintenance by crew is to be verified.

.2 Functional checks of the following are to be carried out:

- CCTV systems;
- sound powered telephone;
- recording instruments.

.3 Operational checks of primary and secondary means of communication are to be undertaken:

- between bridge and dive control station;
- dive control and
  - bells
  - chambers
  - divers in water
  - diving machinery areas
  - winch/ crane operator

.4 Ultrasound underwater telephones may be checked by simulation or during test dive.

18.2.2.4 Launch and Recovery Systems

.1 General

- Bell lifting arrangements, especially load bearing components are to be carefully examined, with NDE as required;

- Attachments and framework, supporting steelwork are to be examined for signs of corrosion, with NDE as necessary;

- General condition of wire rope and its ends is to be visually inspected. Lubrication records and records of exchange of ends are to be checked;

- Dynamic load test of system is to be carried out on main and emergency power supply. The alarm and safety functions are to be verified;

- Simulated power failure test of launch and recovery system in accordance with laid down procedures for emergency retrieval is to be performed in presence of Surveyor;

- Hydraulic power system during launch and recovery is to be examined for

  - unusually high vibration levels
  - oil leakage
  - pressure peaks and jerking

- Oil hygiene analysis is to be carried out, as necessary;

- Bell emergency release mechanism is to be tested.

.2 Controls

- The main electrical power supplies to the following are to be checked:

  - Monitoring devices
  - Alarm systems
  - Control consoles
  - Switchboards, breakers

- The correct operation of change-over from main to emergency supply is to be verified.

.3 Auxiliary Services to Launch and Recovery Systems

- Close examination of umbilical winch systems, including brake and carry out function tests;

- Examine condition of umbilical and safety provisions to stop umbilicals from jumping out of sheaves;

- Examine breathing apparatus provided for winch operator in case of fire related emergency, requiring bell recovery.

18.2.2.5 Safety Equipment

- The condition of A-60 insulation towards any enclosed spaces from the outer area of the diving system is to be examined;

- The alarms, safety limits and failure conditions of the fixed fire-fighting systems is to be verified;

- The quantity and efficacy of portable fire-extinguishers (as per approved plan), is to be verified.

18.3 Additional requirements for Third Annual Survey

18.3.1 In addition to the annual survey requirements stipulated in 18.2, the requirements indicated in the succeeding paragraphs are to be additionally undertaken at every third annual survey, as applicable:

18.3.1.1 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Leak test of bell and chamber to Maximum Allowable Working Pressure (MAWP) with minimum 20% Helium. Leak test of pressure equipment is to be carried out at low and high pressures by increasing the pressure to the working pressure, stepwise. Leak test is to be carried out as per approved procedure, adopting appropriate safety precautions listed in the procedure. The procedure is to include an inspection for leaks at low pressure before increasing to MAWP. The test duration is to be minimum 6 [hrs].

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Leak test of gas containers and pressure vessels to minimum 10% Helium. Precautions and test duration to be as per 18.3.1.1.1;

- Function test of valves on permanently installed gas bottles is to be undertaken.

Note: Leak tests are normally to be carried out with a minimum of 10% Helium, if the pressure vessel or piping is designed to hold Heliox mixtures or pure Helium. Due to the inherent fire risk with the use of air at high pressure, it is recommended that leak tests may be carried out incorporating Nitrogen, where applicable.

.3 Pumps and Compressors

- Running condition test of pumps and compressors is to be carried out;

- Safety valves are to be examined/ tested as per manufacturer's instructions.

.4 System components including piping, umbilicals, hoses, valves, filters etc

- Leak test of pipe work to MAWP with minimum 10% Helium;

- Manual/ automatic control valves are to be randomly tested and recorded ;

- Examine and function test the main bell umbilical to MAWP of hoses.

18.3.1.2 Controls

.1 Gas Supply and Distribution

- Life support systems including pipe work and reclaim units are to be examined and tested.

.2 Depth/ Pressure Control

- As per scope of Annual Survey

.3 Temperature and Humidity Control

- As per scope of Annual Survey

.4 Gas Contamination Analysis

- As per scope of Annual Survey

.5 Domestic/ Sanitary Systems

- As per scope of Annual Survey

.6 Auxiliary Services to Life Support Equipment

- As per scope of Annual Survey

18.3.1.3 Communication

- Scope of annual survey is to be applied for primary, secondary and emergency means of communication;

- Listed alarms and record of their checks/ routine tests as part of planned maintenance system by crew are to be verified, as applicable;

- At least the following alarms, if fitted, are to be function tested:

  - High/ low pressure alarm – chamber
  - Temperature alarm – chamber
  - Humidity alarm – chamber
  - Divers hot water temperature alarm
  - Divers hot water pressure alarm
  - High pressure alarm – gas delivery compressor
  - Low pressure alarm – compressor cooling system
  - Low pressure lub oil alarm – compressor
  - High level alarm for gas reclaim bag
  - High/low alarm – Oxygen analyzers
  - Oxygen sensors/ detectors in control stations

18.3.1.4 Launch and Recovery Systems

.1 General

(a) For submergence launch and recovery system:

- The working weight of the bell is to be determined, compared with previous weight and recorded;

- The following alarms for hydraulic systems for bell launch and recovery are to be tested:

  - Low pressure alarm
  - High temperature alarm
  - Low oil level in tank alarm

.2 Controls

- The power failure alarms for controls of launch and recovery systems, including (for hydraulic system) are to be tested:

  - Low pressure alarm
  - High temperature alarm
  - Low oil in tank alarm

- All alarms are to be function tested.

18.3.1.5 Safety Equipment

- The fire detection and alarm system is to be tested;

- One portable extinguisher at random, is to be function tested;

- Blow through with air of water based fixed extinguishing system is to be carried out to clear the lines;

- Records of last inspection of the fixed extinguishing system are to be reviewed by the Surveyor.

18.4 Special Surveys

18.4.1 Scope

18.4.1.1 Special surveys are to be carried out at 5 yearly intervals before the anniversary date. In addition to the requirements of the third annual survey, the scope of special survey is to be as described in 18.4.2 to 18.4.7.

18.4.2 Pressure Tests

.1 Pressure tests are to be carried out in accordance with an approved procedure, based on a recognized national/ international standard for the relevant pressure vessels. Procedures for testing are to be submitted to IRS, well in advance for review.

.2 The pressure test is to be repeated when the modifications to the pressure boundaries have been carried out and the test requirements apply as given for new pressure vessels.

.3 All pressure tests are to be carried out in presence of IRS Surveyor.

.4 A thorough internal and external visual inspection is to be carried out, prior to hydro tests.

.5 If diving bells are used for observation diving, they are to be hydro-tested to the external pressure test pressure, as per the design code.

18.4.3 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Bell insulation is to be examined and it is to be determined if affected areas require renewal because of damage/ corrosion. Ultrasonic examination may be carried out, as necessary;

- Areas around windows are to be subject to critical examination;

- Chamber and bell are to be hydro-tested as per the manual and recorded.

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Gas storage tubes, air and gas tanks, sewage tanks, hot water tanks are to be hydro tested and recorded.

.3 Pumps and Compressors

- As per scope of third annual survey

.4 System components including piping, umbilicals, hoses, valves, filters etc

- Pressure test of piping systems is to be carried out.

18.4.4 Controls

Survey of the following items is to be carried out with the scope of survey same as that of third annual survey:

.1 Gas Supply and Distribution

.2 Depth/ Pressure Control

.3 Temperature and Humidity Control

.4 Gas Contamination Analysis

.5 Domestic/ Sanitary Systems

.6 Auxiliary Services to Life Support Equipment

18.4.5 Communication

- Primary, secondary and emergency means of communication are to be examined as per scope of third annual survey.

18.4.6 Launch and Recovery Systems

.1 General

(a) For submergence launch and recovery system:

- Bell ballast weight release is to be load tested and NDE to be carried out on load bearing members;
- Emergency retrieval of bell to be tested.

(b) For surface launch and recovery:

- Various systems are to be load tested as per manual and NDE to be carried out on load bearing members;

.2 Controls

- As per scope of third annual survey.

.3 Auxiliary Services to Launch and Recovery Systems

- As per scope of third annual survey.

18.4.7 Safety Equipment

- As per scope of third annual survey.

18.5 Surveys of Hyperbaric Evacuation Systems (HES)

18.5.1 Initial Surveys

.1 The requirements for initial surveys and classification of Hyperbaric Evacuation Systems (HES) are laid down in Pt.5, Ch. 26, Sec. 4.

.2 Statutory requirements of national authorities/ flag administrations are to be taken into account whilst approving and surveying HES.

.3 The interface between the HES and the installed diving system is to be examined carefully so that the HES does not become a hazard to the diving system operations.

.4 HES are connected to the diving system and are to be surveyed in the same manner as the main diving system. Corrosion on the chamber exterior is to be examined carefully due to high humidity levels.

18.5.2 Annual and Special Surveys of HES

18.5.2.1 The initial survey requirements for HES, stipulated in Cl. 4.4.1 of Pt.5, Ch.26, Sec. 4 are to be applied for all annual surveys in addition to the scope laid down below.

18.5.2.2 Annual and Special Survey requirements for components of the HES are indicated in 18.5.2.3 to 18.5.2.7

18.5.2.3 Pressure Equipment

.1 Pressure Vessels for Human Occupancy

- Annual and special survey requirements as applicable to diving systems may be followed.

.2 Gas Storage & Pressure Vessels in Supply and Return Lines

- Examine if gas cylinders exposed to sea water are certified and tested every two years;
- For other components, periodical survey requirements as applicable to diving systems are to be applied.

.3 Pumps and Compressors

- Annual and special survey requirements as applicable to diving systems are to be applied

.4 System components including piping, umbilicals, hoses, valves, filters etc

- Examine, if all valves are firmly secured to prevent any movement due to ship motions in rough weather;
- Examine, if all external valves on the chambers are secured “open” to prevent accidental operation during deployment of HEU.

18.5.2.4 Controls

Annual and special survey requirements are to be as applicable for diving systems, for items .1 to .6, with additional requirements where indicated for each item:

.1 Gas Supply and Distribution

- The following are to be additionally verified at each annual survey:

- Oxygen supply is fitted with a device to ensure Oxygen injection at controlled rate;

- Availability of sufficient Oxygen for metabolic make-up for the maximum complement of divers at a rate of 0.5 [lit/min/diver], for a minimum duration of 24 [hrs];

- There is a minimum amount of Helium/ Oxygen carried, sufficient to compensate for the use of medical locks, as specified by the equipment manufacturer.

.2 Depth/ Pressure Control

.3 Temperature and Humidity Control

- Annual and special survey requirements are to be as applicable to diving systems may be followed. In addition, the following are to be verified at each annual survey:

  - Confirm that there are adequate means of maintaining the diver's thermal balance in the compression chamber to the required level, for a minimum of 24 [hrs];

  - Function test of the external fired diesel heater (if fitted).

.4 Gas Contamination Analysis

.5 Domestic/ Sanitary Systems

.6 Auxiliary Services to Life Support Equipment

- The following are to be additionally verified at each annual survey:

  - The safety provisions applied to reduce potential hazards from battery charging;

  - Ducted hydrogen gas ventilation for safe dumping;

  - Housing of rechargeable batteries in separate well ventilated area, located outside the crew area;

  - Precautions as laid down by the manufacturer being followed for in-situ charging of batteries.

18.5.2.5 Communication

Annual and special survey requirements are to be as applicable to diving systems for items .1 to .4, with additional requirements where indicated for each item:

.1 Primary Means:

- Additionally, the following are to be verified at each annual survey:

  - Examine, if the hard wired communication system linking HES launch control/ HES internal/ saturation life support control is available and effective.

.2 Secondary Means:

.3 Emergency Means:

- Additionally, at each annual survey, examine if the HEU is fitted with relocation devices including:

  - Radar reflector
  - Strobe Light
  - Radio distress beacon

.4 Alarms:

18.5.2.6 Launch and Recovery Systems

.1 General

- Manufacturer's instructions for periodical surveys are to be followed;

- Examine HES release arrangements;

- Launch test the HES with a full load during surveys. In case of a float away chamber, a floatation test is to be carried out with full load;

- Examine if a suitable method of assisting an injured/ unconscious diver in to the chamber is available;

- Examine if, safety locking mechanism is fitted between the saturation diving complex and HES, and the same is effective;

- Examine fall length and confirm that the same allows the HEU to be fully supported in water when the ship/ installation is in the lightest sea-going state. The same is to be determined at the worst angle of list and trim on the side where the HEU is located;

- Examine falls for turning and deterioration. Falls are to be turned end to end at 30 month intervals and renewed when deteriorated, or at intervals not exceeding 5 years;

- Load test of HEU launch system to be carried out, as applicable on annual basis;
- Where secondary means of launch is provided, the launch of the HEU by secondary means is to be tested under same conditions as primary means of launch.

2 Controls

- Annual and special survey requirements as applicable to diving systems may be followed.

.3 Auxiliary Services to Launch and Recovery Systems

- Annual and special survey requirements as applicable to diving systems may be followed.

18.5.2.7 Safety Equipment

- As per the relevant Statutory requirements.

18.6 Surveys for Transit Damage

18.6.1 During transportation of the diving system or hyperbaric facility, precautions are to be taken to protect the pressure hull, external structures, acrylic windows, batteries, etc. from undue deterioration or damage.

18.6.2 A survey for transit damage is to be conducted after the transportation of diving system or hyperbaric facility from the manufacturer's or the assembler's plant to the operational location or from one location of operations to another.

18.6.3 This survey is to include but may not be limited to the following:

- Pressure boundary and its components are to be visually checked for damage.
- Systems and components are to be inspected, and recalibration of instruments may be required if deemed necessary by the Surveyor.
- External structures, fairings and skins are to be checked for damage.
- Further in-depth examination may be required by and at the discretion of the Surveyor.

18.6.4 If the survey is carried out by the Owner and damage is found which affects or may affect classification, IRS is to be advised of the details and provisions are to be made for examination by the Surveyor at first available opportunity.

Section

Section 1

Conditions for Manufacture, Survey and Certification

1.1 Scope

1.1.1 Materials, used for the construction or repair of the hull and machinery of ships which are classed or intended to be classed with IRS, are to be manufactured, tested and inspected in accordance with the requirements of this Part.

1.1.2 Materials complying with recognized national or international standards with specifications equivalent to the requirements of this Part may be accepted.

1.2 Information to be supplied to the manufacturer

1.2.1 The ship or machinery builder is to provide the manufacturer with such information as is necessary to ensure that inspection and testing can be carried out in accordance with these Rules.

1.3 Manufacture

1.3.1 Materials used for the construction or repair of the hull and machinery of ships which are classed or intended to be classed with IRS are to be made at works which have been approved by IRS for the type of the product being supplied.

1.3.2 The manufacturer should demonstrate to the satisfaction of IRS that necessary manufacturing and testing facilities are available and are supervised by qualified personnel.

1.3.3 Approval of manufacturers with respect to the materials and grades covered by this Part will be considered by IRS on the basis of a detailed description of the manufacturing process and inspection routines, results from testing of materials and a report made by IRS Surveyors confirming the information given by the works and results.

1.3.4 Where the manufacturer has more than one works, approval for individual works would be required.

1.4 Survey procedure

1.4.1 The Surveyors are to be allowed access to all the relevant parts of the works and are to be provided with necessary facilities and information to enable them to verify that manufacture is being carried out in accordance with the approved procedure. Adequate facilities are also to be provided for the selection of test materials, the witnessing of mechanical tests and the examination of materials, as required by these Rules.

1.4.2 Prior to the submission of material for acceptance, manufacturers are to provide the Surveyors with details of the order specification and any special conditions additional to the Rule requirements.

1.4.3 Before final acceptance, all materials are to be submitted to specified tests and examinations under conditions acceptable to the Surveyors. The results are to comply with Rules and all materials are to be to the satisfaction of the Surveyors.

1.4.4 The specified tests and examinations are to be carried out prior to the dispatch of all finished materials from the manufacturer's works. Where materials are supplied in the rough or unfinished condition, as many as possible of the specified tests are to be carried out by the manufacturer and any tests or examinations not completed are to be carried out in consultation with the Surveyors, at a subsequent stage of manufacture.

1.4.5 In the event of any material proving unsatisfactory, during subsequent working, machining or fabrication, it is to be rejected, not withstanding any previous certification.

1.5 Chemical composition

1.5.1 The chemical composition of the ladle samples is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory. The manufacturer's analysis will be accepted, but may be subject to occasional independent checks if required by the Surveyors.

1.5.2 At the discretion of the Surveyors, a check chemical analysis of suitable samples from products may also be required. These samples are to be taken from the material used for mechanical tests, but where this is not practicable an alternative procedure for obtaining a representative sample is to be agreed with the manufacturer.

1.6 Heat treatment

1.6.1 Materials are to be supplied in the condition specified in, or permitted by the Rules. Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole item to be uniformly heated to the necessary temperature. In the case of very large components which require heat treatment, alternative methods will be specially considered.

1.7 Test material

1.7.1 Sufficient test material is to be provided for the preparation of the tests detailed in the specific requirements. It is, however, in the interests of manufacturers to provide additional material for any retests which may be necessary, as insufficient or unacceptable test material may be a cause for rejection.

1.7.2 The test material is to be representative of the item or batch and is not to be separated until all the specified heat treatment has been completed, except where provision for an alternative procedure is made in the subsequent chapters of this Part.

In case of castings where separately cast test samples are accepted, the test samples are to be cooled down under the same conditions as the castings.

1.7.3 All test material is to be selected by the surveyor and identified by suitable markings which are to be maintained during the preparation of the test specimen.

1.8 Mechanical tests

1.8.1 The number and direction of test specimens and their dimensions are to be in accordance with the requirements of subsequent chapters of this Part and the specific requirements for the product.

1.8.2 Where Charpy impact tests are required, a set of three test specimens are to be prepared and the average energy value is to comply with the requirements of subsequent Chapters of this part. One individual value may be less than the required average value provided that it is not less than 70 per cent of that value.

1.8.3 Where metric or imperial units are to be used for acceptance testing, the specified values are to be converted in accordance with the appropriate conversions given in Table 1.8.1.

Table 1.8.1 : **Conversion of SI units to metric and imperial units**

1 N/mm^2 or Mpa	= 0.102 kgf/mm^2
1 N/mm^2 or Mpa	= 0.0647 $tonf/in^2$
1 N/mm^2 or Mpa	= 0.145 x 10^3 lbf/in^2
1 J	= 0.102 Kgf m
1 J	= 0.738 ft Ibs
1 Kgf/mm^2	= 9.81 N/mm^2 or MPa
1 $tonf/in^2$	= 15.45 N/mm^2 or MPa
1 Ibf/in^2	= 6.89 x 10^{-3} MPa
1 kgf m	= 9.81 J
1 ft lbf	= 1.36 J

Notes :

The conversions may be rounded to the nearest multiples as follows :

1	For tensile strength values at ambient temperature	1 Kgf/mm^2 0.5 $tonf/in^2$ 1 x 10^3 $lbf.in^2$ 10N/mm^2
2	For yield and proof stress values at ambient temperature	0.5 kgf/mm^2 0.2 $tonf/in^2$ 0.5 x 10^3 lbf/in^2 5 N/mm^2
3	For lower yield or proof stress values at elevated temperatures and stress to rupture.	0.1 kgf/mm^2 0.05 $tonf/in^2$ 0.1 x 10^3 lbf/in^2 1 N/mm^2
4	For impact energy values	0.1 kgf m 1 ft lbf 1 J

1.9 Definitions

1.9.1 The following definitions are applicable to this Part:

Item A single forging, casting, plate, tube or other rolled product as delivered.

Piece The rolled product from a single slab or billet or from a single ingot if this is rolled directly into plates, strips, sections or bars.

Batch A number of similar items or pieces presented as a group for acceptance testing.

1.10 Retest procedures

1.10.1 Where the result of any test, other than an impact test, does not comply with the requirements, two additional tests of the same type may be taken. For acceptance of the material satisfactory results are to be obtained from both of these tests.

1.10.2 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be tested provided that not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is not to be less than the required average value. Additionally, for these combined results, not more than two individual values are to be less than the required average value and, of these, not more than one is to be less than 70 per cent of this average value.

1.10.3 The additional tests detailed in 1.10.1 and 1.10.2 are, where possible, to be taken from material adjacent to the original tests. For castings, however, where insufficient material remains in the original test samples, the additional tests may be prepared from other test samples representative of the castings.

1.10.4 When unsatisfactory results are obtained from tests representative of a batch of material, the item or piece from which the tests were taken is to be rejected. The remainder of the batch may be accepted provided that two further items or pieces are selected and tested with satisfactory results. If the tests from one or both of these additional items or pieces give unsatisfactory results, the batch is to be rejected.

1.10.5 When a batch is rejected, the remaining items or pieces in the batch may be re-submitted individually for test, and those which give satisfactory results may be considered for acceptance by the Surveyors.

1.10.6 At the option of the manufacturer, rejected material may be re-submitted as another grade and may then be considered for acceptance by the Surveyors, provided that the test results comply with the appropriate requirements.

1.10.7 When material which is intended to be supplied in the "as rolled" or "hot finished" condition fails test, it may be suitably heat treated and re-submitted for test, with the prior concurrence of the ship or machinery builder. Similarly materials supplied in the heat-treated condition may be re-heat treated and re-submitted for test.

1.11 Visual and non-destructive examination

1.11.1 Prior to the final acceptance of materials, surface inspection, verification of dimensions and non-destructive examination are to be carried out in accordance with the requirements detailed in subsequent chapters of this Part.

1.11.2 When there is visible evidence to doubt the soundness of any material or component, such as flaws in test specimens or suspicious surface marks, the manufacturer is expected to prove the quality of the material by any acceptable method.

1.12 Rectification of defective material

1.12.1 Small surface imperfections may be removed by mechanical means provided that, after such treatment, the dimensions are acceptable, the area is proved free from defects and the rectification has been completed in accordance with applicable requirements of subsequent chapters of this Part and to the satisfaction of Surveyors.

1.12.2 The repair of defects by welding can be accepted only when permitted by the appropriate specific requirements and provided that the agreement of the Surveyor is obtained before the work is commenced. When a repair has been agreed, it is necessary in all cases to prove by suitable methods of non-destructive examination that the defects have been completely removed before welding is commenced. Welding procedures and inspection on completion of the repair are to be in accordance with the appropriate specific requirement and are to be to the satisfaction of the Surveyor.

1.13 Identification of materials

1.13.1 The manufacturer is to adopt a system of identification which will enable all finished material to be traced to the original cast, and the Surveyors are to be given all facilities for so tracing the material when required. When any item has been identified by the personal mark of a Surveyor, or his deputy, this is not to be removed until an acceptable new identification mark has been made. Failure to comply with this condition will render the item liable to rejection.

1.13.2 Before any item is finally accepted it is to be clearly marked by the manufacturer in at least one place with the particulars detailed in the appropriate specific requirements.

1.13.3 Hard stamping is to be used except where this may be detrimental to the material, in which case stenciling, painting or electric etching is to be used. Paints used to identify alloy steels are to be free from lead, copper, zinc or tin, i.e., the dried film is not to contain any of these elements in quantities more than 250 ppm.

1.13.4 Where a number of identical items are securely fastened together in bundles, the manufacturer need only brand the top of each bundle. Alternatively a durable label giving the required particulars may be attached to each bundle.

Section 2

Certification of Materials Based on Alternative Certification Scheme

2.1 General

2.1.1 Alternative procedures for survey and testing may be accepted by IRS at works where materials are manufactured under closely control rolled conditions by semi-continuous or continuous processes under the Alternative Certification Scheme (ACS), as detailed in Part1, Chapter 1, Section 4 of the Rules.

2.1.2 Where it is considered that compliance with Rule requirements can be satisfactorily achieved, IRS will issue a Quality Assurance Approval Certificate, based on the ACS to the manufacturer.

2.1.3 The quality system procedures and practices of a manufacturer who has been granted approval will be kept under continuous review and audited as per the ACS.

2.2 Requirements for approval

2.2.1 The conditions for approval are broadly outlined in Pt.1, Ch.1, Sec. 4, Cl. 4.3 of the Rules.

2.3 Information required for approval

2.3.1 Manufacturers applying for approval under this scheme are to submit the information required by 2.3.2 to 2.3.6, in addition to the requirements of the ACS (Pt.1, Ch.1, Sec. 4, Cl. 4.4).

2.3.2 A detailed specification for each product.

2.3.3 An outline description of all important manufacturing plant and equipments. This is to include a production flow chart indicating all stages where testing and inspection are carried out along with details of equipments used for measuring and testing.

2.3.4 The system used for the identification and traceability of raw materials, semi-finished and finished Products.

2.3.5 Information on the system of procurement and acceptance of materials e.g. ingots, billets or blooms for further processing where the manufacturer does not produce such raw materials.

2.3.6 Consolidated test results, physical, chemical, non-destructive tests etc. for a period of preceding three months of products, if possible, covering the full range of thickness, weight range and grades for which approval is sought. The data is to include the number of samples, minimum, maximum, average value and standard deviation. For high strength ship steels, the carbon equivalent values are also required. The data is to also include numbers of rejections during manufacture as well as after delivery and reasons thereof.

2.4 Assessment and approval, maintenance of approval and certification of products would be generally based on the ACS detailed in Pt.1, Ch.1, Sec.4 of the Rules.

End of Chapter

Chapter 2

Mechanical Testing Procedures

Contents

Section 1

General Requirements

1.1 General

1.1.1 All tests are to be carried out by competent personnel. The machines are to be maintained in satisfactory and accurate condition and are to be recalibrated at approximately annual intervals. This calibration is to be carried out by a nationally recognized Authority or other organization of standing and is to be carried out to the satisfaction of Surveyors. The accuracy of test machines is to be within ± one per cent. A record of all calibrations is to be kept available in the test house.

Testing machines are to be calibrated in accordance with the following or other equivalent recognized standards:

a) Tensile / compression testing : ISO 7500-1
b) Impact testing : ISO 148-2

1.2 Selection of test samples

1.2.1 Test samples are to be selected by the Surveyor unless otherwise agreed.

1.2.2 All materials in a batch presented for testing are to be of the same product form (e.g. plates, sections, bars). Normally, the materials are to be from the same cast and in the same condition of heat treatment.

1.3 Preparation of test specimens

1.3.1 If test samples are cut from material by flame cutting or shearing, a reasonable margin is required to enable sufficient material to be removed from the cut edges during final machining.

1.3.2 Test specimens are to be cut and prepared in a manner which does not affect their properties, i.e. not subjected to any significant cold straining or heating.

1.3.3 Where possible, test specimens from rolled materials are to retain their rolled surface on both sides.

1.4 Discarding of test specimens

1.4.1 If a test specimen fails because of faulty manufacture, visible defects, or incorrect operation of the testing machine, it may be discarded at the Surveyor's discretion and replaced by a new test specimen prepared from material adjacent to the original test.

Section 2

Tensile Testing

2.1 Dimensions of tensile test specimens

2.1.1 Generally, proportional test specimens with a gauge length of $5.65\sqrt{S_o}$ (where S_o is the cross-sectional area of the test length) are to be used. Where it is not possible to use such specimens, non-proportional specimens may be considered.

2.1.2 For the purpose of determining the different parameters related to tensile testing, three different types of test specimens may be used :

- Round test specimens;
- Flat test specimens; and
- Full cross-section test specimens.

See also Fig.2.1.1.

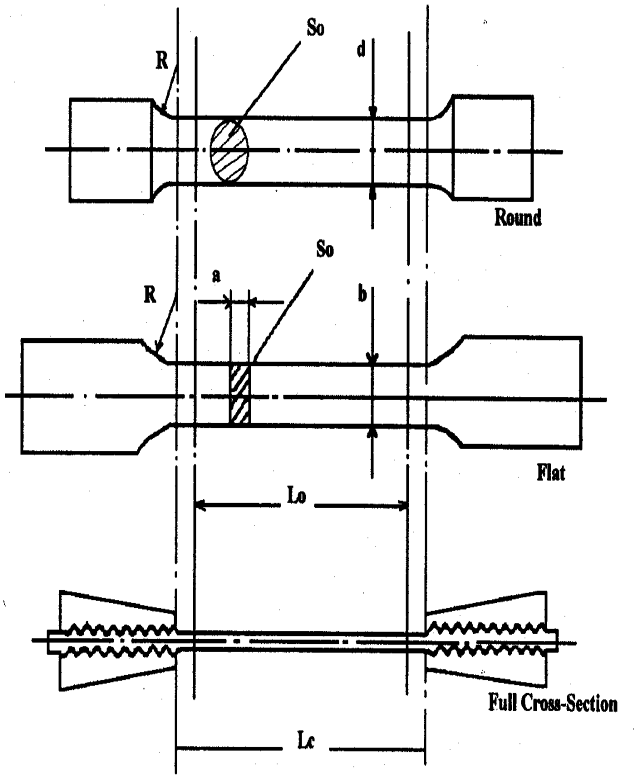

Fig. 2.1.1 : Tensile test specimens

2.1.2.1 The following symbols have been used in the figure and in subsequent paragraphs:-

d =diameter
a =thickness of specimen
b =width
Lo = Original gauge length
Lc = Parallel length
So = Original cross-sectional area
R = Transition radius
D =External tube diameter
t = plate thickness

2.1.2.2 The gauge length may be rounded off to the nearest 5 [mm] provided that the difference between this length and Lo is less than 10% of Lo.

2.1.2.3 For plates with thickness equal to and greater than 3 [mm], test specimen according to alternatives A or B given below are to be used. Where the capacity of the available testing machine is insufficient to allow the use of a test specimen of full thickness, this may be reduced by machining one of the rolled surfaces.

Alternatively for materials over 40 [mm] thick, proportional round test specimens with dimensions as specified in C below may be used.

Alternative A, Non-proportional flat test specimen

a = t
b =25 [mm]
Lo =200 [mm]
Lc $\geq$ 212.5 [mm]
R =25 [mm]

Alternative B, Proportional flat test specimen

a = t

b =25 [mm]

Lo = 5.65 $\sqrt{S_o}$

Lc $\approx$Lo + 2 $\sqrt{S_o}$

R =25 [mm]

Alternative C, round test specimen

d =14 [mm] in general, but in no case less than 10 mm nor more than 20 [mm].

Lo = 5d [mm

Lc $\geq$ Lo + d/2 [mm]

R =10 [mm], in general
$\geq$ 1.5 d [mm], for nodular cast iron and materials with a specified elongation of less than 10%.

2.1.2.4 The round test specimen is to be located with its center t/4 from the plate surface or as close to this position as possible.

2.1.2.5 For sheets and strips with thickness less than 3 [mm]

a = t
b =12.5 [mm]
Lo =50 [mm]
Lc $\approx$75 [mm]
R =25 [mm]

2.1.2.6 Wires: Full cross sectional test specimen with the following dimensions is to be used:

Lo =200 [mm]

Lc =Lo + 50 [mm].

2.1.2.7 For forgings, castings (excluding grey cast iron) and bars round test specimens with dimensions as specified in alternative C of 2.1.2.3 are usually to be used.

2.1.2.8 If for special reasons, other dimensions are to be used, they will have to conform with the following geometric relationship:

Lo =5d;

Lc =Lo + d:

R=10 [mm], except for materials with a specified minimum elongation A $\leq$ 10 per cent, where R is to be 1.5 x d.

2.1.2.9 For tubes, test specimen according to alternative A or B below are to be used:

Alternative A :- Full cross-section test specimens with plugged ends -

Lo = 5.65 $\sqrt{S_o}$

Lc $\approx$ Lo + D/2

Lc is the distance between the grips or the plugs, whichever is smaller.

Alternative B :- Strip
a =wall thickness of tube
b $\geq$ 12 [mm]
Lo = 5.65 $\sqrt{S_o}$
Lc = Lo + 2b

The parallel test length is not to be flattened. but the enlarged ends may be flattened for gripping in the testing machine.

Round test specimens may also be used provided that the wall thickness is sufficient to allow the machining of such specimens to the dimensions in alternative C in 2.1.2.3 above with their axes located at the midwall thickness.

2.1.2.10 The above is subject to any specific dimensions or minimum cross-sectional area requirements, with respect to test specimens, given in any subsequent Chapters of this Part.

2.1.2.11 Tensile test specimens for grey cast iron are to be machined to the dimensions shown in Fig.2.1.2. Usually test specimens are machined from separately cast standard test coupons with 30 [mm] diameter.

2.1.2.12 The tolerances on specimen dimensions are to be in accordance with ISO

6892-98 or other recognised standards as appropriate.

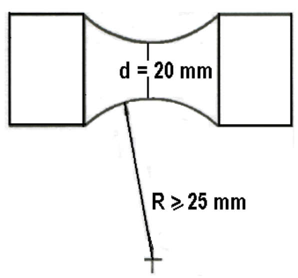

Fig : 2.1.2 : Tensile test specimen for grey cast iron

2.2 Fracture elongation

2.2.1 Unless otherwise specified, the elongation values in this part correspond to those required for proportional test specimens over a gauge length 5.65 $\sqrt{S_o}$.

If any part of the fracture takes place outside of the middle one-third of the original gauge length, the elongation value obtained may not be representative of the material. In such cases if the elongation measured is less than the minimum requirements, the test result may be discarded and a retest carried out.

2.2.2 If the material is ferritic steel of low or medium strength and not cold worked the elongation may also be measured on a non-proportional gauge length after agreement with IRS.

In that case the elongation required is to be calculated from the following formula:

$$A_o = 2 \times A_s \left[\frac{\sqrt{S_o}}{L_o} \right]^{0.4}$$

where,

A_o = Required elongation for the non-proportional test specimen

A_s = Specified elongation on a gauge length of 5.65$\sqrt{S_o}$

S_o = Cross-sectional area of test specimen

L_o = Gauge length of test specimen.

2.3 Definition of yield stress

2.3.1 The yield phenomenon is not exhibited by all the steels detailed in this Part but, for simplification the term "Yield Stress" is used throughout when requirements are specified for acceptance testing at ambient temperature.

2.3.2 Where reference is made to "Yield Stress" in the requirements for carbon, carbon-manganese and alloy steel products and in the requirements for the approval of welding consumables, either the upper yield stress or the 0.2 per cent proof stress under load is to be determined.

2.3.3 For austenitic and duplex stainless steel products and welding consumables, both the 0.2 per cent and 1.0 per cent proof stresses are to be determined.

2.4 Procedure for tensile testing at ambient temperature

2.4.1 Unless otherwise specified, the test is to be carried out at ambient temperature between 10^0C and 35^0C.

2.4.2 Yield stress (Yield point) is to be taken as the value of stress measured at the commencement of plastic deformation at yield or the value of the stress measured at the first peak obtained during yielding even when the peak is equal to or less than any subsequent peaks observed during plastic deformation at yield. The tensile test is to be carried out with an elastic stress rate within the limits indicated in Table 2.4.2.

Table 2.4.2

Modulus of elasticity of the material (E) [N/mm^2]	Rate of stressing [N/mm^2] per second	
	Min.	Max.
< 150 000	2	20
≥ 150 000	6	60

2.4.3 After reaching the yield or proof load, the straining rate may be increased to a maximum of 0.008 per second for the determination of tensile strength.

2.4.4 For steel, the upper yield stress is to be calculated from :

a) the load immediately prior to a distinct drop in the testing machine lever; or

b) the load immediately prior to a fall back in the movement of the pointer or the load at a marked hesitation of this pointer; or

c) a load/extension diagram using the value of load measured either at the commencement of plastic deformation or yield or at the first peak obtained during yielding even when that peak is equal to or less than any subsequent peaks observed.

2.4.5 The 0.2 or 1.0 per cent proof stress (non-proportional elongation) is to be determined from an accurate load/extension diagram by drawing a line parallel to the straight elastic portion and distant from it by an amount representing 0.2 or 1.0 per cent of extensometer gauge length. The point of intersection of this line with the plastic portion of the diagram represents the proof load, from which 0.2 or 1.0 per cent proof stress can be calculated.

2.5 Procedure for tensile testing at elevated temperatures

2.5.1 The test specimens used for the determination of lower yield or 0.2 per cent proof stress at elevated temperatures are to have an extensometer gauge length of not less than 50 [mm] and a cross sectional area of not less than 65 [mm^2]. Where, however, this is precluded by the dimensions of the product or by the test equipment available, the test specimen is to be of the largest practical dimensions.

2.5.2 The heating apparatus is to be such that the temperature of the specimen during testing does not deviate from that specified by more than ± 5°C.

2.5.3 The straining rate when approaching the lower yield or proof load is to be controlled within the range 0.1 to 0.3 per cent of the extensometer gauge length per minute.

2.5.4 The time intervals used for estimation of strain rate from measurements of strain are not to exceed 6 seconds.

Section 3

Impact Tests

3.1 Dimensions of test pieces

3.1.1 Impact tests are to be of either the charpy V-notch or the charpy U-notch type as required by the subsequent Chapters. The test specimens are to be machined to the dimensions and tolerances given in Table 3.1.1 and Table 3.1.2 and are to be carefully checked for dimensional accuracy.

3.1.2 For material under 10 [mm] in thickness the largest possible size of standard subsidiary charpy V-notch is to be prepared with the notch cut in the narrow face. Generally impact tests are not required when the thickness of material is less than 5 [mm] (less than 6 [mm] for pipes and tubes).

Table 3.1.1 : Dimensions and tolerances for charpy V-notch impact test specimens

Dimensions	Nominal	Tolerance
Length [mm]	55	± 0.60
Width [mm]		
- standard specimen	10	± 0.11
- subsize specimen	7.5	± 0.11
- subsize specimen	5	± 0.06
Thickness [mm]	10	± 0.06
Angle of notch	45°	± 2°
Depth below notch [mm]	8	± 0.06
Root radius [mm]	0.25	± 0.025
Distance of notch from end of specimen [mm]	27.5	± 0.42
Angle between plane of symmetry of notch and longitudinal axis of test specimen	90°	± 2°
Ref. Fig.3.1.1		

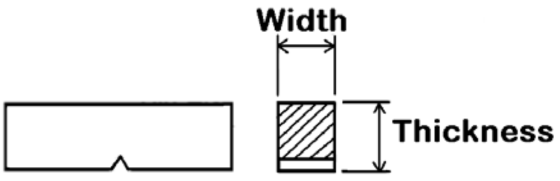

Fig.3.1.1

Table 3.1.2: Dimensions and tolerances for charpy U-notch impact test specimens		
Dimensions	**Nominal**	**Tolerance**
Length [mm]	55	± 0.60
Width [mm]	10	± 0.11
Thickness [mm]	10	± 0.11
Depth of notch [mm]	5	± 0.09
Root radius [mm]	1	± 0.07
Distance of notch from end of test specimen [mm]	27.5	± 0.42
Angle between plane of symmetry of notch and longitudinal axis of test specimen	90°	± 2°
Ref. Fig.3.1.1		

3.2 Testing procedure

3.2.1 All impact tests are to be carried out on Charpy machines having a striking energy of not less than 150J and complying with following requirements:-

a) Distance between supports 40 + 5 [mm] - 0

b) Radius of curvature of supports 1 -1.5 [mm]

c) Taper of supports 1 in 5

d) Angle at tip of hammer 30 ± 1°

e) Radius of curvature of hammer 1.0 -2.5 [mm]

f) Speed of hammer at the instant of striking 4.5 - 7 [m/sec].

3.2.2 Charpy U-notch impact tests are generally to be carried out at ambient temperature. Charpy V- notch impact tests may be carried out at ambient or lower temperatures in accordance with specific requirements given in subsequent Chapters. Where the test temperature is other than ambient, the temperature of the test specimen is to be controlled to within ± 2°C for sufficient time to ensure uniformity throughout the cross section of the test specimen, and suitable precautions are to be taken to prevent any significant change in temperature during the actual test. In cases of dispute, ambient temperature is to be considered as 18°C -27°C.

3.2.3 When reporting results, the units used for expressing the energy absorbed and the testing temperature are to be clearly stated. It is preferred that energy values for both charpy V-notch and charpy U-notch impact tests be expressed in Joules and not [J/cm^2].

3.2.4 The minimum average values for specimens are as given in Table 3.2.4.

Table 3.2.4	
Charpy V-notch specimen size	**Minimum energy, average of 3-specimens**
10 mm x 10 mm	E
10 mm x 7.5 mm	5E/6
10 mm x 5.0 mm	2E/3
Notes: E = the values of energy specified for full thickness 10 mm x 10 mm specimens All other dimensions and tolerances are to be as specified in Table 3.1.1. Only one individual value may be below the specified average value provided it is not less than 70% of that value. In all cases, the largest size Charpy specimens possible for the material thickness shall be machined	

Section 4

Ductility Testing of Pipes and Tubes

4.1 Bend tests

4.1.1 The test specimens are to be cut as circum- ferential strips of full wall thickness and with a width of not less than 40 [mm]. For thick walled pipes, the thickness of the test specimens may be reduced to 20 [mm] by machining. The edges of specimen may be rounded to a radius of 1.6 [mm].

4.1.2 Testing is to be carried out at ambient temperature, and the specimens are to be doubled over, in the direction of the original curvature, around a former. The diameter of the former is to be in accordance with the specific requirements for the material. The test is to be considered satisfactory if, after bending, the specimens are free from cracks and laminations. Small cracks at the edges of the test specimen are to be disregarded.

4.2 Flattening tests

4.2.1 The test specimens are to be cut with the ends perpendicular to the axis of the pipe or tube. The length of the specimen is to be not less than 10 [mm] or greater than 100 [mm].

4.2.2 Testing is to be carried out at ambient temperature and is to consist of flattening the specimens in a direction perpendicular to the longitudinal axis of the pipe. (Reference is made to ISO 8492). Flattening is to be carried out between two plain parallel and rigid platens which extend over both the full length and width after flattening of the test specimen. Flattening is to be continued until the distance between the platens, measured under load, is not greater than the value given by the formula:-

$$H = \frac{t\,(1 + C)}{C + \frac{t}{D}}$$

where,

H = distance between platens [mm];

t = specified thickness of the pipe [mm];

D = Specified outside diameter [mm];

C = a constant dependent on the steel type and detailed in the specific requirements.

After flattening, the specimens are to be free from cracks or other flaws. Small cracks at the ends of the test specimens may be disregarded.

4.2.3 For welded pipes or tubes, the weld is to be placed at an angle of 90° to the direction of the pressure.

4.3 Drift expanding test

4.3.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The edges of the end to be tested may be rounded by filing.

Metallic tubes: The length 'L' equal to twice the external diameter 'D' of the tube if the angle of the drift is 30° and L equal to 1.5D if the angle of the drift is 45° or 60°. (Reference ISO 8493). The test piece may be shorter if after testing the remaining cylindrical portion is not less than 0.5D.

The rate of penetration of the mandrel is not to exceed 50 [mm]/minute.

4.3.2 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the tube symmetrically by means of a hardened conical steel mandrel having a total included angle of 45° or 60°. The mandrel is to be forced into the test specimen until the percentage increase in the outside diameter of the end of the test specimen is not less than the value given in the specific requirements for boiler and superheater tubes. The mandrel is to be lubricated, but there is to be no rotation of the tube or mandrel during the test. The expanded portion of the tube is to be free from cracks or other flaws.

4.4 Flanging tests

4.4.1 The test specimens are to be cut with the ends perpendicular to the axis of the tube. The length of the specimens is to be approximately 1.5D. The length may be shorter provided that after testing the remaining cylindrical portion is not less than O.5D (Reference ISO 8494). The edges of the end to be tested may be rounded by filing. The rate of penetration shall not exceed 50 [mm]/minute.

4.4.2 Testing is to be carried out at ambient temperature and is to consist of flanging the end of the tube symmetrically by means of hardened conical steel mandrels.

4.4.3 The first stage of flanging is to be carried out with a conical angled mandrel having an included angle of approximately 90° (See Fig.4.4.3(a)) The completion of the test is achieved with a second forming tool as shown in Fig.4.4.3(b). The mandrels are to be lubricated and there is to be no rotation of the tube or mandrels during the test. The test is to continue until the drifted portion has formed a flange perpendicular to the axis of the test specimens. The percentage increase in the external diameter of the end of specimens is not to be less than the value given in the specific requirements for boiler and superheater tubes. The cylindrical and flanged portion of the tube is to be free from cracks or other flaws.

4.5 Ring expanding test

4.5.1 The test piece consists of a ring having a length of between 10 to 16 [mm]. (Reference ISO 8495). The rate of penetration of the mandrel is not to exceed 30 [mm]/second.

4.6 Ring tensile test

4.6.1 The ring is to have a length of about 15 [mm] with plain and smoothed ends cut perpendicular to the tube axis. The ring is to be drawn to fracture by means of two mandrels placed inside the ring and pulled in tensile testing machine. The rate shall not exceed 5 [mm]/second. (Reference ISO 8496).

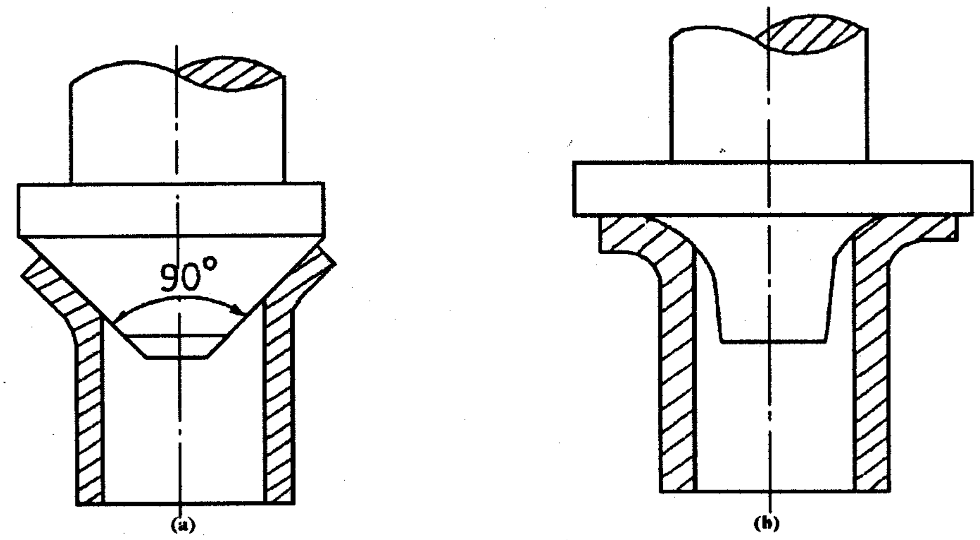

Fig.4.4.3 : Flanging test

Section 5

The Brittle Crack Arrest Toughness Test

5.1 Scope

The standard ESSO test method described in this section is used to estimate the brittle crack arrest toughness value K_{ca} of rolled steel plates for hull of thickness not greater than100 [mm].

5.2 Symbols

Table 5.2 : Symbols used and their meanings

Symbol	Unit	Meaning
t_S	mm	Thickness of test specimen
W_S	mm	Width of test specimen
L_S	mm	Length of test specimen
t_r	mm	Thickness of tab plate
W_r	mm	Width of tab plate
L_r	mm	Length of tab plate
L_P	mm	Distance between pins
a	mm	Length of crack projected on surface normal to the line of load
a_a	mm	Maximum crack length at brittle crack arrest position
T	^oC	Temperature of test specimen
dT/da	$^oC/mm$	Temperature gradient of test specimen
σ	N/mm^2	Gross stress in tested part (load / $W_S.t_S$)
K_{ca}	$N/mm^{3/2}$	Brittle crack arrest toughness value

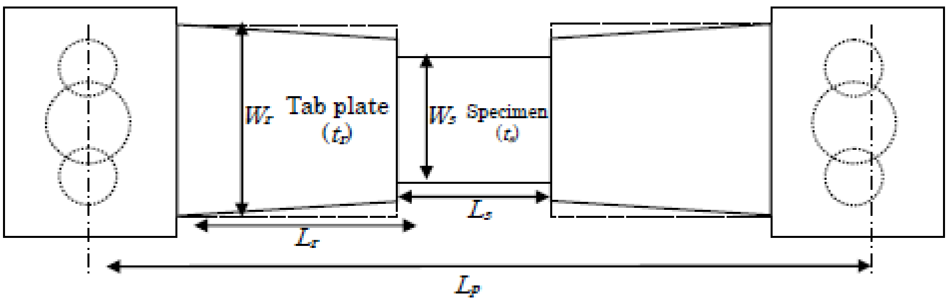

Fig.5.2 : Conceptual view of test specimen, tab and load jig

5.3 Purpose

The purpose of this test is to assess brittle crack arrest toughness with temperature gradient and to obtain the corresponding brittle crack arrest toughness value K_{ca}.

5.4 Standard test specimen

5.4.1 Fig.5.4.1 shows the shape and size of the standard test specimen.

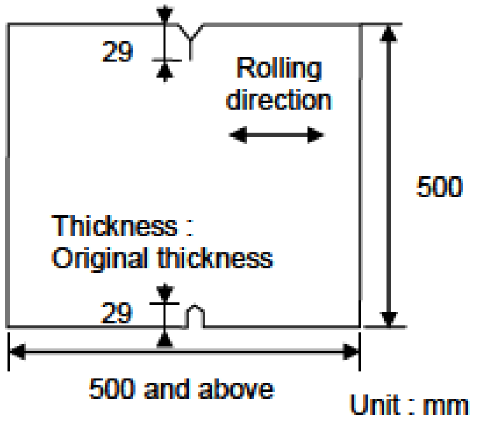

Fig 5.4.1 Shape and size of specimen

5.4.2 The thickness and width of the test specimen is to be in accordance with Table 5.4.2.

Table 5.4.2 : Thickness and width of test specimen	
Thickness, t_s	100[mm] and below
Width of the test specimen W_s	500 [mm]

Note: If the width of the test specimen cannot be made at 500 [mm], it may be taken as 600 [mm].

5.4.3 The test specimens are to be taken from the same steel plate.

5.4.4 Test specimens are to be taken in such a way that the axial direction of the load is parallel to the rolling direction of the steel plate.

5.4.5 The thickness of the test specimen is to be the same as the thickness of the steel plate to be used in the vessel structure.

5 5 Test equipment

5.5.1 The test equipment to be used is to consist of pin load type hydraulic test equipment capable of tensile tests.

5.5.2 The distance between the pins is to be not less than 2,000 [mm]. The distance between pins refers to the distance between the centers of the pin diameters.

5.5.3 Drop weight type or air gun type impact equipment may be used for the impact energy required for generating brittle cracks.

5.5.4 The wedge is to have an angle greater than the upper notch of the test specimen, and an opening force is to be applied on the notch.

5.6 Test preparations

5.6.1 The test piece is to be fixed directly to the pin load jig or by means of weld joint through the tab plate. The overall length of the test specimen and tab plate is to be not less than 3Ws.

The thickness and width of the tab plate are to be in accordance with Table 5.6.1.

Table 5.6.1 : Allowable dimensions of tab plate

Thickness: t_r	Width: W_r
$0.8t_s \le t_r \le 1.5t_s$ (See Notes 1 and 2)	$W_s \le W_r \le 2W_s$

Note 1: t_s : Thickness of test specimen

Note 2: If the tab plate has a thickness smaller than the test specimen, the reflection of stress wave will be on the safer side for the assessment; therefore, considering the actual circumstances for conducting the test, the lower limit of thickness is taken as $0.8t_s$.

5.6.2 Thermocouples are to be fitted at 50 mm pitch on the notch extension line of the test specimen.

5.6.3 If the brittle crack is estimated to deviate from its presumed course, thermocouples are to be fitted at two points separated by 100 mm on the line of load from the notch extension line at the centre of width of the test specimen.

5.6.4 If dynamic measurements are necessary, strain gauges and crack gauges are to be fitted at specific locations.

5.6.5 The test specimen is to be fixed to the testing machine together with the tab plate after welding and the pin load jig.

5.6.6 The impact equipment is to be mounted. The construction of the impact equipment is to be such that the impact energy is correctly transmitted. An appropriate jig is to be arranged to minimize the effect of bending load due to the impact equipment.

5.7 Test method

5.7.1 To eliminate the effect of residual stress or correct the angular deformation of tab welding, a preload less than the test load may be applied before cooling.

5.7.2 Cooling and heating may be implemented from one side on the side opposite the side on which the thermocouple is fitted, or from both sides.

5.7.3 The temperature gradient is to be controlled in the range of 0.25[^{o}C/mm] to 0.35[^{o}C/mm] in the range of width from $0.3W_s$ to $0.7W_s$ at the central part of the test specimen.

5.7.4 When the specific temperature gradient is reached, the temperature is to be maintained for more than 10 minutes, after which the specified test load may then be applied.

5.7.5 After maintaining the test load for at least 30 seconds, a brittle crack is to be generated by impact. The standard impact energy is taken as 20 to 60 [J] per 1 [mm] plate thickness. If the brittle crack initiation characteristics of the base metal are high, and it is difficult to generate a brittle crack, the impact energy may be increased to the upper limit of 120 [J] per 1 [mm] plate thickness.

5.7.6 Loading is stopped when the initiation, propagation, and arrest of crack have been confirmed. Normal temperature is restored, and if necessary, the ligament is broken by gas cutting and forcibly the specimen is broken by using the testing machine. Or, after the ductile crack has been propagated to an adequate length with the testing machine, the ligament is broken by gas cutting.

5.7.7 After forcing the fracture, photos of the fractured surface and the propagation route are to be taken, and the crack length is to be measured.

5.8 Test results

5.8.1 The distance from the top of the test specimen including the notch to the maximum length in the plate thickness direction of the arrested crack tip is to be measured. If the crack surface deviates from the surface normal to the line of load of the test specimen, the projected length on the surface normal to the line of load is to be measured. In this case, if the trace of brittle crack arrest is clearly visible on the fractured surface, the first crack arrest position is taken as the arrest crack position.

5.8.2 From the results of thermocouple measurement, the temperature distribution curve is to be plotted, and the arrest crack temperature is to be measured corresponding to the arrest crack length.

5.8.3 The brittle crack arrest toughness value (K_{ca} value) of each test is to be determined by using the following formula:

$$K_{ca}=\sigma\sqrt{\pi a}\sqrt{\left(\frac{2W_s}{\pi a}\right)\tan\left(\frac{\pi a}{2W_s}\right)}$$

5.9 Report

5.9.1 The following items are to be reported:

(i) Testing machine specifications; testing machine capacity, distance between pins (L_p)

(ii) Load jig dimensions; tab plate thickness (t_r), tab plate width (W_r), test specimen length including tab plate (L_s + 2L_r)

(iii) Test specimen dimensions; plate thickness (t_s); test specimen width (W_s) and length (L_s)

(iv) Test conditions; preload stress, test stress, temperature distribution (figure or table) impact energy

(v) Test results; crack arrest length (a_a), temperature gradient at arrest position, brittle crack arrest toughness (K_{ca})

(vi) Dynamic measurement results (if measurement is carried out); crack growth rate, strain change

(vii) Test specimen photos; fracture route, fractured surface

5.9.2 If the conditions below are not satisfied, the test results are to be treated as reference values.

(i) The brittle crack arrest position is to be in the range of the hatched part shown in Fig.5.9.1

In this case, if the brittle crack arrest position is more than 50 [mm] away from the centre of the test specimen in the longitudinal direction of the test specimen, the temperature of the thermocouple at the ±100 [mm] position is to be within ±3[^{o}C] of the thermocouple at the centre.

(ii) The brittle crack should not have a distinct crack bifurcation while it propagates.

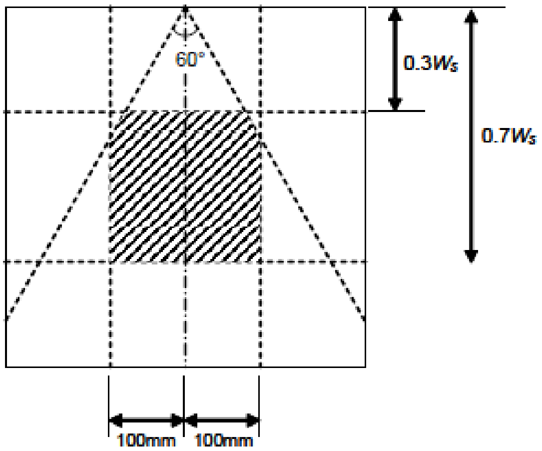

Fig. 5.9.1 Necessary conditions for arrest crack position

5.9.3 From effective test results measured at more than 3 points, the linear approximation equation is to be determined on the Arrhenius plot, and K_{ca} at the desired temperature is to be calculated. In this case, data should exist on both sides, that is, the high temperature and low temperature sides around the assessed temperature.

End of Chapter

Chapter 3

Rolled Steel Plates, Strips, Sections and Bars

Contents

Section 1

General Requirements

1.1 Scope

1.1.1 This Chapter gives general requirements for hot rolled plates, strips and sections intended for use in the construction of ships, boilers, pressure vessels and machinery structures. These requirements are also applicable to hot rolled bars, except where such materials are intended for the manufacture of bolts, shafts, etc. by machining operations only. When used for this purpose hot rolled bars are to comply with the requirements of Ch. 5.

1.2 Manufacture

1.2.1 The steel is to be manufactured at the approved works by the open hearth, electric furnace or one of the basic oxygen processes or by other processes specially approved by IRS.

The approval of the steel works is to be carried out in accordance with IRS Classification Notes: 'Approval scheme for the manufacturing process of normal and higher strength hull structural steels'.

1.2.2 The suitability of each grade of steel for forming and welding is to be demonstrated during the initial approval tests at the steel works. The type and the extent of testing required is at the discretion of IRS.

1.2.3 It is the manufacturer's responsibility to assure that effective process and production controls in operation are adhered to in accordance with the manufacturing specifications. Where control imperfection that may lead to inferior quality of product occurs, the manufacturer is to identify the cause and establish counter measure to prevent its occurrence. Also the complete investigation report is to be submitted to the Surveyor. Each affected piece considered for further usage is to be tested to the Surveyor's satisfaction.

The frequency of testing may be increased to gain confidence for subsequent products as considered necessary.

1.3 Quality of materials

1.3.1 Defects not prejudicial to the proper application of steel are not, except by special agreement, to be grounds for rejection. Where necessary, suitable methods of non-destructive examination may be used for the detection of harmful surface and internal defects. The extent of this examination, together with appropriate acceptance standards, is to be agreed between the purchaser, manufacturer and Surveyors.

1.4 Thickness tolerance of plates and wide flats with width ≥ 600 [mm]

1.4.1 The tolerance on thickness of a given product are defined as follows:

a) Minus tolerance is the lower limit of the acceptable range below the nominal thickness.

b) Plus tolerance is the upper limit of the acceptable range above the nominal thickness.

Note : Nominal thickness is defined by the purchaser at the time of enquiry and order.

1.4.2 The minus tolerance for products for normal strength, higher strength and high strength quenched and tempered steels is 0.3 [mm] irrespective of nominal thickness.

1.4.3 The minus tolerance for products intended for machinery structures are to be in accordance with Table 1.4.3.

Table 1.4.3

Nominal thickness [mm]	Minus tolerance [mm]
≥ 5 to < 8	-0.4
≥ 8 to < 15	-0.5
≥ 15 to < 25	-0.6
≥ 25 to < 40	-0.8
≥ 40	-1.0

1.4.4 The tolerance for thickness below 5 [mm] may be specially agreed.

1.4.5 The plus tolerance on nominal thickness is to be in accordance with a recognized national or international standard or as specified.

1.4.6 The tolerance on sections (except for wide flats) are to be in accordance with the requirements of recognized international or national standard.

1.4.7 The tolerance on nominal thickness are not applicable to areas repaired by grinding which are to be in accordance with a recognized standard.

1.4.8 For materials intended for applications as detailed in Sec. 5 and 6, no minus tolerance is permitted in the thickness of plates and strip.

1.4.9 The responsibility for verification and maintenance of the production within the required tolerance rests with the manufacturer. The Surveyor may require to witness some measurements.

1.4.10 The responsibility for storage and maintenance of the delivered products with acceptable level of surface conditions rests with the shipyard before the products are used in fabrication.

1.4.11 Where zero minus tolerance is applied in accordance with Class C of ISO 7452, the requirements of 1.4.12 to 1.4.14 need not be applied.

Additionally, if ISO 7452 is applied, it is required that the steel mill demonstrate to the satisfaction of IRS that the number of measurements and measurement distribution is appropriate to establish that the mother plates produced are at or above the specified nominal thickness.

1.4.12 Average thickness

1.4.12.1 The average thickness of a product or products is defined as the arithmetic mean of the measurements made in accordance with the requirements of 1.4.13.

1.4.12.2 The average thickness of a product or products for hull structural steels is not to be less than the nominal thickness.

1.4.13 Thickness measurements

1.4.13.1 The thickness is to be measured at locations of a product or products as defined in 1.4.14.

1.4.13.2 Automated method or manual method may be applied to the thickness measurements.

1.4.13.3 The procedure and the records of measurements are to be made available to the Surveyor and copies provided on request.

1.4.14 Thickness measuring locations

1.4.14.1 The requirements of 1.4.14.2 are to be applied to the thickness measuring locations for the thickness tolerance and the average thickness of the product.

1.4.14.2 At least two lines among Line 1, Line 2 or Line 3 as shown in Fig.1.4.14.2 are to be selected for the thickness measurements and at least three points on each selected line are to be selected for thickness measurement. If more than three points are taken on each line the number of points are to be equal on each line.

Note : The measurement locations apply to a product rolled directly from one slab or steel ingot even if the product is to be later cut by the manufacturer. Examples of the original measurements relative to later cut products are shown in Fig. 1.4.14.2b), It is to be noted that the examples shown are not representative of all possible cutting scenarios.

For automated methods, the measuring points at sides are to be located not less than 10 [mm] but not greater than 300 [mm] from the transverse or longitudinal edges of the product.

For manual methods, the measuring points at sides are to be located not less than 10 [mm] but not greater than 100 [mm] from the transverse or longitudinal edges of the product.

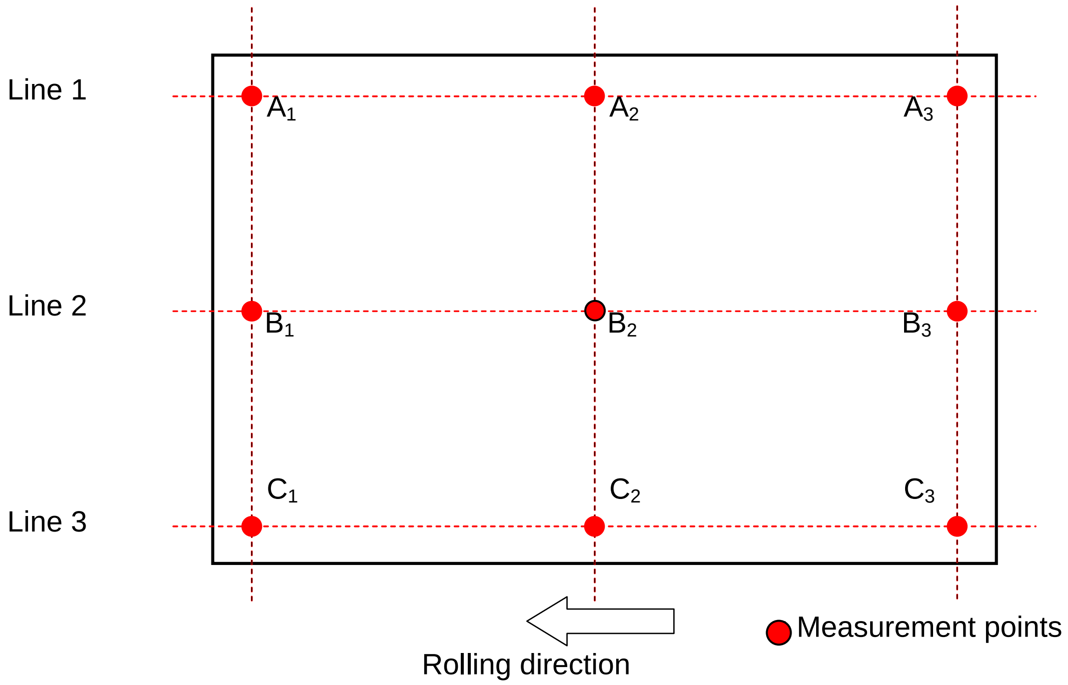

Fig. 1.4.14.2a) : Locations of Thickness Measuring Points for the Original Steel Plates

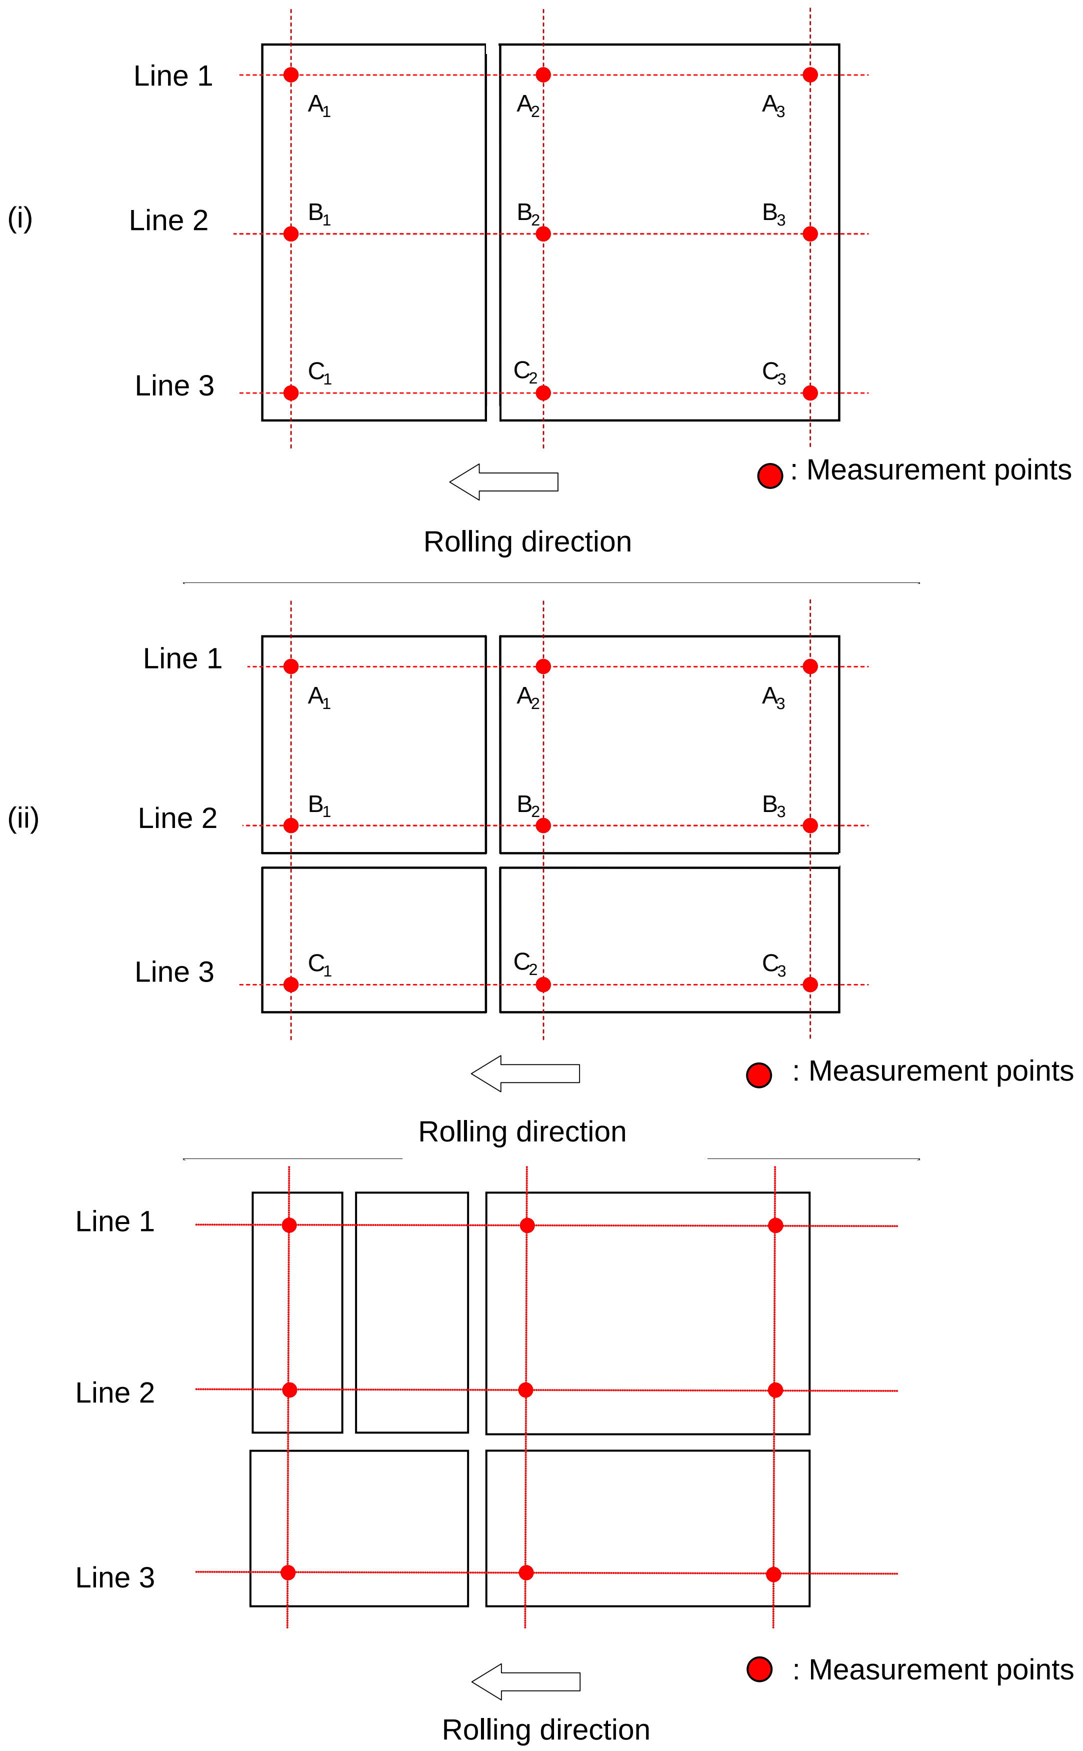
Fig. 1.4.14.2b) : Locations of Thickness Measuring Points for the Cut Steel Products



1.5 Heat treatment, condition of supply

1.5.1 All materials are to be supplied in the heat treated conditions described in the subsequent sections of this chapter unless supply in the as-rolled condition is allowed.

1.5.2 Where the material is supplied in the as rolled condition and intended for subsequent hot forming, the manufacturer is to carry out any heat treatment which may be necessary to prevent hydrogen cracking or make the material in a safe condition for transit and Surveyors are to be advised of any such heat treatment carried out. This requirement is applicable mainly to carbon and carbon-manganese steel products over 50 [mm] thick and to alloy steel products.

1.5.3 Where controlled rolling or thermo-mechanical processing is permitted as an alternative to normalising, these procedures may be used subject to full details being submitted and a test program being carried out under the supervision of the Surveyors and the test results being found satisfactory by IRS. These rolling processes are defined as follows:

(See Fig.1.5.3).

a) As rolled, AR - this procedure involves the rolling of steel at high temperature followed by air-cooling. The rolling and finishing temperatures are typically in the austenite recrystalisation region and above the normalising temperature. The strength and toughness properties of steel produced by this process are generally less than steel heat treated after rolling or than steel produced by advanced processes.

b) Normalising, N - normalising involves heating rolled steel above the critical temperature, Ac3 and in the lower end of the austenite recrystalisation region followed by air-cooling. The process improves the mechanical properties of as rolled steel by refining the grain size.

c) Controlled rolling, CR - this is a procedure in which generally the final rolling temperature is controlled within the range used for normalising heat treatments so that the austenite completely recrystallises.

d) Quenching and Tempering, QT – Quenching involves a heat treatment process in which steel is heated to an appropriate temperature above the Ac3 and then suddenly cooled with an appropriate coolant for the purpose of hardening the microstructure. Tempering subsequent to quenching is a process in which the steel is reheated to an appropriate temperature not higher than the Ac1 to restore toughness properties by improving the microstructure.

e) Thermo-mechanical Rolling, TM – Thermo-mechanical controlled processing - this is a procedure which involves the strict control of both the steel temperature and the rolling reduction. Generally a high proportion of the rolling reduction is carried out close to or below the AR3 transition temperature and may involve rolling towards the lower end of the temperature range of the inter critical duplex phase region thus permitting little if any recrystallisation of the austenite. Unlike controlled rolled (normalised rolling) the properties conferred by TM (TMCP) cannot be reproduced by subsequent normalising or other heat treatment.

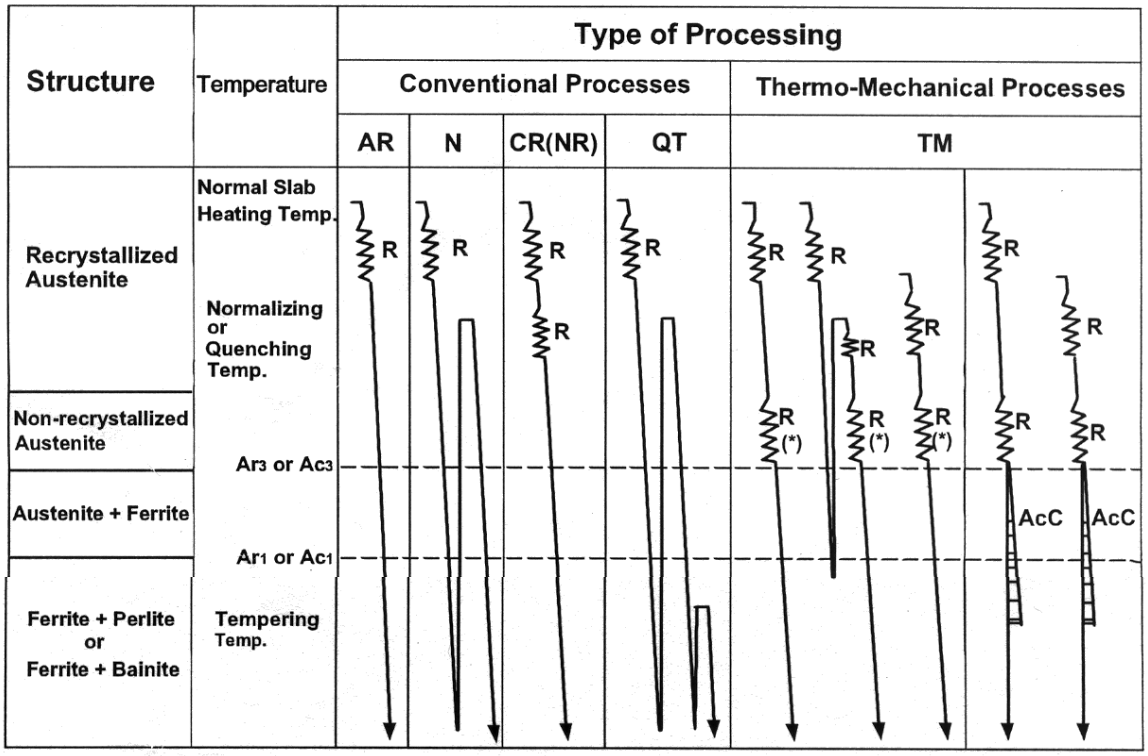
   The use of accelerated cooling on completion of TM-rolling may also be accepted subject to the special approval of IRS. The same applies for use of tempering after completion of the TM-rolling.

f) Accelerated cooling AcC - accelerated cooling is a process, which aims to improve mechanical properties by controlled cooling with rates higher than air cooling immediately after the final TM-rolling operation. Direct quenching is excluded from the accelerated cooling.

   The material properties conferred by TM and AcC cannot be reproduced by subsequent normalising or other heat treatment.

1.5.3.1 Where CR and TM with/without AcC are applied, the programmed rolling schedules are to be verified by IRS at the steel works and are to be made available when required by the attending Surveyor. On the manufacturer's responsibility, the programmed rolling schedules are to be adhered to during the rolling operation. (Refer 1.2.3). To this effect, all the records of actual rolling are to be reviewed by the manufacturer and occasionally by the Surveyor.

When deviation from the programmed rolling schedules or normalizing or quenching and tempering procedures occurs, the manufacturer shall take further measures required in 1.2.3 to the Surveyor's satisfaction.



Notes:

AR:	As Rolled
N:	Normalizing
CR(NR):	Controlled Rolling (Normalizing Rolling)
QT:	Quenching and Tempering
TM:	Thermo-Mechanical Rolling (Thermo-Mechanical Controlled Process)
R:	Reduction
(*):	Sometimes rolling in the dual-phase temperature region of austenite and ferrite
AcC:	Accelerated Cooling

Fig.1.5.3 : Schematic Diagrams of Thermo-Mechanical and Conventional Processes

1.5.3.2 The conditions of supply and the impact test requirements are detailed in subsequent sections of the Chapter.

1.6 Test material

1.6.1 All material in a batch presented for acceptance tests are to be of the same product form e.g. plates, flats, sections. etc., from the same cast and in the same condition of supply.

1.6.2 Test samples

a) The test samples are to be fully representative of the material and, where appropriate, are not to be cut from the material until heat treatment has been completed.

b) The test specimens are not to be separately heat treated in any way.

1.6.3 Unless otherwise agreed, the test samples are to be taken from the following position :

1.6.3.1 **Plates and flats with a width ≥ 600 [mm]** : The test samples are to be taken from one end at a position approximately midway between the axis in the direction of the rolling and the edge of the rolled product (See Fig.1.6.1 a). Unless otherwise agreed the tensile test specimens are to be prepared with their longitudinal axis transverse to the final direction of rolling.

1.6.3.2 **Flats with a width < 600 [mm], bulb flats and other sections** : For flats having a width of 600 [mm] or less, bulb flats and other sections the test specimens are to be taken from one end at a position approximately one third from the outer edge (See Figs.1.6.1 b,c,d), or in the case of small sections as near as possible to this position. In the case of channels, beams or bulb angles the test samples may alternatively be taken from a position approximately one quarter of the width from the web centreline or axis (See Fig.1.6.1 c). The tensile test specimens may be prepared with their longitudinal axis either parallel or transverse to the final direction of rolling.

1.6.3.3 **Bars and other similar products**: The test specimens are to be taken so that the axis of the test specimen is parallel to the direction of rolling. For small sizes, the test specimen may consist of a suitable length of the full cross section of the product (the impact test specimen receiving nevertheless the necessary machining). For larger sizes, the test samples are to be taken so that the axis of the test specimen lies as near as possible to the following :

a) for non-cylindrical sections, at one third of the half diagonal from the outside.

b) for cylindrical sections, at one third of the radius from outside (See Fig.1.6.1 e).

1.6.3.4 For plates and flats with thicknesses in excess of 40 [mm], full thickness specimens may be prepared, but when instead a machined round specimen is used then the axis is to be located at a position lying one-quarter of the product thickness from the surface as shown in Fig.1.6.1.f.

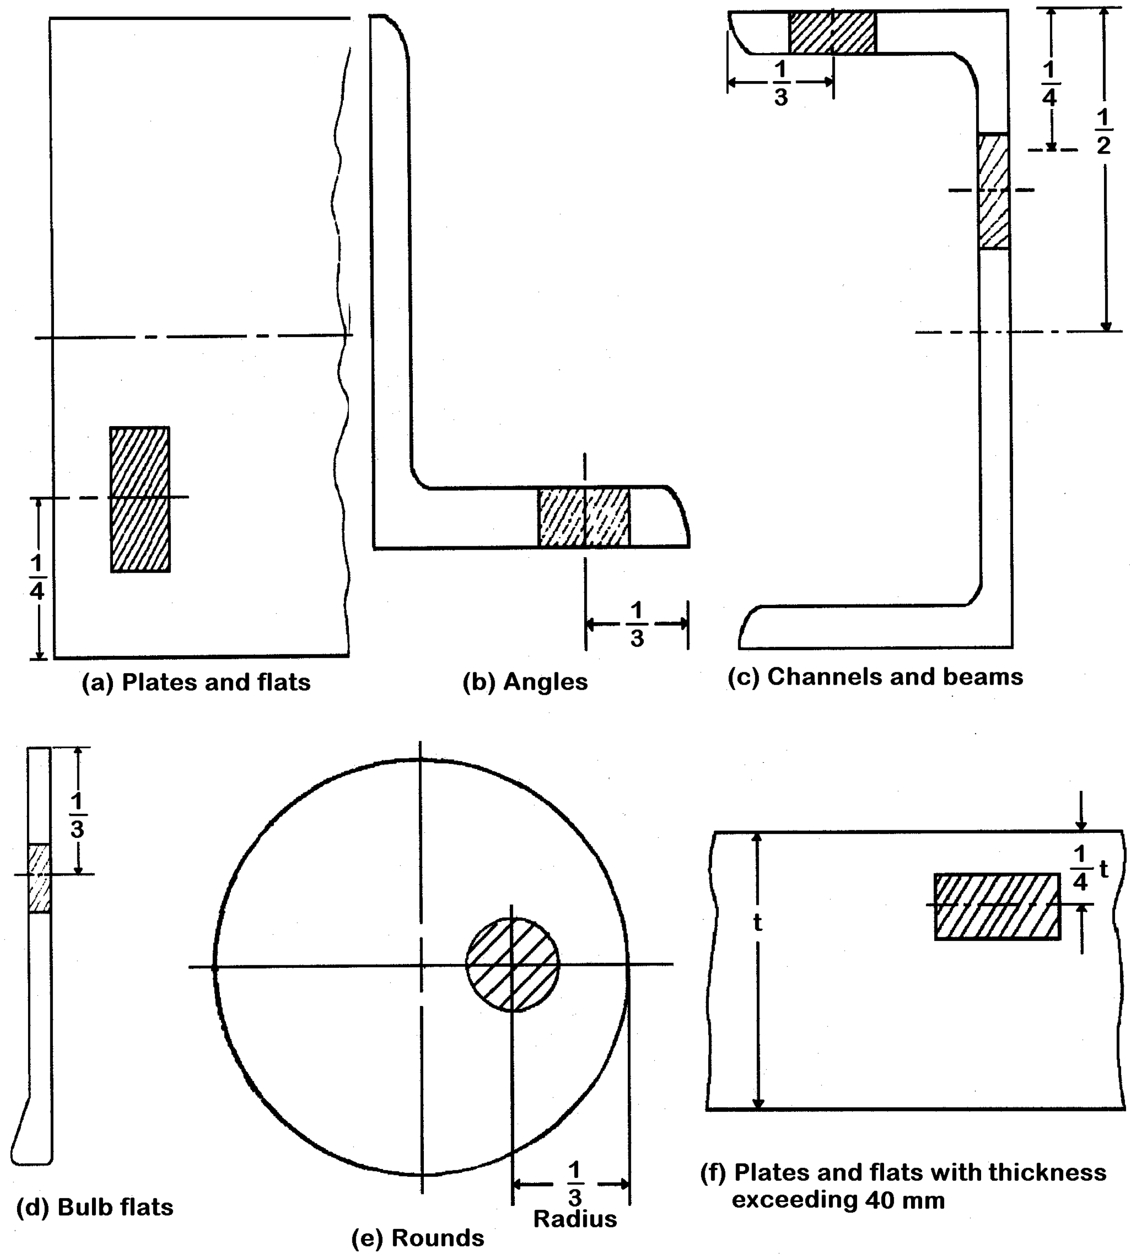


Fig.1.6.1 : Samples for testing

1.7 Mechanical test specimens

1.7.1 The tensile test specimens are to be machined to the dimensions detailed in Ch. 2.

1.7.2 Impact test specimens: The impact test specimens are to be of the charpy V-notch type machined to the dimensions detailed in Ch. 2 and cut with their longitudinal axis either parallel or transverse to the final direction of rolling of the material. They are to be taken from a position close to one of the rolled surfaces, except that for plates and sections over 40 [mm] thick the axis of test specimens are to be one quarter of the thickness from one of the rolled surfaces. For bars and other similar products the axis of the test specimens are to be as specified in 1.6.3.3. The notch is to be cut in a face of the test specimen which was originally perpendicular to the rolled surface. The position of the notch is to be not nearer than 25 [mm] to a flame-cut or sheared edge.

1.8 Surface inspection and dimensions

1.8.1 Surface inspection and verification of dimensions are the responsibility of the steel-maker, and acceptance by the Surveyors of material later found to be defective shall not absolve the steel maker from this responsibility. The manufacturer is also responsible for compliance with the general requirements concerning freedom from harmful internal defects.

1.9 Freedom from defects

1.9.1 All products must have a workmanlike finish and must be free from defects and imperfections which may impair their proper workability and use. This may however, include some discontinuities of a harmless nature, minor imperfections e.g. pittings, rolling in scale, indentations, roll marks, scratches and grooves which cannot be avoided completely despite proper manufacturing and which will not be objected to provided they do not exceed the acceptable limits contained herein.

1.9.2 **Imperfections** : Notwithstanding this, the products may have imperfections exceeding the discontinuities inherent to the manufacturing process, as defined under 1.9.1. In such cases, limits for their acceptability are to be agreed with IRS, taking the end use of the product into consideration.

1.9.3 **Defects** : Cracks, shells, sand patches and sharp edged seams are always considered defects which would impair the end use of the product and which require rejection or repair, irrespective of their size and number. The same applies to other imperfection exceeding the acceptable limits.

1.10 Repairs

1.10.1 Surface defects in structural steel may be removed by local grinding, provided that

a) the nominal product thickness will not be reduced by more than 7 per cent or 3 [mm], whichever is the less.

b) each single ground area does not exceed 0.25 [m^2].

c) each single ground area does not exceed 2 per cent of the total surface in question.

   Ground areas lying in a distance less than their average breadth to each other are to be regarded as one single area.

d) Ground area lying opposite each other on both surfaces must not decrease the product thickness by values exceeding the limits as stated above in a, b and c.

e) the ground area must have smooth transition to the surrounding surface of the product. Ground areas lying in a distance less than their average breadth to each other are to be regarded as one single area. The repairs are to be agreed with the Surveyor in each case and are to be carried out under his supervision unless otherwise agreed. Complete elimination of the defects may be verified by a magnetic particle or dye penetrant test procedure at the Surveyors' discretion.

f) Where necessary the entire surface may be ground to a depth as given by the under thickness tolerances of the product.

1.10.2 Surface defects which cannot be dealt with as in 1.10.1 may be repaired by chipping and/ or grinding followed by welding subject to Surveyor's consent and under his supervision provided:

a) And single welded area shall not exceed 0.125 [m] and the sum of all areas shall not exceed 2 per cent of the surface side in question. The distance between two welded areas is not to be less than their average width.

b) The weld preparation must not reduce the thickness of the product below 80 per cent of the nominal thickness. For occasional defects with depths exceeding the 80 per cent limit, special consideration at the Surveyors' discretion will be necessary.

c) The repair shall be carried out by qualified welders using an approved procedure for the appropriate steel grade. The electrodes shall be of low hydrogen type and must be dried in accordance with manufacturer's requirements and protected against rehumidification before and during welding.

d) The welds are to be of reasonable length and must have at least 3 parallel welding beads. The deposited metal must be sound without any lack of fusion, undercut, cracks and other defects which could impair the workability or use of the product. Welding is to be performed with one layer of beads in excess of which is subsequently to be ground smooth to the surface level.

e) Products which are to be supplied in a heat treated condition are to be welded prior to the heat treatment; otherwise, a new heat treatment may be required.

f) Products supplied in the controlled rolled or as rolled condition may require a suitable heat treatment after welding. however, the post weld heat treatment may be omitted provided the manufacturer has demonstrated by a procedure test that the required properties will be maintained without heat treatment.

g) For every welding repair the manufacturer must provide the Surveyor with a written report and a sketch showing sizes and location of the defects and full details of the repair procedure including the welding consumables, post weld heat treatment and non-destructive testing.

1.10.3 Cracks, shells, sand patches and sharp edged seams are always considered defects which would impair the end use of the product and which require rejection or repair, irrespective of their size and number. The same applies to other imperfections exceeding the acceptable limits.

1.11 Special quality plate material ('z' quality)

1.11.1 When plate material, intended for welded construction, will be subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration "T"- butt welds, but may also be associated with loads applied in service or during construction. Requirements for these materials are detailed in Sec. 8 and it is the responsibility of shipbuilder or fabricator to make provision for the use of this material.

1.12 Branding of materials

1.12.1 Every finished item is to be clearly marked by the manufacturer in at least one place with IRS brand IR and the following particulars:

a) The manufacturer's name or trade mark;

b) Identification mark for the grade of steel, (material supplied in the thermo-mechanically controlled process condition is to have the letter TM added after the identification mark) ;

c) Cast or identification number and/or initials which enable the full history of the item to be traced;

d) If required by the purchaser, his order number or other identification marks.

e) Steels, which have been specially approved and which differ from the requirements given in this Chapter are to have the letter "S" marked after the agreed identification mark.

f) Steel plates that have complied with the requirements for corrosion resistant steel will be identified by adding a corrosion designation to the unified identification mark for the grade of steel. The corrosion resistant steel is to be designated according to its area of application as follows:

- Lower surface of strength deck and surrounding structures; **RCU**

- Upper surface of inner bottom plating and surrounding structures; **RCB**

- For both strength deck and inner bottom plating; **RCW**

1.12.2 Products complying with the requirements of Sec. 8 are to be marked "Z 25" or 'Z 35' as appropriate, in addition to the material grade designation e.g. 'EH36Z25' or 'EH36Z35'.

1.12.3 The above particulars, but excluding the manufacturer's name or trade mark where this is embossed on finished products, are to be encircled with paint or otherwise marked so as to be easily recognizable.

1.12.4 In the event of any material bearing IRS brand failing to comply with the test requirements, the brand name is to be unmistakably defaced.

1.13 Test certificates or shipping statements

1.13.1 The Surveyor is to be supplied, in duplicate, copies of the test certificates or shipping statements for all accepted materials, IRS may require separate documents for each grade of steel. These documents are to contain, in addition to the description, dimensions, etc. of the material at least the following particulars:

a) Purchaser's order number and if known the ship number for which the material is intended;

b) Identification number and/or initials;

c) Identification of steel works;

d) Identification of the grade of steel;

e) Cast number and ladle analysis;

f) For steel with a corrosion resistant steel designation the weight percentage of each element added or intentionally controlled for improving corrosion resistance.

g) Condition of supply when other than as rolled e.g. normalized or controlled rolled;

h) If the material is of rimming quality, this should be stated;

i) Test results.

In the case of 'Z' quality steel, notation 'Z25' or 'Z35' as appropriate, is to be indicated with the steel grade and test results are to include through thickness reduction in area (%).

1.13.2 Before the test certificates or shipping statements are signed by the Surveyor, the manufacturer is required to furnish him with a written declaration stating that the material has been made by an approved process and that it has been subjected to and has withstood satisfactorily the required tests in the presence of the Surveyor or his authorized deputy. The following form of declaration will be accepted if stamped or printed on each test certificate or shipping statement with the name of steelworks and initialed by the makers or an authorized deputy:
"We hereby certify that the material has been made by an approved process in accordance with the Rules of Indian Register of Shipping and has been tested satisfactorily in the presence of the surveyors of Indian Register of Shipping".

1.13.3 When steel is not produced at the works at which it is rolled a certificate is to be supplied to the Surveyor at the rolling mill stating the process by which it was manufactured and the name of the manufacturer, the number of cast from which it was made and the ladle analysis. The Surveyors are to have access to the works at which the steel was produced and the works must be approved by IRS.

Section 2

Normal Strength Steels for Ship Structures

2.1 General

2.1.1 Normal strength hot-rolled steel plates, wide flats, sections and bars intended for use in hull construction, is to comply with the following requirements. Steel differing in chemical composition, deoxidation practice, heat treatment or mechanical properties may be accepted, subject to special agreement by IRS.

2.1.2 These requirements are primarily intended to apply to steel plates not exceeding 100 [mm] in thickness and sections and bars not exceeding 50 [mm] in thickness. For greater thickness, certain variations in the requirements may be allowed or required in particular cases after consideration of the technical circumstances involved.

2.1.3 Additional approval tests may be required to verify the suitability for forming and welding of Grade E plate exceeding 50 [mm] in thickness.

2.2 Deoxidation and chemical composition

2.2.1 The method of deoxidation and the chemical composition of ladle samples are to comply with the requirements of Table 2.2.1.

2.2.2 When any grade of steel is supplied in the thermo-mechanically controlled processed condition, deviations in the specified chemical composition may be allowed by IRS.

2.3 Heat treatment, condition of supply

2.3.1 All materials are to be supplied in a condition complying with Table 2.3.1 and Table 2.3.2. Where alternative arrangements are permitted these are at the option of the steelmaker, unless otherwise expressly stated in the order for the material.

2.4 Mechanical tests

2.4.1 Sizes and orientation of test specimens are to be in Accordance with the requirements of Sec. 1.

Table 2.2.1 : Deoxidation and chemical composition

Grade	A	B	D	E
Deoxidation practice	Any method[1]	Any method except rimmed steel	For t ≤ 25 [mm] killed, For t > 25 [mm] fully killed and fine grain treated[2]	Fully killed fine grain treated
Chemical composition per cent [6,7,8]				
Carbon max.	0.21[4]	0.21	0.21	0.18
Manganese min	2.5 x Carbon %	0.80[5]	0.60	0.70
Silicon max	0.50 max.	0.35 max.	0.35 max.	0.10 - 0.35
Phosphorus max	0.035 max.	0.035 max.	0.035 max.	0.035 max.
Sulphur max	0.035 max.	0.035 max.	0.035 max.	0.035 max.
Aluminium (acid soluble)[3]	-	-	0.015[2]	0.015
Carbon + 1/6 of the manganese content is not to exceed 0.40 per cent				

Notes :

1 For grade A, rimmed steel may be accepted upto 12.5 [mm] thick inclusive provided that it is stated on the test certificates or shipping statements to be rimmed steel and is not excluded by the purchaser's order.
2 Aluminium is required for thickness above 25 [mm].
3 The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020 per cent.
4 Max. 0.23% for sections.
5 For grade B, when the silicon content is 0.10% or more (killed steel), the minimum manganese content may be reduced to 0.60%.
6 IRS may limit the amount of residual/trace elements which may have an adverse effect on the working and use of the steel, e.g. copper and tin.
7 Where additions of any other element have been made as part of the steelmaking practice, the content is to be specified.
8 When any grade of steel is supplied in the thermo-mechanically rolled condition, variation in the specified chemical composition may be allowed or required by IRS.

Table 2.3.1 : Condition of supply for normal strength steel (1)

Grades	Thickness	Condition of supply
A	≤ 50 mm	Any
	> 50 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled (2)
B	≤ 50 mm	Any
	> 50 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled (2)
D	≤ 35 mm	Any
	> 35 mm ≤ 100 mm	Normalized, controlled rolled or thermo-mechanically rolled (3)
E	≤ 100 mm	Normalized or thermo-mechanically rolled (3)

Table 2.3.1 Notes:

1) These conditions of supply and the impact test requirements are summarised in Table 2.3.2

2) Subject to the special approval of IRS, Grades A and B steel plates may be supplied in the as rolled condition.

3) Subject to the special approval of IRS, sections in Grade D steel may be supplied in the as rolled condition provided satisfactory results are consistently obtained from Charpy V-notch impact tests. Similarly sections in Grade E steel may be supplied in the as rolled or controlled rolled condition. For the frequency of impact tests see 2.4.4, 2.4.5, 2.4.6 and 2.4.7.

2.4.2 For each batch presented. except where specially agreed by IRS. one tensile test is to be made from one piece unless the weight of finished material is greater than 50 tonnes in which case one extra test piece is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 [mm] in thickness of plate or diameter of products from the same cast. For sections the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests.

2.4.3 For plates of thickness exceeding 50 [mm] in Grade E steel, one tensile test is to be made on each piece.

2.4.4 For each batch presented, except where specially agreed by IRS at least one set of three Charpy V-notch test specimens is to be made from one piece unless the weight of finished material is greater than 50 tonnes in which case one extra set of three test specimens is to be made from a different piece from each 50 tonnes or fraction thereof. The piece selected for the preparation of test specimen is to be the thickest of each batch. Where steel plates except for Grade 'A' steel over 50 [mm] in thickness is supplied in the controlled rolled condition, the frequency of impact test is to be made from a different piece from each 25 tonnes or fraction thereof.

2.4.5 When subject to the special approval of IRS, material is supplied in the as rolled condition the frequency of impact tests is to be increased to one set from each batch of 25 tonnes or fraction thereof. However, for Grade 'A' steel over 50 [mm] thickness when supplied in the "as rolled" condition, one set of three charpy V-notch test specimens may be taken from each batch of 50 tonnes or fraction thereof.

2.4.6 For plates in Grade E steel, one set of three impact test specimens is to be made from each piece.

2.4.7 For Grade E sections, except where specially agreed, for each batch presented, one set of three impact test specimens is to be made for each 25 tonnes of normalised material and for each 15 tonnes of materials which are not normalised.

2.4.8 Results of mechanical testing are to comply with Table 2.4.1. For impact tests, one individual value may be less than the required average value provided that it is not less than 70 per cent of this average value. *See also Ch.* 1.

2.4.9 Minimum average energy values are specified for Charpy V-notch impact test specimens taken in either the longitudinal or transverse directions.

Generally only longitudinal test specimens need be prepared and tested except for special applications where transverse test specimens may be required. Transverse test results are to be guaranteed by the manufacturer. The tabulated values are for standard specimens 10 [mm] x 10 [mm]. For plate thicknesses lower than 10 [mm], sub-size specimens may be used with reduced requirements as follows :

Specimen 10 x 7.5 [mm] : 5/6 of tabulated energy
Specimen 10 x 5 [mm] : 2/3 of tabulated energy.

Table 2.3.2 : Required condition of supply and number of impact tests for normal strength steels

Grade	Deoxidation Practice	Pro-ducts	Condition of supply (batch for impact tests) (1)(2)			
			Thickness [mm]			
			10 12.5 20 25 30 35 40 50 100			
A	Rimmed	Sections	A(-)	Not applicable		
A	For t ≤ 50 mm Any method except rimmed For t > 50 mm Killed	Plates	A(-)	N(-) TM(-) CR(50), AR*(50)		
A		Sections	A(-)	Not applicable		
B	For t ≤ 50 mm Any method except rimmed For t > 50 mm Killed	Plates	A(-)	A(50)	N(50) TM(50) CR(25), AR*(25)	
B		Sections	A(-)	A(50)	Not applicable	
D	Killed	Plates Sections	A(50)	Not applicable		
D	Plates Killed and fine grain treated	Plates	A(50)	N(50) CR(50) TM(50)	N(50) TM(50) CR(25)	
D		Sections	A(50)	N(50) CR(50) TM(50) AR*(25)	Not applicable	
E	Killed and fine grain treated	Plates	N(Each piece) TM(Each piece)			
E		Sections	N(25) TM(25) AR*(15), CR*(15)	Not applicable		

Remarks:

1. Condition of Supply

A - Any (Not Specified)
N - Normalised Condition
CR - Controlled Rolled Condition
TM - Thermo-Mechanical Rolling
AR* - As Rolled Condition subject to special approval of IRS
CR* - Controlled Rolled Condition subject to special approval of IRS.

2. Number of Impact Tests

One set of impact tests is to be taken from each batch of the specified weight in ( ) in tones or fraction thereof.

Table 2.4.1 : Mechanical properties for normal strength steels

Grade	**Yield strength ReH [N/mm^2] min.**	**Tensile strength Rm [N/mm^2]**	**Elongation $5.65\sqrt{S_o}$ A5 (%)**	**Impact Test**						
				Test Temp. °C	**Average impact energy (J) min.**					
					t ≤ 50 mm		**50 < t ≤ 70 mm**		**70 < t ≤ 100 mm**	
					Long (3)	Trans (3)	Long (3)	Trans (3)	Long (3)	Trans (3)
A	235	400/520 (1)	22(2)	+20	-	-	34(5)	24(5)	41(5)	27(5)
B				0	27(4)	20(4)	34	24	41	27
D				-20	27	20	34	24	41	27
E				-40	27	20	34	24	41	27

Notes:

1) For all thicknesses of Grade A sections the upper limit for the specified tensile strength range may be exceeded at the discretion of IRS.

2) For full thickness flat tensile test specimens with a width of 25 mm and a gauge length of 200 mm the elongation is to comply with the following minimum values:

Thickness [mm]		> 5	> 10	> 15	> 20	> 25	> 30	> 40
	≤ 5	≤ 10	≤ 15	≤ 20	≤ 25	≤ 30	≤ 40	≤ 50
Elongation	14	16	17	18	19	20	21	22

3) See 2.4.9.

4) Charpy V-notch impact tests are generally not required for Grade B steel with thickness of 25 mm or less.

5) Impact tests for Grade A over 50 mm thick are not required when the material is produced using fine grain practice and furnished normalised. TM rolling may be accepted without impact testing at the discretion of IRS.

Section 3

Higher Strength Steels for Ship Structures

3.1 General

3.1.1 Higher strength steel, supplied in three strength levels, 32, 36 and 40, intended for use in hull construction, is to comply with following requirements.

Steel differing in chemical composition, deoxidation practice, heat treatment or mechanical properties may be accepted, subject to special approval by IRS. Such steel is to be given special designation.

3.1.2 Each strength level is subdivided into four grades, AH, DH, EH and FH differing in the required levels of notch toughness.

3.1.3 The requirements of this section are primarily intended to apply to plates not exceeding 100 [mm] in thickness in general, and sections and bars not exceeding 50 [mm] in thickness. For greater thickness, these requirements may be applied with certain variations, as may be agreed by IRS.

The additional requirements for high strength plates having specified minimum yield point of 460 [N/mm^2] with thickness over 50 [mm] and not greater than 100 [mm] for use in longitudinal structural members in the upper deck region of container ships (such as hatch side coaming, hatch coaming, hatch coaming top and attached longitudinal) and denoted by Grade EH47 are also given in this section.

3.1.4 It should be noted that when fatigue loading is present, the effective fatigue strength of a welded construction of higher strength steels may not be greater than that of a construction fabricated from the normal strength steels. Precautions against corrosion fatigue may also be necessary.

Note: Before subjecting steels produced by thermo-mechanical rolling to further heating for forming or stress relieving or using high heat-input welding, special consideration must be given to the possibility of a consequent reduction in mechanical properties.

3.2 Deoxidation and chemical composition

3.2.1 The method of deoxidation and chemical analysis of ladle samples are to comply with the requirements of Table 3.2.1.

The chemical composition of EH 47 steel plates would be specially considered.

Table 3.2.1 : Chemical composition and deoxidation practice for higher strength steels

Grade[1)]	**AH32/DH32/EH32 AH36/DH36/EH36 AH40/DH40/EH40**	**FH32 FH36 FH40**
Deoxidation practice	Fully killed and fine grain refined	
Chemical Composition per cent (Ladle sample)[2)]		
C max. Mn Si max. P max. S max.	0.18 0.90 - 1.60[3)] 0.50 0.035 0.035	0.16 0.90 - 1.60 0.50 0.025 0.025
Grain refining elements[5)]		
Al (acid soluble) min.	0.015[4)]	
Nb V Ti max. Total (Nb + V + Ti)	0.02 - 0.05 0.05 - 0.10 0.02 0.12 max.	
Residual elements		
Cu max. Cr max. Ni max. Mo max.	0.35 0.20 0.40 0.08	0.35 0.20 0.80 0.08

Notes:

1) The number following the grade designation indicates the yield point to which the steel is ordered or produced in [Kg/mm^2].

2) Where additions of any other element have been made as part of the steel making practice, the content is to be indicated.

3) For thickness upto and including 12.5 [mm] the minimum manganese content may be reduced to 0.70 percent.

4) The total aluminium content may be determined instead of the acid soluble content. In such cases the total aluminium content is to be not less than 0.020 percent

5) The steel is to contain aluminium, niobium, vanadium or other suitable grain refining elements, either single or in combination. When used singly the steel is to contain the specified minimum content of the grain refining element. When used in combination, the specified minimum content of atleast one refining element is applicable.

3.2.2 When required, the carbon equivalent value is to be calculated from the ladle analysis using the following formula.

$$\text{Carbon eq.} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \ \%$$

Note: This formula is applicable only to steels which are basically of the carbon manganese type and gives a general indication of the weldability of the steel.

3.2.3 Slight deviations in chemical composition with respect to Grade E36 for plates exceeding 50 [mm] may be permitted provided that these deviations are documented and approved in advance by IRS.

3.2.4 Where additions of any other element have been made as a part of the steel making practice, the content is to be indicated.

3.2.5 When any grade of higher strength steel is supplied in the thermo-mechanically controlled processed condition variations in the specified chemical composition may be allowed or required by lRS.

3.2.5.1 For TM (TMCP) steels the following special requirements apply:

j) The carbon equivalent value is to be calculated from the ladle analysis using the following formula and to comply with the requirements of the following table:

Carbon equivalent for higher strength steels upto 100 mm in thickness produced by TM		
Grade	**Carbon equivalent**	**Max. (%)[1)]**
	t ≤ 50	**50 < t ≤ 100**
AH32, DH32, EH32, FH32	0.36	0.38
AH36, DH36, EH36, FH36	0.38	0.40
AH40, DH40, EH40, FH40	0.40	0.42
EH47	NA	0.49
t = thickness [mm]		
Note: 1) It is a matter for the manufacturer and shipbuilder to mutually agree in individual cases as to whether they wish to specify a more stringent carbon equivalent.		

$$\text{Carbon eq.} = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} \ \%$$

ii) Other means such as cold cracking susceptibility P_{cm}, may be considered instead of the carbon equivalent for evaluating the weldability.

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

3.2.5.2 The carbon equivalent of EH47 grade steel calculated as per 3.2.2 is not to exceed 0.49%. The cold cracking susceptibility P_{cm} calculated using the formula mentioned in 3.2.5.1.(ii) is not to exceed 0.22%.

3.3 Heat treatment, condition of supply

3.3.1 All materials are to be supplied in a condition complying with the requirements given in Table 3.3.1. Where alternative conditions are permitted, these are at the option of the steelmaker, unless otherwise expressly stated in the order for material.

3.4 Mechanical tests

3.4.1 Sizes and orientation of test specimens are to be in accordance with the requirements of Sec. 1.

3.4.2 For each batch presented, except where specially agreed by IRS, one tensile test is to be made from one piece unless the weight of finished material is greater than 50 tonnes in which case one extra test piece is to be made from a different piece from each 50 tonnes or fraction thereof. Additional tests are to be made for every variation of 10 [mm] in thickness of plate or diameter of products from the same cast. For sections, the thickness to be considered is the thickness of the product at the point at which samples are taken for mechanical tests.

3.4.3 For plates of thickness exceeding 50 [mm] in Grade E steel, one tensile test is to be made on each piece.

3.4.4 For each batch of plates presented, (except for Grades EH32, EH36, EH40, EH47, FH32, FH36 and FH40) the number of Charpy V-notch impact tests is to be as follows :

i) Except where otherwise specified or specially agreed by IRS, for each batch presented, at least one set of three Charpy V-notch impact test specimens is to be made from one piece unless the weight of finished material is greater than 50 tonnes, in which case one extra set of three test specimens is to be made from a different piece from each 50 tonnes or fraction thereof.

ii) For steel plates of Grades AH40 and DH40 with thickness over 50 [mm] in normalized or TM condition, one set of impact test specimens is to be taken from each batch of 50 tonnes or fraction thereof. For those in QT condition, one set of impact test specimens is to be taken from each length as heat treated.

iii) When, subject to special approval of IRS, material is supplied in the as rolled condition, the frequency of impact tests is to be increased to one set from each batch of 25 tonnes or fraction thereof.

iv) The piece selected for the preparation of test specimens is to be the thickest in each batch.

3.4.5 For each batch of Grade EH32, EH36, EH40 and EH47 steel presented, the number of Charpy V- notch impact tests is to be as follows:

i) For plates one set of three Charpy V-notch impact test specimens is to be taken from each piece.

ii) For sections one set of impact tests is to be taken from each batch of 25 tonnes or fraction thereof.

iii) When, subject to special approval of IRS, sections are supplied in the as-rolled condition, one set of impact tests is to be taken from each batch of 15 tonnes or fraction thereof.

iv) For (ii) and (iii) above the piece selected for the preparation of test specimens is to be the thickest in each batch.

Table 3.3.1 : Required condition of supply and number of impact tests for higher strength steels

Grade	Deoxi-dation Practice	Grain Refining Elements	Pro-ducts	Condition of supply (batch for impact tests) (1)(2)				
				Thickness [mm]				
				10 – 12.5	12.5 – 20	20 25 30 35	40	50 100
AH32 AH36	Killed and fine grain treated	Nb and/or V	Plates	A(50)			N(50) CR(50),TM(50)	N(50), CR(25), TM(50)

			Sections	N(25) TM(25) QT(25)	Not applicable

Remarks

1. Condition of Supply

A - Any (Not Specified)

N - Normalised Condition

CR - Controlled Rolled Condition

TM - Thermo-Mechanical Rolling

QT - Quenched and Tempered Condition

AR* - As Rolled Condition subject to special approval of IRS

CR* - Controlled Rolled Condition subject to special approval of IRS.

2. Number of Impact Tests

One set of impact tests is to be taken from each batch of the "specified weight" in ( ) in tones or fraction thereof.

For Grades A32 and A36 steels charpy impact tests are not generally required provided that satisfactory results are obtained from occasional check tests selected by the Surveyor.

3.4.6 Mechanical Tests for EH47 grade steel

3.4.6.1 The following conditions also have to be met for EH47 steel in addition to the conditions mentioned in 3.4.1 to 3.4.5 for the Charpy V-notch impact test.

- Test samples are to be taken from the plate corresponding to the top of the ingot, unless otherwise agreed.
- In case of continuous castings, test samples are to be taken from a randomly selected plate.
- The location of the test sample is to be at the square cut end of the plate, approximately one quarter width from an edge, as shown in Fig 3.4.6.1.

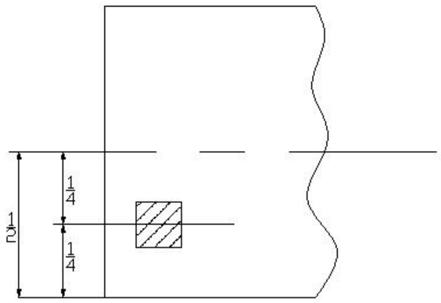

Fig.3.4.6.1: Location of Test Sample

- Samples are to be taken with respect to the principal rolling direction of the plate at the locations representing the top and the bottom of the plate as follows:
  - Longitudinal Charpy V-notch impact test: top and bottom.
  - Transverse Charpy V-notch impact test: Top only.
  - Strain Aged longitudinal Charpy V-notch impact test : Top only
- Charpy V-notch impact tests are required from both the quarter and mid thickness locations of the test samples.
- The Charpy V-notch impact test temperature is to be -40^{o}C.
- In addition to the determination of the energy value, the lateral expansion and percentage crystallinity are also to be reported.
- The strain aged samples are to be strained to 5% followed by heating to 250^{o}C prior to testing.
- Additionally at each location, Charpy V-notch impact tests are to be carried out with appropriate temperature intervals to properly define the full transition range.

3.4.6.2 The Deep Notch Test or Crack Tip Opening Displacement (CTOD) test is to be carried out. The test method and results are to be acceptable to IRS.

3.4.6.3 The Naval Research Laboratory (NRL) drop weight test is to be carried out in compliance with ASTM E208 or equivalent method.
Nil Ductility Transition Temperature (NDTT) is to be reported for reference.

3.4.6.4 The Brittle crack arrest test (standard ESSO test) as given in Pt.2, Ch.2, Sec.5 is to be carried out in order to obtain the brittle crack arrest toughness for reference.

3.4.7 Weldability Tests for EH47 grade steel

3.4.7.1 Charpy V-notch Impact test

- Charpy V-notch Impact tests are to be taken at a position of ¼ thickness from the plate surface on the face side of the weld with the notch perpendicular to the plate surface.
- One set of the specimens transverse to the weld is to be taken with the notch located at the fusion line and at a distance 2.5 and minimum 20 [mm] from the fusion line.
- The fusion boundary is to be identified by etching the specimen with a suitable reagent.
- One additional set of specimens is to be taken from the root side of the weld with the notch located at the same position and at the same depth as for the face side.
- The impact test temperature is -40^{o}C.
- Additionally at each location, impact tests are to be carried out with appropriate temperature intervals to properly define the full transition range.

3.4.7.2 Y-shape weld crack test (Hydrogen Crack Test) has to be conducted in accordance with recognized international standards such as ISO 3690.

3.4.7.3 Brittle fracture initiation test (CTOD) or deep notch test is to be carried out.
The test method and results are to be acceptable to IRS.

3.4.8 One set of Charpy V-notch impact test specimens are to be tested from each rolled length for Grades FH32, FH36 and FH40 of steel plates supplied in the normalised or thermo-mechanically controlled process condition.

3.4.9 For steels in the quenched and tempered condition, one tensile and one set of three Charpy V- notch impact tests are to be made on each plate as heat treated.

3.4.10 Generally only longitudinal (L) impact test specimens need be prepared and tested. however in all cases transverse (T) test results are to be guaranteed by the manufacturer.

3.4.11 The results of all tensile tests and the average energy value from each set of three impact tests are to comply with the appropriate requirements given in Tables 3.4.1 and Table 3.4.2.

3.4.12 When standard subsidiary impact specimens are necessary (See Ch. 2).

Table 3.4.1 : Mechanical properties for higher strength steels

Grade	Yield strength ReH [N/mm²] min.	Tensile strength Rm [N/mm²]	Elongation 5.65 $\sqrt{S_o}$ A5 (%)	Impact Test						
				Test Temp. °C	Average impact energy (J) min.					
					t ≤ 50 mm		50 < t ≤ 70 mm		70 < t ≤ 100 mm	
					Long (2)	Trans (2)	Long (2)	Trans (2)	Long (2)	Trans (2)
AH32	315	440/570	22(1)	0	31(3)	23(3)	38	26	46	31
DH32				-20	31	22	38	26	46	31
EH32				-40	31	22	38	26	46	31
FH32				-60	31	22	38	26	46	31
AH36	355	490/630	21(1)	0	34(3)	24(3)	41	27	50	34
DH36				-20	34	24	41	27	50	34
EH36				-40	34	24	41	27	50	34
FH36				-60	34	24	41	27	50	34
AH40	390	510/660	20(1)	0	39	27	46	31	55	37
DH40				-20	39	27	46	31	55	37
EH40				-40	39	27	46	31	55	37
FH40				-60	39	27	46	31	55	37

t = thickness [mm]

NOTES:

1) For full thickness flat tensile test specimens with a width of 25 [mm] and a gauge length of 200 [mm] the elongation [%] is to comply with the following minimum values:

Grade	Thickness [mm]							
	≤ 5	> 5 ≤ 10	> 10 ≤ 15	> 15 ≤ 20	> 20 ≤ 25	> 25 ≤ 30	> 30 ≤ 40	> 40 ≤ 50
AH32, DH32, EH32 & FH32	14	16	17	18	19	20	21	22
AH36, DH36, EH36 & FH36	13	15	16	17	18	19	20	21
AH40, DH40, EH40 & FH40	12	14	15	16	17	18	19	20

2) See 2.4.9.

3) For Grades A32 and A36 steels a relaxation in the number of impact tests for acceptance purposes may be permitted by special agreement with IRS provided that satisfactory results are obtained from occasional check tests.

Table 3.4.2: Conditions of supply, grade and mechanical properties for EH47 steel plates

Supply Condition	Grade	Mechanical Properties			Impact Test			
		Yield Strength [N/mm^2]min	Tensile Strength [N/mm^2]	Elongation (%) min.	Test Temp. (^{o}C)	Average Impact Energy [J] min.		
						50<t<70	70<t<85	85<t<100
TMCP	EH 47	460	570/720	17	-40^{o}C	53	64	75

Note : t: Thickness [mm]

Section 4

High Strength Quenched and Tempered Steels for Welded Structures

4.1 General

4.1.1 These requirements apply to weldable high strength and tempered steel plates and wide flats up to 70 [mm] thickness. The application of these requirements for products with thicknesses above 70 [mm] and for product forms other than plates and wide flats such as sections and tubulars, are to be specially agreed.

4.1.2 Steel differing from the requirements in this section in respect of chemical composition, deoxidation practice, heat treatment or mechanical properties may be accepted, subject to special approval by IRS.

4.1.3 The steel covered by the scope of these requirements are divided into six yield strength levels of 420, 460, 500, 550, 620 and 690 [N/mm^2]. For each yield strength level four grades AH, DH, EH and FH are specified, based on the impact test temperature.

4.1.4 Special consideration may be given to the supply of those steels in thickness upto 50 [mm] in the TMCP condition subject to approval of IRS.

4.2 Approval

4.2.1 The steels must be approved by IRS and for this purpose the steel maker is to submit a specification containing such details as chemical composition, manufacturing process, mechanical properties, delivery condition, recommendation for welding, cold and hot forming and heat treatment. In addition, IRS may require initial approval tests to be performed. Weldability of each grade of steel is to be demonstrated by the steel maker during the initial approval procedure to the satisfaction of IRS.

4.3 Deoxidation and chemical composition

4.3.1 The steel shall be fully killed and fine grain treated.

4.3.2 The chemical composition is to be determined by the steel maker, in an adequately equipped competently staffed laboratory, from each cast or ladle and is to comply with the requirements of the approved specifications and limits given in Table 4.3.1.

4.3.3 The cold cracking susceptibility P_{cm} for evaluating weldability should be calculated from the ladle analysis in accordance with the following formula.

$$P_{cm} = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

The maximum P_{cm} to be achieved is to be agreed with IRS and included in the approved specification.

4.4 Heat treatment

4.4.1 All materials are to be supplied in the quenched and tempered condition. This requirement excludes precipitation hardening steels.

Table 4.3.1 : Chemical composition

Yield strength level [N/mm^2]	Grade	Maximum content of elements per cent[1)]					
		C	Si	Mn	P	S	N
420 to 690	AH	0.21	0.55	1.70	0.035	0.035	0.020
420 to 690	DH	0.20	0.55	1.70	0.030	0.030	0.020
420 to 690	EH	0.20	0.55	1.70	0.030	0.030	0.020
420 to 690	FH	0.18	0.55	1.60	0.025	0.025	0.020

1) Elements used for alloying and fine grain treatment are to be as detailed in the approved specification.

4.5 Mechanical tests

4.5.1 Sizes and orientation of test specimens are to be in accordance with the requirements of Sec. 1.

4.5.2 One tensile and one set of three Charpy V-notch impact tests are to be made on each piece as heat treated. For continuous heat treated plates special consideration may be given regarding the number and location of test specimens required.

4.5.3 The tensile test specimens are to be taken as given in 1.6.3.1 and 1.6.3.2. The results of all tensile tests are to comply with the appropriate requirements given in Table 4.5.1 and Table 4.5.2. In the case of other product forms (See 1.6.3.3), where longitudinal tests have been agreed, the elongation values are to be 2 percent units above those given in Table 4.5.1 and Table 4.5.2.

4.5.4 Unless otherwise accepted by IRS, the V-notch impact test specimens for plates and wide flats over 600 [mm] are to be taken with their axes transverse to the main rolling direction and the results should comply with the appropriate requirements of Table 4.5.1 and Table 4.5.2. For other product forms the impact tests are to be in the longitudinal direction, the results of tests are to comply with appropriate requirements of Table 4.5.1 and Table 4.5.2. Normally sub-surface test specimens will be taken, however, for material with a thickness in excess of 40 [mm], impact tests should be taken at the quarter thickness (t/4) location.

4.5.5 If required by IRS, through thickness tensile tests are to be performed in accordance with the requirements of Sec. 8.

Table 4.5.1 : Mechanical properties requirements, 70 [mm] maximum thickness

Grade of steel	Yield stress [N/mm^2] min. (See Note 1)	Tensile strength [N/mm^2]	Elongation per cent min. (Lo = 5.65√So) (See Note 2)	Impact Tests (See Note 3)	
				Test temp.°C	Average energy (J) min.
AH 420	420	530 - 680	18	0	42(L) 28(T)
DH 420	420	530 - 680	18	-20	42(L) 28(T)
EH 420	420	530 - 680	18	-40	42(L) 28(T)
FH 420	420	530 - 680	18	-60	42(L) 28(T)
AH 460	460	570 - 720	17	0	46(L) 31(T)
DH 460	460	570 - 720	17	-20	46(L) 31(T)
EH 460	460	570 - 720	17	-40	46(L) 31(T)
FH 460	460	570 - 720	17	-60	46(L) 31(T)
AH 500	500	610 - 770	16	0	50(L) 33(T)
DH 500	500	610 - 770	16	-20	50(L) 33(T)
EH 500	500	610 - 770	16	-40	50(L) 33(T)
FH 500	500	610 - 770	16	-60	50(L) 33(T)
AH 550	550	670 - 830	16	0	55(L) 37(T)
DH 550	550	670 - 830	16	-20	55(L) 37(T)
EH 550	550	670 - 830	16	-40	55(L) 37(T)
FH 550	550	670 - 830	16	-60	55(L) 37(T)
AH 620	620	720 - 890	15	0	62(L) 41(T)
DH 620	620	720 - 890	15	-20	62(L) 41(T)
EH 620	620	720 - 890	15	-40	62(L) 41(T)
FH 620	620	720 - 890	15	-60	62(L) 41(T)
AH 690	690	770 - 940	14	0	69(L) 46(T)
DH 690	690	770 - 940	14	-20	69(L) 46(T)
EH 690	690	770 - 940	14	-40	69(L) 46(T)
FH 690	690	770 - 940	14	-60	69(L) 46(T)

L = Longitudinal;

T = transverse.

Note 1 : Where the yield stress is not marked in the tensile test, the 0.2% proof stress is applicable.

Note 2 : For full thickness flat test specimens with a width of 25 [mm] and a gauge length of 200 [mm] the elongation is to comply with the minimum values shown in Table 4.5.2

Note 3 : For A grade steels, a reduction in the number of impact tests required for acceptance purpose may be permitted by special agreement with IRS provided that satisfactory results are obtained from occasional check tests.

Table 4.5.2 : Elongation minimum values for a width of 25 [mm] and a 200 [mm] gauge length

Strength Grade	Thickness [mm]						
	≤ 10	> 10 ≤ 15	> 15 ≤ 20	> 20 ≤ 25	> 25 ≤ 40	> 40 ≤ 50	> 50 ≤ 70

690	9	10	11	11	12	13	14

Section 5

Steel for Low Temperature Service

5.1 General

5.1.1 This section gives specific requirements for carbon-manganese and nickel alloy steels with toughness properties at low temperatures and intended for use in the construction of cargo tanks and process pressure vessels for liquefied gases.

5.1.2 The requirements of this section are also applicable for other types of pressure vessels where the use of steels with guaranteed impact properties at low temperature is required.

5.1.3 Provision is made for plates and sections up to 40 [mm] thick.

5.1.4 Steel differing in chemical composition, condition of supply or mechanical properties may be accepted, subject to special agreement by IRS.

5.2 Deoxidation and chemical composition

5.2.1 All steels are to be in the fully killed and fine grain refined condition.

5.2.2 The chemical composition of carbon-manganese steels are to comply with the appropriate requirements of grades AH, DH, EH and FH strength levels 32, 36 and 40 (See Table 3.2.1). However these grades are to be designated as L T -AH, L T -DH, L T -EH and L T -FH respectively for the uses defined in 5.1.1.

5.2.3 The chemical compositions of nickel alloy steels are to comply with the appropriate requirements of Table 5.2.1.

Table 5.2.1 : Chemical composition of nickel alloy steels				
Elements	**1.5 Ni**	**3.5 Ni**	**5 Ni**	**9 Ni**
C max.	0.18	0.15	0.12	0.10
Si	0.10 - 0.35	0.10 - 0.35	0.10 - 0.35	0.10 - 0.35
Mn	0.30 - 1.50	0.30 - 0.90	0.30 - 0.90	0.30 - 0.90
Ni	1.30 - 1.70	3.20 - 3.80	4.70 - 5.30	8.50 - 10.0
P max.	0.025	0.025	0.025	0.025
S max.	0.020	0.020	0.020	0.020
Al min. (acid soluble)[1)]	0.015	0.015	0.015	0.015
Residual elements				
Cr max.	0.25	0.25	0.25	0.25
Cu max.	0.35	0.35	0.35	0.35
Mo max.	0.08	0.08	0.08	0.08
Total of residual elements max.	0.60	0.60	0.60	0.60
1) The total aluminium content may be determined by other methods instead of the acid soluble method. In such cases the total aluminium content is to be not less than 0.020 percent.				

5.3 Heat treatment

5.3.1 All materials are to be supplied in a condition complying with Table 5.3.1.

Table 5.3.1 : Conditions of supply		
Grade	**Plates**	**Sections and Bars**
LT-AH LT-DH	N, TMCP N, TMCP	Any Any
LT-EH LT-EH	N^2, TMCP, QT N^2, TMCP, QT	N, TMCP N, TMCP
1.5 Ni 3.5 Ni 5 Ni	N^2, QT, normalized and tempered N^2, QT, normalized and tempered N^2, QT, normalized and tempered	
9 Ni	QT, Double normalized and tempered	

1	N = Normalized TMCP = Thermo-mechanically controlled process QT = Quenched and tempered
2	The term "Normalized" does not include normalized rolling.

5.4 Mechanical tests

5.4.1 Test pieces for tensile testing of plates are to be cut with their principal axes transverse to the final direction of rolling.

5.4.2 For each batch of plate presented, one tensile test is to be made from one end of each piece unless the mass and length of the piece exceeds 5 tonnes and 15 m in which case test pieces are to be taken from both ends of each piece.

5.4.3 Sections and bars are to be presented for acceptance test in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the mass of a batch exceeds 10 tonnes.

5.4.4 One set of three Charpy V-notch impact test specimens are to be taken for each tensile test specimen required. For plates, these are to be cut with their principal axis perpendicular to the final direction of rolling and for sections. these are to be taken longitudinally.

5.4.5 The results of all tensile tests are to comply with appropriate requirements given in Table 5.4.1. The ratio between the yield stress and the tensile strength is not to exceed 0.9 for normalized and TMCP steels and 0.94 for Q & T steels.

5.4.6 The average energy value from each set of three impact tests are to comply with appropriate requirements given in Table 5.4.1.

5.4.7 When standard subsidiary impact specimens are necessary (See Sec. 2).

5.4.8 When steel with improved through thickness properties is required or specified in the order, the materials are to be tested as detailed in Sec. 8.

Table 5.4.1 : Mechanical properties for acceptance purposes

Grade of Steel		Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on $5.65\sqrt{S_o}$ % min.	Charpy V-notch impact test	
					Test temp.°C	Impact Energy min.
LT-AH	32	315	440 - 590	22	0	Plates transverse tests Average energy 27 J Sections and bars longitudinal tests Average energy 41 J
	36	355	490 - 620	21		
	40	390	510 - 650	20		
LT-DH	32	315	440 - 590	22	-20	
	36	355	490 - 620	21		
	40	390	510 - 650	20		
LT-EH	32	315	440 - 590	22	-40	
	36	355	490 - 620	21		
	40	390	510 - 650	20		
LT-FH	32	315	440 - 590	22	-60	
	36	355	490 - 620	21		
	40	390	510 - 650	20		
1.5 Ni		275	490 - 640	22	-80	
3.5 Ni		285	450 - 610	21	-95	
5 Ni		390	540 - 740	21	-110	
9 Ni		490	640 - 790	18	-196	

Notes:

1 These requirements are applicable to products not exceeding 40 [mm] in thickness. The requirements for thicker products are subject to agreement.

2 The minimum design temperatures at which plates of different thicknesses in the above grades may be used are given in Pt.3, Ch.2, Table 2.4.1 and Pt.5, Ch.4, Table 6.1.2 and Table 6.1.3. Consideration will be given to the use of thicknesses greater than those in the table or to the use of temperatures below - 165°C

Section 6

Steels for Boilers and Pressure Vessels

6.1 General

6.1.1 The following requirements are for carbon, carbon-manganese and alloy steels intended for use in the construction of boilers and pressure vessels. In addition to specifying mechanical properties at ambient temperature for the purpose of acceptance testing, these requirements also give details of appropriate mechanical properties at elevated temperatures which may be used for design purposes.

6.1.2 Where it is proposed to use a carbon or carbon-manganese steel with a specified minimum tensile strength intermediate to the following specified properties, corresponding minimum values for yield and elongation and mechanical properties at elevated temperatures may be obtained by interpolation.

6.1.3 Carbon and carbon-manganese steels with a specified minimum tensile strength of greater than 490 [N/mm^2] but not exceeding 520 [N/mm^2] may be accepted provided that details of proposed specifications are submitted for approval.

6.1.4 Where it is proposed to use alloy steels other than those specified herein, details of the specifications are to be submitted for approval. In such cases the specified minimum tensile strength is not to exceed 600 [N/mm^2].

6.1.5 Materials intended for use in the construction of the cargo tanks and process pressure vessels, storage tanks for liquefied gases and for other low temperature applications are to comply with the requirements of Sec. 5.

6.2 Deoxidation and chemical composition

6.2.1 The method of deoxidation and the chemical analysis of ladle samples is to comply with the requirements of Table 6.2.1.

Table 6.2.1 : Deoxidation and chemical composition

Grade of steel	Deoxidation	Chemical composition per cent						
C and C-Mn steel		C max.	Si	Mn	P max.	S max.	Al	Residual elements
360 AR	Any method except rimmed steel	0.18	0.50 max.	0.40-1.30	0.040	0.04	-	Cr 0.25 max. Cu 0.30 max. Mo 0.10 max. Ni 0.30 max. Total 0.70 max.
410 AR		0.21	0.50 max.	0.40-1.30	0.040	0.040	-	
460 AR		0.23	0.50 max.	0.80-1.50	0.040	0.040	-	
360	Any method except rimmed steel	0.17	0.35 max.	0.40-1.20	0.035	0.035	-	
410		0.20	0.35 max.	0.50-1.30	0.035	0.035	-	
460		0.20[1]	0.40 max.	0.80-1.40	0.035	0.035	-	
490	Killed	0.20[1]	0.10-0.50	0.90-1.60	0.035	0.035		
360 FG	Killed fine grained	0.17	0.35 max.	0.40-1.20	0.035	0.035	See note 2	
410 FG		0.20	0.35 max.	0.50-1.30	0.035	0.035	See note 2	
460 FG		0.20[1]	0.40 max.	0.80-1.50	0.035	0.035	See note 2	
490 FG		0.20[1]	0.10-0.50	0.90-1.60	0.035	0.035	See note 2	

Alloy steels	Deoxi-dation	C	Si	Mn	P max.	S max.	Al	Cr	Mo	Residual elements
1 Cr 1/2 Mo 470	Killed	0.10-0.18	0.15-0.35	0.4-0.8	0.035	0.035	See note 3	0.70-1.30	0.40-0.60	Cu 0.30 max. Ni 0.30 max.
2 1/4 Cr 1 Mo 480		0.08-0.18	0.15-0.50	0.4-0.8	0.035	0.035	See note 3	2.00-2.50	0.90-1.10	

Notes:

1 For thickness greater than 30 [mm], carbon 0.22 percent max.

2 Aluminium (acid soluble) 0.015 per cent min, or Aluminium (total) 0.018 percent min. Niobium, Vanadium or other suitable grain refining elements may be used either in place of or in addition to aluminium.

3 Aluminium (acid soluble or total) 0.020 percent max.

6.3 Heat treatment, condition of supply

6.3.1 All materials are to be supplied in a condition complying with the requirements of Table 6.3.1.

However, when agreed, material intended for hot forming may be supplied in the as rolled condition.

Table 6.3.1 : Heat treatment	
Grade of steel	**Condition of supply**
Carbon and carbon- manganese 360 AR to 460 AR	As rolled, maximum thickness or diameter is 40 [mm]
Carbon and carbon- manganese 360 to 490	Normalized or controlled rolled
Carbon and carbon- manganese 360 FG to 490 FG	Normalized or controlled rolled
1Cr 1/2 Mo 470	Normalized and tempered
2 1/4 Cr 1 Mo 480	Normalized and tempered

6.4 Mechanical tests

6.4.1 For plates a tensile test specimen is to be taken from one end of each piece when the weight does not exceed 5 tonnes and the length does not exceed 15 [m]. When either of these limits is exceeded, tensile test specimens are to be taken from both ends of each piece. A piece is to be regarded as the rolled product from a single slab or a single ingot, if this is rolled directly into plates.

6.4.2 For strips, tensile test specimens are to be taken from both ends of each coil.

6.4.3 Sections and bars are to be presented for acceptance tests in batches containing not more than 50 lengths, as supplied. The material in each batch is to be of the same section size, from the same cast and in the same condition of supply. One tensile test specimen is to be taken from material representative of each batch, except that additional tests are to be taken when the weight of a batch exceeds 10 tonnes.

6.4.4 Where plates are required for hot forming and it has been agreed that the heat treatment will be carried out by the fabricator, the tests at the steel works are to be made on material which has been cut from the plates and given a normalizing or normalizing and tempering heat treatment in a manner simulating the treatment which will be applied to the plates.

6.4.5 If required by the Surveyors or by the fabricator test material may be given a simulated stress relieving heat treatment prior to the preparation of the test specimens. This has to be stated on the order together with agreed details of the simulated heat treatment and the mechanical properties which can be accepted.

6.4.6 The results of the tensile tests are to comply with the appropriate requirements given in Table 6.4.1, Table 6.4.2 and Table 6.4.3.

Table 6.4.1 : Mechanical properties for acceptance purposes : carbon and carbon-manganese steels - as rolled				
Grade of steel	**Thick-ness [mm]**	**Yield stress [N/mm^2] min.**	**Tensile strength [N/mm^2]**	**Elonga-tion on 5.65√So % min.**
360 AR	≤ 40	190	360-480	24
410 AR	≤ 40	215	410-530	22
460 AR	≤ 40	240	460-580	21

Table 6.4.2 : Mechanical properties for acceptance purposes : carbon and carbon-manganese steels-normalized or controlled rolled

Grade of steel	Thickness [mm] (see Note)	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65√So % min.
360	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	205 195 185	360 - 480	26 26 25
410	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	235 225 215	410 - 530	24 24 23
460	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	285 255 245	460 - 580	22 22 21
490	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	305 275 265	490 - 610	21 21 20
360 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	235 215 195	360 - 480	26 26 25
410 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	265 245 235	410 - 530	24 24 23
460 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	295 285 275	460 - 580	22 22 21
490 FG	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	315 315 305	490 - 610	21 21 21

Note:

For thicknesses greater than 63 [mm], the minimum values for yield stress may be reduced by 1 per cent for each 5 [mm] increment in thickness over 63 [mm]. The minimum elongation values may also be reduced one unit, e.g. 20 percent reduced to 19 percent for all thicknesses over 63 [mm]. For thicknesses over 100 [mm], the above values are to be agreed.

Table 6.4.3 : Mechanical properties for acceptance purposes : alloy steels-normalized and tempered

Grade of steel	Thickness [mm] (see Note)	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on 5.65√So % min.
1 CR 1/2 Mo 470	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	305 305 305	470 - 620	20 20 19
2 1/4 Cr 1 Mo 480	> 3 ≤ 16 > 16 ≤ 40 > 40 ≤ 63	275 265 265	480 - 630	18 18 17

Table 6.4.3 (Contd.)

Note:

For thicknesses greater than 63 [mm], the minimum values for yield stress may be reduced by 1 per cent for each 5 [mm] increment in thickness over 63 [mm]. The minimum elongation values may also be reduced one unit, e.g. 20 percent reduced to 19 percent for all thicknesses over 63 [mm]. For thicknesses over 100 [mm], the above values are to be agreed.

6.5 Mechanical properties for design purposes at elevated temperatures

6.5.1 Nominal values for the minimum lower yield or 0.2 per cent proof stress at temperatures of 50°C and higher are given in the following tables :

Table 6.5.1 Carbon and carbon manganese steels - As rolled (applicable only when the design temperature does not exceed 350°C).

Table 6.5.2 Carbon and carbon-manganese steels normalized or controlled rolled.

Table 6.5.3 Alloy steels. Normalized and tempered.

6.5.2 These values are intended for design purposes only and verification is not required except for materials complying with National or proprietary specifications where the elevated temperature properties used for design purposes are higher than those given in Table 6.5.1 to Table 6.5.3. The extent of testing in such cases would have to be specially agreed by IRS.

6.5.3 Values for the estimated average stress to rupture in 100,000 hours are given in Table 6.5.4 and may be used for design purposes.

Table 6.5.1 : Mechanical properties for design purposes - Carbon and carbon - manganese steels - as rolled

Grade of steel	Thickness [mm]	Design temperature°C (See Note)						
		50	**10**	**150**	**200**	**250**	**300**	**350**
		Nominal minimum lower yield or 0.2 percent proof stress [N/mm^2]						
360 AR	≤ 40	154	153	152	145	128	108	102
410 AR		186	183	181	174	155	134	127
460 AR		218	213	210	203	182	161	153
Note : Maximum permissible design temperature is 350°C								

Table 6.5.2 : Mechanical properties for design purposes - carbon and carbon - manganese steels - normalized or controlled rolled

Section 7

Steels for Machinery Structures

7.1 General

7.1.1 Steel plates, strips, sections or bars intended for use in the construction of welded machinery structures are to comply with one of the following alternatives:

a) Any grade of normal strength structural steel or high strength structural steel as detailed in Sec. 2 and 3.

b) Any grade of carbon or carbon-manganese steel as detailed in Sec. 6 except that for this application batch testing is acceptable and the same is to be carried out in accordance with the requirements of Sec. 2.

Section 8

Plates with Specified minimum through Thickness Properties ('Z' quality)

8.1 General

8.1.1 Following requirements are for special quality plate material with improved ductility in the through thickness or "Z direction.

8.1.2 The use of this material known as 'Z' quality steel, is recommended when plate material, intended for welded construction, will be subject to significant strain in a direction perpendicular to the rolled surfaces. These strains are usually associated with thermal contraction and restraint during welding, particularly for full penetration "T"- butt welds but may also be associated with loads applied in service or during construction. Where these strains are of sufficient magnitude, lamellar tearing may occur. Two 'Z' quality steels are specified; Z25 for normal ship applications and 'Z35' for more severe applications.

Through thickness properties are characterized by specified values for reduction of area in a through thickness tensile test.

8.1.3 This special quality material is to comply with the requirements of Sec. 2, 3, 4, 5, 6 and 7 as appropriate and the following additional requirements.

8.2 Manufacture

8.2.1 All plates are to be manufactured at works which have been approved by IRS for this quality of material.

8.2.2 The sulphur content is not to exceed 0.008 per cent, as determined by ladle analysis. It is recommended that the steel should be efficiently vacuum de-gassed.

8.3 Test material

8.3.1 Unless otherwise agreed, through thickness tensile tests are only required for plate materials where the thickness exceeds 15 [mm]. A test sample large enough to provide six test specimens are to be cut from the centre of one end of each rolled piece representing the batch. (See Fig.8.3.1). Where appropriate the end selected should be representative of the top end of an ingot or the start of a concast strand. Generally three through thickness tensile test specimens are to be prepared while the rest of the sample remains for possible retests.

8.3.2 The batch size is to be determined depending on the product and sulphur content as given in Table 8.3.2.

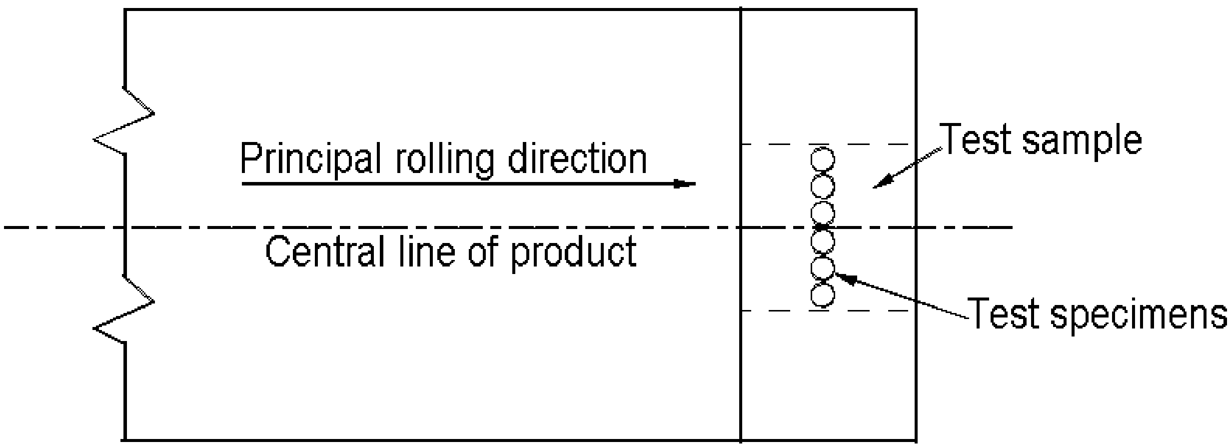

Fig.8.3.1 : Plate and wide flat sampling position

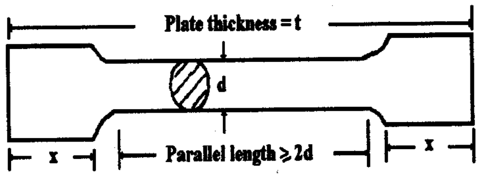
Table 8.3.2 : Batch size dependent on product and sulphur content		
Product	**S > 0.005%**	**S ≤ 0.005%**
Plates	Each piece (parent plate)	Maximum 50t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness ≤ 25 mm	Maximum 10t of products of the same cast, thickness and heat treatment	Maximum 50t of products of the same cast, thickness and heat treatment
Wide flats of nominal thickness > 25 mm	Maximum 20t of products of the same cast, thickness and heat treatment	Maximum 50t of products of the same cast, thickness and heat treatment

8.4 Dimensions of through thickness tensile test specimens

8.4.1 At the option of the steel maker test specimens (Fig.8.4.1a) or test specimens with welded extensions (Fig.8.4.1b) may be used. For both types of test specimens, the diameter of the parallel portion is not to be less than 6 [mm] when plate thickness is less than or equal to 25 [mm] and 10 [mm] when the plate thickness is greater than 25 [mm].

Alternatively, round test specimens, including those with welded extensions, may be prepared in accordance with a recognized standard.

8.4.2 The tolerances on specimen dimensions are to be in accordance with ISO 6892-98 or other recognised standards as appropriate.

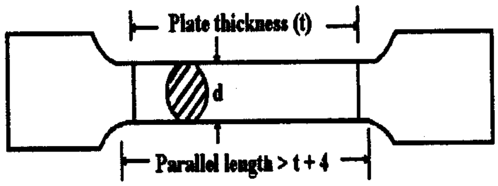


t = thickness of plate [mm]
d = 6 mm; when 15 mm ≤ t ≤ 25 [mm]
d = 10 mm min. when t > 25 [mm]
x = 5 mm max. when d = 6 [mm]
x = 8 mm max. when d = 10 [mm]

Fig 8.4.1 (a) : Plain test specimen

8.5 Mechanical tests

8.5.1 The acceptable minimum average value for the reduction of area of the three tensile test specimens taken in the through thickness direction are given in Table 8.5.1. Only one individual value may be below the minimum average, but not less than the minimum individual value for the appropriate grade.



t = Thickness of plate [mm]
d = 6 mm; when 15 mm ≤ t ≤ 25 [mm]
d = 10 mm when t 25 [mm]

Fig 8.4.1 (b) : Test specimen with welded extension

Table 8.5.1 : Reduction of area acceptance values

Grade	Z25	Z35
Minimum average	25%	35%
Minimum individual	15%	25%

8.5.2 A value less than minimum individual value will require rejection of the piece. However, in case of batch testing each remaining piece in the batch may be individually tested.

8.5.3 Depending on the test results, retest may be permitted in the cases shown in Fig.8.5.3. In these instances, three more tensile tests are to be taken from the remaining test sample. The average of all 6 tensile tests is to be greater than the required minimum average with not more than two results below the minimum average.

In case of failure after retest, either the batch represented by the piece is rejected or each piece within batch may be retested.

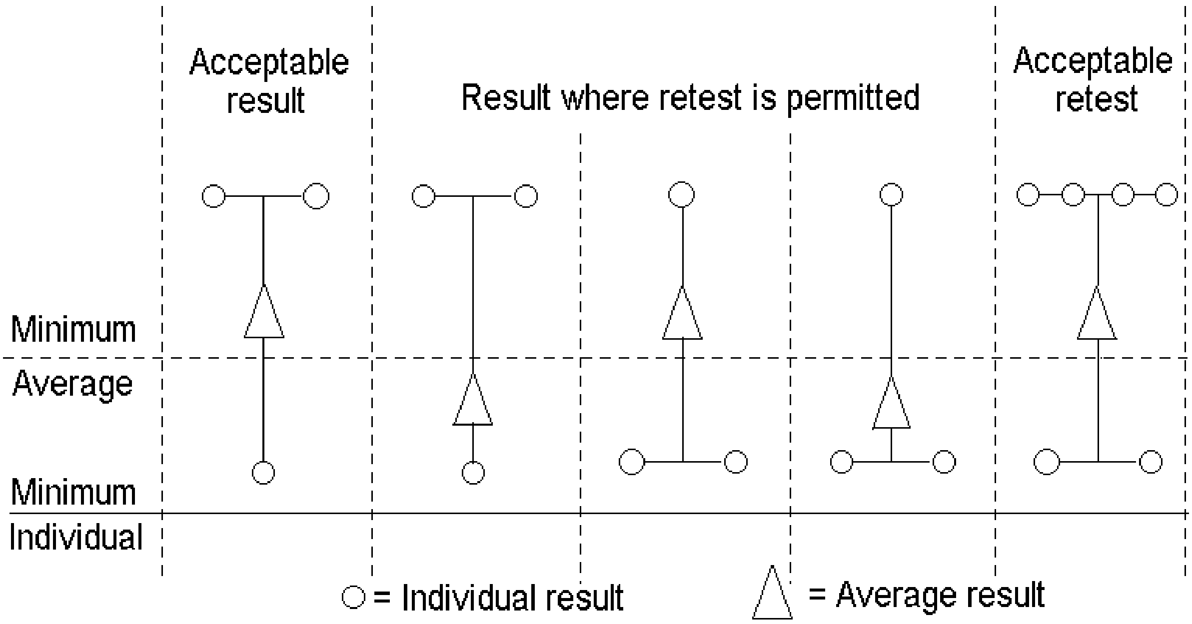


Fig.8.5.3 : Diagram showing acceptance / rejection and retest criteria

8.6 Non-destructive examination

8.6.1 All special 'Z' quality plates are to be ultrasonically tested in the final supply condition, with a probe of frequency 4 MHz. The ultrasonic testing is to be carried out in accordance with either EN 10160-1989 Level S2/E3 or ASTM A578 Level C.

Section 9

Austenitic and Duplex Stainless Steels

9.1 Scope

9.1.1 This section gives the requirements for rolled products in austenitic and duplex (austenite plus ferrite) stainless steels intended for use in the construction of cargo tanks, storage tanks and process pressure vessels for chemicals and liquefied gases.

9.1.2 Austenitic stainless steels are suitable for applications where the lowest design temperature is not lower than –165°C.

9.1.3 Austenitic stainless steels are also suitable for service at elevated temperatures and for such applications the proposed specification should contain, in addition to the requirements of 9.1.6, minimum values for 0.2 and 1.0 per cent proof stresses at the design temperature.

9.1.4 Duplex stainless steels are suitable for applications where the lowest design temperature is above 0°C. Any requirement to use duplex stainless steels below 0°C will be subject to special consideration.

9.1.5 Duplex stainless steels are also suitable for service at temperatures upto 300°C and for such applications the proposed specification should include, in addition to the requirements of 9.1.6, a minimum value for 0.2 per cent proof stress at the design temperature.

9.1.6 A specification giving details of the chemical composition, heat treatment and mechanical properties, including for the austenitic grades, both the 0.2 and 1.0 percent proof stresses, is to be submitted for consideration and approval.

9.2 Chemical composition

9.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 9.2.1.

9.3 Heat treatment

9.3.1 All materials are to be supplied in the solution treated condition.

Table 9.2.1 : Chemical composition

Type and grade of steel	Chemical composition % (see Note)									
	C max	Si max	Mn max	P max	S max	Cr	Ni	Mo	N	Other

9.4 Mechanical tests

9.4.1 Tensile test specimens are to be taken in accordance with the appropriate requirements of 5.4 and 6.4.1.

9.4.2 For the duplex grades, one set of three Charpy V-notch impact test specimens machined in the longitudinal direction from each tensile test piece is to be tested at –20°C. The average energy value of the three specimens is to be not less than 41 Joules.

For austenitic grades of steel, impact tests are only required for design temp. below –105°C. In such cases, impact tests carried out at a temperature of –196°C on a set of three charpy V-notch specimens are to comply with the following:

a) Plates : Transverse test pieces; minimum average energy value 27 Joules.
b) Strips, sections and bars : Longitudinal test pieces, minimum average energy value 41 Joules.

9.4.3 Where standard subsidiary Charpy V-notch test specimens are necessary, see Chapter 2, Sec.3.1.2.

9.4.4 The results of all tensile tests are to comply with the requirements of Table 9.4.1 or the approved specification.

9.5 Through thickness tests

9.5.1 Where material will be strained in a through thickness direction during welding or in service, through thickness tests are required on plates over 10 [mm] thick in all the grades of steels listed in Table 9.2.1, apart from Grades 304L, 304LN, 321 and 347.

9.5.2 Testing is to conform with the requirements of Section 8, with the exception given in 9.5.3.

9.5.3 When the reduction in area is less than 35 per cent, metallographic or other evidence is required to show that no significant amount of any detrimental phase, such as sigma, is present.

Table 9.4.1 : Mechanical properties for acceptance purposes

Type and grade of steel	0.2% proof stress [N/mm^2] minimum	1% proof stress [N/mm^2] minimum	Tensile strength [N.mm^2] minimum	Elongation on 5.65 $\sqrt{S_o}$ % minimum

UNS S 32750	550	-	795	15

9.6 Intergranular corrosion tests

9.6.1 For certain specific applications such as storage tanks for chemicals, it may be necessary to demonstrate that the material used is not susceptible to intergranular corrosion resulting from grain boundary precipitation of chromium-rich carbides.

9.6.2 When required, one test of this type is to be carried out for each tensile test. The testing is to be carried out in accordance with ASTM A262, practice E, copper-copper sulphate-sulphuric acid or another recognized standard. The bent specimen is to be free from cracks indicating the presence of intergranular attack. The material for the test is to be taken adjacent to that for the tensile test.

9.7 Dimensional tolerances

9.7.1 The minimum tolerance on thickness is to be as given in Table 1.4.1.

9.8 Clad plates

9.8.1 Carbon or carbon-manganese steel plates, clad on one or both surfaces with a suitable grade of austenitic or duplex stainless steel, may be used for the construction of cargo or storage tanks for chemicals.

9.8.2 The carbon or carbon-manganese steel base plates are to comply with the requirements of Section 6 and the austenitic or duplex cladding material generally with the requirements of this section.

9.8.3 The process of manufacture is to be specially approved and may be either by roll cladding or by explosive bonding.

9.8.4 Where the use of clad materials is proposed, the material specification is to be submitted for consideration, together with details of the extent and the acceptance standards for non-destructive examination.

9.9 Identification of materials

9.9.1 The particulars detailed in 1.12 are to be marked on all materials which have been accepted.

9.10 Certification of materials

9.10.1 Each test certified or shipping statement is to give the information detailed in 1.13, together with general details of heat treatment and where applicable, the results obtained from intercrystalline corrosion tests. The chemical composition is to include the content of all the elements detailed in Table 9.2.1.

Section 10

Normal and Higher Strength Corrosion Resistant Steels for Cargo Oil Tanks

10.1 Scope

10.1.1These requirements apply to normal and higher strength corrosion resistant steels when such steel is used as the alternative means of corrosion protection for cargo oil tanks as specified in the performance standard MSC.289 (87) of Regulation 3-11, Part A-1, Chapter II-1 of the SOLAS Convention (See Pt.3, Ch.2, Sec.3)

10.1.2 The requirements are primarily intended to apply to steel products with a thickness as follows:

- For steel plates and wide flats;
  - All Grades: Up to 50 [mm] in thickness
- For sections and bars;
  - All Grades: Up to 50 [mm] in thickness

10.1.3 Normal and higher strength Corrosion Resistant steels as defined within this section, are steels whose corrosion resistance performance in the bottom or top of the internal cargo oil tank is tested and approved to satisfy the requirements in MSC.289 (87) in addition to other relevant requirements for ship material, structural strength and construction. It is not intended that such steels be used for corrosion resistant applications in other areas of a vessel that are outside of those specified in the performance standard MSC.289 (87) of Regulation 3-11, Part A-1, Chapter II-1 of the SOLAS Convention.

10.1.4 The basic requirements for ship steels specified in this chapter apply to corrosion resistant steels except where modified by this section.

10.1.5 The welding requirements specified in Ch.11 for approval of consumables for welding normal and higher strength hull structural steels also apply except as modified by this section. Welding procedures are to be approved according to Pt.3, Ch.17, Sec.2.5.

10.2 Testing and Approval

10.2.1 All materials are to be manufactured at works which have been approved by IRS. .

10.2.2 The corrosion tests and assessment criteria are to be in accordance with the Appendix of the Annex to Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers (MSC.289 (87)). Approval can be given for application in one of the following areas of a cargo oil tank:

a) Lower surface of strength deck and surrounding structures.

b) Upper surface of inner bottom plating and surrounding structures.

c) For both strength deck and inner bottom plating.

10.2.3 The manufacturer has to submit to IRS a request for approval, which is to include the following:

a) Corrosion test plan and details of equipment and test environments.

b) Technical data related to product assessment criteria for confirming corrosion resistance.

c) The technical background explaining how the variation in added and controlled elements improves corrosion resistance.

d) The grades, the brand name and maximum thickness of corrosion resistant steel to be approved. Designations for corrosion resistant steels are given in Table 10.1.

e) The welding processes and the brand name of the welding consumables to be used for approval.

Table 10.1 : Designations for Corrosion Resistant Steels		
Type of steel	**Location where Steel is Used**	**Corrosion Resistant Designation**
Rolled steel for hull	For strength deck, ullage space	RCU
	For inner bottom	RCB
	For both strength deck and inner bottom plating	RCW

10.2.4 The test program submitted by the manufacturer will be reviewed by IRS, if found satisfactory, it will be approved and returned to the manufacturer for acceptance prior to tests being carried out. Tests that need to be witnessed by the IRS Surveyor will be identified.

10.2.5 Method for selection of test samples is to satisfy the following:

i. The numbers of test samples is to be in accordance with the requirements of the Appendix of the Annex to Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks of Crude Oil Tankers (MSC.289 (87)).
ii. The number of casts and test samples selected are to be sufficient to make it possible to confirm the validity of interaction effects and/or the control range (upper limit, lower limit) of the elements which are added or intentionally controlled, for improving the corrosion resistance. Where agreed, this may be supported with data submitted by the manufacturer.
iii. Additional tests may be required by IRS when reviewing the test program against the paragraph ii.

10.2.6 In addition to paragraph 10.2.5 above, IRS may require additional tests in the following cases:

a) When IRS determines that the control range is set by the theoretical analysis of each element based on existing data, the number of corrosion resistance tests conducted in accordance with the Appendix of the Annex to Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks (MSC.289 (87)) is too few to adequately confirm the validity of the control range of chemical composition.

b) When IRS determines that the data of the corrosion resistance test result obtained for setting the control range of chemical composition varies too widely.

c) When IRS determines that the validity of the corrosion resistance test result for setting the control range of chemical composition is insufficient, or has some flaws.

d) When IRS's surveyor has not attended the corrosion resistance tests for setting the control range of chemical composition, and IRS determines that additional testing is necessary in order to confirm the validity of the test result data.

e) When IRS determines that it is necessary, for reasons other than cases (a) to (d) above.

The chemical composition of the corrosion resistant steel is to be within the range specified for rolled steel for hull. Elements to be added for improving the corrosion resistance and for which content is not specified are to be generally within 1% in total.

10.2.7 The manufacturer is to carry out the approval test in accordance with the approved test plan.

10.2.8 IRS's Surveyor is to be present, as a rule, when the test samples for the approval test are being identified and for approval tests, see also 10.2.4.

10.2.9 After completion of the approval test, the manufacturer is to produce the report of the approval test and submit to IRS.

10.2.10 IRS will give approval for corrosion resistant steel where approval tests are considered by IRS to have given satisfactory results based on the data submitted in accordance with the provisions of this section.

10.2.11 The results will be assessed by IRS in accordance with the acceptance criteria specified in the Appendix of the Annex to Performance Standard for Alternative Means of Corrosion Protection for Cargo Oil Tanks (MSC.289 (87)).

10.2.12 It is the manufacturer's responsibility to assure that effective process and production controls in operation are adhered to within the manufacturing specifications. If the process or production controls are changed in any way, or any product fails to meet specifications, the manufacturer is to issue a report explaining the reasons, and, in the instance of product which fails to meet specifications, the measures to prevent recurrence.
The complete report is to be submitted to the Surveyor along with such additional information as the Surveyor may require. Each affected piece is to be tested to the Surveyor's satisfaction. The frequency of testing for subsequent products is at the discretion of IRS.

10.2.13 The certificate is to contain the manufacturer's name, the period of validity of the certificate, the grades and thickness of the steel approved, welding methods and consumables approved.

10.3 Method of manufacture

10.3.1 The method of manufacture, deoxidation process and rolling practice is to be in accordance with Sec. 2 for normal strength steels and Sec 3 for high strength steel.

10.4 Chemical Composition

10.4.1 The chemical composition of the samples taken from each ladle of each cast is to be determined by the manufacturer in an adequately equipped and competently staffed laboratory and is to be in accordance with the appropriate requirements mentioned in Sec. 2 for normal strength steels and Sec 3 for high strength steel.

10.4.2 The manufacturer will establish a relationship of all the chemical elements which affect the corrosion resistance, the chemical elements added or controlled to achieve this are to be specifically verified for acceptance. Verification is to be based on the ladle analysis of the steel. The manufacturer's declared analysis will be accepted subject to periodic random checks as required by the Surveyor. The carbon equivalent is to be in accordance with Sec. 2 for normal strength steels and Sec 3 for high strength steel.

10.5 Condition of supply

10.5.1 All materials are to be supplied in one of the supply conditions mentioned in Sec. 2 for normal strength steels and Sec 3 for high strength steel.

10.6 Mechanical Tests

10.6.1 Tensile testing and Charpy V-notch impact testing is to be carried out in accordance with Sec. 2 for normal strength steels and Sec 3 for high strength steel.

10.7 Freedom from defects

10.7.1 The steel is to be reasonably free from segregations and non-metallic inclusions. The finished material is to have a workmanlike finish and is to be free from internal and surface defects prejudicial to the use of the material for the intended application.

10.7.2 The acceptance criteria for surface finish and procedures for the repair of defects, as detailed in Sec1.8 and Sec.1.9 are to be observed.

10.8 Tolerances

10.8.1 Unless otherwise agreed or specially required the thickness tolerances in Sec1 are applicable.

10.9 Identification of materials

10.9.1 The steelmaker is to adopt a system for the identification of ingots, slabs and finished pieces which will enable the material to be traced to its original cast. The Surveyor is to be given full facilities for so tracing the material when required.

10.10 Inspection and testing

10.10.1 Facilities for Inspection

The manufacturer is to afford the Surveyor all necessary facilities and access to all relevant parts of the works to enable him to verify that the approved process is adhered to, for the selection of test materials, and the witnessing of tests, as required by the Rules, and for verifying the accuracy of the testing equipment.

10.10.2 Testing Procedures

The prescribed tests and inspections are to be carried out at the place of manufacture before dispatch. The test specimens and procedures are to be in accordance with Ch.2 Sec1. All the test specimens are to be selected and stamped by the Surveyor and tested in his presence, unless otherwise agreed.

10.10.3 Through Thickness Tensile Tests

If plates and wide flats with thickness of 15 mm and over are ordered with through thickness properties, the through thickness tensile test in accordance with Sec.8 is to be carried out.

10.10.4 Ultrasonic Inspection

If plates and wide flats are ordered with ultrasonic inspection, this is to be made in accordance with an accepted standard at the discretion of IRS.

10.10.5 Surface inspection and dimensions

Surface inspection and verification of dimensions are the responsibility of the steel maker. The acceptance by the IRS's Surveyor shall not absolve the steel maker from this responsibility.

10.11 Test material

10.11.1 Definitions are to be in accordance with Ch.1 Sec.1.9 and requirements for test samples are to be in accordance with Ch.1 Sec.1.7.

10.12 Test specimens

10.12.1 The dimensions, orientation and location of the Charpy V-notch impact test and tensile test specimens within the test samples are to be in accordance with Ch.2 Sec.2,and Sec3 and Ch.3 Sec 2.4 for normal strength steels.

10.12.2 The dimensions, orientation and location of the Charpy V-notch test and tensile test specimens within the test samples are to be in accordance with Ch.2 Sec.2 and Sec.3 and Ch.3, Sec. 3.4 for high strength steels.

10.13 Retest procedure

10.13.1 To be in accordance with Ch.1 Sec.1.10.

10.14 Branding

10.14.1 To be in accordance with Sec.1.12 and Table 10.1.

10.15 Documentation

10.15.1 To be in accordance with Sec.1.13.
IRS may require separate documents for each grade of steel.

End of Chapter

Chapter 4

Steel Castings

Contents

Section 1

General Requirements

1.1 Scope

1.1.1 All important steel castings, as defined in the relevant construction rules are to be manufactured and tested in accordance with the requirements of this Chapter.

1.1.2 Where required by the relevant Rules dealing with design and construction, castings are to be manufactured and tested in accordance with Ch.1 and Ch.2, together with the general requirements given in this Section and the appropriate specific requirements given in Sec.2 to 5.

1.1.3 As an alternative to 1.1.3, castings which comply with national or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this chapter or alternatively are approved for a specific application. Generally, survey and certification are to be carried out in accordance with the requirements of Ch.1.

1.2 Manufacture

1.2.1 Castings are to be made by manufacturer approved by IRS.

1.2.2 The steel is to be manufactured by a process approved by IRS.

1.2.3 All flame cutting, scarfing or arc-air gouging to remove surplus metal is to be undertaken in accordance with recognized good practice and is to be carried out before the final heat-treatment. Preheating is to be employed when necessitated by the chemical composition and/or thickness of the castings. If necessary, the affected areas are to be either machined or ground smooth.

1.2.4 For certain components including steel castings subjected to surface hardening process, the proposed method of manufacture may require special approval by IRS.

1.2.5 When two or more castings are joined by welding to form a composite the proposed welding procedure is to be submitted for approval. Welding procedure qualification tests may be required.

1.3 Quality of castings

1.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

1.3.2 The surfaces are not to be treated in any way which may obscure defects.

1.4 Chemical composition

1.4.1 All castings are to be made from killed steel and the chemical composition is to be appropriate for the type of steel and the mechanical properties specified for the castings. The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring to the heat. When multiple heats are tapped into a common ladle, the ladle analysis shall apply.

1.5 Inspection

1.5.1 All castings are to be cleaned and adequately prepared for examination; suitable methods include pickling, caustic cleaning, wire brushing, local grinding, shot or sand blasting. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

1.5.2 Before acceptance all castings are to be presented to the Surveyors for visual examination. Where applicable, this is to include the examination of internal surfaces. Unless otherwise agreed, the verification of dimensions is the responsibility of the manufacturer.

1.5.3 When required by the relevant construction Rules, or by the approved procedure for welded composite components appropriate non-destructive testing is also to be carried out before acceptance and the results are to be reported by the manufacturer. The castings to be examined, extent of testing and acceptance criteria are detailed in IRS Classification Notes on “Guidelines for Non-Destructive Examination of Steel Castings for Marine Application.

1.5.4 When required by the relevant construction Rules castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

1.5.5 In the event of any casting proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

1.6 Hydraulic pressure testing

1.6.1 When required by the relevant construction Rules, castings are to be pressure tested before final acceptance. These tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

1.7 Rectification of defective castings

1.7.1 General

i) Steel casting defects are to be removed with or without weld repair before considering suitable for use subject to approval of IRS.

ii) Procedure of removal of defect and weld repair is to be in accordance with IRS “Classification Notes on Guidelines for Non-Destructive Examination of Steel Castings for Marine Application.

iii) Where the defective area is to be repaired by welding, the excavations are to be suitably shaped to allow good access for welding. The resulting grooves are to be subsequently ground smooth and complete elimination of the defective material is to be verified by MT or PT.

iv) Shallow grooves or depressions resulting from the removal of defects may be accepted provided that they will cause no appreciable reduction in the strength of the casting. The resulting groves or depressions are to be subsequently ground smooth and complete elimination of the defective material is to be verified by MT or PT. Small surface irregularities sealed by welding are to be treated as weld repairs.

v) The manufacturer is to maintain full records detailing the extent and location of repairs made to each casting and details of weld procedures and heat treatments applied for repairs. These records are to be available to the Surveyor and copies provided on request.

1.7.2 Weld repairs

When it has been agreed that a casting can be repaired by welding the following requirements apply:

i) Before welding is started, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted for approval:

ii) All castings in alloy steels and all castings for crankshafts are to be suitably pre-heated prior to welding. Castings in carbon or carbon-manganese steel may also require to be pre-heated depending on their chemical composition and the dimensions and position of the weld repairs.

iii) Welding s to be done under cover in positions free from draughts and adverse weather conditions by qualified welders with adequate supervision. As far as possible, all welding is to be carried out in the downhand (flat) position.

iv) The welding consumables used are to be of an appropriate composition, giving a weld deposit with mechanical properties similar and in no way inferior to those of the parent castings. Welding procedure tests are to be carried out by the manufacturer to demonstrate that satisfactory mechanical properties can be obtained after heat treatment as detailed in Sec.2.

v) After welding has been completed the castings are to be given either a suitable heat treatment in accordance with the requirements of Sec.2 or a stress relieving heat treatment at a temperature of not less than 550°C. The type of heat treatment employed will be dependent on the chemical composition of the casting and he dimensions, positions and nature of the repairs.

vi) Subject to the prior agreement of IRS special consideration may be given to the omission of postweld heat treatment or to the acceptance of local stress relieving heat treatment where the repaired area is small and machining of the casting has reached an advanced stage.

vii) On completion of heat treatment the weld repairs and adjacent material are to be ground smooth and examined by magnetic particle or liquid penetrant testing. Supplementary examination by ultrasonics or radiography may also be repaired depending on the dimensions and nature of the original defect. Satisfactory results are to be obtained from all forms of non-destructive testing used.

1.8 Identification of castings

1.8.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and Surveyors are to be given full facilities for so tracing the castings when required.

1.8.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:

i) Steel quality.

ii) Identification number, cast number or other marking which will enable the full history of the casting to be traced.

iii) Manufacturer's name or trade mark.

iv) The IRS brand name 'IR'.

v) Abbreviated name of the IRS local office.

vi) Personal stamp of Surveyors responsible for inspection.

vii) Where applicable, test pressure.

1.8.3 When small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with IRS.

1.9 Certification

1.9.1 The manufacturer is to provide the Surveyor with a test certificate or shipping statement giving the following particulars for each casting or batch of castings which has been accepted:-

a) Purchaser's name and order number;

b) Description of castings and steel quality;

c) Identification number;

d) Steel making process, cast number and chemical analysis of ladle samples;

e) Results of mechanical testing;

f) General details of heat treatment;

g) Where applicable, test pressure.

Section 2

Hull and Machinery Steel Castings for General Applications

2.1 Scope

2.1.1 The requirements given in this section are applicable to steel castings intended for hull and machinery applications such as stern frames, rudder frames, crankshafts, turbine casings, bedplates, etc.

2.1.2 These requirements are applicable only to steel castings where the design and acceptance tests are related to mechanical properties at ambient temperature. For other applications, additional requirements may be necessary, especially when the castings are intended for service at low or elevated temperatures.

2.1.3 Where the use of alloy steel castings is proposed full details of the chemical composition, heat treatment, mechanical properties, testing inspection and rectification are to be submitted for approval of IRS.

2.2 Chemical composition

2.2.1 For carbon and carbon-manganese steel castings the chemical composition is to comply with the overall limits given in Table 2.2.1 or where applicable, the requirements of the approved specification.

2.2.2 Unless otherwise required, suitable grain refining elements such as aluminium may be used at the discretion of the manufacturer. The content of such elements is to be reported.

Table 2.2.1 : Chemical composition limits for hull and machinery steel castings (%)

Steel type	Applications	C (max.)	Si (max.)	Mn	S (max.)	P (max.)	Residual elements (max.)				Total residuals (max.)
							Cu	Cr	Ni	Mo	
C, C-Mn	Castings for non-welded construction	0.40	0.60	0.50 – 1.60	0.040	0.040	0.30	0.30	0.40	0,15	0.80
	Castings for welded construction	0.23	0.60	1.60 max.	0.040	0.040	0.30	0.30	0.40	0.15	0.80

2.3 Heat treatment

2.3.1 Castings are to be supplied in one of the following conditions:

Fully annealed
Normalised
Normalised and tempered
Quenched and tempered

The tempering temperature is not less than 550°C.

2.3.2 Castings or component such as crankshafts and engine bedplates, where dimensional stability and freedom from internal stresses are important are to be given a stress relief heat treatment. This is to be carried out at a temperature of not less than 550°C followed by furnace cooling to 300°C or lower.

2.3.3 Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole casting to be uniformly heated to the necessary temperature. In the case of very large castings alternative methods for heat treatment will be specially considered by IRS. Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform unless the temperature uniformity of the furnace is verified at regular intervals.

2.3.4 If a casting is locally reheated or any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment may be required in order to avoid the possibility of harmful residual stresses.

2.3.5 The manufacturer’s works is to maintain records of heat treatment identifying the furnace used, furnace charge, date, temperature and time at temperature. The records are to be presented to the Surveyor on request.

2.4 Mechanical tests

2.4.1 Test material, sufficient for the required tests and for possible retest purposes is to be provided for each casting or batch of castings.

2.4.2 At least one test sample is to be provided for each casting. Unless otherwise agreed these test samples are to be either integrally cast or gated to the castings and are to have a thickness of not less than 30 [mm].

2.4.3 Where the casting is of complex design or where the finished mass exceeds 10 tonnes, two test samples are to be provided. Where large castings are made from two or more casts, which are not mixed in a ladle prior to pouring, two or more test samples are to be provided corresponding, the number of the casts involved. These are to be integrally cast at locations as widely separated as possible.

2.4.4 For castings where the method of manufacture has been specially approved by IRS in accordance with 1.2.4, the number and position of test samples is to be agreed with IRS having regard to the method of manufacture employed.

2.4.5 As an alternative to 2.4.2, where a number of small castings of about the same size, each of which is under 1000 [kg] in mass are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one test sample is to be provided for each batch of castings.

2.4.6 The test samples are not to be detached from the casting until the specified heat treatment has been completed and they have been properly identified.

2.4.7 One tensile test specimen is to be taken from each test sample.

2.4.8 The preparation of test specimens and the procedures used for mechanical testing are to comply with the relevant requirements of Ch.2. Unless otherwise agreed all tests are to be carried out in the presence of the Surveyors.

2.5 Mechanical properties

2.5.1 Table 2.5.1 gives the minimum requirements for yield stress, elongation and reduction of area corresponding to different strength levels. Where it is proposed to use a steel with a specified minimum tensile strength intermediate to those given, corresponding minimum values for the other properties may be obtained by interpolation.

2.5.2 Castings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 2.5.1 but subject to any additional requirements of the relevant construction rules.

2.5.3 The mechanical properties are to comply with the requirements of Table 2.5.1, appropriate to the specified minimum tensile strength or, where applicable, the requirements of the approved specification.

2.5.4 Where the result of a tensile test does not comply with the requirements, two additional tests may be taken. If satisfactory results are obtained from both of these additional tests the casting or batch of castings is acceptable. If one or both retests fail the castings or batch of castings is to be rejected.

2.5.5 The additional tests detailed in 2.5.4 are to be taken, preferably from the same, but alternatively from another, test sample representative of the casting or batch of castings.

2.5.6 At the option of the manufacturer, when a casting or batch of castings has failed to meet the test requirements, it may be reheat treated and re-submitted for acceptance tests.

Table 2.5.1 : Mechanical properties for hull and machinery steel castings

Specified minimum tensile strength (1) [N/mm^2]	**Yield stress [N/mm^2] min.**	**Elongation on 5.65 √So (%) min.**	**Reduction of area (%) min.**
400	200	25	40
440	220	22	30
480	240	20	27
520	260	18	25
560	300	15	20
600	320	13	20

Note:
(1) A tensile strength range of 150 [N/mm^2] may additionally be specified.

Section 3

Ferritic Steel Castings for Low Temperature Services

3.1 General

3.1.1 This Section gives the requirements for castings in carbon-manganese and nickel alloy steels intended for use in liquefied gas piping systems where the design temperature is lower than 0°C and for other applications where guaranteed impact properties at low temperatures is required.

3.1.2 Other steel types may also be accepted upon consideration in each case.

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples is to comply with the overall limits given in Table 3.2.1. The carbon-manganese steel is to be fine grain treated.

Table 3.2.1 : Chemical composition of ferritic steel castings for low temperature service

Type of steel	Chemical composition %						
	C max.	Si max.	Mn	S max.	P max.	Ni	Residual elements max.
Carbon-manganese	0.25	0.60	0.70-1.60	0.030	0.030	0.80 max.	
$2\frac{1}{4}$ Ni	0.25	0.60	0.50-0.80	0.025	0.030	2.00-3.00	Cr 0.25 Cu 0.30 Mo 0.15 V 0.03 Total 0.60
$3\frac{1}{2}$ Ni	0.15	0.60	0.50-0.80	0.020	0.025	3.00-4.00	

3.3 Heat treatment

3.3.1 Castings are to be supplied in one of the following conditions :

a) normalized.
b) normalized and tempered.
c) quenched and tempered.

3.4 Mechanical tests

3.4.1 The mechanical properties of steel castings are to comply with requirements given in Table 3.4.1.

3.4.2 The tensile test is to be carried out at ambient temperature and the impact tests are to be carried out at the temperature specified in the table.

3.4.3 The average energy value from a set of three charpy V-notch impact test specimens is not to be lower than the required average value given in Table 3.4.1. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value.

3.5 Non-destructive testing

3.5.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of 1.7 and additionally agreed between the manufacturer, purchaser and Surveyor.

Table 3.4.1 : Mechanical properties for acceptance purposes : ferritic steel castings for low temperature service							
Type of steel	**Grade**	**Yield stress [N/mm²] min.**	**Tensile strength [N/mm²]**	**Elongation on 5.65√So% min.**	**Reduction of area % min.**	**Charpy V-notch impact test**	
						Test temp.°C	**Average energy J min.**
Carbon-manganese	400 430 450	200 215 230	400 - 550 430 - 580 460 - 610	25 23 22	40 35 30	-60 (see Note)	27
$2\frac{1}{4}$ Ni	490	275	490 - 640	20	35	-70	34
$3\frac{1}{2}$ Ni	490	275	490 - 640	20	35	-95	34
Note : The temperature for carbon-maganese steels may be 5°C below the design temperature if the latter is above -55°C, with a maximum test temperature of -20°C.							

Section 4

Steel Castings for Propellers

4.1 Scope

4.1.1 These requirements are applicable to the manufacture of cast steel propellers, blades and bosses.

4.1.2 Where the use of alternative alloys is proposed, particulars of chemical composition, mechanical properties and heat treatment are to be submitted for approval.

4.1.3 These requirements may also be used for the repair of propellers damaged in service, subject to prior approval of IRS.

4.2 Manufacture

4.2.1 All propellers, blades and bosses are to be manufactured by foundries approved in accordance with Pt.2, Ch.1. The scope of the procedure tests involved in the approval is to be agreed.

4.2.2 General characteristics of castings

All castings are to have a workmanlike finish and are to be free from imperfections that could be considered to impair in-service performance.

4.2.3 Chemical composition

Typical cast steel propeller alloys are grouped into four types depending on their chemical composition as given in Table 4.2.1.

4.2.4 Heat treatment

Martensitic castings are to be austenitized and tempered. Austenitic castings should be solution treated.

4.2.5 Mechanical tests

4.2.5.1 The mechanical properties are to meet the requirements in Table 4.2.2. These values refer to the test specimens machined from integrally cast test bars attached to the hub or on the blade.

4.2.5.2 Where possible, the test bars attached on blades are to be located in an area between 0.5 to 0.6R, where R is the radius of the propeller.

4.2.5.3 The test bars are not to be detached from the casting until the final heat treatment has been carried out. Removal is to be by non-thermal procedures.

4.2.5.4 Separately cast test bars may be used subject to prior approval of IRS. The test bars are to be cast from the same heat as the castings represented and heat treated with the castings represented.

Table 4.2.1 : Typical chemical composition for steel propeller castings

Alloy type	C max. (%)	Mn max. (%)	Cr (%)	Mo[1)] max. (%)	Ni (%)
Martensitic (12 Cr 1 Ni)	0.15	2.0	11.5 - 17.0	0.5	Max. 2.0
Martensitic (13 Cr 4 Ni)	0.06	2.0	11.5 - 17.0	1.0	3.5 - 5.0
Martensitic (16 Cr 5 Ni)	0.06	2.0	15.0 - 17.5	1.5	3.5 - 6.0
Austenitic (19 Cr 11 Ni)	0.12	1.6	16.0 - 21.0	4.0	8.0 - 13.0
Note 1) Minimum values are to be in accordance with recognised national or international standards					

Table 4.2.2 : Mechanical properties for steel propeller castings

Alloy type	Proof stress $R_{p0.2}$ min. [N/mm^2]	Tensile strength R_m min. [N/mm^2]	Elongation A_5 min. (%)	Red. Of area Z min. (%)	Charpy V-notch[1]) Energy min. (J)
(12 Cr 1 Ni)	440	590	15	30	20
(13 Cr 4 Ni)	550	750	15	35	30
(16 Cr 5 Ni)	540	760	15	35	30
(19 Cr 11 Ni)	180[2)]	440	30	40	-

Notes:

1) Not required for general service and the lowest ice class notations. For other ice class notations, tests are to be made -10^{o}C.

2) $R_{p1.0}$ value is 205 [N/mm^2].

4.2.5.5 At least one set of mechanical tests is to be made on material representing each casting in accordance with Part 2, Chapter 2.

4.2.5.6 As an alternative to 4.2.5.5, where a number of small propellers of about the same size and less than 1 [m] in diameter, are made from one cast and heat treated in the same furnace charge, a batch testing procedure may be adopted using separately cast test samples of suitable dimensions. At least one set of mechanical tests is to be provided for each multiple of five castings in the batch.

4.3 Visual examination

4.3.1 All castings must be supplied in a clean fettled condition.

4.3.2 All finished castings are to be 100% visually inspected by the Surveyor. The Surveyor may require areas to be etched for the purpose of investigating weld repairs.

4.3.3 Castings are to be free from cracks, hot tears or other imperfections which, due to their nature, degree or extent, will interfere with the use of the castings.

4.4 Dimensions, dimensional and geometrical tolerances

4.4.1 The dimensions are the responsibility of the manufacturer and the report on the dimensional inspection is to be handed over to the Surveyor, who may require checks to be made in his presence.

4.4.2 Static balancing is to be carried out on all propellers in accordance with the approved drawing. Dynamic balancing may be necessary for propellers running above 500 rpm.

4.5 Non-destructive examination

4.5.1 All finished castings are subject to non-destructive testing in accordance with the requirements given in 4.5.2 to 4.5.9.

4.5.2 In order to relate the degree of non-destructive testing to the criticality of imperfections, propeller blades are divided into three severity zones designated A, B and C. Further, a distinction is made between low skew and high skew properties. (See Ch.8, Sec.3).

4.5.3 For all propellers, separately cast blades and hubs, the surfaces covered by severity Zones A, B and C are to be liquid penetrant tested. Testing of Zone A is to be undertaken in the presence of the Surveyor, whilst testing of Zone B and C may be witnessed by the Surveyor upon his request.

4.5.4 If repairs have been made either by grinding or by welding, the repaired areas are additionally to be subjected to the liquid penetrant testing independent of their location and/or severity Zone. Weld repairs are, independent of their location, always to be assessed according to Zone A.

4.5.5 The following definitions relevant to liquid penetrant indications apply:

Indication : the presence of detectable bleed-out of the penetrant liquid from the material discontinuities appearing at least 10 minutes after the developer has been applied;

Linear indication : an indication in which the length is at least three times the width;

Nonlinear indication : an indication of circular or elliptical shape with a length less than three times the width;

Aligned indication : three or more indications in a line, separated by 2 [mm] or less edge-to-edge;

Open indication : an indication that can be detected by the use of contrast dye penetrant;

Non-open indication : an indication that cannot be detected by the use of contrast dye penetrant;

Relevant indication : an indication that is caused by a condition or type of discontinuity that requires evaluation. Only indications which have any dimension greater than 1.5 [mm] shall be considered relevant.

4.5.6 For the purpose of evaluating indications, the surface is to be divided into reference areas of 100 [cm^2], which may be square or rectangular with the major dimension not exceeding 250 [mm]. The area shall be taken in the most unfavorable location relative to the indication being evaluated.

4.5.7 The indications detected may, with respect to their size and number, not exceed the values given in the Table 4.5.1.

4.5.8 Where serious doubt exists that the castings are not free from internal defects, further non-destructive inspections are to be carried out upon request of the Surveyor, e.g. radiographic and/or ultrasonic tests. The acceptance criteria are then to be agreed between the manufacturer and IRS in accordance with the recognised standard.

4.5.9 The foundry is to maintain records of inspections traceable to each casting. These records are to be reviewed by the Surveyor. The foundry is also to provide the Surveyor with a statement confirming that non-destructive tests have been carried out with satisfactory results.

Table 4.5.1 : Allowable number and size of indications depending on severity zones

Severity zone	Max. total number of indications	Indication type	Max. number for each type[1),2)]	Max. dimension of indication [mm]
A	7	Non-linear	5	4
		Linear	2	3
		Aligned	2	3
B	14	Non-linear	10	6
		Linear	4	6
		Aligned	4	6
C	20	Non-linear	14	8
		Linear	6	6
		Aligned	6	6

Table 4.5.1 (Contd.)

Notes:

1) Single non-linear indications less than 2 [mm] in Zone A and less than 3 [mm] in other zones may be disregarded.

2) The total number of non-linear indications may be increased to the maximum total number, or part thereof, represented by the absence of linear or aligned indications.

4.6 Repair

4.6.1 Defective castings are to be repaired in accordance with the requirements given in 4.6.2 to 4.6.7 and, where applicable, the requirements of 4.7.

4.6.2 In general the repairs are to be carried out by mechanical means, e.g. by grinding or milling. The resulting grooves are to be blended into the surrounding surface so as to avoid any sharp contours. Complete elimination of the defective material is to be verified by liquid penetrant testing.

4.6.3 Weld repairs are to be undertaken only when they are considered to be necessary and have prior approval of the Surveyor. All weld repairs are to be documented by means of sketches or photographs showing the location and major dimensions of the grooves prepared for welding. The documentation is to be presented to the Surveyor prior to repair welding.

4.6.4 The excavations are to be suitably shaped to allow good access for welding. The resulting grooves are to be subsequently ground smooth and complete elimination of the defective material is to be verified by liquid penetrant testing. Welds having an area less than 5 [cm^2] are to be avoided.

4.6.5 Grinding in severity Zone A may be carried out to an extent that maintains the blade thickness. Repair welding is generally not permitted in severity Zone A and will only be allowed after special consideration.

4.6.6 Defects in severity Zone B that are not deeper than t/40 [mm] ("t" is the minimum local thickness according to the Rules) or 2 [mm], whichever is greatest, are to be removed by grinding. Those defects that are deeper may be repaired by welding subject to prior approval from IRS.

4.6.7 Repair welding is generally permitted in severity Zone C.

4.7 Weld repair procedure

4.7.1 The scope of the procedure tests involved in the qualification is given in 4.10.

Before welding is started, a detailed welding procedure specification is to be submitted covering the weld preparation, welding positions, welding parameters, welding consumables, preheating, post weld heat treatment and inspection procedures.

4.7.2 All weld repairs are to be made by qualified welders using qualified procedures.

4.7.3 Welding is to be done under controlled conditions free from draughts and adverse weather.

4.7.4 Metal arc welding with electrodes or filler wire used in the procedure tests is to be used. The welding consumables are to be stored and handled in accordance with the manufacturer's recommendations.

4.7.5 Slag, undercuts and other imperfections are to be removed before depositing the next run.

4.7.6 The martenistic steels are to be furnace re-tempered after weld repair. Subject to prior approval, however, local stress relieving may be considered for minor repairs.

4.7.7 On completion of heat treatment the weld repairs and adjacent material are to be ground smooth. All weld repairs are to be liquid penetrant tested.

4.7.8 The manufacturer is to be maintain records of welding, subsequent heat treatment and inspections traceable to each casting repaired. These records are to be reviewed by the Surveyor.

4.8 Identification

4.8.1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1. The following details are to be marked on all castings which have been accepted:

a) Heat number or other marking which will enable the full history of the casting to be traced;

b) The IRS certificate number and abbreviated name of local IRS office;

c) Ice class symbol, where applicable;

d) Skew angle for high skew propellers;

e) Date of final inspection.

4.8.2 The IR stamp is to be put on when the casting has been accepted.

4.9 Certification

4.9.1 The manufacturer is to provide the Surveyor with an inspection certificate giving the following particulars for each casting which has been accepted:

a) Purchaser's name and order number;

b) Vessel identification, where known;

c) Description of the casting with drawing number;

d) Diameter, number of blades, pitch, direction of turning;

e) Skew angle for high skew propellers;

f) Final mass;

g) Alloy type, heat number and chemical composition;

h) Casting identification number;

i) Details of time and temperature of heat treatment;

j) Results of the mechanical tests.

4.9.2 The manufacturer is to provide a statement regarding non-destructive tests as required by 4.5.9 and where applicable, records of weld repairs as required by 4.7.8.

4.10 Welding procedure qualification test

4.10.1 Preparation of test assembly

A test assembly of minimum 30 [mm] thickness is to be welded. The types of specimens to be prepared are shown in Fig.4.10.1.

4.10.2 Non-destructive testing

Prior to sectioning, the test assembly is to be visually inspected and liquid penetrant tested. Imperfections shall be assessed in accordance with 4.5.

4.10.3 Macro-examination

Two macro-sections shall be prepared and etched on one side to clearly reveal the weld metal, the fusion line and the heat affected zone. The sections are to be examined by eye (aided by low power hand lens if desired) for any imperfections present in the weld metal and HAZ. Cracks or crack-like imperfections, slag inclusions and pores greater than 3 [mm] are not permitted.

4.10.4 Tensile testing

Two flat transverse tensile test specimens shall be prepared. Testing procedures shall be in accordance with Ch.4 Sec.1 requirements. The tensile strength shall meet the specified minimum value of the base material. The location of fracture is to be reported, i.e. weld metal, HAZ or base material.

4.10.5 Charpy V-notch testing

Impact test is not required, except where the base material is impact tested. Charpy V-notch test specimens shall be in accordance with Pt.2, Ch.2, Sec.3. Two sets shall be taken, one set with the notch positioned in the center of the weld and one set with the notch positioned in the fusion line, respectively.

The test temperature and impact energy shall comply with the requirement specified for the base material.

4.10.6 Hardness testing

One of the macro-sections shall be used for HV5 hardness testing. Indentations shall traverse 2 [mm] below the surface. At least three individual indentations are to be made in the weld metal, the HAZ (both sides) and in the base material (both sides). The values are to be reported for information.

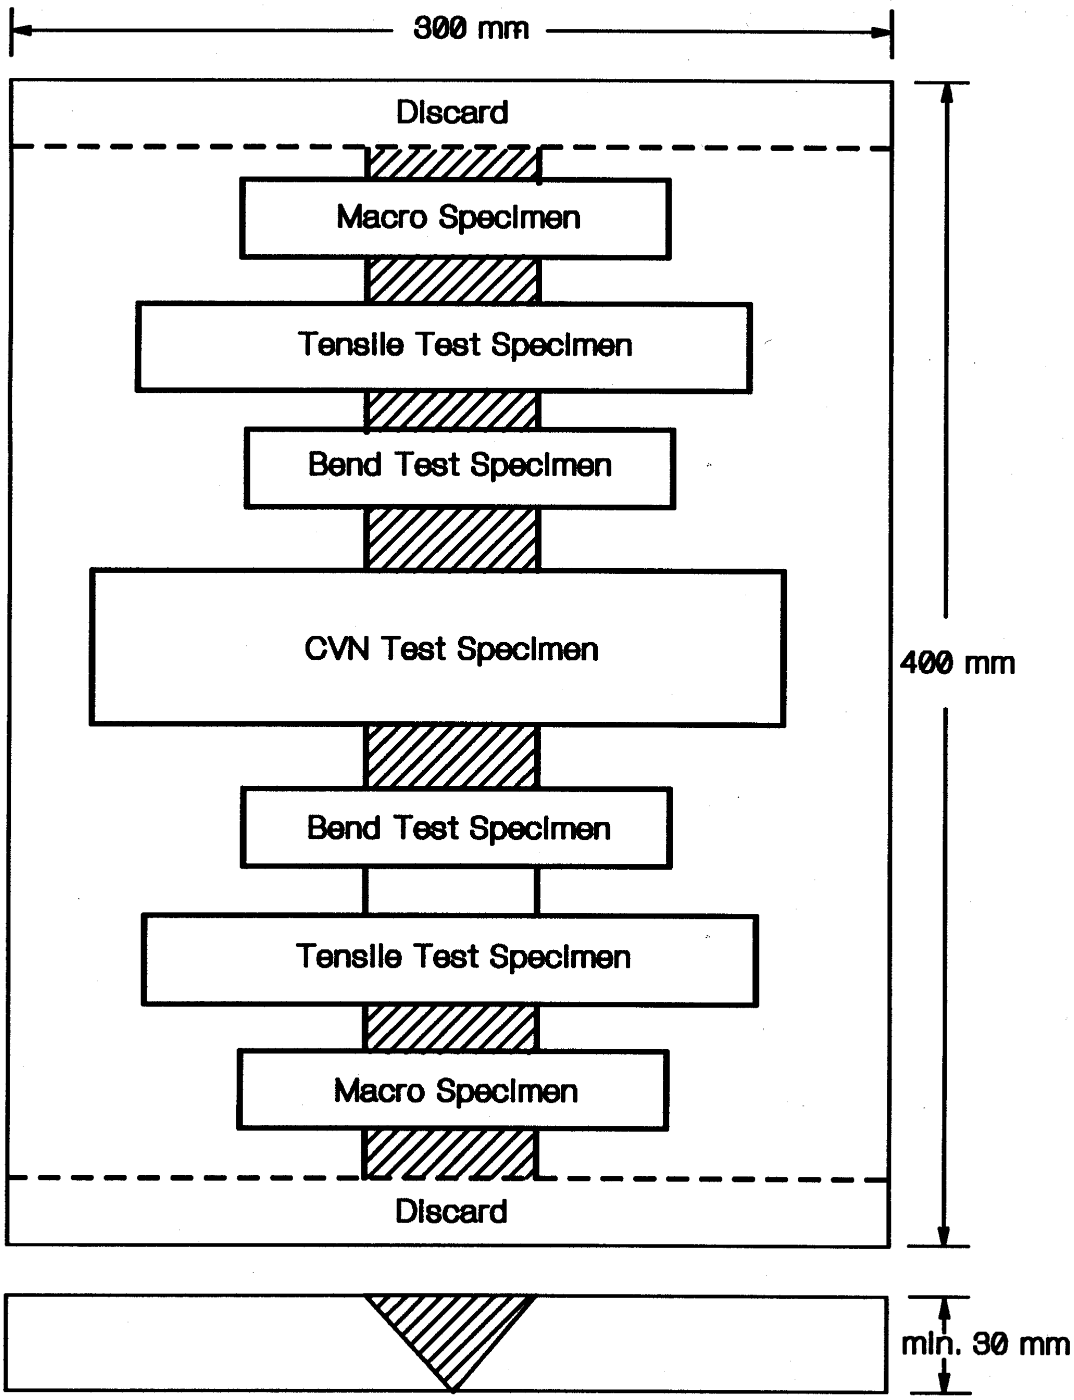

Fig.4.10.1 : Weld test assembly

Section 5

Austenitic Stainless Steel Castings

5.1 Scope

5.1.1 This section gives the requirements for castings in austenitic stainless steels for piping systems in ships for liquefied gases where the design temperature is not lower than –165°C and in bulk chemical carriers.

5.1.2 Where it is proposed to use alternative steels, particulars of the specified chemical composition, mechanical properties and heat treatment are to be submitted for approval.

5.2 Chemical composition

5.2.1 The chemical composition of ladle samples is to comply with the requirements given in Table 5.2.1.

<table>
<tr><th colspan="10">Table 5.2.1 : Chemical composition of austenitic stainless steel castings</th></tr>
<tr><th rowspan="2">Type of steel</th><th colspan="9">Chemical composition %</th></tr>
<tr><th>C max.</th><th>Si</th><th>Mn</th><th>S</th><th>P</th><th>Cr</th><th>Mo</th><th>Ni</th><th>Others</th></tr>
<tr><td>304L</td><td>0.03</td><td rowspan="6">0.20-1.5</td><td rowspan="6">0.50-2.0</td><td colspan="2" rowspan="6">0.40 max.</td><td rowspan="6">17.0-21.0</td><td>-</td><td>8.0-12.0</td><td>-</td></tr>
<tr><td>304</td><td>0.08</td><td>-</td><td>8.0-12.0</td><td>-</td></tr>

<tr><td colspan="10">Note: When guaranteed impact values at low temperature are not required, the maximum carbon content may be 0.08% and the maximum niobium may be 1.00%.</td></tr>
</table>

5.3 Heat treatment

5.3.1 All castings are to be solution treated at a temperature of not less than 1000°C and cooled rapidly in air, oil or water.

5.4 Mechanical tests

5.4.1 One tensile test specimen is to be prepared from material representing each casting or batch of castings. In addition, where the castings are intended for liquefied gas applications, where the design temperature is lower than –55°C, one set of three Charpy V-notch impact test specimens is to be prepared.

5.4.2 The tensile test is to be carried out at ambient temperature and the results are to comply with the requirements given in Table 5.4.2.

5.4.3 The average value for impact test specimens is to comply with the appropriate requirements given in Table 5.4.2. One individual value may be less than the required average value provided that it is not less than 70 percent of this average value. See Ch.1, 1.10 for re-test procedures.

Table 5.4.2 : Mechanical properties for acceptance purposes : austenitic stainless steel castings

Type of steel	Tensile strength [N/mm^2] minimum	1.0% proof stress [N/mm^2] minimum	Elongation on 5.65 $\sqrt{S_o}$ % minimum	Reduction of area % minimum	Charpy V-notch impact tests	
					Test temp. °C	Average energy J minimum
304L	430	215	26	40	-196	41
304	480	220				
316L	430	215	26	40	-196	41
317	480	240				
347	480	215	22	35	-196	41

5.5 Intergranular corrosion tests

5.5.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on castings in grades 304, 316 and 317. Such tests may not be required for grades 304L, 316L and 347.

5.5.2 Where an intergranular corrosion test is specified, it is to be carried out in accordance with the standard referred in 9.6.2 of Chapter 3.

5.6 Non-destructive examination

5.6.1 The non-destructive examination of castings is to be carried out in accordance with the appropriate requirements of Classification Notes "Guidelines for non-destructive examination of steel castings for marine application" and additionally agreed between the manufacturer, purchaser and Surveyor.

Section 6

Castings for other Applications

6.1 General

6.1.1 Details of chemical composition, heat treatment, mechanical properties of steel castings for crankshafts and those intended for elevated temperature service are to be submitted for approval of IRS.

End of Chapter

Chapter 5

Steel Forgings

Contents

Section

Section 1

General Requirements

1.1 Scope

1.1.1 All important steel forgings, as defined in the relevant construction Rules, are to be manufactured and tested in accordance with the requirements of this Chapter.

1.1.2 Where required by the relevant Rules dealing with design and construction, forgings are to be manufactured and tested in accordance with Ch.1 and 2, together with the general requirements given in this Chapter.

1.1.3 Alternatively, forgings which comply with National or proprietary specifications may be accepted provided such specifications give reasonable equivalence to these requirements or are otherwise specially approved for a specific application by IRS.

1.2 Manufacture

1.2.1 Forgings are to be made at the works approved by IRS.

1.2.2 The steel used in the manufacture of forgings is to be made by a process approved by IRS.

1.2.3 Adequate top and bottom discards are to be made to ensure freedom from piping and harmful segregations in the finished forgings.

1.2.4 The plastic deformation is to be such as to ensure soundness, uniformity of structure and satisfactory mechanical properties after heat treatment. The reduction ratio is to be in accordance with the following Table:

Method of manufacture	Total reduction ratio (See Notes 1, 2 & 3)
Made directly from ingots or forged blooms or billets	3:1 where L > D 1.5:1 where L ≤ D
Made from rolled products	4:1 where L > D 2:1 where L ≤ D
Notes 1 L and D are the length and diameter respectively of the part of the forging under consideration.	
2 the reduction ratio is to be calculated with reference to the average cross-sectional area of the ingot. Where an ingot is initially upset, this reference area may be taken as the average cross-sectional area after this operation.	
3 For rolled bars used as a substitute for forgings (see 1.1.1) the reduction ratio is not to be less than 6 : 1	
4 For forgings made by upsetting, the length after upsetting is to be not more than one-third of the length before upsetting or, in the case of an initial forging reduction of at least 1.5:1, not more than one half of the length before upsetting.	

1.2.5 For crankshafts, where grain flow is required in the most favourable direction having regard to the mode of stressing in service, the proposed method of manufacture may required special approval by IRS. In such cases, tests may be required to demonstrate that a satisfactory structure and grain flow are obtained.

1.2.6 The shaping of forgings or rolled slabs and billets by flame cutting, scarfing or arc-air gouging is to be undertaken in accordance with recognized good practice and unless otherwise approved, is to be carried out before the final heat treatment. Preheating is to be employed when necessitated by the composition and/or thickness of the steel.

1.2.7 For certain components, subsequent machining of all flame cut surfaces may be required.

1.2.8 When two or more forgings are joined by welding to form a composite component the proposed welding procedure specification is to be submitted for approval. Welding procedure qualification tests may be required.

1.3 Quality of forgings

1.3.1 All forgings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

1.4 Chemical composition

1.4.1 All forgings are to be made from killed steel, and the chemical composition is to be appropriate for the type of steel, dimensions and required mechanical properties of the forgings being manufactured.

1.4.2 The chemical composition of each heat is to be determined by the manufacturer on a sample taken preferably during the pouring of the heat. When multiple heats are tapped into a common ladle, the ladle analysis is applicable.

1.5 Heat treatment (including surface hardening and straightening)

1.5.1 At an appropriate stage of manufacture, after completion of all hot working operations, forgings are to be suitably heat treated to refine the grain structure and to obtain the required mechanical properties. Heat treatment is to be carried out in properly constructed furnaces which are efficiently maintained and have adequate means for control and recording of temperature. The furnace dimensions are to be such as to allow the whole furnace charge to be uniformly heated to the necessary temperature. In the case of very large forgings alternative methods of heat treatment will be specially considered by IRS.

1.5.2 Except as provided in 1.5.7 and 1.5.8 forgings are to be supplied in one of the following conditions:

a) Carbon and carbon-manganese steels
   Fully annealed
   Normalized
   Normalized and tempered
   Quenched and tempered

b) Alloy steels
   Quenched and tempered

For all types of steel the tempering temperature is not less than 550°C. Where forgings for gearing are not intended for surface hardening tempering at lower temperature may be allowed.

1.5.3 Alternatively, alloy steel forgings may be supplied in the normalized and tempered condition, in which case the specified mechanical properties are to be agreed with IRS.

Sufficient thermocouples are to be connected to the furnace charge to measure and record that its temperature is adequately uniform unless the temperature uniformity of the furnace is verified at regular intervals.

1.5.4 If for any reasons a forging is subsequently heated for further hot working the forging is to be re-heat treated.

1.5.5 If any straightening operation is performed after the final heat treatment, a subsequent stress relieving heat treatment to avoid harmful residual stresses is to be carried out, unless otherwise agreed.

1.5.6 Where it is intended to surface harden forgings, full details of the proposed procedure and specification are to be submitted for the approval of IRS. For the purpose of this approval, the manufacturer may be required to demonstrate by test that the proposed procedure gives a uniform surface layer of the required hardness and depth and that it does not impair the soundness and properties of the steel.

1.5.7 Where induction hardening or nitriding is to be carried out after machining, forgings are to be heat treated at an appropriate stage to a condition suitable for this subsequent surface hardening.

1.5.8 Where carburizing is to be carried out after machining, forgings are to be heat treated at an appropriate stage (generally either by full annealing or by normalising and tempering) to a condition suitable for subsequent machining and carburizing.

1.5.9 If a forging is locally reheated or any straightening operation is performed after the final heat treatment, consideration is to be given to a subsequent stress relieving heat treatment.

1.5.10 The manufacturer is to maintain records of heat treatment identifying the furnace used, furnace charge, date, temperature and time at the beginning and end of heat treatment cycle. The records are to be presented to the Surveyor on request.

1.6 Mechanical tests

1.6.1 The requirements of Mechanical tests and mechanical properties are given in Section 2 and 3.

1.7 Inspection

1.7.1 Before acceptance, all forgings are to be presented to the Surveyors for visual examination. Where applicable, this is to include the examination of internal surfaces and bores. Unless otherwise agreed, the verification of the dimensions is the responsibility of the manufacturer.

1.7.2 When required by the relevant construction Rules, or by the approved procedure for welded composite components appropriate non-destructive testing is also to be carried out before acceptance and the results are to be reported by the manufacturer.

The forgings to be examined, the extent of testing and acceptance criteria are detailed in IRS Classification Notes on “Guidelines for Non-Destructive Examination of Hull and Machinery Steel Forgings”.

1.7.3 When required by the conditions of approval for surface hardened forgings, (1.5.6) additional test samples are to be processed at the same time as the forgings which they represent. These test samples are subsequently to be sectioned in order to determine the hardness, shape and depth of the locally hardened zone and which are to comply with the requirements of the approved specification.

1.7.4 In the event of any forging proving defective during subsequent machining or testing, it is to be rejected notwithstanding any previous certification.

1.8 Rectification of defective forgings

1.8.1 Defects may be removed by grinding or chipping and grinding provided the component dimensions are acceptable.
The resulting grooves are to have a bottom radius of approximately three times the groove depth and are to be blended into the surrounding surface so as to avoid any sharp contours. Complete elimination of the defective material is to be verified by magnetic particle testing or liquid penetrant testing.

1.8.2 Repair welding of crankshaft forgings is not permitted. In the case of other forgings repair welding may be allowed subject to prior approval of IRS. In such cases, full details of the extent and location of the repair, the proposed welding procedure, heat treatment and subsequent inspection procedures are to be submitted for the approval.

1.8.3 The forging manufacturer is to maintain records of repairs and subsequent inspections traceable to each forging repaired. The records are to be presented to the Surveyor on request.

a) Purchaser's name and order number;

b) Description of forgings and steel quality identification number;

c) Steel making process, cast number and chemical analysis of ladle sample;

d) Results of mechanical tests;

e) General details of heat treatment;

f) Identification number.

1.9 Identification of forgings

1.9.1 Before acceptance, all forgings, which have been tested and inspected with satisfactory results, are to be clearly marked in at least one place with the IRS brand IR and the following particulars:

a) The manufacturer's name or trade mark;

b) Identification mark for the grade of steel;

c) Identification number and/or initials which enable the full history of the forging to be traced;

d) Personal stamp of Surveyor responsible for inspection;

e) Test pressure, where applicable;

f) Date of final inspection;

g) The 'IRS' name;

h) Abbreviated name of IRS local office.

1.9.2 Where small forgings are manufactured in large numbers, modified arrangements for identification may be specially agreed with IRS.

1.10 Certification

1.10.1 The manufacturer is to provide the Surveyor, in duplicate, with a test certificate or shipping statement giving the following particulars for each forging or batch of forgings which has been accepted:

a) Purchaser's name and order number;

b) Description of forgings and steel quality identification number;

c) Steel making process, cast number and chemical analysis of ladle sample;

d) Results of mechanical tests;

e) General details of heat treatment;

f) Identification number.

Section 2

Hull and Machinery Steel Forgings for General Applications

2.1 Scope

2.1.1 The requirements given in this section are applicable to steel forgings intended for hull and machinery applications such as rudder stocks, pintles, propeller shafts, crankshafts, connecting rods, piston rods, gearing etc. Where relevant, these requirements are also applicable to material for forging stock and to rolled bars intended to be machined into components of simple shape.

2.1.2 These requirements are applicable only to steel forgings where the design and acceptance tests relate to mechanical properties at ambient temperature. For other applications, additional requirements may be necessary especially when the forgings are intended for service at low or elevated temperatures.

2.2 Chemical Composition

2.2.1 The chemical composition is to comply with the overall limits given in Tables 2.2.1 and Table 2.2.2 or, where applicable, the requirements of the approved specification.

2.2.2 At the option of the manufacturer, suitable grain refining elements such as aluminium, niobium or vanadium may be added. The content of such elements is to be reported.

2.2.3 Elements designated as residual elements in the individual specifications are not to be intentionally added to the steel. The content of such elements is to be reported.

Table 2.2.1 : Chemical composition limits [1] for hull steel forgings [6]

Steel type	C	Si	Mn	P	S	Cr	Mo	Ni	Cu [4]	Total residuals
C, C-Mn	0.23 [2], [3]	0.45	0.20-1.50	0.035	0.035	0.30 [4]	0.15 [4]	0.40 [4]	0.30	0.85
Alloy	[5]	0.45	[5]	0.035	0.035	[5]	[5]	[5]	0.30	-

[1] Composition in percentage mass by mass maximum unless shown as a range.

[2] The carbon content may be increased above this level provided that the carbon equivalent (Ceq) is not more than 0.41%, calculated using the following formula:

$$Ceq = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15} (\%)$$

[3] The carbon content of C and C-Mn steel forgings not intended for welded construction may be 0.65 maximum.

[4] Elements are considered as residual elements.

[5] Specification is to be submitted for approval.

[6] Rudder stocks and pintles should be of weldable quality.

Table 2.2.2 : Chemical composition limits [1] for machinery steel forgings

Steel type	C	Si	Mn	P	S	Cr	Mo	Ni	Cu [3]	Total residuals
C, C-Mn	0.65 [2]	0.45	0.30-1.50	0.035	0.035	0.30 [3]	0.15 [3]	0.40 [3]	0.30	0.85
Alloy [4]	0.45	0.45	0.30-1.00	0.035	0.035	Min 0.40 [5]	Min 0.15 [5]	Min 0.40 [5]	0.30	-

[1] Composition in percentage mass by mass maximum unless shown as a range or as a minimum.

[2] The carbon content of C and C-Mn steel forgings intended for welded construction is to be 0.23 maximum. The carbon content may be increased above this level provided that the carbon equivalent (Ceq) is not more than 0.41%.

[3] Elements are considered as residual elements unless shown as a minimum.

[4] Where alloy steel forgings are intended for welded constructions, the proposed chemical composition is subject to approval by IRS.

[5] One or more of the elements is to comply with the minimum content.

2.3 Mechanical tests

2.3.1 Adequate number of test coupons are to be provided for carrying out tests including for retest purposes, with a cross-sectional area of not less than that part of the forging which it represents. This test material is to be integral with each forging except as provided in 2.3.7 and 2.3.10. Where batch testing is permitted according to 2.3.10 the test material may alternatively be a production part or separately forged. Separately forged test material is to have a reduction ratio similar to that used for the forgings represented.

2.3.2 For the purpose of these requirements a set of tests is to consist of one tensile test specimen and when required in other sections of Rules three Charpy V-notch impact test specimens.

2.3.3 Test specimens are normally to be cut with their axes either parallel (longitudinal test) or tangential (tangential test) to the principal axial direction of each product.

2.3.4 Unless otherwise agreed, the longitudinal axis of test specimens is to be positioned as follows:

a) for thickness or diameter upto maximum 50 [mm], the axis is to be at the mid-thickness or the center of the cross section.
b) for thickness or diameter greater than 50 [mm], the axis is to be at one quarter thickness (mid-radius) or 8- [mm], whichever is less, below any heat treated surface.

2.3.5 Except as provided in 2.3.10 the number and direction of tests is to be as follows:

a) Hull components such as rudder stocks, pintles etc. General machinery components such as shafting, connecting rods, etc.
One set of tests is to be taken from the end of each forging in a longitudinal direction except that, at the discretion of the manufacture the alternative directions or positions as shown in Fig.2.3.5a, Fig.2.3.5b and Fig.2.3.5c may be used. Where a forging exceeds both 4 tonnes in mass and 3 [m] in length one set of tests is to be taken from each end. These limits refer to the ‘as forged’ mass and length but excluding the test material.

b) Pinions - Where the finished machined diameter of the toothed portion exceeds 200 [mm] one set of tests is to be taken from each forging in a tangential direction adjacent to the toothed portion (test position B in Fig.2.3.5d). Where the dimensions preclude the preparation of tests from this position, tests in a tangential direction are to be taken from the end of the journal (test position C in Fig.2.3.5d). If however, the journal diameter is 200 [mm] or less the tests are to be taken in a longitudinal direction (test position A in Fig.2.3.5d). Where the finished length of the toothed portion exceed 1.25 [m], one set of tests is to be taken from each end.

c) Small pinions - Where the finished diameter of the toothed portion is 200 [mm] or less one set of tests is to be taken in a longitudinal direction (test position A in Fig.2.3.5d).

d) Gear wheels - One set of tests is to be taken from each forging in tangential direction (test position A or B in Fig.2.3.5e).

e) Gear wheel rims (made by expanding)
One set of tests is to be taken from each forging in a tangential direction (test position A or B in Fig.2.3.5.f). Where the finished diameter exceeds 2.5 [m] or the mass (as heat treated excluding test material) exceeds 3 tonnes, two sets of tests are to be taken from diametrically opposite positions (test positions A and B in Fig. 2.3.5f). The mechanical properties for longitudinal test are also to be applied.

f) Pinion sleeves - One set of tests is to be taken from each forging in tangential direction (test position A or B in Fig.2.3.5g). Where the finished length exceeds 1.25 [m] one set of tests is to be taken from each end.

g) Crankwebs
One set of tests is to be taken from each forging in a tangential direction.

h) Solid open die forged crankshafts
One set of tests is to be taken in a longitudinal direction from the driving shaft end of each forging (test position A in Fig.2.3.5h).
Where the mass (as heat treated but excluding test material) exceeds 3 tonnes tests in a longitudinal direction are to be taken from each end (test positions A and B in Fig.2.3.5h). Where, however, the crankthrows are formed by machining or flame cutting, the second set of tests is to be taken in a tangential direction from material removed from the crankthrow at the end opposite the driving shaft end (test position C in Fig.2.3.5h).

2.3.6 For closed die crankshaft forgings and crankshaft forgings where the method of manufacture has been specially approved in accordance with 1.2.5, the number and position of test specimens is to be agreed with IRS having regard to the method of manufacture employed.

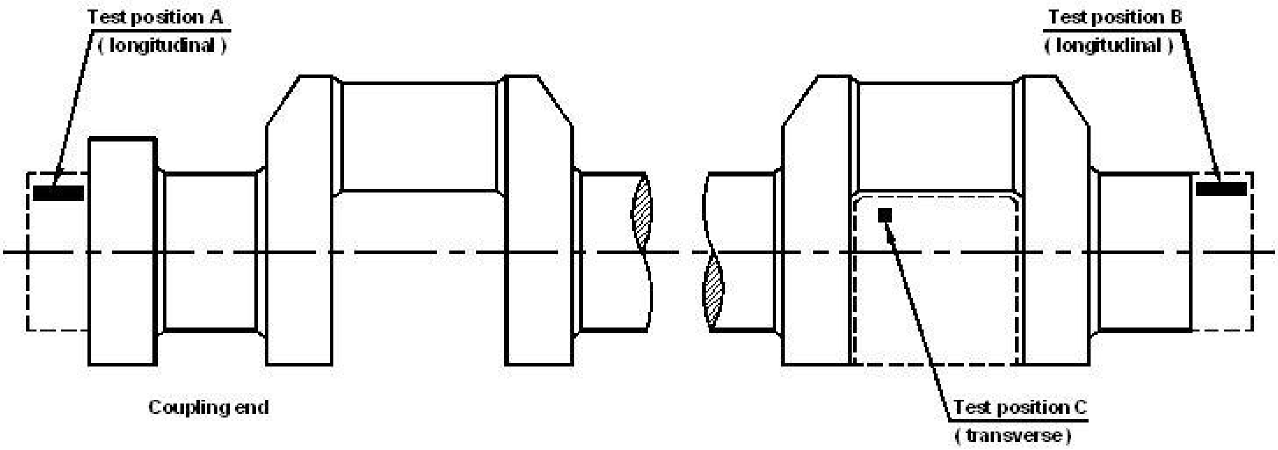

Fig.2.3.5h : Solid forged crankshaft

2.3.7 When a forging is subsequently divided into a number of components, all of which are heat treated together in the same furnace charge, for test purposes this may be regarded as one forging and the number of tests required is to be related to the total length and mass of the original multiple forging.

2.3.8 Except for components which are to be carburized or for hollow forgings where the ends are to be subsequently closed, test material is not to be cut from a forging until all heat treatment has been completed.

2.3.9 When forgings are to be carburized sufficient test material is to be provided for both preliminary tests in the as forged condition and for final tests after completion of carburizing.

For this purpose duplicate sets of test material are to be taken from positions as detailed in 2.3.5, except that irrespective of the dimensions or mass of the forging, tests are required from one position only and in the case of forgings with integral journals, are to be cut in a longitudinal direction.

This test material is to be machined to a diameter of D/4 or 60 [mm], whichever is less, where D is the finished diameter of the toothed portion.

For preliminary tests, one set of test material should be given a blank carburizing and it should undergo same heat treated cycle which the forged material will be subjected to.

For final acceptance tests, the second set of test material is to be blank carburized and heat treated along with the forgings which they represent.

At the discretion of the forge master or gear manufacturer test samples of larger cross section may be either carburized or blank carburized, but these are to be machined to the required diameter prior to the final quenching and tempering heat treatment.

Alternative procedures for testing of forgings which are to be carburized may be specially agreed with IRS.

2.3.10 Normalized forgings with mass upto 1000 [kg] each and quenched and tempered forgings with mass upto 500 [kg] each may be batch tested. A batch is to consist of forgings of similar shape and dimensions, made from the same heat of steel, heat treated in the same furnace charge and with a total mass not exceeding 6 tonnes for normalized forgings and 3 tonnes for quenched and tempered forgings respectively.

2.3.11 A batch testing procedure may also be used for hot rolled bars. A batch is to consist of either:

i) material from the same rolled ingot or bloom provided that where this is cut into individual lengths, these are all heat treated in the same furnace charge, or

ii) bars of the same diameter and heat, heat treated in the same furnace charge and with a total mass not exceeding 2.5 tonnes.

2.3.12 The preparation of test specimens and the procedures used for mechanical testing are to comply with the relevant requirements of Pt.2, Ch.2. Unless otherwise agreed all tests are to be carried out in the presence of the Surveyor.

2.4 Mechanical properties

2.4.1 Table 2.4.1 and Table 2.4.2 gives the minimum requirements for yield stress, elongation, reduction of area and impact test energy values corresponding to different strength levels but it is not tended that these should necessarily be regarded as specific grades. Where it is proposed to use a steel with a specified minimum tensile strength intermediate to those given, corresponding minimum values for the other properties may be obtained by interpolation.

2.4.2 Forgings may be supplied to any specified minimum tensile strength selected within the general limits detailed in Table 2.4.1 and Table 2.4.2 but subject to any additional requirements of the relevant construction rules.

2.4.3 The mechanical properties are to comply with the requirements of Table 2.4.1 and Table 2.4.2 appropriate to the specified minimum tensile strength or, where applicable the requirements of the approved specification.

2.4.4 At the discretion of IRS hardness tests may be required in the following cases:

i) Gear forgings after completion of heat treatment and prior to machining the gear teeth:

The hardness is to be determined at four positions equally spaced around the circumference of the surface where teeth will subsequently be cut. Where the finished diameter of the toothed portion exceeds 2.5 [m], the above number of test positions is to be increased to eight. Where the width of a gear wheel rim forging exceeds 1.25 [m], the hardness is to be determined at eight positions at each end of the forging.

ii) Small crankshaft and gear forgings which have been batch tested:

In such cases at least one hardness test is to be carried out on each forging.

The results of hardness tests are to be reported and, for information purposes, typical Brinell hardness values are given in Table 2.4.2.

2.4.5 Hardness tests may also be required on forgings which have been induction hardened, nitrided or carburized. For gear forgings these tests are to be carried out on the teeth after, where applicable, they have been ground to the finished profile. The results of such tests including depth of hardening are to comply with the approved specifications. (See 1.5.6).

2.4.6 Where the result of a tensile test does not comply with the requirements, two additional tests may be taken. If satisfactory results are obtained from both of these additional tests the forging or batch of forgings is acceptable. If one or both retests fail the forging or batch of forgings is to be rejected.

2.4.7 Where the results from a set of three impact test specimens do not comply with the requirements an additional set of three impact test specimens may be taken provided that not more than two individual values are less than the required average value and of these not more than one is less than 70% of this average value. The results obtained are to be combined with the original results to form a new average which, for acceptance of the forgings or batch forgings, is to be not less than the required average value.

Additionally, for these combined results not more than two individual values are to be less than the required average value and of these not more than one is to be less than 70% of this average value.

2.4.8 The additional tests detailed in 2.4.6 and 2.4.7 are to be taken, preferably from material adjacent to the original tests, but alternatively from another test position or sample representative of the forging or hatch of forgings.

2.4.9 At the option of the manufacturer, when a forging or a batch of forgings has failed to meet the test requirements, it may be re- heat treated and re-submitted for acceptance tests.

Table 2.4.1 : Mechanical properties for hull steel forgings

Steel type	Tensile strength 1) R_m min. [N/mm^2]	Yield stress R_e min. [N/mm^2]	Elongation as min. %		Reduction of area Z min. %	
			Long.	Tang.	Long.	Tang.
C and C-Mn	400	200	26	19	50	35
	440	220	24	18	50	35
	480	240	22	16	45	30

	900	630	13	9	40	27	260-320
	1000	700	12	8	35	24	290-365
	1100	770	11	7	35	24	320-385

Table 2.4.2 (Contd.)

1) The following ranges for tensile strength may be additionally specified:

specified minimum tensile strength :	< 600 [N/mm^2]	≥ 600 [N/mm^2]
tensile strength range :	120 [N/mm^2]	150 [N/mm^2]

2) For propeller shafts intended for ships with ice class notation except the lowest one, Charpy V-notch impact testing is to be carried out for all steel types at –10°C and the average energy value is to be minimum 27J (longitudinal test). One individual value may be less than the required average value provided that it is not less than 70% of this average value.

3) The hardness values are typical and are given for information purposes only.

Section 3

Ferritic Steel Forgings for Low Temperature Service

3.1 Scope

3.1.1 The requirements for carbon-manganese and nickel steels suitable for low temperature service are detailed in this section. They are applicable to all forgings with material thickness up to and including 50 [mm] used for the construction of cargo tanks, storage tanks and process pressure vessels for liquefied gases and where the design temperature is less than 0°C, to forgings for the piping systems.

3.1.2 The requirements are also applicable to forgings for other pressure vessels and pressure piping systems where the use of steels with guaranteed impact properties at low temperatures is required.

3.2 Chemical composition

3.2.1 The chemical composition of ladle samples is, in general, to comply with the requirements given in Table 3.2.1 of Ch.3.

3.3 Heat treatment

3.3.1 Forgings are to be normalized, normalized and tempered or quenched and tempered in accordance with the approved specification.

3.4 Mechanical tests

3.4.1 At least one tensile and three V-notch impact test specimens are to be taken from each forging or each batch of forgings. Where the dimensions and shape allow, the test specimens are to be cut in a longitudinal direction.

3.4.2 The impact tests are to be carried out at a temperature appropriate to the type of steel and for the proposed application. Where forgings are intended for ships for liquefied gases the test temperature is to be in accordance with the requirements given in Table 5.4.1 of Ch.3, Sec.5.

3.4.3 The results of all tensile tests are to comply with the approved specification.

3.4.4 The average energy values for impact tests are also to comply with the approved specification and generally with the requirements of Ch.3, Sec.5. See also Ch.2.

3.4.5 For material thickness above 50 [mm], the material properties are to be agreed.

3.5 Pressure tests

3.5.1 When applicable, pressure tests are to be carried out in accordance with the requirements of the relevant construction Rules.

Section 4

Austenitic Stainless Steel Forgings

4.1 General

4.1.1 Forgings in austenitic stainless steels are acceptable for use in the construction of cargo tanks, storage tanks and piping systems for chemicals and liquefied gases. They may also be accepted for elevated temperature service in boilers.

4.1.2 Where it is proposed to use forgings in these types of steels, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval. These are to comply in general, with the requirements of Chapter 3, Section 9 for austenitic steel plates.

4.1.3 Unless otherwise specified, impact tests are not required for acceptance purposes. Where they are required tests are to be made on longitudinal specimens at minus 196°C and the minimum average energy requirements is to be 41J.

4.2 Mechanical properties for design purposes

4.2.1 Where austenitic stainless steel forgings are intended for service at elevated temperatures, the nominal values for the minimum one per cent proof stress at temperatures of 100°C and higher given in Table 4.2.1 may be used for design purposes. Verification of these values is not required except for material complying with a National or proprietary specification in which the elevated temperature properties proposed for design purposes are higher than those given in Table 4.2.1.

4.3 Non-destructive examination

4.3.1 Non-destructive examination is to be carried out in accordance with the requirements of Classification Notes “Guidelines for non-destructive examination of hull and machinery steel forgings” or as otherwise agreed between the manufacturer, purchaser and Surveyor.

4.4 Intergranular corrosion tests

4.4.1 Where corrosive conditions are anticipated in service, intergranular corrosion tests are required on forgings in Grades 304, 316 and 317. Such tests may not be required for Grades 304L, 316L, 321 and 347.

4.4.2 When an intergranular corrosion test is specified, it is to be carried out in accordance with the standard referred in Section 9.6.2 of Chapter 3.

Table 4.2.1 : Mechanical properties for design purposes : austenitic stainless steels

Chapter 6

Steel Pipes and Tubes

Contents

Section

Section 1

General Requirements

1.1 Scope

1.1.1 The requirements of this Chapter are applicable to boiler tubes, superheater tubes and pipes intended for use in the construction of boilers, pressure vessels and ship and machinery pressure piping systems.

1.1.2 In addition to specifying mechanical properties for the purpose of acceptance testing, these requirements give details of appropriate mechanical properties at elevated temperatures to be used for design purposes.

1.1.3 Except for pipes for Class III pressure systems (as defined in Pt.4, Ch.2) all pipes and tubes are to be manufactured and tested in accordance with the requirements of Ch.1 and 2 of this Part, the general requirements of this Section and the appropriate requirements given in Sec.1 to 5.

1.1.4 Steels, intended for the cargo and process piping systems of ships for liquefied gases where the design temperature is less than 0°C, are to comply with specific requirements of Sec.5.

1.1.5 Pipes and tubes, which comply with national or proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are otherwise specially approved for a specific application and provided that survey is carried out in accordance with Ch.1 of this Part.

1.1.6 At the discretion of the Surveyor, a modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

1.1.7 Pipes for Class III pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable national specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material. Forge butt welded pipes are not acceptable for certain applications as detailed in Pt.4, Ch.2 and Pt.5, Ch.23.

1.2 Manufacture

1.2.1 Pipes for Class I and II pressure systems, boilers and superheater tubes are to be manufactured at works approved by IRS. The steel used is to be manufactured in accordance with Ch.3, Sec.1.

1.2.2 Unless a particular method is requested by the purchaser, pipes and tubes may be manufactured by any of the following methods:-

a) hot finished seamless;

b) cold finished seamless;

c) electric resistance or induction welded;

d) cold finished electric resistance or induction welded;

e) electric fusion welded.

1.2.3 Care is to be taken during manufacture that the pipe or tube surfaces coming in contact with any non-ferrous metals or their compounds are not contaminated to such an extent as could prove harmful during subsequent fabrication and operation.

1.3 Quality

1.3.1 All pipes and tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.

1.3.2 All pipes and tubes are to be reasonably straight. The ends are to be cut nominally square with the axis of the pipes or tubes, and are to be free from excessive burrs.

1.3.3 The tolerances on the wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable national/ international standards.

1.4 Chemical composition

1.4.1 The requirements for the chemical composition of the ladle sample and the acceptable method of de-oxidation is to comply with the requirements detailed in the relevant Section of this Chapter.

1.5 Heat treatment

1.5.1 All pipes and tubes are to be supplied in the condition detailed in the relevant specific requirements.

1.6 Test material

1.6.1 Pipes and tubes are to be presented for test in batches. The size of a batch and the number of tests to be performed are dependent on the application.

1.6.2 Where heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size, manufactured from the same type of steel and subjected to the same finishing treatment in a continuous furnace, or heat treated in the same furnace charge in a batch type furnace.

1.6.3 Where no heat treatment has been carried out, a batch is to consist of pipes or tubes of the same size manufactured by the same method from material of the same type of steel.

1.6.4 For pipes for class I pressure systems and boiler and superheater tubes, at least 2 per cent of the number of lengths in each batch is to be selected at random for the preparation of tests at ambient temperature.

1.6.5 For pipes for class II pressure systems, each batch is to contain not more than the number of lengths given in the following Table. Tests are to be carried out on at least one pipe selected at random from each batch or part thereof.

Outside diameter [mm]	Number of pipes in a batch
≤ 323.9	200 pipes as made
> 323.9	100 pipes as made

1.7 Test specimens and testing procedures

1.7.1 The procedures for mechanical tests and the dimensions of the test specimens are to be in accordance with Ch.2.

1.8 Visual and non-destructive testing

1.8.1 All pipes for Class I and II pressure systems, boiler and superheater tubes are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the pipes and tubes to be carried out.

1.8.2 For welded pipes and tubes the manufacturer is to employ suitable non-destructive methods for the quality control of the welds. It is preferred that this examination is carried out on a continuous basis.

1.9 Hydraulic tests

1.9.1 Each pipe and tube is to be subjected to a hydraulic test at the manufacturer's works.

1.9.2 The hydraulic test pressure is to be determined by the following formula, except that the maximum test pressure need not exceed 14 [N/mm^2].

$$P = \frac{2st}{D}$$

where,

P = test pressure [N/mm^2];

D = nominal outside diameter [mm];

t = nominal wall thickness [mm];

s = 80 per cent of the specified minimum yield stress [N/mm^2], for ferritic steels and 70 per cent of the specified minimum 1.0 per cent proof stress [N/mm^2] for austenitic steels. These relate to the values specified for acceptance testing at ambient temperature.

1.9.3 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted. Where it is proposed to adopt a test pressure other than determined as in 1.9.2, the proposal will be subject to special consideration.

1.10 Rectification of defects

1.10.1 Surface imperfections may be removed by grinding provided that the thickness of the pipe or tube after dressing is not less than the required minimum thickness. The dressed area is to be blended into the contour of the tube.

1.10.2 By agreement with the Surveyor, the repair of minor defects by welding can be accepted. Welding procedures, including preheating, post weld heat treatment and inspection, are to be to the complete satisfaction of the Surveyor. In all cases, the area is to be tested by magnetic particle examination, or in case of austenitic steels, by liquid penetrant examination on completion of welding, heat treatment and surface grinding.

1.11 Identification

1.11.1 Pipes and tubes are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1. The following details are to be shown on all materials which have been accepted:-

a) IR;

b) Manufacturer's name or trade mark;

c) Identification mark for the specification or grade of steel;

d) Identification number and/or initials which will enable the full history of the item to be traced;

e) The personal stamp of the Surveyor responsible for the final inspection.

1.11.2 It is recommended that hard stamping be restricted to the end face, but it may be accepted in other positions in accordance with national standards and practices.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with copies of test certificate or shipping statement for all material which has been accepted.

1.12.2 Each test certificate is to contain the following particulars:-

a) Purchaser's name and order number;

b) The yard number for which the material is intended, if known;

c) Address to which material is despatched;

d) Specification or the grade of material;

e) Description and dimensions;

f) Identification number and/or initials;

g) Cast number and chemical composition of ladle samples;

h) Mechanical test results, and results of the intercrystalline corrosion tests where applicable;

i) Condition of supply.

1.12.3 The chemical composition stated on the certificate is to include the content of all the elements detailed in the specific requirements. Where rimmed steel is supplied, this is to be stated on the certificate.

1.12.4 When steel is not produced at the pipe or tube mill, a certificate is to be supplied by the steelmaker stating the process of manufacture, the cast number and the ladle analysis.

1.12.5 The works at which the steel was produced must be approved by IRS.

Section 2

Seamless Pressure Pipes

2.1 General

2.1.1 Following requirements are applicable for seamless pressure pipes in carbon, carbon-manganese and low alloy steels.

2.1.2 Where pipes are used for the manufacture of pressure vessel shells and headers, the requirements of forgings in Ch.5 are applicable where the wall thickness exceeds 40 [mm].

2.2 Manufacture and chemical composition

2.2.1 Tubes are to be manufactured by a seamless process and may be hot or cold finished.

2.2.2 The method of de-oxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 2.2.1.

2.3 Heat treatment

2.3.1 Pipes are to be supplied in the condition given in Table 2.3.1.

Table 2.3.1 : Heat treatment

Type of steel	Condition of supply
Carbon and carbon-manganese	
Hot finished	Not finished[1]
	Normalized[2]
Cold finished	Normalized[2]
Alloy steels	
1 Cr $\frac{1}{2}$ Mo	Normalized and tempered
2 $\frac{1}{4}$ Cr 1 Mo	
Grade 410	Fully annealed
Grade 490	Normalized and tempered 650-750°C
$\frac{1}{2}$ Cr $\frac{1}{2}$ Mo $\frac{1}{4}$ V	Normalized and tempered

Notes:

1. Provided that the finishing temperature is sufficiently high to soften the material.
2. Normalized and tempered at the option of the manufacturer.

Table 2.2.1 : Chemical composition of seamless pressure pipes

Type of steel	Grade	Method of deoxi-dation	Chemical composition of ladle samples %											
			C	Si	Mn	S max	P max	Residual elements						
Carbon and carbon-manganese	320	Semi-killed or killed	≤ 0.16	-	0.40 - 0.70	0.050	0.050	Ni 0.30 max., Cr 0.25 max., Mo 0.10 max., Cu 0.30 max. Total 0.70 max.						
	360		≤ 0.17	≤ 0.35	0.40 - 0.80	0.045	0.045							
	410	Killed	≤ 0.21	≤ 0.35	0.40 - 1.20	0.045	0.045							
	460	Killed	≤ 0.22	≤ 0.35	0.80 - 1.40	0.045	0.045							
	490	Killed	≤ 0.23	≤ 0.35	0.80 - 1.50	0.045	0.045							
								Ni	Cr	Mo	Cu	Sn	V	Al
1 Cr $\frac{1}{2}$ Mo	440	Killed	0.10-0.18	0.10-0.35	0.40-0.70	0.040	0.040	0.30 max.	0.70-1.10	0.45-0.65	0.25 max.	0.03 max.	-	≤ 0.020
2 $\frac{1}{4}$ Cr 1 Mo	410 490	Killed	0.08-0.15	0.10-0.50	0.40-0.70	0.040	0.040	0.30 max.	2.0-2.5	0.90-1.20	0.25 max.	0.03 max.	-	≤ 0.020
$\frac{1}{2}$ Cr $\frac{1}{2}$ Mo $\frac{1}{4}$ V	460	Killed	0.10-0.18	0.10-0.35	0.40-0.70	0.040	0.040	0.30 max.	0.30-0.60	0.50-0.70	0.25 max.	0.03 max.	0.22 - 0.32	≤ 0.020

2.4 Mechanical tests

2.4.1 All pipes are to be presented in batches as defined in Sec.1.

2.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

2.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 2.4.1.

2.5 Mechanical properties for design

2.5.1 Values for nominal minimum lower yield or 0.2 per cent proof stress at 50°C and higher are given in Table 2.5.1 and are intended for design purposes only. Verification of these values is not required, except for materials complying with national or proprietary specifications where the elevated temperature properties used for design are higher than those given in Table 2.5.1.

2.5.2 In such cases, at least one tensile test at the proposed design or other agreed temperature is to be made on each cast. The test specimen is to be taken from material adjacent to that used for tests at ambient temperature and tested in accordance with the procedures given in Ch.2. If tubes or pipes of more than one thickness are supplied from one cast, the test is to be made on the thickest tube or pipe.

2.5.3 As an alternative to 2.5.2, a manufacturer may carry out an agreed comprehensive test program for a stated grade of steel to demonstrate that the specified minimum mechanical properties at elevated temperatures can be consistently obtained. This test program is to be carried out under the supervision of the Surveyors, and the results submitted for assessment and approval. When a manufacturer is approved on this basis, tensile tests at elevated temperatures are not required for acceptance purposes, but at the discretion of the Surveyors, occasional check tests of this type may be requested.

2.5.4 Values for the estimated average stress to rupture in 100,000 hours are given in Table 2.5.2 and may be used for design purposes.

Table 2.4.1 : Mechanical properties for acceptance purposes : Seamless pressure pipes (maximum wall thickness 40 mm)

Type of steel	Grade	Yield stress [N/mm^2] min.	Tensile strength [N/mm^2]	Elongation on $5.65\sqrt{S_o}$% min.	Flattening test constant C	Bend test diameter of former (t = thickness)
Carbon and carbon-manganese	320	195	320-440	25	0.10	4t
	360	215	360-480	24	0.10	4t

570	-	-	35	51	51	59
580	-	-	-	44	44	46

Note : When tempering temperature exceeds 750°C, the values for Grade 410 are to be used.

Section 3

Welded Pressure Pipes

3.1 General

3.1.1 Following requirements are applicable to welded pressure pipes in carbon, carbon-manganese and low alloy steels.

3.1.2 Where it is proposed to use submerged arc longitudinally welded pipes, details of the specification are to be submitted.

3.2 Manufacture and chemical composition

3.2.1 Pipes are to be manufactured by the electric or induction welding process and, if required, may be subsequently hot reduced or cold finished.

3.2.2 The method of de-oxidation and the chemical composition of ladle samples are to comply with the appropriate requirements given in Table 3.2.1.

3.2.3 Where rimmed steel is used, the strips are to be rolled in single widths and not slit longitudinally, except to trim the edges.

Table 3.2.1 : Chemical composition of welded pressure pipes

Type of steel	Grade	Method of deoxi-dation	Chemical composition of ladle samples %										
			C	Si	Mn	S max.	P max.	Residual elements					
Carbon and carbon-manga-nese	320	Any method (see Note)	≤ 0.16	-	0.30-0.70	0.050	0.050	Ni 0.30 max., Cr 0.25 max., Mo 0.10 max., Cu 0.30 max. Total 0.70 max.					
	360		≤ 0.17	≤ 0.35	0.40-1.00	0.045	0.045						
	410	Killed	≤ 0.21	≤ 0.35	0.40-1.20	0.045	0.045						
	460	Killed	≤ 0.22	≤ 0.35	0.80-1.40	0.045	0.045						
								Ni	Cr	Mo	Cu	Sn	Al
1 Cr $\frac{1}{2}$ Mo	440	Killed	0.10-0.18	0.10-0.35	0.40-0.70	0.040	0.040	0.30 max.	0.70-1.10	0.45-0.65	0.25 max.	0.03 max.	≤ 0.020
Note : For rimmed steels the carbon content may be increased to 0.19% max.													

3.3 Heat treatment

3.3.1 Pipes are to be supplied in the heat treated condition given in Table 3.3.1.

Table 3.3.1 : Heat treatment : Welded pressure pipes

Type of steel	Condition of supply
Carbon and carbon-manganese	Normalized (Normalized and tempered at the option of the manufacturer)
1 Cr $\frac{1}{2}$ Mo	Normalized and tempered

3.4 Mechanical tests

3.4.1 All pipes are to be presented in batches as defined in Sec.1.

3.4.2 Each pressure pipe selected for test is to be subjected to tensile and flattening or bend tests.

3.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 3.4.1.

3.5 Mechanical properties for design

3.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 [N/mm^2] to 460 [N/mm^2] and 1 Cr $\frac{1}{2}$ Mo steel can be taken from the appropriate Tables in Sec.2.

3.5.2 Where rimmed steel is used, the design temperature is limited to 400°C.

Table 3.4.1 : Mechanical properties for acceptance purposes : Welded pressure pipes

Type of steel	Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on $5.65\sqrt{S_o}$% minimum	Flattening test constant C
Carbon and carbon-manganese	320	195	320 - 440	25	0.10
	360	215	360 - 480	24	0.10
	410	235	410 - 530	22	0.08
	460	265	460 - 580	21	0.07
1 Cr $\frac{1}{2}$ Mo	440	275	440 - 590	22	0.07

Section 4

Boiler and Superheater Tubes

4.1 General

4.1.1 The following requirements are applicable for boiler and superheater tubes in carbon, carbon-manganese and low alloy steels.

4.1.2 Austenitic stainless steels may also be used for this type of service. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval.

4.2 Manufacture and chemical composition

4.2.1 Tubes are to be seamless or welded and are to be manufactured in accordance with the requirements of Sec.2 and 3 respectively.

4.2.2 The method of de-oxidation and the chemical composition of ladle samples are to comply with the requirements given in Table 2.2.1 or Table 3.2.1, as appropriate.

4.3 Heat treatment

4.3.1 All tubes are to be supplied in accordance with the requirements given in Table 2.3.1 or Table 3.3.1 as appropriate, except that 1 Cr $\frac{1}{2}$ Mo steel may be supplied in the normalized only condition when the carbon content does not exceed 0.15 per cent.

4.4 Mechanical tests

4.4.1 Tubes are to be presented for test in batches as defined in Sec.1.

4.4.2 Each boiler and superheater tube selected for test is to be subjected to at least the following:

a) Tensile test;

b) Flattening or bending tests at the manufacturer's option;

c) Expanding or flanging tests at the manufacturer's option.

4.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 4.4.1.

4.5 Mechanical properties for design

4.5.1 The mechanical properties at elevated temperature for carbon and carbon-manganese steels in Grades 320 [N/mm^2] to 460 [N/mm^2], 1 Cr $\frac{1}{2}$ Mo and 2 $\frac{1}{4}$ Cr 1 Mo steels can be taken from the appropriate Tables in Sec.2.

4.5.2 Where rimmed steel is used, the design temperature is limited to 400°C.

Table 4.4.1 : Mechanical properties for acceptance purposes : Boilers and superheater tubes

Type of steel	Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on $5.65\sqrt{S_o}$ % minimum	Flattening test constant C	Bend test diameter of former (t=thickness)	Drift expanding and flanging test minimum % increase in outside diameter. Ratio : Inside diameter / Outside diameter: $\le$ 0.6	> 0.6 $\le$ 0.8	> 0.8
Carbon and carbon-manganese	320	195	320-440	25	0.10	4t	12	15	19

Section 5

Tubes and Pipes for Low Temperature Services

5.1 Scope

5.1.1 This Section gives the requirements for seamless and welded carbon, carbon-manganese and nickel alloy steel pipes not exceeding 25 [mm] in thickness intended for use in liquefied gas piping systems where the design temperature is lower than 0°C and also for other pressure piping systems where guaranteed impact properties at low temperature is required.

5.2 Manufacture

5.2.1 The pipes are to be manufactured seamless or by a welding process, and may be hot or cold finished.

5.3 Chemical composition

5.3.1 The chemical composition of ladle samples is in general to comply with the requirements given in Table 5.3.1. Steels for the production of tubes and pipes are to be killed.

Table 5.3.1 : Chemical composition

Type of steel	Grade	Method of deoxi-dation	Chemical composition of ladle sample %							
			C max.	Si	Mn	P max.	S max.	Ni	Al met	Residual Elements
Carbon	360	Fully killed	0.17	0.10-0.35	0.40-1.00	0.045	0.045	-	≥ 0.015 see note	Cr 0.25 Cu 0.30 Mo 0.10 Ni 0.30 Total 0.70
Carbon-manganese	410 & 460		0.2	0.10-0.35	0.60-1.40	0.045	0.045	-	≥ 0.015 see note	
3.5 Ni	440		0.15	0.15-0.35	0.30-0.90	0.040	0.040	3.25-3.75	-	Cr 0.25 Cu 0.30 Mo 0.10 Total 0.60
9 Ni	690		0.3	0.15-0.30	0.30-0.90	0.040	0.040	8.50-9.50	-	

Note : Where a minimum Al_{met} of 0.015% is specified, the determination of the total aluminium is acceptable provided that the result is not less than 0.018%.

5.4 Heat treatment

5.4.1 Pipes are to be supplied in the condition given in Table 5.4.1.

Table 5.4.1 : Heat treatment

Type of Steel	Condition of Supply
Carbon and Carbon-manganese	Hot finished Normalized Normalized and tempered
3.5 Ni	Normalized Normalized and tempered
9 Ni	Double normalized and tempered Quenched and tempered

5.5 Mechanical tests

5.5.1 All pipes are to be presented for test in batches as defined in Sec.1 pressure piping systems.

5.5.2 At least two percent of the number of lengths in each batch is to be selected at random for the preparation of the tests.

5.5.3 Each pipe or tube selected for test is to be subjected to following tests:

- Seamless pipes and tubes:
  - one tensile test
  - one set of impact tests
  - one flattening test or bend test or ring tensile test
  - one drift or one ring expanding test where appropriate.
- Welded tubes and pipes:
  - one tensile test on the base material
  - one tensile test on the weld for pipes with D ≥ 508 [mm]
  - one set of impact tests
  - two flattening tests or bend tests or one ring tensile test (ERW and IW)
  - one drift or one ring expanding test (ERW and IW) -two bend tests (SAW).

5.5.4 Ring tensile test may be carried out in conformity with ISO 8495 or other equivalent standard.

5.5.5 The impact tests are to consist of a set of three Charpy V-notch test specimens cut in the longitudinal direction with the notch perpendicular to the original surface of the pipe. The dimension of the test specimens are to be in accordance with the requirements of Ch.2. Impact testing is not required for wall thickness below 6 [mm].

5.5.6 The impact values are to be determined at the lowest test temperature specified for the steel grade and the wall thickness in question.

5.5.7 The results of all mechanical tests are to comply with the appropriate values given in Table 5.5.1.

5.5.8 The energy value from a set of three Charpy V-notch impact test specimens is not to be lower than the required average value given in Table 5.5.1. One individual value may be less than the required average value provided that it is not less than 70 per cent of this average value.

Table 5.5.1 : Mechanical properties for acceptance purposes

Type of steel	Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on 5.65 $\sqrt{S_o}$% min.	Flattening test constant C	Bend test diameter of former (t=thickness)	Charpy V-notch impact tests	
							Test temperature °C	Average energy J minimum
Carbon	360	210	360-480	24	0.10	4t	-40	27
Carbon-manganese	410	235	410-530	22	0.08	4t	-50	27
	460	260	460-580	21	0.07		-50	27
3.5 Ni	440	245	440-590	16	0.08	4t	-100	27
9 Ni	690	510	690-840	15	0.08	4t	-196	39

Section 6

Austenitic Stainless Steel Pressure Pipes

6.1 Scope

6.1.1 This section gives the requirements for austenitic stainless steel pipes suitable for use in the construction of the piping systems for chemicals and for liquefied gases where the design temperature is not less than –165°C.

6.1.2 Austenitic stainless steels are also suitable for service at elevated temperatures. Where such applications are proposed, details of the chemical composition, heat treatment and mechanical properties are to be submitted for consideration and approval. See also Pt.4, Ch.2, 1.9.5.

6.1.3 Where it is intended to supply seamless pipes in the direct quenched condition, a programme of tests for approval is to be carried out under the supervision of the Surveyors, and the results are to be to the satisfaction of IRS.

6.2 Manufacture and chemical composition

6.2.1 Pipes are to be manufactured by a seamless or a continuous automatic electric fusion welding process.

6.2.2 Welding is to be in a longitudinal direction, with or without the addition of filler metal.

6.2.3 The chemical composition of the ladle samples is to comply with the appropriate requirements of Table 6.2.1.

Table 6.2.1 : Chemical composition										
Type of steel	**Grade**	**Chemical composition of ladle sample %**								
		C max.	**Si**	**Mn**	**P max.**	**S max.**	**Cr**	**Mo**	**Ni**	**Others**
304L	490	0.03	<1.00	<2.00	0.045	0.030	17.0-19.0	-	9.0-13.0	-
316L	490	0.03	<1.00	<2.00	0.045	0.030	16.0-18.5	2.0-3.0	11.0-14.5	-
321	510	0.08	<1.00	<2.00	0.045	0.030	17.0-19.0	-	9.0-13.0	Ti ≥ 5 xC ≤ 0.80
347	510	0.08	<1.00	<2.00	0.045	0.030	17.0-19.0	-	9.0-13.0	Nb≥10 x C≤1.00

6.3 Heat treatment

6.3.1 Pipes are generally to be supplied by the manufacturer in the solution treated condition over their full length.

6.3.2 Alternatively, seamless pipes may be direct quenched immediately after hot forming, while the temperature of the pipes is not less than the specified minimum solution treatment temperature.

6.4 Mechanical tests

6.4.1 All pipes are to be presented in batches as defined in Section 1 for Class I and II piping systems.

6.4.2 Each pipe selected for test is to be subjected to tensile and flattening or bend tests.

6.4.3 The results of all mechanical tests are to comply with the appropriate requirements given in Table 6.4.1.

Where the design temperature is less than –105°C, impact tests are to be carried out on a set of three Charpy V-notch specimens. The tests are to be made on longitudinal specimens at –196°C and the average energy is to be not less than 41 Joules.

Table 6.4.1 : Mechanical properties for acceptance purposes							
Type of steel	**Grade**	**0.2% proof stress [N/mm^2] (see Note)**	**1.0% proof stress [N/mm^2]**	**Tensile strength [N/mm^2]**	**Elongation on 5.65 $\sqrt{S_o}$ % minimum**	**Flattening test constant**	**Bend test diameter of former (t=thickness)**
304L	490	175	205	490-690	30	0.09	3t
316L	490	185	215	490-690	30	0.09	3t
321	510	195	235	510-710	30	0.09	3t
347	510	205	245	510-710	30	0.09	3t
Note : The 0.2% proof stress values given for information purposes and unless otherwise agreed are not required to be verified by test.							

6.5 Intergranular corrosion tests

6.5.1 For materials used for piping systems for chemicals, intercrystalline corrosion tests are to be carried out on one per cent of the number of pipes in each batch, with a minimum of one pipe.

6.5.2 For pipes with an outside diameter not exceeding 40 [mm], the test specimens are to consist of a full cross section. For larger pipes, the test specimens are to be cut as circumferential strips of full wall thickness and having a width of not less than 12.5 [mm]. In both cases, the total surface areas is to be between 15 and 35 [cm^2].

6.5.3 When required, one test of this type is to be carried out for each tensile test. The testing is to be carried out in accordance with ASTM A262, practice E, copper-copper sulphate-sulphuric acid or another recognized standard. The bent specimen is to be free from cracks indicating the presence of intergranular attack. The material for the test is to be taken adjacent to that for the tensile test.

6.5.4 After immersion, the full cross-section test specimens are to be subjected to a flattening test in accordance with the requirements of Chapter 2. The strip test specimens are to be subjected to a bend test through 90° over a mandrel of diameter equal to twice the thickness of the test specimen.

6.6 Fabricated pipework

6.6.1 Fabricated pipework is to be produced from material manufactured in accordance with 6.2, 6.3, 6.4 and 6.5.

6.6.2 Welding is to be carried out in accordance with an approved and qualified procedure by suitably qualified welders.

6.6.3 Fabricated pipework may be supplied in the as-welded condition without subsequent solution treatment provided that welding procedure tests have demonstrated satisfactory material properties including resistance to intercrystalline corrosion.

6.6.4 In addition, butt welds are to be subjected to 5 per cent radiographic examination for Class I and 2 per cent for Class II pipes.

6.6.5 Fabricated pipework in the as-welded condition and intended for systems located on deck is to be protected by a suitable corrosion control coating.

End of Chapter

Chapter 7

Iron Castings

Contents

Section

Section 1

General Requirements

1.1 Scope

1.1.1 This Chapter gives the requirements for both grey and spheroidal or nodular graphite iron castings intended for ship and machinery construction.

1.1.2 All important iron castings, as defined in the relevant parts of the Rules dealing with design and construction, are to be manufactured and tested in accordance with the requirements of Ch.1 and 2 and the requirements given in the following paragraphs.

1.1.3 As an alternative to 1.1.2, castings which comply with National or Proprietary specifications may be accepted, provided that such specifications give reasonable equivalence to these requirements or otherwise are specially approved or required by IRS.

1.1.4 Where small castings are produced in large quantities, the manufacturer may adopt alternative procedure for testing and inspection, subject to the approval of IRS.

1.1.5 These requirements are applicable only to castings where the design and acceptance tests are related to mechanical properties at ambient temperature. For other applications additional requirements may be necessary, especially when the castings are intended for service at low or elevated temperatures.

1.2 Manufacture

1.2.1 All castings, as designated in1.1.2, are to be manufactured at foundries approved by IRS.

1.2.2 Suitable mechanical methods are to be employed for the removal of surplus material from the castings. Thermal cutting processes are not acceptable, except as a preliminary operation to the mechanical methods.

1.2.3 Where castings of the same type are regularly produced in quantity, the manufacturer is to make any tests necessary to prove the quality of the prototype castings and is also to make periodical examinations to verify the continued efficiency of the manufacturing technique. The Surveyor is to be given the opportunity to witness these tests.

1.3 Quality of castings

1.3.1 Castings are to be free from surface or internal defects which could be prejudicial to their proper application in service. The surface finish is to be in accordance with good practice and any specific requirements of the approved plan.

1.4 Chemical composition

1.4.1 The chemical composition of the iron used is left to the discretion of the manufacturer, who is to ensure that it is suitable to obtain the mechanical properties specified for the castings.

1.5 Heat treatment

1.5.1 Except as required by 1.5.2, castings may be supplied in either the as cast or heat treated condition.

1.5.2 For some applications, such as high temperature service or where dimensional stability is important, castings may be required to be given a suitable tempering or stress relieving heat treatment. This is to be carried out after any refining heat treatment and before machining. The special qualities with 350 [N/mm^2] and 400 [N/mm^2] nominal tensile strength and impact test are to undergo ferritizing heat treatment.

1.5.3 Where it is proposed to locally harden the surface of castings, full details of the proposed procedure and specifications are to be submitted for approval by IRS.

1.6 Mechanical tests

1.6.1 Separately cast test samples are to be used unless otherwise agreed between the manufacturer and the purchaser. The test samples are generally to be one of the standard types detailed in Fig.1.6.1, Fig.1.6.2 and Fig.1.6.3 with a thickness of 25 [mm]. Test samples of dimensions, other than as detailed in Fig.1.6.1 to Fig.1.6.3 may, however, be specially required for some components. For grey cast iron the test samples are to be in the form of cylindrical bars of 30 [mm] diameter and of suitable length. When two or more test samples are cast simultaneously in a single mould, the bars are to be at least 50 [mm] apart as indicated in Fig.1.6.4.

1.6.2 Integrally cast samples may be used when a casting is more than 20 [mm] thick and its mass exceeds 200 [kgs] subject to agreement between the manufacturer and the purchaser. The type and location of the test sample are to be selected to provide approximately the same cooling conditions as for the casting it represents.

1.6.3 At least one test sample is to be provided for each casting or batch of castings. A batch consists of castings poured from a single ladle of metal provided they are all of similar type and dimensions. A batch should not normally exceed two tonnes of fettled castings and a single casting will constitute a batch if its mass is two tonnes or more.

1.6.4 For continuous melting of same grade of cast iron in large tonnages the mass of the batch may be increased to the output of two hours of pouring. If production is carefully monitored by systematic checking of the melting process, such as chill testing, chemical analysis or thermal analysis, test samples may be taken at longer intervals.

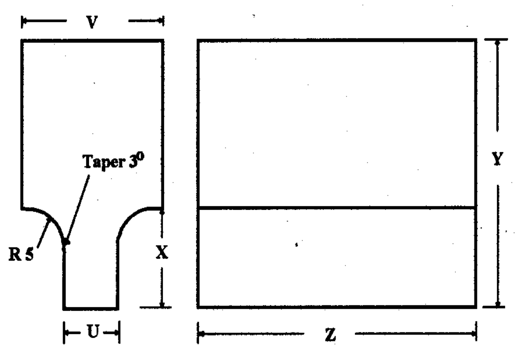
1.6.5 For large castings where more than one ladle of treated metal is used, additional test samples are to be provided so as to be representative of each ladle used.

1.6.6 All test samples are to be suitably marked to identify them with the castings which they represent.

1.6.7 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

1.6.8 The test samples are to be cast in moulds made from the same type of material as used for the castings and are not to be stripped from the moulds until the metal temperature is below 500°C.

1.6.9 One tensile test specimen is to prepared from each test sample. The dimensions of the test specimens and the testing procedures used are to be in accordance with Ch.2.



Standardsample		Alternative samples, when required		
U	25	12	50	75
V	55	40	90	125
X	40	30	60	65
Y	100	80	150	185
Z	To suit testing machine (approx. 150 [mm])			

Fig.1.6.1 : Standard test specimen

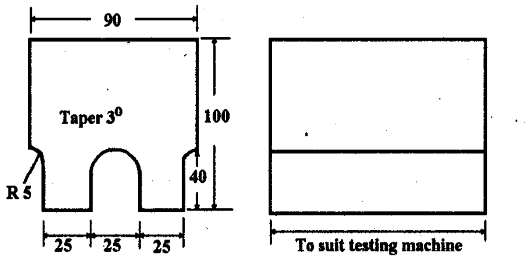


Fig.1.6.2 : Standard test specimen

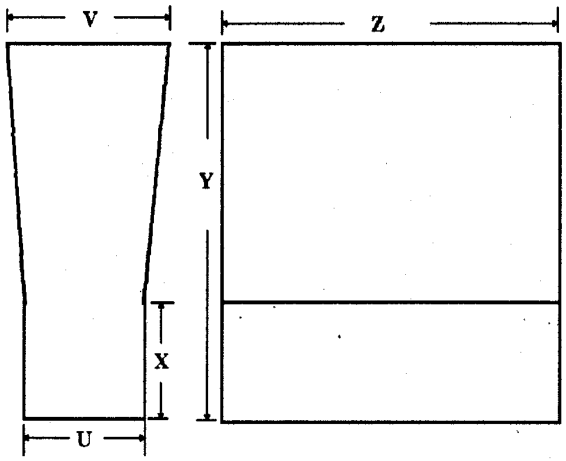

Standardsample		Alternative samples, when required		
U	25	12	50	75
V	55	40	90	125
X	40	25	50	65
Y	140	135	150	175
Z	To suit testing machine (approx. 150 [mm])			

Fig.1.6.3 : Standard test specimen

Dimensions in millimeters

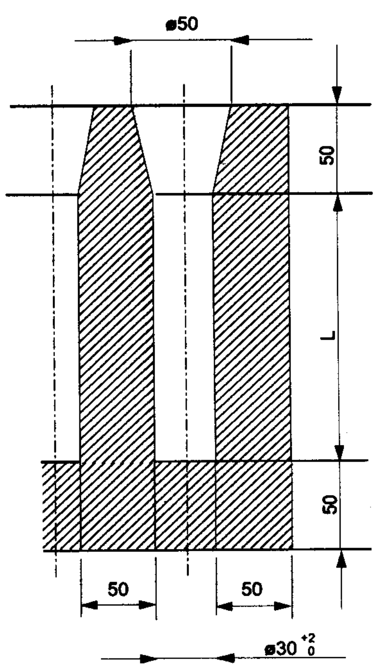

Fig.1.6.4 : Test sample for grey cast iron

1.7 Mechanical properties

1.7.1 For grey iron castings, only the tensile strength is to be determined and the results obtained are to comply with the minimum value specified for the castings being supplied. The specified minimum tensile strength is to be not less than 200 [N/mm^2] and not more than 350 [N/mm^2]. The fractured surfaces of all tensile test specimens are to be granular and grey in appearance.

1.7.2 For spheroidal or nodular graphite iron castings the tensile strength and elongation are to be determined. The results of all tests are to comply with the requirements of Table 1.7.1, but subject to any additional requirements of the relevant construction rules. Typical ranges of hardness values are also given in Table 1.7.1 and are intended for information purposes.

1.7.3 Retest requirements for tensile tests are to be in accordance with 1.10 of Chapter 1.

1.8 Visual and non-destructive examination

1.8.1 All castings are to be cleaned and adequately prepared for examination. The surfaces are not to be hammered, peened or treated in any way which may obscure defects.

Table 1.7.1 : Mechanical properties for acceptance purposes (spheroidal or nodular graphite iron)

Specified Minimum Tensile Strength [N/mm^2]		0.2% proof stress (see Note) [N/mm^2]	Elongation on $5.65\sqrt{S_o}$ % min.	Typical Hardness Brinell (see para 1.7.2)	Impact Energy Test Temp. °C	Impact Energy J Min.[2]	Typical structure of matrix (see para 1.9.2)
Ordinary qualities	370	230	17	120 - 180	-	-	Ferrite
	400	250	12	140 - 200	-	-	Ferrite
	500	320	7	170 - 240	-	-	Ferrite/Pearlite
	600	370	3	190 - 270	-	-	Ferrite/Pearlite
	700	420	2	230 - 300	-	-	Pearlite
	800	480	2	250 - 350	-	-	Pearlite or Tempered Structure
Special qualities	350	220	22[3]	110 - 170	20	17(14)	Ferrite
	400	250	18[3]	140 - 200	20	14(11)	Ferrite

Notes:

1. For intermediate values of specified minimum tensile strength, the minimum values for 0.2% proof and elongation may be obtained by interpolation.
2. The average value measured on 3 Charpy V-notch specimens. One result may be below the average value but not less than the minimum shown in brackets.
3. In the case of integrally cast samples, the elongation may be 2 percentage points less.

1.8.2 Before acceptance, all castings are to be visually examined including, where applicable, the examination of internal surfaces. Unless otherwise agreed the verification of dimensions is the responsibility of the manufacturer.

1.8.3 Supplementary examination of castings by suitable non-destructive testing procedures is generally not required except in circumstances where there is reason to suspect the soundness of the casting.

1.8.4 When required by the relevant construction Rules, castings are to be pressure tested before final acceptance.

1.8.5 Cast crankshafts are to be subjected to a magnetic particle inspection. Crack like indications are not permitted.

1.9 Metallographic examination

1.9.1 For spheroidal or nodular graphite iron castings, a representative sample from each ladle of treated metal is to be prepared for metallographic examination. These samples may conveniently be taken from the tensile test specimens but alternative arrangement for the provision of the samples may be adopted provided that they are taken from the ladle towards the end of the casting period.

1.9.2 Examination of the samples is to show that at least 90 per cent of the graphite is in a dispersed spheroidal or nodular form. Details of the typical matrix structure are given in Table 1.7.1 and are intended for information purposes only.

1.10 Rectification of defective castings

1.10.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

1.10.2 Subject to the prior approval of the Surveyor, castings containing local porosity may be rectified by impregnation with a suitable plastic filler, provided that the extent of the porosity is such that it does not adversely affect the strength of the castings.

1.10.3 Repairs by welding are generally not permitted, but may be considered in special circumstances. In such cases, full details of the proposed repair procedure are to be submitted for approval prior to commencement of the proposed rectification.

1.11 Identification of castings

1.11.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original ladle of treated metal and the Surveyor is to be given full facilities for so tracing the castings when required.

1.11.2 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked by the manufacturer with the following particulars:-

a) Grade of cast iron;

b) Identification number, or other marking which will enable the full history of the casting to be traced;

c) Manufacturer's name or trade mark;

d) IR and the abbreviated name of the local office of IRS;

e) Personal stamp of the Surveyor responsible for inspection;

f) Where applicable, test pressure;

g) Date of final inspection.

1.11.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with IRS.

1.12 Certification

1.12.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:-

a) Purchaser's name and order no;

b) Description of castings and quality of cast iron;

c) Identification number;

d) Results of mechanical tests;

e) Where applicable, details of heat treatment;

f) Where specially required, the chemical analysis of the ladle sample;

g) Where applicable, test pressure.

End of Chapter

Chapter 8

Copper Alloys

Contents

Section 1

General Requirements

1.1 Scope

1.1.1 The Rules in this Chapter apply to copper alloys used in castings for valves and fittings, propeller castings and tubes.

1.1.2 When required by the relevant parts of the Rules, dealing with design and construction, tubes and castings are to be manufactured and tested in accordance with the appropriate requirements of Ch.1 and 2 and the requirements of this Chapter.

1.1.3 Alternatively, tubes and castings which comply with National or proprietary specifications may be accepted provided these specifications give reasonable equivalence to the requirements of this Chapter and provided that survey is carried out in accordance with the requirements of Ch.1.

1.1.4 Where it is proposed to use an alloy which is not specified in this Chapter, details of chemical composition, heat treatment and mechanical properties are to be submitted for approval.

Section 2

Castings for Valves and Fittings

2.1 Scope

2.1.1 Following requirements make provision for copper alloy castings for valves, liner bushes and other fittings intended for use in ship and machinery construction.

2.2 Manufacture

2.2.1 Approval of Works, as required by Ch.1, for the manufacture of castings, covered by this Section, is not required.

2.3 Quality of castings

2.3.1 All castings are to be free from surface or internal defects, which could be prejudicial to their proper application in service.

2.4 Chemical composition

2.4.1 The chemical composition is to comply with the appropriate requirements of Table 2.4.1.

2.4.2 Where a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis may be accepted subject to occasional check tests as requested by the Surveyors.

Table 2.4.1 : Chemical composition

Designation	Chemical composition %								
	Cu	Sn	Zn	Pb	Ni	Mn	P	Fe	Al
90/10 Cu-Sn Phosphor-bronze	Remainder	9.0-11.0	0.5 max.	0.75 max.	0.5 max.	-	0.50 max.	-	-
85/5/10 Leaded bronze	Remainder	4.0-6.0	2.0 max.	9.0-11.0	2.0 max.	-	0.10 max.	-	-
88/10/2 Gunmetal	Remainder	8.5-11.0	1.0-3.0	1.5 max.	1.0 max.	-	-	-	-
87/7/3/3 Leaded Gunmetal	Remainder	6.0-8.0	1.5-3.0	2.5-3.5	2.0 max.	-	-	-	-
85/5/5/5 Leaded Gunmetal	Remainder	4.0-6.0	4.0-6.0	4.0-6.0	2.0 max.	-	-	-	-
70/30 Cu-Ni-Fe	Remainder	-	-	-	29.0-32.0	0.5-1.50	-	0.4-1.0	-
90/10 Cu-Ni-Fe	Remainder	-	-	-	9.0-11.0	0.5-1.0	-	1.0-1.8	-
Ni-Al-bronze	Remainder	0.10 max.	1.0 max.	0.03 max.	3.0-6.0	0.5-4.0	-	2.0-6.0	7.0-11.0

2.5 Heat treatment

2.5.1 At the option of the manufacturer castings may be supplied in the 'as cast' or heat treated condition.

2.6 Mechanical tests

2.6.1 The test material may be separately cast as a keel block sample in accordance with Fig.3.6.1 or as otherwise agreed with the Surveyor. For liners and bushes, the test material may be cut from the ends of the casting.

2.6.2 Where castings are supplied in a heat treated condition, the test samples are to be similarly heat treated prior to the preparation of the tensile specimens.

2.6.3 The results of all tests are to comply with the appropriate requirements given in Table 2.6.1.

2.7 Visual examination

2.7.1 All castings must be supplied in a clean fettled condition.

2.7.2 Before acceptance, all castings are to be presented for visual examination by the Surveyor. This is to include the examination of internal surfaces where applicable.

2.7.3 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

2.8 Pressure testing

2.8.1 Where required by the relevant construction Rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence of the Surveyors and are to be to their satisfaction.

Table 2.6.1 : Mechanical properties for acceptance purposes

Designation	0.2% proof stress [N/mm^2] minimum (see Note)	Tensile Strength [N/mm^2] minimum	Elongation on $5.65\sqrt{S_o}$% minimum
90/10 Cu-Sn Phosphor-bronze	120	250	15
85/5/10 Leaded bronze	100	200	16
88/10/2 Gunmetal	130	270	13
87/7/3/3 Leaded Gunmetal	130	250	16
85/5/5/5 Leaded Gunmetal	100	200	16
70/30 Cu-Ni-Fe	220	420	20
90/10 Cu-Ni-Fe	160	320	20
Ni-Aluminium bronze	240	590	16

Note:

The 0.2% proof stress values are given for information purposes only and, unless otherwise agreed, are not required to be verified by test.

2.9 Rectification of defective castings

2.9.1 Minor surface defects may be removed by grinding provided that the dimensional tolerances are not exceeded.

2.9.2 Proposal to repair a defective casting by welding are to be submitted to the Surveyor for approval before this work is commenced. Such proposals are to include details of the extent and positions of all defects. The Surveyor is to satisfy himself the number and size of the defects are such that castings can be efficiently repaired.

2.9.3 A statement and/or sketch detailing the extent and position of all weld repairs is to be prepared by the manufacturer as permanent record.

2.9.4 Weld repairs to liners in copper alloys containing more than 0.5 per cent lead are not permitted.

2.10 Identification

2.10.1 Before acceptance, all castings which have been tested and inspected with satisfactory results are to be clearly marked with the following details:

a) Identification number, cast number or other markings which will enable the full history of the casting to be traced;

b) IR and the abbreviated name of the IRS local office;

c) Personal stamp of the Surveyor responsible for inspection;

d) Test pressure, where applicable;

e) Date of final inspection.

2.10.2 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

2.11 Certification

2.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which has been accepted:-

a) Purchaser's name and order no.;

b) Description of castings and alloy type;

c) Identification number

d) Type of heat treatment, where applicable;

e) Ingot or cast analysis.

2.11.2 In addition to 2.11.1 the manufacturer is to provide a signed statement and/or sketch detailing the extent and position of all weld repairs made to each casting.

Section 3

Castings for Propellers

3.1 Scope

3.1.1 Following requirements make provision for propeller and propeller blade castings in copper alloys.

3.2 Manufacture

3.2.1 All castings are to be manufactured at foundries approved by IRS in accordance with the appropriate requirements of Ch.1.

3.2.2 An application for approval is to be made to IRS supported by following information:

- Specification of the propeller materials;
- Manufacturing procedures;
- Repair methods;
- NDT inspection procedures;

- Description of the foundry facilities including the maximum capacity of the ladles.

3.2.3 The extent of tests required for approval is to be agreed upon with IRS. The approval is based on verifying that the chemical and physical properties of the cast test coupons of the propeller material in question comply with the rules.

3.2.4 The foundry is to have an adequately equipped approved laboratory manned by experienced personnel for carrying out chemical analysis, mechanical testing and microstructure examination of the representative cast test coupons. Provision is also to be made for NDT inspection, if these test facilities are not available at the foundry then details are to be submitted of an approved local laboratory which will provide such services.

3.3 Quality of castings

3.3.1 All castings must have a workmanlike finish and are to be free from surface or internal defects which would be prejudicial to their proper application in service. Minor casting defects which may still be visible after machining such as small sand and slag inclusions, cold shuts and scabs are to be trimmed off by the manufacturer.

3.4 Chemical composition

3.4.1 The chemical composition of samples from each cast is to comply with the requirements given in Table 3.4.1.

3.4.2 The manufacturer is to maintain permanent records of all chemical analysis, which are to be made available to the Surveyor for verifying that the chemical composition of each casting is within the specified limits.

3.4.3 When a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor.

3.4.4 It is recommended for alloys Grade Cu 1 and Cu 2 that the zinc equivalent is not to exceed 45 percent and is to be calculated using the following formula:

$$\text{Zinc equivalent} = 100 - \frac{100 \text{ x } \%\text{Cu}}{100 + \text{A}}$$

where A is the algebraic sum of the following:

1 x % Sn

5 x % Al

- 0.5 x % Mn

- 0.1 x % Fe

- 2.3 x % Ni.

Table 3.4.1 : Chemical composition of propeller and propeller blade castings

Alloy Designation	Chemical composition of ladle samples %							
	Cu	**Sn**	**Zn**	**Pb**	**Ni**	**Fe**	**Al**	**Mn**
Grade Cu1 Manganese Bronze (high strength brass)	52 - 62	1.5 max.	35 - 40	0.5 max.	1.0 max.	0.5-2.5	0.5-3.0	0.5-4.0
Grade Cu2 Ni-Manganese Bronze (high strength brass)	50 - 57	1.5 max.	33 - 38	0.5 max.	3.0-8.0	0.5-2.5	0.5-2.0	1.0-4.0
Grade Cu3 Ni-Aluminium Bronze	77 - 82	0.1 max.	1.0 max.	0.03 max.	3.0-6.0	2.0-6.0	7.0-11.0	0.5-4.0
Grade Cu4 Mn-Aluminium Bronze	70 - 80	1.0 max.	6.0 max.	0.05 max.	1.5-3.0	2.0-5.0	6.5-9.0	8.0-20.0

3.5 Heat treatment

3.5.1 At the option of the manufacturer, castings may be supplied in the 'as cast' or heat treated condition.

3.6 Mechanical tests

3.6.1 Test samples are to be provided from each cast used for the manufacture of propeller or propeller blade castings.

3.6.2 The test samples are to be of the keel block type, generally in accordance with the dimensions given in Fig.3.6.1 or as agreed with the Surveyor and are to be cast in moulds made from the same type of material as used for castings.

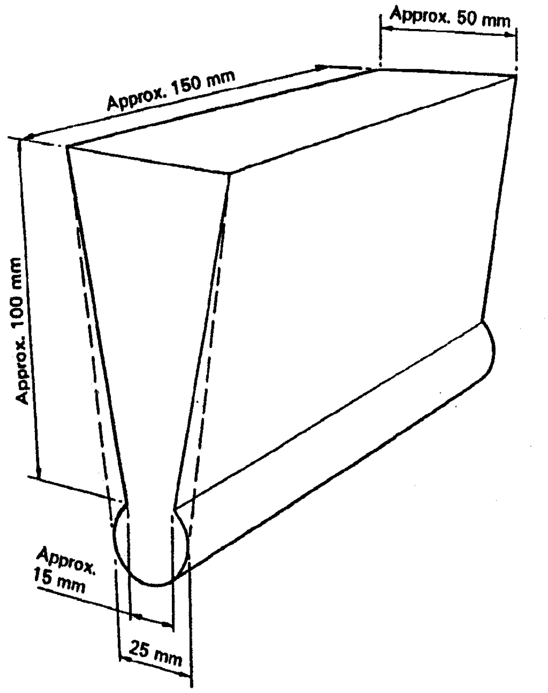

Fig. 3.6.1 : Keel block test sample

3.6.3 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent.

3.6.4 The results of all tests are to comply with the appropriate requirements given in Table 3.6.1.

Note : These properties are a measure of the mechanical quality of the metal in each heat and they are generally not representative of the mechanical properties of the propeller casting itself which may be upto 30% lower than that of a separately cast test coupon. For integrally cast test specimens the requirements are to be specially agreed with IRS.

Table 3.6.1 : Mechanical properties for acceptance purposes : propeller and propeller blade castings

Alloy Designation	0.2% proof stress [N/mm^2] minimum	Tensile Strength [N/mm^2] minimum	Elongation on $5.65\sqrt{S_o}$% minimum
Grade Cu1 Manganese bronze	175	440	20
Grade Cu2 Ni-Manganese bronze	175	440	20
Grade Cu3 Ni-Aluminium bronze	245	590	16
Grade Cu4 Mn-Aluminium bronze	275	630	18

Note:

The mechanical properties of other alloys meeting the above limiting values are to be in accordance with a specification approved by IRS.

3.7 Surface quality and dimensions

3.7.1 All castings are to be fettled, cleaned and adequately prepared for inspection.

3.7.2 Propeller castings are to be inspected at all stages of manufacture and the whole surface including the bore is to be subjected to a comprehensive visual examination in the finished condition by the Surveyor. The Surveyor may require areas to be etched (e.g. by iron chloride) for purpose of investigating weld repairs.

3.7.3 The dimensions are to be checked by the manufacturer and the report on the dimensional inspection is to be given to the Surveyor, who may require checks to be made in his presence.

3.8 Non-destructive examination

3.8.1 Dye penetrant inspection

a) The severity zones "A" are to be subjected to a dye penetrant inspection in the presence of the Surveyor. For the inspection and acceptance standard, see 3.10. In zones "B" and "C" the dye penetrant inspection is to be performed by the manufacturer and may be witnessed by the Surveyor upon his request. See 3.9 for definitions of severity zones.

b) If repairs have been made either by grinding or by welding the repaired areas are additionally to be subjected to the dye penetrant inspection independent of their location and/or severity zone.

3.8.2 Radiographic and ultrasonic examination

Where serious doubts exist that the castings are not free from internal defects further non-destructive examination is to be carried out upon request of the Surveyor, e.g. radiographic and/or ultrasonic testing. Acceptance criteria are to be agreed between the manufacturer and IRS in accordance with a recognized standard.

Guidance

The absorption of the X-rays and gamma-rays is stronger in copper-based alloys than in steel. For propeller bronzes, 300 kV X-rays can normally be used upto 50 [mm] and Co60 gamma-rays upto 160 [mm] thickness. Due to the limited thicknesses that can be radiographed as well as for other practical reasons radiography is generally not a realistic method for checking of the thickest parts of large propellers.
As a general rule, ultrasonic testing of Cu1 and Cu2 is not feasible due to the high damping capacity of these materials. For Cu3 and Cu4, ultrasonic inspection of subsurface defects is possible.

3.8.3 Documentation of defects

All defects requiring welding repair on the castings are to be documented preferably on drawings or special sketches showing their dimensions and locations. Furthermore, the inspection procedure is to be documented. The documentation is to be presented to the Surveyor prior to any repair welding.

3.9 Definition of skew, severity zones

3.9.1 Skew : The skew of a propeller is defined as follows:

The maximum skew angle of a propeller blade is defined as the angle, in projected view of the blade, between a line drawn through the blade tip and the shaft centreline and a second line through the shaft centreline which acts as a tangent to the locus of the mid-points of the helical blade section. See Fig.3.9.1.

High skew propellers have a skew angle greater than 25°, low skew propellers a skew angle of up to 25°.

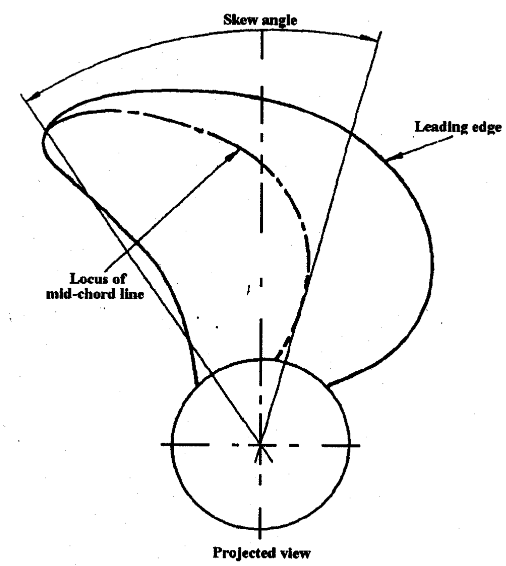

Fig.3.9.1 : Definition of skew angle

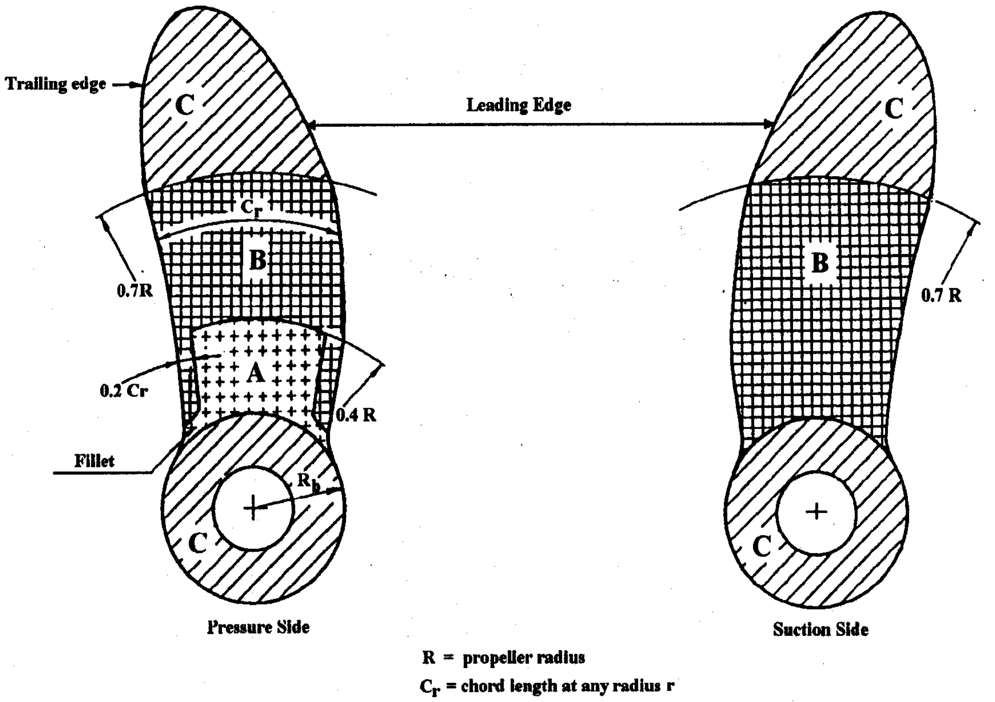

Fig. 3.9.2 : Severity zones for integrally cast low skew propellers

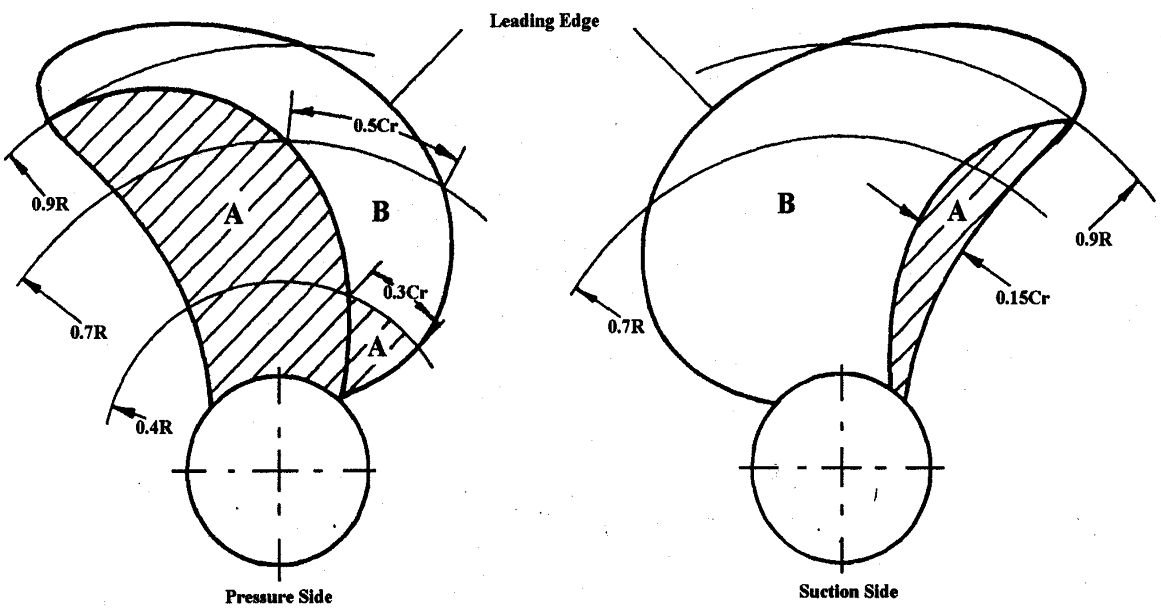

Fig. 3.9.3 : Severity zones in blades with skew angles greater than 25 degrees

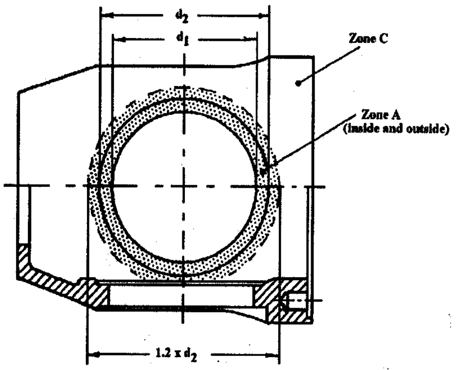

Fig. 3.9.4 : Severity zones for controllable pitch propeller boss

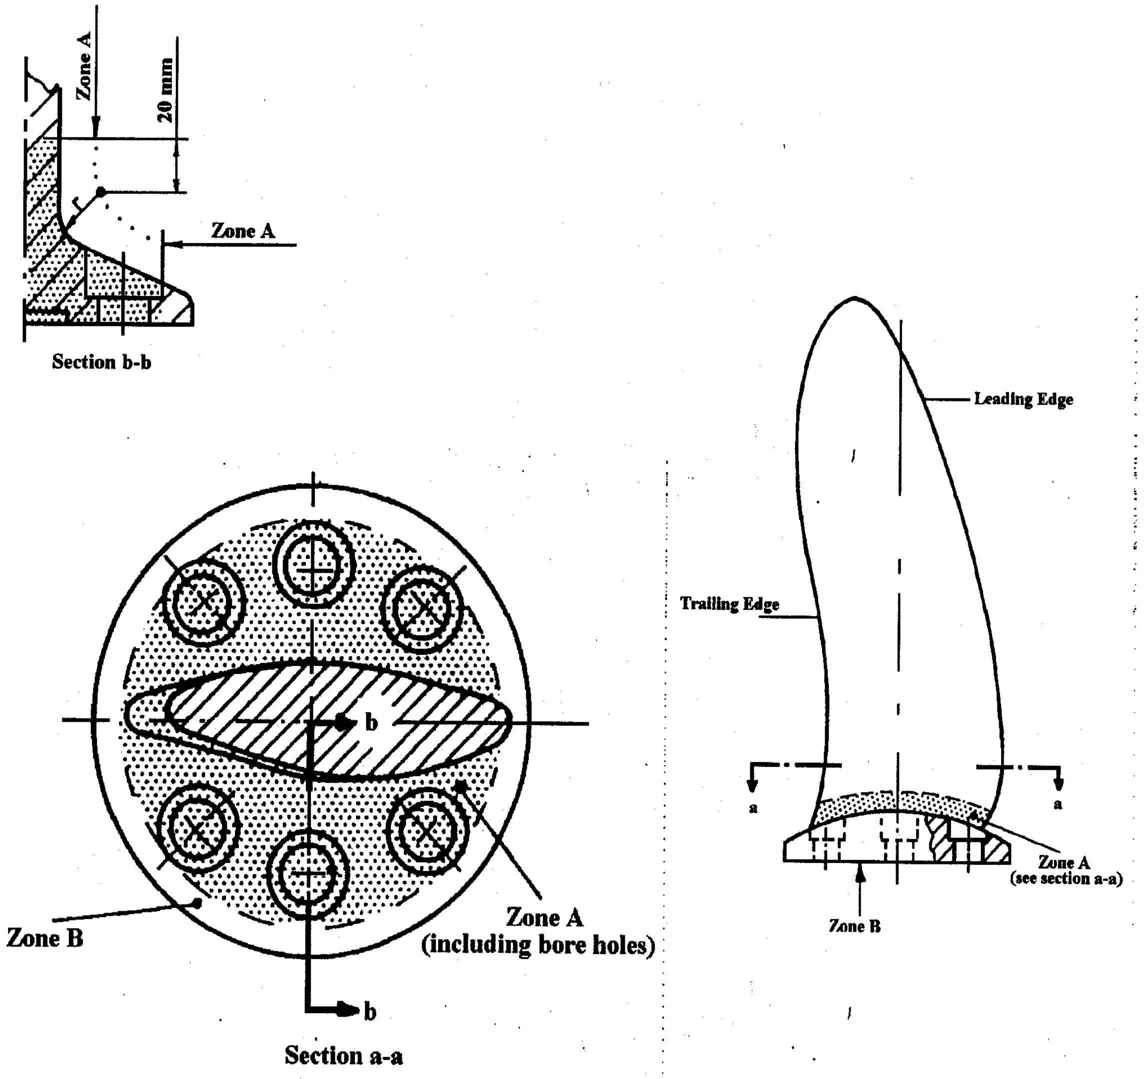

Fig. 3.9.5 : Severity zones for controllable and built-up propellers

[Note : The remaining surfaces of the propeller blades are to be divided into severity zones as given for solid propellers (Fig. 3.9.2 and 3.9.3)]

3.9.2 Severity zones

In order to relate the degree of examination to the criticality of defects in propeller blades and to help reduce the risk of failure by fatigue cracking after repair, propeller blades are divided into the three zones designated A, B and C.

Zone A is the region carrying the highest operating stresses and which, therefore, requires the highest degree of inspection. Generally, the blade thicknesses are greatest in this area giving the greatest degree of restraint in repair welds and this in turn leads to the highest residual stresses in and around any repair welds. High residual tensile stresses frequently lead to fatigue cracking during subsequent service so that relief of these stresses by heat treatment is essential for any welds made in this zone. Welding is generally not permitted in Zone A and will only be allowed after special consideration by the Classification Society. Every effort should be made to rectify a propeller which is either defective or damaged in this area without recourse to welding even to the extent of reducing the scantlings, if this is acceptable. If a repair using welding is agreed, post-weld stress relief heat treatment is mandatory.

Zone B is a region where the operation stresses may be high. Welding should preferably be avoided but generally is allowed subject to prior approval from the Classification Society. Complete details of the defect/damage and the intended repair procedure are to be submitted for each instance in order to obtain such approval.

Zone C is a region in which the operation stresses are low and where the blade thicknesses are relatively small so that repair welding is safer and, if made in accordance with an approved procedure is freely permitted.

3.9.2.1 Low-skew propellers

a) Zone A is in the area on the pressure side of the blade, from and including the fillet to 0.4R and bounded on either side by lines at a distance 0.15 times the chord length Cr from the leading edge and 0.2 times Cr from the trailing edge, respectively. See Fig.3.9.2.

   Where the hub radius (Rb) exceeds 0.27R, the other boundary of Zone A is to be increased to 1.5Rb. Zone A also includes the parts of the separate cast propeller hub which lie in the area of the windows as described in Fig.3.9.4 and the flange and fillet area of controllable pitch and built-up propeller blades as described in Fig.3.9.5.

b) Zone B is on the pressure side the remaining area upto 0.7R and on the suction side the area from the fillet to 0.7R. See Fig.3.9.1.

c) Zone C is the area outside 0.7R on both sides of the blade. It also includes the surface of the hub of a monobloc propeller and all the surfaces of the hub of controllable pitch propeller other than those designated Zone A above.

3.9.2.2 High-skew propellers

a) Zone A is the area on the pressure face contained within the blade root-fillet and a line running from the junction of the leading edge with the root fillet to the trailing edge at 0.9R and at passing through the mid-point of the blade chord at 0.7R and a point situated at 0.3 of the chord length from the leading edge at 0.4R. It also includes an area along the trailing edge on the suction side of the blade from the root to 0.9R and with its inner boundary at 0.15 of the chord lengths from the trailing edge.

b) Zone B constitutes the whole of the remaining blade surfaces.

c) Zone A and B are illustrated in Fig.3.9.3.

3.10 Acceptance criteria for dye penetrant examination

3.10.1 Inspection procedure

The dye penetrant inspection is to be carried out in accordance with a standard or specification agreed with the Surveyor.

3.10.2 Definitions

Indication — In the dye penetrant inspection an indication is the presence of detectable bleed-out of the penetrant liquid from the material discontinuities appearing at least 10 minutes after the developer has been applied.

Shape of Indications — A distinction is made between circular, linear and aligned indications, See Fig.3.10.1.

Reference area — The reference area is defined as an area of 100 [cm^2] which may be square or rectangular with the major dimension not exceeding 250 [mm].

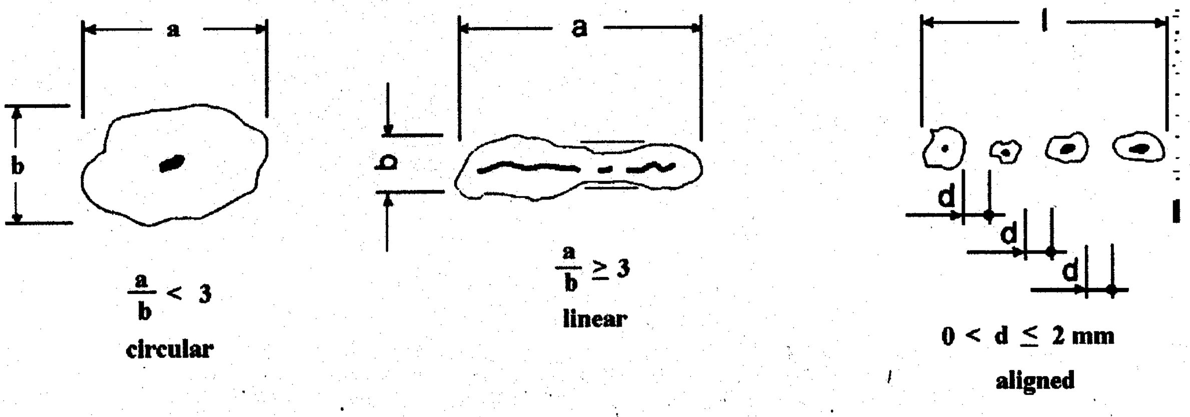

Fig.3.10.1 : Shape of indications

Table 3.10.1 : Allowable number and size of indications in a reference area of 100 [cm^2], depending on severity zones

Severity zones	Max. total number of indications	Type of indication	Max. number of each type [1)2)]	Max. acceptable value for "a" or "l" of indications [mm]
A	7	Circular Linear Aligned	5 2 2	4 3 3
B	14	Circular Linear Aligned	10 4 4	6 6 6
C	20	Circular Linear Aligned	14 6 6	8 6 6

Notes:

1) Singular circular indications less than 2 [mm] for zone A and less than 3 [mm] for the other zones may be disregarded.

2) The total number of circular indications may be increased to the max. total number, or part thereof, represented by the absence of linear/aligned indications.

3.10.3 Acceptance standard

3.10.3.1 For the judgement, the surface to be inspected is to be divided into reference areas of 100 [cm^2] as given in the definitions, see para 3.10.2. The indications detected may, with respect to their size and number, not exceed the values given in the Table 3.10.1.

The area is to be taken in the most unfavourable location relative to the indication being evaluated.

3.10.3.2 Areas which are prepared for welding are, independent of their location, always to be assessed according to Zone A. The same applies to the welded areas after being finished machined and/or ground.

3.11 Metallographic examination

3.11.1 Samples for metallographic examination are to be prepared from propellers and propeller blade castings for Grades Cu1 and Cu2. These samples are to be representative of each cast, and may conveniently be taken from the tensile test specimen. The proportion of alpha-phase determined from the average of at least five counts is to be not less than 25 percent.

3.12 Rectification of defects

3.12.1 Indications exceeding the acceptance standard of Table 3.10.1, cracks, shrinkage cavities, sand, slag and other non-metallic inclusions, blow holes and other discontinuities which may impair the safe service of the propeller are defined as defects and must be repaired.

3.12.2 Repair procedures

a) In general the repairs are to be carried out by mechanical means, e.g. by grinding, chipping or milling. Welding may be applied subject to the agreement with the Surveyor.

b) After milling or chipping grinding is to be applied for such defects which are not to be welded. Grinding is to be carried out in such a manner that the contour of the ground depression is as smooth as possible in order to avoid stress concentrations or to minimise cavitation corrosion.

c) Welding of areas less than 5 [cm^2] is to be avoided.

3.12.3 Repair of defects in zone A

a) In zone A, repair welding will generally not be allowed unless specially approved by IRS.

b) Grinding may be carried out to an extent which maintains the blade thickness of the approved drawing.

c) The possible repair of defects which are deeper than those referred to above will be specially considered by IRS.

3.12.4 Repair of defects in zone B

a) Defects that are not deeper than dB = (t/40) [mm] (t = minimum local rule thickness [mm]) or 2 [mm] (whichever is greater) below minimum local rule thickness should be removed by grinding.

b) Those defects that are deeper than allowable for removal by grinding may be repaired by welding.

3.12.5 Repair of defects in zone C

In zone C, repair welds are generally permitted.

3.13 Balancing

3.13.1 Static balancing is to be carried out on all propellers. Dynamic balancing is necessary for propellers running above 500 [rpm].

3.14 Repair welding

3.14.1 General requirements

3.14.1.1 Companies wishing to carry out welding work on propellers must have at their disposal the necessary workshops, lifting gear, welding equipment, preheating and where necessary, annealing facilities, testing devices as well as certified welders and expert welding supervisors to enable them to perform the work properly. Proof is to be furnished to the Surveyor that these conditions are satisfied before welding work begins.

3.14.1.2 The company concerned is to prepare and submit to IRS a detailed welding specification covering the weld preparation, welding procedure, filler metals, preheating and post weld heat treatment and inspection procedures.

3.14.1.3 Before welding is started, Welding Procedure Qualification Tests are to be carried out and witnessed by the Surveyors. Each welder/operator is to demonstrate his ability to carry out the proposed welding using the same process, consumable and position which are to be used in actual repair (for the scope of tests see 3.18).

3.14.2 Welding preparation

Defects to be repaired by welding are to be ground to sound material according to the requirements as given under 3.12. To ensure complete removal of the defects the ground areas are to be examined by dye penetrant methods in the presence of the Surveyor. The welding grooves are to be prepared in such a manner which will allow a good fusion of the groove bottom.

3.14.3 Welding repair procedure

3.14.3.1 Metal arc welding is recommended for all types of repair on bronze propellers.

For material thickness less than 30 [mm], gas welding may give a satisfactory weldment for Cu1 and Cu2 materials.

Arc welding with coated electrodes and gas-shielded metal arc process (GMAW) are generally to be applied. Argon-shielded tungsten welding (GTAW) is to be used with care due to the higher specific heat input of this process.

Adequate pre-heating is to be carried out with care to avoid local overheating.

Recommended filler metals, pre-heating and stress relieving temperatures are listed in Table 3.14.3(a).

3.14.3.2 All propeller alloys are generally to be welded in down-hand (flat) position. Where this cannot be done, gas-shielded metal arc welding is to be carried out.

The section to be welded is to be clean and dry. Flux-coated electrodes are to be dried before welding according to the maker's instructions.

To minimize distortion and the risk of cracking, interpass temperatures are to be kept low especially in the case of Cu3 alloys.

Slag, undercuts and other defects are to be removed before depositing the next run.

Table 3.14.3(a) : Recommended filler metals and heat treatments

Alloy type	Filler metal	Preheat temp.°C [min]	Interpass temp.°C [max]	Stress relief temp.°C	Hot straightening temp.°C
Cu1	Al-bronze [1)] Mn-bronze	150	300	350 - 500	500 - 800
Cu2	Al-bronze Ni-Mn-bronze	150	300	350 - 550	500 - 800
Cu3	Al-bronze Ni-Al-bronze [2)] Mn-Al-bronze	50	250	450 - 500	700 - 900
Cu4	Mn-Al-bronze	100	300	450 - 600	700 - 850

Notes:

1) Ni-Al-bronze and Mn-Al-bronze are acceptable.

2) Stress relieving not required, if filler metal Ni-Al-bronze is used.

Table 3.14.3(b) : Soaking times for stress relief heat treatment of copper alloy propellers				
Stress relief temp.°C	**Alloy grade Cu1 and Cu2**		**Alloy grade Cu3 and Cu4**	
	Hours per 25 [mm] thickness	**Max. recommended total time hours**	**Hours per 25 [mm] thickness**	**Max. recommended total time hours**
350	5	15	-	-
400	1	5	-	-
450	1/2	2	5	15
500	1/4	1	1	5
550	1/4	1.2	1/2 [1)]	2 [1)]
600	-	-	1/4 [1)]	1 [1)]
Note 1) 550°C and 600°C only applicable for Cu4 alloys				

3.14.3.3 All welding work is to be carried out preferably in the shop free from draughts and influence of the weather.

3.14.3.4 With the exception of alloy Cu3 (Ni-Al-bronze) all weld repairs are to be stress relief heat treated, in order to avoid stress corrosion cracking. However, stress relief heat treatment of alloy Cu3 propeller castings may be required after major repairs in zone B (and specially approved welding in Zone A) or if a welding consumable susceptible to stress corrosion cracking is used. In such cases the propeller is to be either stress relief heat treated in the temperature 450 to 500°C or annealed in the temperature range 650 - 800°C, depending on the extent of repair, see Table 3.14.3(a).

3.14.3.5 The soaking times for stress relief heat treatment of copper alloy propellers is to be in accordance with Table 3.14.3(b). The heating and cooling is to be carried out slowly under controlled conditions. The cooling rate after any stress relieving heat treatment shall not exceed 50°C/hr until the temperature of 200°C is reached.

3.15 Straightening

3.15.1 Application of load

For hot and cold straightening purposes, static loading only is to be used.

3.15.2 Hot straightening

Straightening of a bent propeller blade or a pitch modification should be carried out after heating the bent region and approximately 500 [mm] wide zones on either side of it to the suggested temperature range given in Table 3.14.3.(a). The heating is to be slow and uniform and the concentrated flames such as oxy-acetylene and oxy-propane are not to be used. Sufficient time is be allowed for the temperature to become fairly uniform through the full thickness of the blade section. The temperature is to be maintained within the suggested range throughout the straightening operation. A thermocouple instrument or temperature indicating crayons are to be used for measuring the temperature.

3.15.3 Cold straightening

Cold straightening should be used for minor repairs of tips and edges only. Cold straightening on Cu1, Cu2 and Cu4 bronze is always to be followed by a stress relieving heat treatment, See Table 3.14.3(a).

3.16 Identification

3.16.1 Castings are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1. The following details are to be marked on all the castings which have been accepted:

a) Heat number, casting number or other identification mark which will enable the full history of the item to be traced;

b) Alloy grade;

c) IR and the abbreviated name of the local IRS office;

d) Personal stamp of the Surveyor responsible for inspection;

e) Date of final inspection;

f) IRS certificate number;

g) Skew angle for high skew propellers;

h) Ice class symbol, where applicable.

3.17 Certification

3.17.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting:

a) Purchaser's name and order number;

b) Description of casting;

c) Alloy designation and/or trade name;

d) Identification number of casting;

e) Type of heat treatment.

3.18 Welding procedure and welder's qualification test

3.18.1 General

The qualification test is to be carried out with the same welding process, filler metal, preheating and stress-relieving treatment as those intended to be applied in the actual repair work.

3.18.2 Test sample

A test sample of minimum 30 [mm] thickness is to be welded in down-hand (flat) position. The required test specimens and their dimensions are shown in Fig.3.18.1.

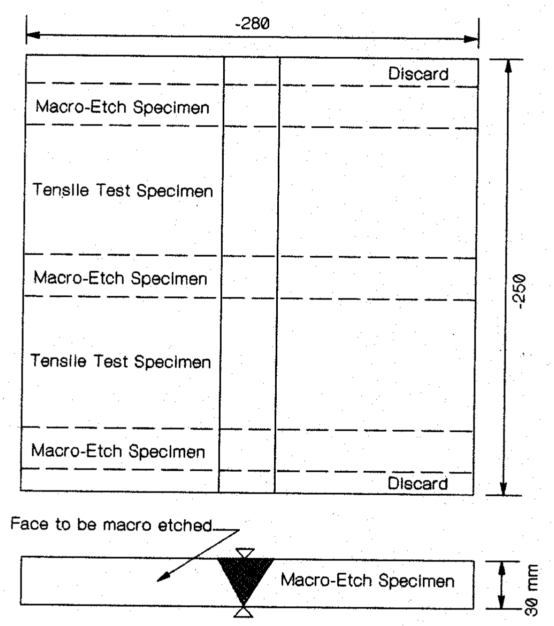

Fig.3.18.1 : Test specimen

3.18.3 Qualification testing

3.18.3.1 Non-destructive testing

After completion, the weldment is to be 100% tested by a dye-penetrant method. No cracks are permitted.

3.18.3.2 Macro-etching

Three macro-etch samples are to be prepared (See Fig.3.18.1). A suitable etchant for this purpose is:

5 g iron (III) chloride
30 ml hydrochloric acid (cone)
100 ml water.

Pores greater than 3 [mm] and cracks are not permitted.

3.18.3.3 Mechanical testing

Two tensile test specimens are to be prepared as given in 1.8.2 and Fig.1.8.2 of Part 2, Chapter 11 The tensile strength requirements given in Table 3.18.3, are to be met. Alternatively tensile test specimens according to recognised standards may be used.

Table 3.18.3 : Required tensile strength values

Alloy Type	Tensile strength [N/mm^2] min
Cu 1	370
Cu 2	410
Cu 3	500
Cu 4	550

Section 4

Tubes

4.1 Scope

4.1.1 Following requirements make provision for copper and copper alloy tubes intended for use in heat exchangers, condensers and pressure piping systems.

4.1.2 Except for pipes for Class lll pressure systems (as defined in Pt.4, Ch.2) all pipes and tubes are to be manufactured and tested in accordance with the requirements of Ch.1 and 2 of this Part and the requirements of this Section.

4.1.3 Pipes and tubes which comply with national/international or proprietary specifica-ions may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are otherwise specifically approved for a specific application and provided that survey is carried out in accordance with Ch.1 of this Part.

4.1.4 At the discretion of the Surveyor, modified testing procedure may be adopted for small quantities of materials. In such cases, these may be accepted on the manufacturer's declared chemical composition and hardness tests or other evidence of satisfactory properties.

4.1.5 Pipes for Class lll pressure systems are to be manufactured and tested in accordance with the requirements of an acceptable national/ international specification. The manufacturer's test certificate will be acceptable and is to be provided for each consignment of material.

4.2 Manufacture

4.2.1 Approval of Works, as required by Ch.1, for the manufacture of copper and copper alloy tubes is generally not required.

4.2.2 Unless otherwise agreed tubes shall be solid drawn.

4.3 Quality

4.3.1 Tubes are to have a workmanlike finish and are to be clean and free from such surface and internal defects as can be established by the specified tests.

4.3.2 The tubes are to be supplied in straight lengths, and the ends are to be cut clean and square with the axis of the tube.

4.3.3 The tolerance on wall thickness and diameter of pipes and tubes are to be in accordance with an acceptable national/ international standard.

4.4 Chemical composition

4.4.1 The chemical analysis is to comply with the requirements of Table 4.4.1. Residual elements are not to be present in amounts greater than specified in an acceptable national/international standard.

4.5 Heat treatment

4.5.1 All tubes are to be supplied in the annealed condition. Aluminium brass tubes may additionally be required to be given a suitable stress relieving heat treatment when subjected to a cold straightening operation after annealing.

4.6 Mechanical tests

4.6.1 The tubes are to be presented in lots of 600 tubes or 900 [Kg], whichever is greater. Each lot is to contain tubes of the same dimensions, material grade and in the same state of heat treatment. From each lot 2 tubes are to be selected for testing.

4.6.2 Following tests are to be carried out on each tube selected for testing in accordance with the requirements of Ch.2:

a) Tensile test;

b) Flattening test;

c) Drift Expanding test.

4.6.3 Flattening test is to be carried out until the interior surfaces of the tube meet.

4.6.4 For the drift-expanding test, the mandrel is to have an included angle of 45°.

4.6.5 The results of all mechanical tests are to comply with the requirements of Table 4.6.1.

Table 4.4.1 : Chemical composition of tubes [1)]

Designation	Chemical composition %								
	Cu	**Fe**	**Ni**	**Zn**	**As**	**Al**	**Mn**	**P**	**Pb**
Phosphorus deoxidised non-arsenical copper	99.90 [2)] min.	-	-	-	-	-	-	0.013-0.050	-
Phosphorus deoxidised arsenical copper	99.20 [2)] min.	-	-	-	0.30-0.50	-	0.013-0.050	-	-
Al-brass	76.0-79.0	-	-	Remainder	0.02-0.06	1.8-2.3	-	-	-
Copper-nickel 90/10	Remainder	1.0-1.8	9.0-11.0	-	-	-	0.5-1.0	-	-
Copper-nickel 70/30	Remainder	0.4-1.0	30.0-32.0	-	-	-	0.5-1.5	-	-

Notes:

1) Table shows essential alloying elements only
2) Includes silver also.

4.7 Visual examination

4.7.1 All pipes are to be presented for visual examination and verification of dimensions. The manufacturer is to provide adequate lighting conditions to enable an internal and external examination of the tubes to be carried out.

4.8 Stress cracking test

4.8.1 This test is applicable to aluminium brass only. Mercurous Nitrate Test or alternatively at the express agreement between purchaser and manufacturer Ammonia Vapour Cracking Test are to be carried out on test specimen to prove that the tubes are free from internal stresses. The tests are to be carried out in accordance with an acceptable national/international standard.

4.8.2 Should a specimen reveal cracks when tested, the manufacturing batch shall be rejected. The manufacturer shall be free to submit the batch to renewed heat treatment before presenting it for retesting.

4.9 Hydraulic test

4.9.1 All tubes are to be hydraulically tested by the manufacturer to the following pressure:

$$P = \frac{5 \text{ x } t \text{ x } Rm}{D}$$

where,

P = Test pressure;

t = nominal wall thickness;

D = nominal outside diameter;

Rm = Tensile strength in accordance with Table 4.6.1.

Unless otherwise stated the pressure need not be greater than 7.0 [N/mm^2].

4.9.2 The test pressure is to be maintained for sufficient time to permit proof and inspection. Unless otherwise agreed, the manufacturer's certificate of satisfactory hydraulic test will be accepted subject to 10 per cent of the tubes being retested in the presence of the Surveyor. If one of the tubes in a batch does not pass the test, it will be rejected, and all other tubes in the batch are to be retested.

4.10 Identification

4.10.1 Tubes are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1, with at least the following details:

a) IR;

b) Manufacturer's name or trade mark;

c) Grade of material.

4.10.2 Identification is to be by rubber stamp or stencil. Hard stamping is not to be used.

4.11 Certification

4.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each lot of material accepted:-

a) Purchaser's name and Order no.;

b) Grade of material;

c) Description and dimensions;

d) Cast number and chemical composition;

e) Mechanical test results and results of stress cracking tests where applicable.

Table 4.6.1 : Mechanical properties for acceptance purposes

Designation	0.2% proof stress [N/mm^2] minimum	Tensile strength [N/mm^2] minimum	$5.65\sqrt{S_o}$% minimum	Drift expansion test % minimum
Phosphorus deoxidised non-arsenical copper	100	220	35	30
Phosphorus deoxidised arsenical copper	100	220	35	30
Al-brass	110	320	35	30
Copper-nickel 90/10	100	270	30	30
Copper-nickel 70/30	120	360	30	30

End of Chapter

Chapter 9

Aluminium Alloys

Contents

Section

Section 1

General

1.1 Scope

1.1.1 This Chapter specifies the requirements for wrought aluminium alloys for structural applications, aluminium alloy castings and aluminium/steel transition joints intended for use in ship and machinery construction.

1.1.2 This Chapter is not applicable to aluminium alloys for forgings and to the use of aluminium alloys at low temperature for cryogenic applications. For these products suitable alloys which comply with recognized standards may be used.

1.1.3 These requirements are applicable to wrought aluminium alloy products within a thickness range of 3 [mm] and 50 [mm] inclusive. The application of aluminium alloys products outside this thickness range requires prior agreement of IRS.

1.1.4 The numerical designation (grade) of aluminium alloys and the temper designation are based on those of the Aluminium Association.

Temper conditions (delivery heat treatment) are as defined in EN 515 Or ANSI H35.1.

1.1.5 When required by the relevant Chapters of the Rules dealing with design and construction, structural aluminium alloys, aluminium alloy castings and aluminium/steel transition joints are to be manufactured and tested in accordance with the appropriate requirements of Ch.1 and 2 and those detailed in this Chapter.

1.1.6 Consideration may be given to aluminium alloys not specified in this chapter and to alternative temper conditions, complying with recognized national or international standards with specifications equivalent to the requirements of this chapter.

Section 2

Wrought Aluminium Alloys

2.1 Scope

2.1.1 This Section deals with wrought aluminium alloys for structural applications including plates, sections, tubes, bars and rivet bars and rivets.

2.1.2 Wrought aluminium alloys are to have a satisfactory resistance to corrosion in marine environment. Grades for welded structures are to be weldable, applying one of the welding methods approved by IRS.

2.1.3 The alloy grades 6005A, 6061 of the 6000 series should not be used in direct contact with sea water unless protected by anodes and/or paint system.

2.2 Manufacture

2.2.1 Aluminium alloys are to be manufactured at Works approved by IRS.

2.2.2 The alloys may be cast either in ingot moulds or by an approved continuous casting process. Plates are to be formed by rolling and may be hot or cold finished. Bars and sections may be formed by rolling, extrusion or drawing.

2.3 Quality of materials

2.3.1 Materials are to be free from surface or internal defects of such a nature as would be harmful in service.

2.4 Dimensional tolerances

2.4.1 The dimensional tolerances are to be in accordance with Table 2.4.1, Table 2.4.2 and Table 2.4.3 and are minimum requirements.

2.4.2 Dimensional tolerances other than those given in Table 2.4.1, Table 2.4.2 and Table 2.4.3 are to comply with a recognized national or international standard.

2.5 Chemical composition

2.5.1 Samples for chemical analysis are to be taken representative of each cast, or the equivalent where a continuous melting process is involved.

2.5.2 The chemical composition of these samples is to comply with the requirements of Table 2.5.1.

Table 2.4.1 : Under thicknesses tolerances for rolled products

	Thickness tolerances for nominal width [mm]		
Nominal thickness [t] [mm]	w ≤ 1500	1500 < w ≤ 2000	2000 < w ≤ 3500
3.0 ≤ t < 4.0	0.10	0.15	0.15
4.0 ≤ t < 8.0	0.20	0.20	0.25
8.0 ≤ t < 12.0	0.25	0.25	0.25
12.0 ≤ t < 20.0	0.35	0.40	0.50
20.0 ≤ t < 50.0	0.45	0.50	0.65

Table 2.4.2 : Under thicknesses tolerances for extruded open profiles

	Thickness tolerances for nominal thicknesses for a diameter of the circumscribing circle [mm]		
Nominal thickness [mm]	Upto 250	From 250 to 400	Above 400
From 3 to 6	0.25	0.35	0.40
From 6 to 50	0.30	0.40	0.45

Table 2.4.3 : Under thicknesses tolerances for extruded closed profiles

Nominal thickness [mm]	Thickness tolerances [mm]
From 3 to 6	0.25
From 6 to 50	0.30

Table 2.5.1 : Chemical composition

Grade	Al	Si	Fe	Cu	Mn	Mg	Cr	Zn	Ti	Oth-ers (2)	Oth-ers (2)	Misc.
	%	%	%	%	%	%	%	%	%	Each %	Total %	
5059	Remainder	0.45	0.50	0.25	0.6-1.2	5.0-6.0	0.25	0.40-0.90	0.20	0.05 [3)]	0.15 [4)]	
5083	Remainder	≤ 0.40	≤ 0.40	≤ 0.10	0.4-1.0	4.0-4.9	0.05-0.25	≤ 0.25	≤ 0.15	≤ 0.05	≤ 0.15	
5086	Remainder	≤ 0.40	≤ 0.50	≤ 0.10	0.20-0.7	3.5-4.5	0.05-0.25	≤ 0.25	≤ 0.15	≤ 0.05	≤ 0.15	
5383	Remainder	0.25	0.25	0.20	0.7-1.0	4.0-5.2	0.25	0.40	0.15	0.05 [3)]	0.15 [3)]

6005-A	Remainder	0.50-0.9	≤ 0.35	≤ 0.30	≤ 0.50	0.040-0.7	≤ 0.30	≤ 0.20	≤ 0.10	≤ 0.05	≤ 0.15	0.12 ≤ Mn + Cr ≤ 0.50
6061	Remainder	0.40-0.8	≤ 0.7	0.15-0.40	≤ 0.15	0.8-1.2	0.04-0.35	≤ 0.25	≤ 0.15	≤ 0.05	≤ 0.15	
6082	Remainder	0.7-1.3	≤ 0.50	≤ 0.10	0.40-1.0	0.6-1.2	≤ 0.25	≤ 0.20	≤ 0.10	≤ 0.05	≤ 0.15	

Notes:

1. Slight variations in the content of some elements, compared with values indicated in this Table may be accepted with IRS's agreement.
2. Other metallic elements such as Ni, Ga.V are considered as impurities. The regular analysis need not be made for these elements.
3. Zr: maximum 0.20. The total for other elements does not include Zirconium.
4. Zr: 0.05-0.25. The total for other elements does not include Zirconium.

2.5.3 The manufacturer's declared analysis will be accepted subject to occasional checks if required by IRS Surveyor, particularly, product analysis may be required where the final product chemistry is not well represented by the analysis from the cast.

2.5.4 When the aluminium alloys are not cast in the same works in which they are manufactured into semi finished products, the works is to give a certificate detailing the chemical composition and heat number.

2.6 Heat treatment

2.6.1 Temper conditions (delivery heat treatment) are defined in Table 2.8.1.

2.7 Test material

2.7.1 All materials in a lot forwarded for sampling are to be of the same alloy, production batch and product form (plates, sections etc.). The materials in one lot are to be of the same dimensions and in the same delivery condition.

Artificially aged grades are to be from the same furnace batch.

2.7.2 Wherever practicable, the tensile test pieces for rolled and extruded sections are to be of full section of material. Otherwise, the pieces are to be taken in the range one third to half the distance from the edge to center of the predominant or thickest part of the section.

2.8 Testing and inspection

2.8.1 Testing procedures

The test specimens and procedures are to be in accordance with Ch.2.

2.8.2 Verification of proper fusion of press welds for closed profiles.

The Manufacturer has to demonstrate by macrosection tests or drift expansion tests of closed profiles performed on each batch of closed profiles that there is no lack of fusion at the press welds.

2.8.3 Drift expansion tests

2.8.3.1 Every fifth profile is to be sampled after final heat treatment.
One sample is to be selected from the batches of five profiles or less.

Every profile is to be selected if the length exceeds 6 [m].

2.8.3.2 Two samples are to be cut from the front and back end of each production profile.

2.8.3.3 The test specimens are to be cut with the ends perpendicular to the axis of the profile. The edges of the end may be rounded by filing.

2.8.3.4 The length of the specimen is to be in accordance with details given in Chapter 2.

2.8.3.5 Testing is to be carried out at ambient temperature and is to consist of expanding the end of the profile by means of a hardened conical steel mandrel having an included angle of at least 60°.

2.8.3.6 The sample is considered to be unacceptable if the sample fails with a clean split along the weld line which confirms lack of fusion.

2.8.4 Requirements of mechanical properties for rolled products in different delivery conditions are given in Table 2.8.1 and are applicable for thickness within the range 3 [mm] to 50 [mm]. For thickness above 10 [mm], however, lower mechanical properties may be accepted.

2.8.5 Requirements of mechanical properties for extruded products in different delivery conditions are given in Table 2.8.2 and are applicable for thickness within the range 3 [mm] to 50 [mm].

2.8.6 Requirements of mechanical properties and delivery conditions for extruded closed profiles are given in Table 2.8.3.

2.8.7 Other delivery conditions with related mechanical properties may be accepted by IRS, in each particular case.

Table 2.8.1 : (Contd.)

Grade	**Temper [3] condition**	**Thickness, t**	**0.2% proof stress [N/mm^2]**	**Tensile strength [N/mm^2]**	**Elongation % minimum [1]**	
					On gauge length of 50 [mm]	**On gauge length of 5 x dia**
5456	O	$3 \leq t \leq 6.3$ mm	130-205	290-365	16	
		$6.3 < t \leq 50$ mm	125-205	285-360	16	14
	H116	$3 \leq t \leq 30$ mm	230	315	10	10
		$30 < t \leq 40$ mm	215	305		10
		$40 < t \leq 50$ mm	200	285		10
	H321	$3 \leq t \leq 12.5$ mm	230-315	315-405	12	
		$12.5 < t \leq 40$ mm	215-305	305-385		10
		$40 < t \leq 50$ mm	200-295	285-370		10

Notes:

1) Elongation in 50 mm apply for thicknesses upto and including 12.5 mm and in 5d for thicknesses over 12.5 mm.
2) 8% for thicknesses upto and including 6.3 mm.
3) The mechanical properties for the O and H111 tempers are the same. However, they are separated to discourage dual certification as these tempers represent different processing.

Designation	**Condition**
F	As fabricated
O	Annealed, soft
H1	Strain hardened only
H2	Strain hardened and partially annealed
H3	Strain hardened and thermally stabilized
H321	Strain hardened and stabilized
H11	Strain hardened to specified strength
H12	Strain hardened to specified strength
H13	Strain hardened to specified strength
H111	Less strain hardened than H11 e.g. by straightening or stretching
H112	No controlled strain hardening, but there are mechanical property limits
H116	Treatment against exfoliation corrosion
T5	Cooled from an elevated temperature shaping process and then artificially aged
T6	Solution heat treated and then artificially aged.

Table 2.8.2 : Mechanical properties for extruded products 3 [mm] ≤ t ≤ 50 mm

Grade	Temper condition	Thickness, t	0.2% proof stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation % minimum [1)]	
					On gauge length of 50 [mm]	On gauge length of 5 x dia
5083	O	3 ≤ t ≤ 50 mm	110	270-350	14	12
	H/111	3 ≤ t ≤ 50 mm	165	275	12	10
	H112	3 ≤ t ≤ 50 mm	110	270	12	10
5383	O	3 ≤ t ≤ 50 mm	145	290	17	17
	H111	3 ≤ t ≤ 50 mm	145	290	17	17
	H112	3 ≤ t ≤ 50 mm	190	310		13
5059	H112	3 ≤ t ≤ 50 mm	200	330		10
5086	O	3 ≤ t ≤ 50 mm	95	240-315	14	12
	H111	3 ≤ t ≤ 50 mm	145	250	12	10
	H112	3 ≤ t ≤ 50 mm	95	240	12	10
6005A	T5	3 ≤ t ≤ 50 mm	215	260	9	8
	T6	3 ≤ t ≤ 10 mm	215	260	8	6
		10 ≤ t ≤ 50 mm	200	250	8	6
6061	T6	3 ≤ t ≤ 50 mm	240	260	10	8
6082	T5	3 ≤ t ≤ 50 mm	230	270	8	6
	T6	3 ≤ t ≤ 50 mm	250	290	6	
		3 ≤ t ≤ 50 mm	260	310	10	8

Notes:

1) The values are applicable for longitudinal and transverse tensile test specimens as well.
2) Elongation in 50 mm applies for thicknesses upto and including 12.5 mm and in 5d for thicknesses over 12.5 mm.

Table 2.8.3 : Mechanical properties for extruded closed profiles (testing transverse to extruding direction)

Grade	Temper condition	0.2% proof stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation % min on gauge length of 5 x dia
6061	T5/T6	205	245	4
6005A	T5/T6	215	250	5
6082	T5/T6	240	290	5

2.9 Freedom from defects

2.9.1 The finished material is to have a good finish and is to be free from internal and surface defects prejudicial to the use of the concerned material for the intended application.

2.9.2 Slight surface imperfections may be removed by smooth grinding or machining as long as the thickness of the material remains within the tolerances given in 2.4.

2.10 Corrosion testing

2.10.1 Rolled 5xxx-alloys of type 5083, 5383, 5059, 5086 and 5456 in the H116 and H321 tempers intended for use in marine hull construction or in marine applications where frequent direct contact with seawater is expected, are to be corrosion tested with respect to exfoliation and intergranular corrosion resistance.

2.10.2 The manufacturers are to establish the relationship between microstructure and resistance to corrosion when the above alloys are approved. A reference photomicrograph taken at 500x under the conditions specified in ASTM B928, Section 9.4.1, is to be established for each of the alloy-tempers and relevant thickness ranges. The reference photographs are to be taken from samples which have exhibited no evidence of exfoliation corrosion and a pitting rating of PB or better, when subjected to the test described in ASTM G66 "Standard test method for visual assessment of exfoliation, corrosion susceptability of 5xxx series aluminium alloys" (ASSET Test). The samples are also to have exhibited resistance to intergranular corrosion at a mass loss not greater than 15 [mg/cm^2], when subjected to tests described in ASTM G67 "Standard test method for determining the susceptibility to intergranular corrosion of 5xxx series aluminium alloys by mass loss after exposure to nitric acid" (NAMLT). Upon satisfactory establishment of the relationship between microstructure and resistance to corrosion, the master photomicrographs and the results of the corrosion tests are to be approved by IRS. Production practices are not to be changed after approval of the reference micrographs.

Other test methods may also be accepted at the discretion of IRS.

2.10.3 For batch acceptance of 5xxx-alloys in the H116 and H321 tempers, metallographic examination of one sample selected from mid width at one end of a coil or random sheet or plate is to be carried out. The microstructure of the sample is to be compared to the reference photomicrograph of acceptable material in the presence of the Surveyor. A longitudinal section perpendicular to the rolled surface is to be prepared for metallographic examination under the conditions specified in ASTM B928, Section 9.6.1. If the microstructure shows evidence of continuous grain boundary network of aluminium-magnesium precipitate in excess of the reference photomicrographs of acceptable material, the batch is either to be rejected or tested for exfoliation-corrosion resistance and intergranular corrosion resistance subject to the agreement of the Surveyor. The corrosion tests are to be in accordance with ASTM G66 and G67 or equivalent standards. Acceptance criteria are as noted below:

i) The sample is to exhibit no evidence of exfoliation corrosion
ii) The pitting rating of the sample is to be PB or better when subjected to ASTM G66 ASSET test
iii) The sample is to exhibit resistance to intergranular corrosion at a mass loss no greater than 15 [mg/cm^2] when subjected to ASTM G67 NAMLT test.

If the results from testing satisfy the acceptance criteria the batch is accepted, else it is to be rejected.

As an alternative to metallographic examination, each batch may be tested for exfoliation-corrosion resistance and intergranular corrosion resistance, in accordance with ASTM G66 and G67 under the conditions specified in ASTM B928 or equivalent standards. If this alternative is used, then the results of the test must satisfy the acceptance criteria stated above.

2.11 Test materials

2.11.1 Definition of batches
Each batch is made up of products:

- of the same alloy grade and from the same cast
- of the same product form and similar dimensions (for plates, the same thickness)
- manufactured by the same process
- having been submitted simultaneously to the same temper condition.

2.11.2 The test samples are to be taken

- at one third of the width from a longitudinal edge of rolled products.
- in the range 1/3 to 1/2 of the distance from the edge to the centre of the thickest part of extruded products.

2.11.3 Test samples are to be taken so that the orientation of test specimens is as follows:

a) Rolled products

Normally, tests in the transverse direction are required. If the width is insufficient to obtain transverse test specimen, or in the case of strain hardening alloys, tests in the longitudinal direction will be permitted.

b) Extruded products

The extruded products are tested in longitudinal direction.

2.11.4 After removal of test samples, each test specimen is to be marked in order that its original identity, location and orientation is maintained.

2.12 Mechanical test specimens

2.12.1 Type and location of tensile test specimens are to be in accordance with details given in Ch.2.

2.13 Number of test specimens

2.13.1 Tensile test

a) Rolled products

- One tensile test specimen is to be taken from each batch of the product. If the weight of one batch exceeds 2000 [kg], one extra tensile test specimen is to be taken from every 2000 [kg] of the product or fraction thereof, in each batch.
- For single plates or for coils weighing more than 2000 [kg] each, only one tensile test specimen per plate or coil shall be taken.

b) Extruded products

- For the products with a nominal weight of less than 1 [kg/m], one tensile test specimen is to be taken from each 1000 [kg], or fraction thereof, in each batch. For nominal weights between 1 and 5 [kg/m], one tensile test specimen is to be taken from each 2000 [kg] or fraction hereof, in each batch. If the nominal weight exceeds 5 [kg/m], one tensile test specimen is to be taken for each 3000 [kg] of the product or fraction thereof, in each batch.

2.13.2 Corrosion tests

For rolled plates of grade 5083, 5383, 5059 and 5086 delivered in the tempers H116 or H321, one sample is to be tested per batch.

2.14 Retest procedures

2.14.1 When the tensile test from the first piece selected in accordance with Sec.11 fails to meet the requirements, two further tensile tests may be made from the same piece. If both of these additional tests are satisfactory, this piece and the remaining pieces from the same batch may be accepted.

2.14.2 If one or both the additional tests referred to above are unsatisfactory, the piece is to be rejected, but the remaining material from the same batch may be accepted provided that two of the remaining pieces in the batch selected in the same way, are tested with satisfactory results. If unsatisfactory results are obtained from either of these two pieces then the batch of material is to be rejected.

2.14.3 In the event of any material bearing the Classification Society's brand failing to comply with the test requirements, the brand is to be unmistakably defaced by the manufacturer.

2.15 Visual and non-destructive examination

2.15.1 Surface inspection and verification of dimensions are the responsibility of the manufacturer, and acceptance by the Surveyors of material later found to be defective shall not absolve the manufacturer from this responsibility.

2.15.2 In general, the non-destructive examination of materials is not required for acceptance purposes. Manufacturers are expected, however to employ suitable methods of non-destructive examination for the general maintenance of quality standards.

2.15.3 For applications where the non-destructive examination of materials is considered to be necessary, the extent of this examination, together with appropriate acceptance standards, are to be agreed between the purchaser, manufacturer and Surveyor.

2.16 Rectification of defects

2.16.1 Local surface defects may be removed by machining or grinding, provided the thickness of the material remains within the tolerances given in para 2.4. The extent of repairs is to be agreed upon with the Surveyor, and all repairs are to be carried out under Surveyor's supervision, unless otherwise arranged.

2.16.2 Surface defects which cannot be dealt with as in 2.12.1 are not allowed to be repaired, unless it can be ensured that repair by welding does not affect the strength and stability of the piece for the intended purpose. Any case of repair by welding is to be specified in detail for consideration and approval by the Surveyor. Prior to any such repair welding, the defect is to be removed by machining or grinding. After complete removal of the defect and before welding the thickness of the piece at no place is to be reduced by more than 20 per cent. The welding is to be carried out by approved welders. The weld is to be ground flush with the surrounding piece surface. Before repair welding is commenced and after grinding the weld bead, suitable non destructive testing may be required at the discretion of the Surveyor.

2.17 Identification

2.17.1 The manufacturer is to adopt a system of identification which will ensure that all finished material in a batch presented for test is of the same nominal chemical composition.

2.17.2 Products are to be clearly marked by the manufacturer in accordance with the requirements of Ch.1. The following details are to be shown on all materials which have been accepted:

a) Manufacturer's name or trade mark;

b) Grade of alloy;

c) Identification mark which will enable the full history of the item to be traced;

d) Abbreviated designation of temper condition in accordance with para 2.6;

e) Personal stamp of the Surveyor responsible for the final inspection and also IRS's stamp.

f) Tempered grades that are corrosion tested in accordance with 2.12 are to be marked "M" after the temper condition, e.g. 5083 H321 M.

2.17.3 When extruded products are bundled together or packed in crates for delivery, the marking specified in para 2.17.2 are to be affixed by a securely fastened tag or label.

2.18 Certification

2.18.1 Each test certificate or shipping statement is to include the following particulars :

a) Purchaser's name and order number;

b) Contract number;

c) Address to which material is to be dispatched;

d) Description and dimensions;

e) Specification or grade of alloys;

f) Identification mark which will enable the full history of the item to be traced;

g) Chemical composition;

h) Mechanical test results (Not required on shipping statement);

i) Details of heat treatment, where applicable; and

j) Corrosion test results (if any).

2.18.2 Where the alloy is not produced at the works at which it is wrought, a certificate is to be supplied by the Manufacturer of the alloy stating the cast number and chemical composition. The works at which alloys are produced must be approved by IRS.

Section 3

Aluminium Alloy Castings

3.1 Scope

3.1.1 Provision is made in this section for aluminium alloy castings intended for use in the construction of ships, ships for liquid chemicals and other marine structures, liquefied gas piping systems where the design temperature is not lower than minus 165°C. These materials should not be used for piping outside cargo tanks except for short lengths of pipes attached to cargo tanks in which case fire resisting insulation should be provided.

3.1.2 Castings are to be manufactured and tested in accordance with Ch.1 and Ch.2 and also with the requirements of this Section.

3.1.3 As an alternative to 3.1.2, castings which comply with National/International and proprietary specifications may be accepted provided that these specifications give reasonable equivalence to the requirements of this Section or are approved for a specific application. Generally survey and certification are to be carried out in accordance with the requirements of Ch.1.

3.2 Manufacture

3.2.1 Castings are to be manufactured at foundries approved by IRS.

3.3 Quality of castings

3.3.1 All castings are to be free from surface or internal defects which would be prejudicial to their proper application in service.

3.4 Chemical composition

3.4.1 The chemical composition of a sample from each cast is to comply with the requirements given in Table 3.4.1. Suitable grain refining elements may be used at the discretion of the Manufacturer. The content of such elements is to be reported in ladle analysis.

3.4.2 Where it is proposed to use alloys not specified in Table 3.4.1 details of chemical composition, heat treatment and mechanical properties are to be submitted for approval.

3.4.3 When a cast is wholly prepared from ingots for which an analysis is already available, and provided that no significant alloy additions are made during melting, the ingot maker's certified analysis can be accepted subject to occasional checks as required by the Surveyor.

Table 3.4.1 : Chemical composition for aluminium alloy castings

Alloy Element %	Grade			
	AlMg3	**AlSi12**	**AlSi10Mg**	**AlSi7 High purity**
Copper	0.1 max	0.1 max.	0.1 max.	0.1 max.
Magnesium	2.5 - 4.5	0.1 max.	0.15 - 0.4	0.25 - 0.45
Silicon		0.5 max. 11.0 - 13.5	9.0 - 11.0	6.5 - 7.5
Iron	0.5 max.	0.7 max.	0.6 max.	0.2 max.
Manganese	0.6 max.	0.5 max.	0.6 max.	0.1 max.
Zinc	0.2 max.	0.1 max.	0.1 max.	0.1 max.
Chromium	0.1 max.	-	-	-
Titanium	0.2 max.	0.2 max.	0.2 max.	0.2 max.
Others				
each	0.05 max.	0.05 max.	0.05 max.	0.05 max.
Total	0.15 max.	0.15 max.	0.15 max.	0.15 max.
Aluminium	Remainder	Remainder	Remainder	Remainder

3.5 Heat treatment

3.5.1 Castings are to be supplied in the following conditions:

Grade Al-Mg 3	As manufactured
Grade Al-Si 12	As manufactured
Grade Al-Si 10 Mg	As manufactured or solution heat treated and precipitation hardened
Grade Al-Si 7 Mg	Solution heat treated and precipitation (high purity) hardened

3.6 Mechanical tests

3.6.1 At least one tensile specimen is to be tested from each cast, where heat treatment is involved, for each treatment batch from each cast. Where continuous melting is employed 500 [kgs] of fettled castings may be regarded as a cast.

3.6.2 The test samples are to be separately cast in moulds made from the same type of material as used for the castings. These moulds should conform to National Standards.

3.6.3 The methods and procedures for the identification of the test specimens, and the castings they represent, are to be agreed with the Surveyor. The identification marks are to be maintained during the preparation of test specimens.

3.6.4 Where castings are supplied in the heat treated condition, the test samples are to be heat treated together with the castings which they represent prior to testing.

3.6.5 The results of all tensile tests are to comply with the appropriate requirements given in Table 3.6.1 and/or Table 3.6.2.

Table 3.6.1 : Minimum mechanical properties for acceptance purpose of sand cast and investment cast reference test pieces

Alloy	Temper (see Note)	Tensile strength [N/mm^2]	Elongation %
AlMg3	M	150	5
AlSi12	M	150	3
AlSi10Mg	M	150	2
AlSi10Mg	TF	220	1
AlSi7Mg	TF	230	5

Note
M - As cast condition
TF - Solution heat treated and precipitation hardened condition

Table 3.6.2 : Minimum mechanical properties for acceptance purpose of chill cast reference test pieces

Alloy	Temper (see Note)	Tensile strength [N/mm^2]	Elongation %
AlMg3	M	150	5
AlSi12	M	170	3
AlSi10Mg	M	170	3
AlSi10Mg	TF	240	1.5
AlSi7Mg	TF	250	5

Note
M - As cast condition
TF - Solution heat treated and precipitation hardened condition

3.7 Visual examination

3.7.1 All castings are to be cleaned and adequately prepared for inspection.

3.7.2 The accuracy and verification of dimensions are the responsibility of the manufacturer, unless otherwise agreed.

3.7.3 Before acceptance, all castings are to be presented to the Surveyor for visual examination.

3.8 Rectification of defective castings

3.8.1 At the discretion of the Surveyor, small surface blemishes may be removed by local grinding.

3.8.2 Where appropriate, repair by welding may be accepted at the discretion of the Surveyor. Such repair is to be made in accordance with an approved procedure.

3.9 Pressure testing

3.9.1 Where required by the relevant construction rules, castings are to be pressure tested before final acceptance. Unless otherwise agreed, these tests are to be carried out in the presence and to the satisfaction of the Surveyor.

3.10 Identification

3.10.1 The manufacturer is to adopt a system of identification which will enable all finished castings to be traced to the original cast and the Surveyor is to be given full facilities for tracing the casting when required.

3.10.2 All castings which have been tested and inspected with satisfactory results are to be clearly marked with following details :

a) Identification number, cast number or other numbers which will enable the full history of the casting to be traced;

b) IR and the abbreviated name of local office of IRS;

c) Personal stamp of the surveyor responsible for the inspection;

d) Test pressure where applicable; and

e) Date of final inspection.

3.10.3 Where small castings are manufactured in large numbers, modified arrangements for identification may be specially agreed with the Surveyor.

3.11 Certification

3.11.1 The manufacturer is to provide the Surveyor with a written statement giving the following particulars for each casting or batch of castings which have been accepted :

a) Purchaser name and order number;

b) Description of castings and alloy type;

c) Identification number;

d) Ingot or Cast analysis;

e) General details of heat treatment where applicable;

f) Results of mechanical tests; and

g) Test pressure, where applicable.

Section 4

Aluminium/Steel Transition Joints

4.1 Scope

4.1.1 Provision is made in this section for explosion bonded composite aluminium/steel transition joints used for connecting aluminium structures to steel plating.

4.1.2 Each design is to be separately approved by IRS.

4.2 Manufacture

4.2.1 Transition joints are to be manufactured by an approved producer in accordance with an approved specification which is to include the maximum temperature allowable at the interface during welding.

4.2.2 The aluminium material is to comply with the requirements of Sec.1 and the steel is to be of an appropriate grade complying with the requirements of Ch.3.

4.2.3 Alternative materials which comply with International, National or proprietary specifications may be accepted provided that they give reasonable equivalence to the requirements of 4.2.2 or are approved for a specific application.

4.2.4 Intermediate layers between aluminium and steel may be used, in which case the material of any such layer is to be specified by the manufacturer and will be recorded in the approval certificate. Any such intermediate layer is then to be used in all production joints.

4.3 Visual and non-destructive examination

4.3.1 Each composite plate is to be subjected to 100 per cent visual and ultrasonic examination in accordance with a relevant National/ International standard to determine the extent of any unbounded areas. The unbounded areas are unacceptable and any such area and the surrounding 25 [mm] area is to be discarded.

4.4 Mechanical tests

4.4.1 Two shear test specimens and two tensile test specimens are to be taken from each end of each composite plate for tests to be made on bond strength. One shear and one tensile test specimen from each end are to be tested at ambient temperature after heating to the maximum allowable interface temperature; the other two specimens are to be tested without heat treatment.

4.4.2 Shear tests may be made on a specimen as shown in Fig.4.4.1 or an appropriate equivalent. Tensile tests may be made across the interface by welding extension pieces to each surface or by the ram method shown in Fig.4.4.2 or by an appropriate alternative method.

4.4.3 The shear and tensile strengths of all the test specimens are to comply with the requirements of the manufacturing specification.

4.4.4 If either the shear or tensile test strength of the bond is less than the specified minimum but not less than 70 per cent of the specified minimum, two additional shear and two tensile test specimens from each end of the composite plate are to be tested and, in addition bend tests as described in 4.4.6 and Table 4.4.1 are to be conducted.

4.4.5 If either the shear or the tensile strength of the bond is less than 70 per cent of the specified minimum the case is to be investigated. After evaluation of the results of this investigation IRS will consider the extent of composite plate which is to be rejected.

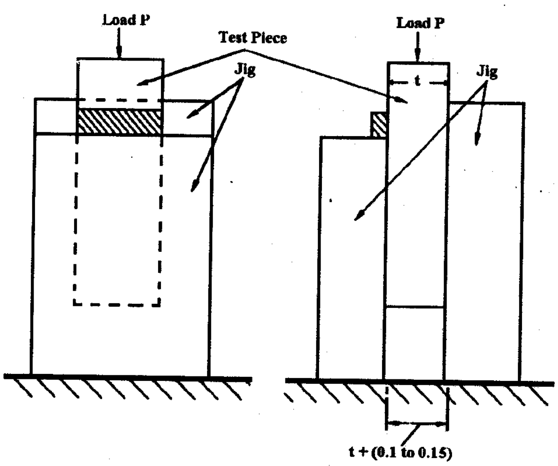

Fig.4.4.1 : Shear tests

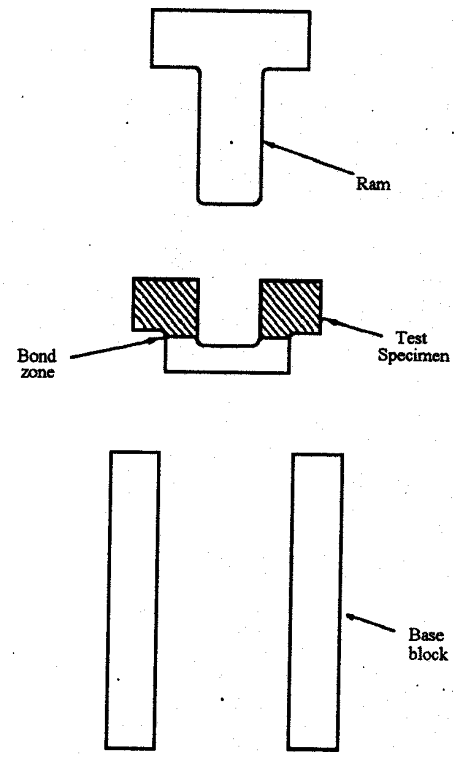

Fig.4.4.2 : Tensile tests

4.4.6 Bend tests, when required, are to be made under the following conditions, as listed in Table 4.4.1 :

a) the aluminium plate is in tension;

b) the steel plate is in tension; and

c) a side bend is applied.

Table 4.4.1 : Bend tests on explosion bonded aluminium / steel transition joints

Type of test	Minimum bend, degrees	Diameter of former
Aluminium in tension	90	3T
Steel in tension	90	3T
Side bend	90	6T

4.5 Identification

4.5.1 Each acceptable transition strip is to be clearly marked with IRS brand IR and the following particulars :

a) Manufacturers name or trade mark;

b) Identification mark for the grade of aluminium; and

c) Identification mark for the grade of steel.

The particulars are to be stamped on the aluminium surface at one end of the strip.

4.6 Certification

4.6.1 Each test certificate or shipping statement is to include the following particulars :

a) Purchaser's name and order number;

b) The contract number for which the material is intended, if known;

c) Address to which the material is dispatched;

d) Description and dimensions of the material;

e) Specification or grades of both the aluminium alloy and the steel and any intermediate layer;

f) Cast numbers of steel and aluminium plates;

g) Identification number of the composite plate; and

h) Mechanical test results (not required on the shipping statement).

Section

Section 1

Anchors

1.1 Scope

1.1.1 The following paragraphs give requirements for cast, forged or fabricated steel anchor heads, shanks and anchor shackles. The requirements given in this section are applicable to the following types of anchors:

a) Ordinary stockless and stocked anchors
b) High Holding Power (HHP) anchors, and
c) Super High Holding Power (SHHP) anchors not exceeding 1500 [kg] in mass.

1.2 Manufacture

1.2.1 Cast steel anchor heads, shanks and shackles are to be manufactured and tested in accordance with the relevant requirements for castings for welded construction of Ch.4. The steel is to be fine grain treated with aluminium. The toughness of steel castings for SHHP anchors is to be not less than charpy V-notch energy average of 27 J at 0°C.

1.2.2 Forged steel anchor heads, shanks, shackles and anchor crown pins are to be manufactured in accordance with the requirements for forgings of weldable quality of Ch.5.

1.2.3 Plate material and bars used for the manufacture of fabricated parts of steel anchors are to comply with the requirements of Ch.3. For welded super high holding power (SHHP) anchors, the base steel grades are to be selected with respect to the material grade requirements for Class II in Part 3, Chapter 2 'Materials of Construction' Section 2 'Use of Steel Grades'.

1.2.4 The welding consumables are to meet the toughness for the base steel grades in accordance with Part 2, Chapter 11 'Approval of Welding Consumables for Use in Ship Construction'.

1.2.5 Fabrication is to be carried out by qualified welders using approved welding procedure.

1.2.6 The toughness of the anchor shackles for SHHP anchors is to meet that for Grade CC3 anchor chain given in Section 2. The toughness of steel castings for SHHP anchors is to be not less than charpy V-notch energy average of 27 J at 0°C.

1.2.7 Hardness values of mating parts are to be such that the more easily replaceable part wears faster.

1.3 Dimensions and tolerances

1.3.1 Anchors are to be manufactured as per approved drawings or as per internationally recognised designs meeting the tolerances specified in such documents. In addition the following dimensional tolerances are also to be applied:

- the clearance either side of the shank within the shackle jaws is not to be more than 3 [mm] for anchors upto 3000 [kg] mass, 4 [mm] for anchors upto 5000 [kg] mass, 6 [mm] for anchors upto 7000 [kg] mass and 12 [mm] for larger anchors.

- the shackle pin is to be push fit in the eyes of the shackle, which are to be chamfered on the outside to ensure tightness when the pin is clenched over. The shackle pin to hole clearance is not to be more than 0.5 [mm] for pins upto 57 [mm] and not more than 1 [mm] for pins of larger diameter

- the anchor crown pin is to be snug fit within the chamber and long enough to prevent horizontal movement. The gap is not to be more than 1% of the chamber length.

- The lateral movement of the shank should not exceed 3 degrees.

1.4 Proof test of anchors

1.4.1 Anchors of all sizes are to be proof load tested with the load specified in Table 1.4.1. Anchors having a mass of 75 [kgs] or more inclusive of stock (56 [kgs] in case of high holding power anchors) are to be tested at a proving establishment recognized by IRS.

1.4.2 The proof test load is to be as given in Table 1.4.1. The mass to be used in the Table is to be as follows:-

a) For stockless anchors - the total mass of the anchor;

b) For stocked anchors - the mass of the anchor excluding the stock;

c) For high holding power anchors - a nominal mass equal to 1.33 times the actual mass of the anchor;

d) For super high holding power anchors - a nominal mass equal to 2.0 times the actual mass of the anchor.

1.4.3 The proof load is to be applied on the arm or on the palm at a spot which, measured from the extremity of the bill, is one-third of the distance between it and the centre of the crown.

In the case of the stockless anchors, both arms are to be tested at the same time, first on one side of the shank, then reversed and tested on the other.

1.4.4 Before application of proof test load the anchors are to be examined to be sure that castings are reasonably free of surface imperfections of harmful nature.

On completion of the proof load tests the anchors are to be examined for cracks and other defects and for anchors made in more than one piece, the anchors are to be examined for free rotation of their heads over the complete angle.

In every test the difference between the gauge lengths (shown in Fig.1.4.4), where one-tenth of the required load was applied first and where the load has been reduced to one-tenth of the required load from the full load, is not to exceed one percent (1%).

1.4.5 In addition to the requirements given in this Chapter attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

Table 1.4.1 : Proof test load of anchors

Mass of anchor [kg] (1)	**Proof test load [kN] (2)**	**Mass of anchor [kg] (3)**	**Proof test load [kN] (4)**	**Mass of anchor [kg] (5)**	**Proof test load [kN] (6)**

1600	292.0	6600	773.0	31000	2030.0
1700	307.0	6700	779.0	32000	2070.0
1800	321.0	6800	786.0	34000	2160.0
1900	335.0	6900	794.0	36000	2250.0

Table 1.4.1 : Proof test load of anchors (Contd.)

Mass of anchor [kg] (1)	Proof test load [kN] (2)	Mass of anchor [kg] (3)	Proof test load [kN] (4)	Mass of anchor [kg] (5)	Proof test load [kN] (6)
38000	2330.0	42000	2490.0	46000	2650.0
40000	2410.0	44000	2570.0	48000	2730.0
Proof loads for intermediate masses are to be determined by linear interpolation					

Notes

Where ordinary anchors have a mass exceeding 48 000 [kg], the proof loads are to be taken as 2.059 (mass of anchor in kg)$^{2/3}$ [kN].

Where high holding power anchors have a mass exceeding 38 000 [kg], the proof loads are to be taken as 2.452 (actual mass of anchor in kg)$^{2/3}$ [kN].

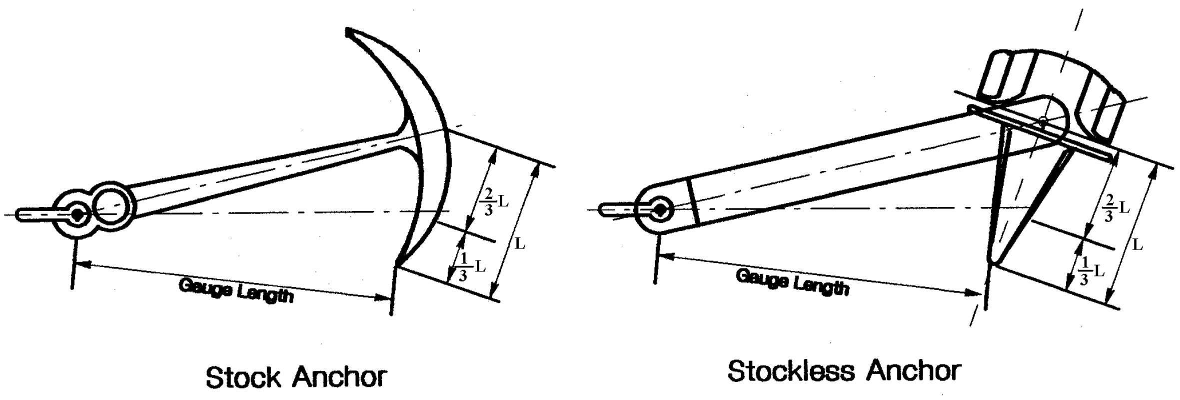

Fig.1.4.4 : Gauge Length

1.5 Inspections and other tests

1.5.1 Inspection and testing of anchor components is to be carried out as per the following:

a) Cast components are to be tested as per

Test Programme A

or

Test Programme B, where the Charpy V notch energy average of the cast material at 0°C is not less than 27J.

b) Forged / fabricated components are to be tested as per Test Programme B.

Test Programme A is to consist of Drop Test, Hammering Test, Visual Inspection and General NDE as described below.

Test Programme B is to consist of Visual Inspection, general NDE and Extended NDE as described in 1.5.5 and 1.5.6 below.

1.5.2 Drop test is to be carried out by dropping each anchor component individually from a height of 4 [m] to an iron or steel slab. The iron or steel slab should be able to resist the impact. The component under test should not fracture.

1.5.3 Hammering test is to be carried on each fluke and shank, after the drop test, by hammering the component, hung clear off the ground using a non-metallic sling, with a hammer of not less than 3 [kg] mass, to check the soundness.

1.5.4 Visual inspection is to be carried out of all accessible surfaces after the proof load test.

1.5.5 General non-destructive examination is to be carried out, after proof load testing, as per Table 1.5.5.

1.5.6 Extended non-destructive examination is to be carried out, after proof load testing, as per Table 1.5.6.

1.6 Identification

1.6.1 All identification marks are to be stamped on one side of the anchor, on the shank and the fluke, at locations reserved solely for this purpose.

1.6.2 The following details are to be marked on all the anchors:-

a) IR and abbreviated name of local office of IRS issuing the certificate;

b) Number of the certificate;

c) Month and year of test;

d) Mass (also the letters 'HHP/SHHP', when approved for as high holding power anchor/super high holding power anchor);

e) Mass of stock (in case of stocked anchors);

f) Personal stamp of Surveyor responsible for inspection.

g) Manufacturer's mark

h) Unique cast identification number of shank and fluke, if applicable.

1.6.3 In addition to the markings detailed in 1.6.2, each important part of the anchor is to be plainly marked with the words 'forged steel' or 'cast steel' as appropriate.

1.7 Painting

1.7.1 Anchors are to be painted only on completion of all inspections and tests.

Section 2

Stud Link Chain Cables

2.1 Scope

2.1.1 The following requirements apply to the materials, design, manufacture and testing of stud link anchor chain cables and accessories used for ships.

2.1.2 Depending upon the nominal tensile strength of the chain cable steel used for manufacture, stud link chain cables are subdivided in to three grades, namely CC1, CC2 and CC3.

2.2 Manufacture

2.2.1 Chain cables and accessories are to be manufactured at Works approved by IRS for the pertinent type of chain cable, size and method of manufacture.

2.2.2 Chain cables are to be preferably manufactured by flash butt welding using material suitable for CC1, CC2 or CC3 grades of chain cables. Chain cables may also be manufactured by drop forging or casting.

Accessories such as shackles, swivels and swivel shackles are to be forged or cast in steel of at least grade CC2 material. The welded construction of these components will be specially considered.

2.2.3 Details of the method of manufacture and the specification of the steel are to be submitted for approval.

2.2.4 All materials used for the manufacture of chain cables and accessories are to be supplied by manufacturer's works approved by IRS. However, for Grade CC1 steel bars, approval of material manufacturer is not required.

For Grade CC3 steel bars, detailed material specifications including manufacturing procedure, deoxidation practice, specified chemical composition, heat treatment and mechanical properties are to be submitted.

2.3 Design and tolerances

2.3.1 The form and proportion of chain cable links and shackles are to be in accordance with ISO/1704-1991 (see Figs.2.3.1 to 2.3.6). All dimensions in the figures are shown in multiples of the nominal diameter d of the common link. The dimensions in brackets may be chosen for studless links in outboard end swivel pieces. Where designs do not comply with this and where accessories are of welded construction, plans giving full details of the design, manufacturing process and heat treatment are to be submitted for approval.

2.3.2 The following tolerances are applicable to links with the provision that the plus tolerance may be up to 5 per cent of the nominal diameter:

a)

Nominal diameter Measured at the Crown (see note)	**Max. minus tolerance**
Upto 40 [mm]	1 [mm]
Over 40 and upto 84 [mm]	2 [mm]
Over 84 and upto 122 [mm]	3 [mm]
Over 122 and upto 152 [mm]	4 [mm]
Over 152 and upto 184 [mm]	6 [mm]
Over 184 and upto 210 [mm]	7.5 [mm]

Note : Two measurements are to be taken at the same location: one in the plane of the link (see d_p in Fig.2.3.7) and one perpendicular to the plane of the link.

The cross sectional area of the crown must not have any negative tolerance. For the tolerances of the diameters of the weld, the approved manufacturer's specifications would be applicable;

Diameter measured at locations other than the crown is to have no negative tolerance. Plus tolerance may be up to 5 per cent of the nominal diameter.

a) The maximum allowable tolerance on assembly measured over a length of 5 links may equal +2.5 per cent but may not be negative (measured with the chain under tension after proof load test);

b) All other dimensions are subject to a manufacturing tolerance of ± 2.5 per cent, provided that all of the final link parts fit together properly;

c) Studs must be located in the links centrally and at right angles to the sides of the link, although the studs at each end of any length may also be located off-centre to facilitate the insertion of the joining shackle. The following tolerances are regarded as being inherent in the method of manufacture and will not be objected to provided the stud fits snugly and its ends lie practically flush against the inside of the link.

Maximum off-centre distance 'X'	10 per cent of the nominal diameter d
Maximum deviation "α" from the 90° position	4°

The tolerances are to be measured in accordance with Fig.2.3.7.

2.3.3 The following tolerances are applicable to accessories :

Nominal diameter : + 5 per cent, - 0 per cent
Other diameter : ± 2.5 per cent.

2.4 Material for welded chain cables and accessories

2.4.1 Bar material intended for the manufacture of welded chain cables is to be in accordance with the appropriate requirements of Ch.3. Rimming steel is not acceptable for this application.

2.4.2 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same cast. A suitable length from one bar in each batch is to be selected for test purposes.

2.4.3 In order to evaluate the suitability of the bar material the sample selected from each batch is to be tested in a heat treatment condition equivalent to that of the finished chain cable and accessories. For this purpose only the sample need be heat treated.

2.4.4 For all grades, one tensile test is to be taken from each sample selected. Additionally one set of three Charpy V-notch impact test specimens is to be prepared and tested as required in Table 2.4.1.

2.4.5 Where the dimensions allow, the test specimens are to be taken at approximately one-third of the radius from the outer surface as shown in Fig.2.4.1. For smaller diameters the test specimens are to be taken as close as possible to these positions.

2.4.6 The cross-sectional area of the tensile test specimen is to be not less than 150 [mm^2]. Alternatively, the tensile test specimen may be a suitable length of bar tested in full cross-section.

2.4.7 The impact test specimens are to be notched in the radial direction as shown in Fig.2.4.1.

2.4.8 The results of all the mechanical testing are to comply with the requirements of Table 2.4.1.

2.4.9 The average value obtained from one set of three impact test specimens is to comply with the requirements given in Table 2.4.1. One individual value only may be below the specified average value provided it is not less than 70% of that value.

If the Charpy V-notch impact test requirements are not achieved, a retest of three further specimens selected from the same sample as per 1.10.2 of Chapter 1 shall be permissible. Failure to meet the requirements will result in rejection of the test unit represented unless it can be clearly attributable to improper simulated heat treatment.

If the tensile test requirements are not achieved, a retest of two further specimens selected from the same sample shall be permissible. Failure to meet the specified requirements in either of the additional tests will result in rejection of the test unit represented unless it can be clearly attributable to improper simulated heat treatment.

2.4.10 If failure to pass the tensile test or the Charpy V-notch impact test is definitely attributable to improper heat treatment of the test sample, a new test sample may be taken from the same piece and re-heat treated. The complete test (both tensile and impact test) is to be repeated and the original results obtained may be disregarded.

2.4.11 The chemical composition of the steel bars is to be generally within the limits given in Table 2.4.2.

2.4.12 The tolerances on diameter and roundness of rolled steel bars are to be within the limits specified in Table 2.4.3 unless otherwise agreed.

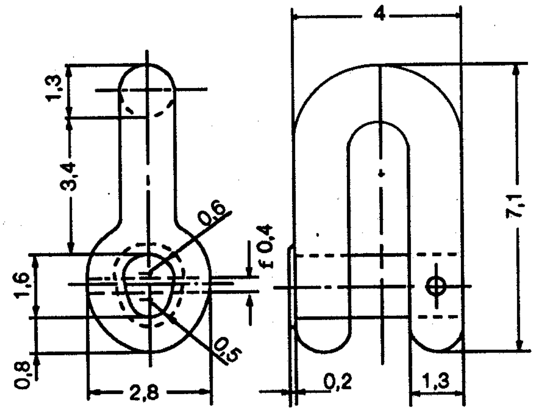

Fig. 2.3.4 : Joining shackle with shackle pin

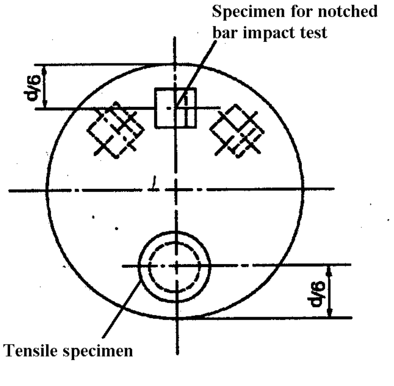

Fig. 2.4.1 : Position of test pieces

Table 2.4.1 : Mechanical properties of rolled steel bars for acceptance purposes

Designation	Tensile strength [N/mm^2]	Yield strength [N/mm^2] min.	Elongation on 5.65 $\sqrt{S_o}$% min.	Reduction of area % min.	Impact Tests	
					Test temp.°C	Average energy J min.[1]
Grade CC1	370 - 490	-	25	-	-	-
Grade CC2	490 - 690	295	22	-	0	27[1]
Grade CC3	Min. 690	410	17	40	0[2]	60
					-20	35

1 The impact test of grade CC2 material may be waived, if the chain is to be supplied in a heat treated condition as per Table 2.9.1.

2 The impact testing is normally to be carried out at 0°C.

Table 2.4.2 : Chemical composition of rolled steel bars

Designation	Chemical Composition					
	C max.	Si	Mn	P max.	S max.	Al (Total)[1] min.
Grade CC1	0.20	0.15 - 0.35	min. 0.40	0.040	0.040	-
Grade CC2[2]	0.24	0.15 - 0.55	max. 1.60	0.035	0.035	0.020
Grade CC3 [3]	To be specially considered in each case					

1 Aluminium may be replaced partly by other grain refining elements.

2 Subject to special consideration, additional alloying elements may be added.

3 To be killed and of fine grain.

Table 2.4.3 : Dimensional tolerance of rolled steel bars

Nominal diameter [mm]	Tolerance on diameter [mm]	Tolerance on roundness (dmax - dmin) [mm]
Less than 25	-0 + 1.0	0.6
25 – 35	-0 +1.2	0.8
36 – 50	-0 + 1.6	1.1
51 – 80	-0 + 2.0	1.5
81 – 100	-0 +2.6	1.95
101 – 120	-0 + 3.0	2.25
121 – 160	-0 + 4.0	3.0
161 – 210	-0 + 5.0	4.0

2.4.13 The minimum markings required for the steel bars are the manufacturers' brandmark, the steel grade and an abbreviated symbol of the heat. Steel bars having diameters of up to and including 40 mm and combined into bundles, may be marked on permanently affixed labels.

2.4.14 Material certification : Bar material for Grade 2 or Grade 3 is to be certified by IRS. For each consignment, manufacturers shall forward to the Surveyor a certificate containing at least the following data:

- Manufacturer's name and/or purchaser's order no.
- Number and dimensions of bars and weight of consignment
- Steel specification and chain grade
- Heat number
- Manufacturing procedure
- Chemical composition
- Details of heat treatment of the test sample (where applicable)
- Results of mechanical tests (where applicable)
- Number of test specimens (where applicable).

2.5 Material for cast chain cables and accessories

2.5.1 Manufacture of cast steel chain cables is generally to be in accordance with Ch.4, as appropriate.

2.5.2 All castings must be properly heat treated i.e. normalized, normalized and tempered or quenched and tempered, as specified in Table 2.7.1 for the relevant grade of steel.

2.6 Material for forged chain cables and accessories

2.6.1 The procedure for the manufacture of drop forgings for chain cables will be specially considered, but is generally to be in accordance with the appropriate requirements of Ch.5.

2.6.2 The stock material may be supplied in the as rolled condition. Finished forgings are to be properly heat treated, i.e. normalized, normalized and tempered or quenched and tempered, as specified for the relevant grade of steel in Table 2.7.1.

2.7 Heat treatment of completed chain cables

2.7.1 The completed chain cable and accessories are to be heat treated in accordance with Table 2.7.1, for the appropriate grade of cable.

2.7.2 In all cases, heat treatment is to be carried out prior to the proof, load test, breaking load test and all mechanical testing.

2.8 Materials and welding of studs

2.8.1 The studs are to be made of steel corresponding to that of the chain cable or from rolled, cast or forged mild steels. The use of other materials, e.g. grey or nodular cast iron is not permitted.

2.8.2 The welding of studs is to be in accordance with an approved procedure subject to following :

a) The studs being of weldable steel;

b) The studs being welded at one end only, i.e. opposite to the weldment of the link. The stud ends must fit inside of the link without appreciable gap;

Table 2.7.1 : Condition of supply of chain cables and accessories

Grade	Chain cables	Accessories
CC1	As welded or normalized	NA
CC2	As welded or normalized 1)	Normalized
CC3	Normalized, Normalized and tempered or Quenched and tempered	Normalized, normalized and tempered or Quenched and tempered

1) Grade CC2 chain cables made by forging or casting are to be supplied in the normalized condition

NA = Not Applicable.

c) The welds, preferably in the horizontal position, are to be executed by qualified welders using suitable welding consumables;

d) All the welds are to be completed before the final heat treatment of the chain cable; and

e) The welds are to be free from defects liable to impair the proper use of the chain.

2.9 Testing of completed chain cables

2.9.1 Finished chain cables are to be tested in the presence of a Surveyor, at a proving establishment recognized by IRS. For this purpose the chain cables must be free from paint and anti-corrosive media. Special attention would be given to the visual inspection of the flash-butt-weld, if present. In addition to the requirements of this Chapter, attention must be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

2.9.2 Each length of chain is to be subjected to a proof loading test in an approved testing machine and is to withstand the load given in Table 2.9.1 for the appropriate grade and size of cable. On completion of the test, each length of cable is to be examined and is to be free from significant defects.

Should a proof load test fail, the defective link(s) is (are) to be replaced, a local heat treatment to be carried out on the new link(s) and the proof load test is to be repeated. In addition, an investigation is to be made to identify the cause of the failure.

Table 2.9.1 : Formulae for proof load and breaking load tests

Test	Grade CC1	Grade CC2	Grade CC3
Proof load (kN)	$0.00686d^2$ (44 – 0.08d)	$0.00981d^2$ (44 – 0.08d)	$0.01373d^2$ (44 – 0.08d)
Breaking load (kN)	$0.00981d^2$ (44 – 0.08d)	$0.01373d^2$ (44 – 0.08d)	$0.01961d^2$ (44 – 0.08d)
Note d = nominal diameter [mm]			

Table 2.9.2 : Number of mechanical test specimens for finished chain cables and accessories

Grade	Manufacturing method	Condition of supply 1)	Number of test specimens		
			Tensile test for base metal	Charpy V-notch impact test	
				Base metal	Weldment
CC1	Flash-butt welded	AW N	NR	NR	NR
CC2	Flash-butt welded	AW -------------------- N	1 -------------------- NR	3 -------------------- NR	3 -------------------- NR
	Forged or Cast	N	1	3 [2]	NA
CC3	Flash-butt welded	N NT QT	1	3	3
	Forged or Cast	N NT QT	1	3	NA

1) AW = As Welded, N = Normalized, NT = Normalized and Tempered, QT = Quenched and Tempered

2) For chain cables, Charpy V-notch impact test is not required.

NR = Not required
NA = Not applicable

Table 2.9.3 : Mechanical properties of finished chain cables and accessories							
Grade	**Yield strength [N/mm^2] min.**	**Tensile strength [N/mm^2] min.**	**Elongation on 5.65 √So % min.**	**Reduction of area % min.**	**Charpy V-notch impact test**		
					Test tempera-ture, in C	**Absorbed energy, in Joules min.**	
						Base metal	**Weldment**
CC1	NR	NR	NR	NR	NR	NR	NR
CC2	295	490 – 690	22	NR	0	27	27
CC3	410	690 min.	17	40	0 [1)]	60	50
					-20	35	27
1) Testing is normally to be carried out at 0°C. NR = Not required.							

2.9.3 Sample lengths comprising of at least three links are to be taken from every four lengths or fraction of chain cables and tested at the breaking loads given in Table 2.9.1. The breaking load is to be maintained for a minimum of 30 seconds. The links concerned are to be made in a single manufacturing cycle together with the chain cable and must be welded and heat treated together with it. Only after this these may be separated from the chain cable in the presence of the Surveyor.

2.9.4 Where a breaking load test specimen fails, a further specimen is to be cut from the same length of cable and subjected to test. If this re-test fails, the length of cable from which it was taken is to be rejected. When this test is also representative of other lengths, each of the remaining lengths in the batch is to be individually tested and is to meet the requirements of the breaking load test.

2.9.5 For large diameter cables where the required breaking load is greater than the capacity of the testing machines, special consideration will be given to acceptance of other alternative testing procedure.

2.9.6 Mechanical test specimens required in Table 2.9.2 are to be taken from every four lengths in accordance with 2.9.7. For forged or cast chain cables where the batch size is less than four lengths, the sampling frequency is to be by heat treatment charge. Mechanical tests are to be carried out in the presence of the Surveyor. The test specimens and their location are to be according to 2.4.5 to 2.4.7 and Fig.2.4.1. Testing and re-testing are to be carried out as given in 2.4.9.

2.9.7 An additional link (or where the links are small, several links) for mechanical test specimen removal is to be provided in a length of chain cable not containing the specimen for the breaking test. The specimen link must be manufactured and heat treated together with the length of chain cable.

2.10 Accessories for chain cables

2.10.1 End and joining shackles, attachment links, adapter pieces, swivels and other fittings are to be subjected to the proof and breaking loads appropriate to the grade and size of cable for which they are intended in accordance with the requirements of Table 2.9.1.

2.10.2 The breaking load is to be applied to at least one item out of every 25 (one in 50 for lugless shackles). The items need not necessarily be representative of each heat of steel or individual purchase order. Enlarged links and end links need not be tested provided that they are manufactured and heat treated together with the chain cable. The tested item is to be destroyed and not used as part of an outfit, in general. However, the accessories, which have been successfully tested at the prescribed breaking load appropriate to the chain, may be used in service at the discretion of IRS where the accessories are manufactured with the following:

a) material having higher strength characteristics than those specified for the part in question (e.g. grade 3 material for accessories for grade 2 chain).

b) or alternatively, same grade material as the chain but with increased dimensions and it is verified by procedure tests that such accessories are so designed that the breaking strength is not less than 1.4 times the prescribed breaking load of the chain for which they are intended.

2.10.3 The breaking load test may be waived if –

a) The breaking load has been demonstrated on the occasion of the approval testing of parts of the same design, and

b) The mechanical properties of each manufacturing batch are approved, and

c) The parts are subjected to suitable non-destructive testing.

2.10.4 Unless otherwise specified, the forging or casting must at least comply with the mechanical properties given in Table 2.9.3, when properly heat treated. For test sampling, forgings or castings of similar dimensions originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit. From each test unit, one tensile test specimen and the Charpy V-notch impact test specimens are to be taken in accordance with Table 2.9.2. Mechanical tests are to be carried out in the presence of the Surveyor. Location of test specimens and test procedure are to be as given in 2.4.5 to 2.4.7 and Fig.2.4.1. Testing / re-testing is to be carried out as per 2.4.9. Enlarged links and end links need not be tested provided they are manufactured and heat treated together with the chain cable.

2.11 Identification

2.11.1 All lengths of cables and accessories are to be stamped with the following identification marks:-

a) IR and the abbreviated name of the local office of IRS issuing the certificate;
b) Number of certificate;
c) Date of test;
d) Proof load and grade of chain;
e) Personal stamp of the Surveyor responsible for inspection.

Section 3

Short Link Chain Cables

3.1 General

3.1.1 Details regarding the form and proportions of short link chain cable, materials, method of manufacture and testing are to be submitted for special consideration by IRS.

3.1.2 In general the short link chain cables are to comply with the grades L(3) and M(4) of ISO 1834.

3.2 Testing and inspection of chain cables

3.2.1 All chain cable of 12.5 [mm] diameter and above, and all steering chains irrespective of diameter are to be tested at a proving establishment recognised by IRS. In addition to the requirements stated in this Chapter, attention is to be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

3.2.2 For chain of diameter less than 12.5 [mm], other than steering chains, the manufacturer's tests will be accepted.

3.2.3 After completion of all manufacturing processes, including heat treatment and galvanising, the whole of the chain is to be subjected to the appropriate proof load specified in Table 3.2.1.

3.2.4 The whole of the chain is to be inspected after the proof load test and is to be free from significant defects.

3.2.5 At least one sample, consisting of seven or more links, is to be selected by the Surveyor from each 200 [m] or less of chain for breaking load tests. Two additional links may be required for engagement in the jaws of the testing machine. These extra links are not to be taken into account in determining the total elongation (See 3.2.7).

3.2.6 The breaking load is to comply with the appropriate requirements of Table 3.2.1.

3.2.7 The total elongation of the breaking load sample at fracture, expressed as a percentage of the original inside length of the sample after proof loading, is to be not less than 20 per cent.

Table 3.2.1 : Mechanical test requirements for short link chain cables				
Chain diameter [mm]	**Grade L(3)**		**Grade M(4)**

45	-	-	637	1274

Section 4

Steel Wire Ropes

4.1 General

4.1.1 Steel wire ropes are to be manufactured at Works approved by IRS.

4.1.2 The wire ropes are to be of six strand type with minimum of 16 wires in each strand. In addition to complying with the requirements of this Chapter, the details regarding form of construction and minimum breaking strength are to be in accordance with IS: 2266-1989. Alternative type of wire ropes will be specially considered on the basis of an equivalent breaking load and the suitability of the construction for the purpose intended.

4.1.3 It is recommended that the wire ropes intended for stream wires, towlines and mooring lines be of fiber core construction and wire ropes for towlines and mooring lines used in association with mooring winches be of wire rope core.

4.2 Materials

4.2.1 The wire used in the manufacture of the rope is to be drawn from steel made in accordance with the requirements of Ch.3.

Table 4.2.1 : Torsion test - Speed of testing	
Diameter of coated wire [mm]	Maximum speed of testing twists per minute
< 1.5	90
≥ 1.5 < 3.0	60
≥ 3.0 < 4.0	30

4.2.2 The tensile strength is generally to be within the ranges 1420 to 1570 [N/mm^2]; 1570 to 1770 [N/mm^2] or 1770 to 1960 [N/mm^2].

4.2.3 The wire is to be galvanized by a hot dip or electrolytic process to give a uniform coating which may be any of the following grades:-

Grade 1 : heavy coating, drawn after galvanizing;

Grade 2 : heavy coating, finally galvanized;

Grade 3 : light coating, drawn after galvanizing.

4.2.4 Torsion and zinc coating tests are to be carried out on wire samples taken from a suitable length of the completed rope. After unstranding and straightening, six wires are to be subjected to both a torsion test and a wrap test for adhesion of coating. Additionally, tests to determine the uniformity of the zinc coating are to be carried out.

4.2.5 As an alternative to test specimens taken as detailed in 4.2.4, tests may be carried out on the wire before the rope is stranded.

4.2.6 For the torsion test, the length of the sample is to be such as to allow a length between the grips of 100 times the wire diameter or 300 [mm], whichever is less. The wire is to be twisted by causing one or both of the vices to be revolved until fracture occurs. The speed of testing is not to exceed, for a length equal to 100 times the diameter, that given in Table 4.2.1 (a tensile load not exceeding 2 per cent of the breaking load of the wire may be applied to keep the wire stretched). The wire is to withstand, without fracture on a length of 100 times the diameter of wire, the number of complete twists given in Table 4.2.2.

Table 4.2.2 : Torsion test - Minimum number of twists

Diameter of coated wire [mm]	Minimum number of twists			
	Grade 2		Grade 1 or 3	
	Tested before stranding	Tested after stranding	Tested before stranding	Tested after stranding
< 1.3	15	13	27	24
≥ 1.3 < 2.3	15	13	26	23
≥ 2.3 < 3.0	14	12	23	20
≥ 3.0 < 4.0	12	10	21	18

4.3 Zinc coating tests

4.3.1 The mass per unit area of the zinc coating is to be determined in accordance with a recognised standard and is to comply with the minimum values given in Table 4.3.1.

Table 4.3.1 : Zinc coating

Diameter of coated wire [mm]	Zinc coating [grams/m^2]	
	Grade 1 or 2	Grade 3
≥ 0.40 < 0.50	75	40
≥ 0.50 < 0.6	90	50
≥ 0.6 < 0.8	110	60
≥ 0.8 < 1.0	130	70
≥ 1.0 < 1.2	150	80
≥ 1.2 < 1.5	165	90
≥ 1.5 < 1.9	180	100
≥ 1.9 < 2.5	205	110
≥ 2.5 < 3.2	230	125
≥ 3.2 < 4.0	250	135

4.3.2 The uniformity of the zinc coating is to be determined by a dip test carried out in accordance with the requirements of a recognized standard.

4.3.3 The adhesion of the coating is to be tested by wrapping the wire round a cylindrical mandrel for 10 complete turns. The ratio between the diameter of the mandrel and that of the wire is to be as in Table 4.3.2. After wrapping on the appropriate mandrel the zinc coating is to have neither flaked nor cracked to such an extent that any zinc can be removed by rubbing with bare fingers.

Table 4.3.2 : Wrap test for adhesion of zinc coating

Coating	Diameter coated wire [mm]	Max. ratio of mandrel to wire diameter
Grade 1 and 2	< 1.5	4
	≥ 1.5	6
Grade 3	< 1.5	2
	≥ 1.5	3

4.4 Test on completed ropes

4.4.1 The breaking load is to be determined by testing to destruction a sample cut from the completed rope. This sample is to be of sufficient length to provide a clear test length of at least 36 times the rope diameter between the grips.

4.4.2 The actual breaking load is not to be less than that given in the appropriate approved standard.

4.5 Identification

4.5.1 All completed ropes are to be identified with attached labels detailing the rope type, diameter and length.

Section 5

Offshore Mooring Chains

5.1 Scope

5.1.1 Following requirements apply to the materials, design, manufacture and testing of offshore mooring chain and accessories intended to be used for application such as: mooring of mobile offshore drilling units, mooring of floating production units, mooring of offshore loading systems and mooring of gravity based structures during fabrication.

5.1.2 Mooring equipment covered by these requirements are common stud and studless links, connecting common links (splice links), enlarged links, end links, detachable connecting links (shackles), end shackles, swivels and swivel shackles.

5.1.3 Studless link chain is normally to be deployed only once, being intended for long-term permanent mooring systems with pre-determined design life.

5.2 Chain grades

5.2.1 Depending on the nominal tensile strength of the steels used for manufacture, chains are subdivided into five grades, namely R3, R3S, R4, R4S and R5.

5.2.2 Manufacturers propriety specifications for R4S and R5 may vary subject to design conditions and acceptance of IRS.

5.2.3 Each Grade is to be individually approved. Approval for a higher grade does not constitute approval of a lower grade.

5.3 Approval of chain manufacturers

5.3.1 Offshore mooring chain are to be manufactured only by works approved by IRS. For this purpose approval tests are to be carried out, the scope of which is to include proof and breaking load tests, measurements and mechanical tests including fracture mechanics tests.

5.3.2 Manufacturers are to submit for review and approval the sequence of all operations from receiving inspection of raw materials to the shipment of finished products along with details of the following manufacturing processes:

a) bar heating and bending including the method, temperatures, temperature control and recording;

b) flash welding including current, force, time and dimensional variables as well as control and recording of parameters;

c) flash removal including method and inspection;

d) stud insertion method for stud link chain;

e) heat treatment including furnace types, means of specifying, controlling and recording of temperature and chain speed and allowable limits, quenching bath and agitation, cooling method after exit;

f) proof and break loading including method/machinery, means of horizontal support (if applicable), method of measurement and recording;

g) non-destructive examination procedures.

h) the manufacturer's surface quality requirement of mooring components.

5.3.3 For initial approval CTOD (Crack Tip Opening Displacement) tests are to be carried out on the particular mooring grade of material. CTOD tests are to be conducted in accordance with a recognized standard such as BS 7448 Parts 1 and 2. The CTOD test piece is to be a standard 2 x 1 single edge notched bend piece, test location as shown in Fig.5.3.1. The minimum test piece size is to be 50 x 25 [mm] for chain diameter less than 120 [mm] and 80 x 40 [mm] for diameter 120 [mm] and above. CTOD specimens are to be taken from both the side of the link containing the weld and from the opposite side. Three links are to be selected for testing, i.e, a total of six CTOD specimens. The tests are to be taken at minus 20°C and meet the minimum values indicated below:

Chain Type	R3 [mm]		R3S [mm]		R4 [mm]		R4S and R5 [mm]	
	BM	WM	BM	WM	BM	WM	BM	WM
Stud link	0.20	0.10	0.22	0.11	0.24	0.12	0.26	0.13
Studless	0.20	0.14	0.22	0.15	0.24	0.16	0.26	0.17
Note : BM : Base metal WM : Welded metal								

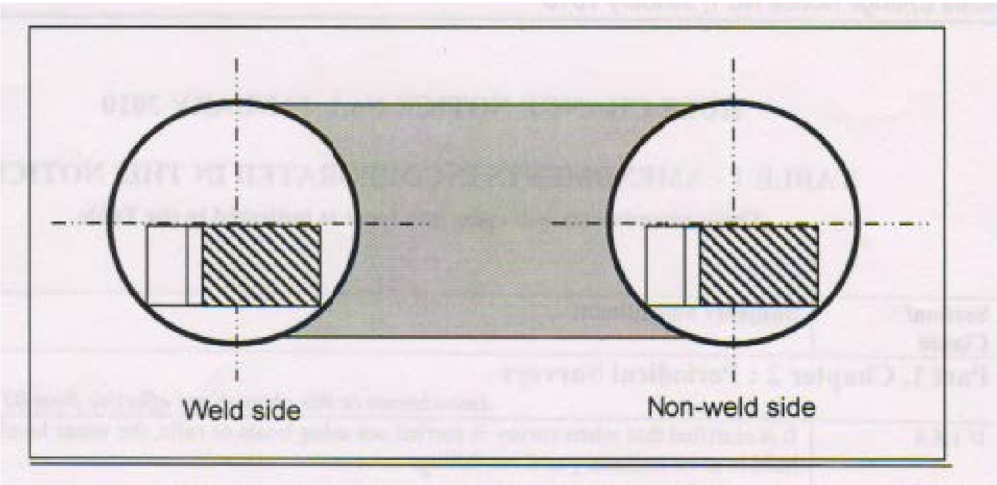

Fig.5.3.1 : Location of CTOD test specimens

5.3.4 Calibration of furnaces is to be verified by measurement and recording of a calibration test piece with dimensions equivalent to the maximum size of link manufactured. Thermocouples are to be placed both on the surface and in a drilled hole located at the mid thickness position of the calibration block.

5.3.5 For R4S and R5 chain and accessories, prior to approval, the manufacturer is to have undertaken experimental tests or have relevant supporting data to develop the chain and accessory material. The tests and data may include: fatigue tests, hot ductility tests (no internal flaws are to develop whilst bending in the link forming temperature range), welding parameter research, heat treatment study, strain age resistance, temper embrittlement study, stress corrosion cracking (SCC) data and hydrogen embrittlement (HE) study, using slow strain test pieces in hydrated environments. Reports indicating the results of experimental tests are to be submitted.

5.4 Approval of quality system at chain and accessory manufacturers

5.4.1 Chain and accessory manufacturers are to have a documented and effective quality system approved by IRS. The provision of such a quality system is required in addition to, and not in lieu of, the witnessing of tests by a Surveyor as specified in 5.7 to 5.14.

5.5 Approval of steel mills - rolled bar

5.5.1 Bar material intended for chain and accessories are to be manufactured only by works approved by IRS. The approval is limited to a nominated supplier of bar material. If a chain manufacturer wishes to use material from a number of suppliers, separate approval tests must be carried out for each supplier.

Approval will be given only after successful testing of the completed chain. The approval will normally be limited upto the maximum diameter equal to that of the chain diameter tested. The rolling reduction ratio is to be recorded and is to be at least 5:1. The rolling reduction ratio used in production can be higher, but should not be lower than that qualified.

5.5.2 The bar manufacturer is to submit a specification of the chemical composition of the bar material, which must be approved by IRS and by the chain manufacturer.

For Grade R4, R4S and R5 chain the steel is to contain a minimum of 0.20 per cent molybdenum.

5.5.3 A heat treatment sensitivity study simulating chain production conditions is to be applied in order to verify mechanical properties and establish limits for temperature and time combinations. All test details and results are to be submitted to IRS.

5.5.4 The bar manufacturer is to provide evidence that the manufacturing process produces material that is resistant to strain ageing, temper embrittlement and for R3S, R4, R4S and R5, hydrogen embrittlement. All test details and results are to be submitted to IRS.

5.6 Approval of forge shops and foundries - accessories

5.6.1 Forge shops and foundries intending to supply finished or semi-finished accessories are to be approved by IRS. A description of manufacturing processes and process controls is to be submitted to IRS. The scope of approval is to be approved by IRS. The approval is to be limited to a nominated supplier of forged or cast material. If an accessory manufacturer wishes to use material from a number of suppliers, a separate approval must be carried out for each supplier.

5.6.2 Approval will be given only after successful testing of the completed accessory. The approval will normally be limited to the type of accessory and the designated mooring grade of material upto the maximum diameter or thickness equal to that of the completed accessory used for qualification. Qualification of accessory pins to maximum diameters is also required. Individual accessories of complex geometries will be specially considered.

5.6.3 For forgings – The forging reduction ratio, used in the qualification tests, from cast ingot / slab to forged component is to be recorded. The forging reduction ratio used in production can be higher, but should not be lower than that qualified.

5.6.4 The forge shop or foundry is to submit a specification of chemical composition of the forged or cast material, which must be approved by IRS. For Grade R4, R4S and R5 chain the steel should contain a minimum of 0.20 per cent molybdenum.

5.6.5 Forges and foundries are to provide evidence that the manufacturing process produces material that is resistant to strain ageing, temper embrittlement and for R4S and R5 grades, hydrogen embrittlement. A heat treatment sensitivity study simulating accessory production conditions shall be applied in order to verify mechanical properties and establish limits for temperature and time combinations. (Cooling after tempering shall be appropriate to avoid temper embrittlement). All test details and results are to be submitted to IRS.

5.6.6 For initial approval CTOD tests are to be carried out on the particular mooring grade of material. Three CTOD tests are to be tested in accordance with a recognized standard such as BS 7448 Parts 1 and 2. The CTOD test piece is to be a standard 2 x 1 single edge notched bend specimen taken from the quarter thickness location. The minimum test piece size shall be 50 x 25 [mm] for chain diameters less than 120 [mm] and 80 x 40 [mm] for diameters 120 [mm] and above. The tests are to be taken at minus 20°C and the results submitted for review.

5.6.7 Calibration of furnaces shall be verified by measurement and recording of a calibration test piece with dimensions equivalent to the maximum size of link manufactured. Thermocouples are to be placed both on the surface and in a drilled hole located to the mid thickness position of the calibration block.

5.6.8 For R4S and R5 refer to additional requirements in 5.3.5.

5.7 Rolled steel bars

5.7.1 Steel manufacture

5.7.1.1 The steels are to be manufactured by basic oxygen, electric furnace or such other process as may be specially approved. All steels are to be killed and fine grain treated. The austenitic grain size is to be 6 or finer in accordance with ASTM E112.

5.7.1.2 Steel for bars intended for R4S and R5 chain is to be vacuum degassed.

5.7.1.3 For R4S and R5 the following information is to be supplied by the bar manufacturer to the mooring chain manufacturer and the results included in the chain documentation:

a) Each heat is to be examined for non-metallic inclusions. The level of micro inclusions is to be quantified and assessed to be sure inclusion levels are acceptable for the final product.

b) A sample from each heat is to be macro etched according to ASTM E381 or equivalent to be sure there is no injurious segregation or porosity.

c) Jominy hardenability data, according to ASTM A255, or equivalent, is to be supplied with each heat.

5.7.2 Chemical composition

For acceptance tests, the chemical composition of ladle samples of each heat is to be determined by the bar manufacturer and is to comply with the approved specification (see 5.5.2).

5.7.3 Mechanical tests

.1 Bars of the same nominal diameter are to be presented for test in batches of 50 tonnes or fraction thereof from the same heat. Test specimens are to be taken from material heat treated in the same manner as intended for the finished chain.

.2 Each heat of Grade R3S, R4, R4S and R5 steel bars is to be tested for hydrogen embrittlement. In case of continuous casting, test samples representing both the beginning and the end of the charge are to be taken. In case of ingot casting, test samples representing two different ingots are to be taken.

a) Two tensile test specimens are to be taken from the central region of bar material which has been subjected to the heat treatment cycle intended to be used in production. The specimens are to preferably have a diameter of 20 mm, alternatively 14 mm. One specimen is to be tested within max. 3 hours (1 1/2 hours for 14 mm diameter specimen) after machining. Where this is not possible, the specimen is to be cooled to -60°C immediately after machining and kept at that temperature for a period of maximum 5 days.

   The second specimen is to be tested after baking at 250°C for 4 hours (2 hours for 14 mm diameter specimen).

b) A slow strain rate < 0.0003 per second is to be used during the entire test, until fracture occurs. (This is approx. 10 minutes for a 20 mm diameter specimen).

c) Tensile strength, elongation and reduction of area are to be reported. The requirement for the test is:

$$\frac{Z_1}{Z_2} \geq 0.85$$

where,

Z_1 = Reduction of area without baking

Z_2 = Reduction of area after baking

d) If the requirement of $Z_1/Z_2 \geq 0.85$ is not achieved, the bar material may be subjected to a hydrogen degassing treatment after agreement with the Surveyor(s). New tests are to be performed after degassing.

.3 For all grades, one tensile and three Charpy V-notch specimens are to be taken from each sample selected. The test specimens are to be taken at approximately one-third radius below the surface, as shown in Sec. 2, Fig.2.4.1. The results of all tests are to be in accordance with the appropriate requirements of Table 5.7.1.

.4 If the tensile test requirements are not achieved, a retest of two further specimens selected from the same sample will be permissible.
Failure to meet the specified requirements of either or both additional tests will result in rejection of the batch represented unless it can be clearly attributable to improper simulation of the heat treatment.

.5 If the impact test requirements are not achieved, a retest of three further specimens selected from the same sample will be permissible. The results are to be added to those previously obtained to form a new average. The new average is to comply with the requirements. No more than two individual results are to be lower than the required average and no more than one result is to be below 70 per cent of the specified average value.
Failure to meet the requirements will result in rejection of the batch represented. Where the failure can be clearly attributable to improper simulation of the heat treatment, new tests may be permitted at the discretion of the Surveyor.

5.7.4 Dimensional tolerances

The diameter and roundness are to be within the tolerances specified in Sec. 2, Table 2.4.3, unless otherwise agreed.

5.7.5 Non-destructive examination and repair

a) Non-destructive examination is to be performed in accordance with recognized standards. Non-destructive examination procedures, together with rejection / acceptance criteria are to be submitted to IRS.

b) Non-destructive examination operators are to be appropriately qualified (to a minimum level II in accordance with a recognized standard such as ISO 9712, SNT-TC-1A, EN 473 or ASNT Central Certification Program) in the method of non-destructive examination.

c) 100 percent of bar material intended for either chain or fittings is to be subjected to ultrasonic examination at an appropriate stage of the manufacture. The bars are to be free of pipe, cracks and flakes.

d) 100 percent of the bar material is to be examined by magnetic particle or eddy current methods. The bars are to be free of injurious surface imperfections such as seams, laps and rolled-in mill scale. Provided that their depth is not greater than 1 per cent of the bar diameter, longitudinal discontinuities may be removed by grinding and blending to a smooth contour.

e) The frequency of NDE may be reduced at the discretion of the Surveyor provided it is verified by statistical means that the required quality is consistently achieved.

5.7.6 Marking

Each bar is to be stamped with the steel grade designation and the charge number (or a code indicating the charge number) on one of the end surfaces. Other marking methods may be accepted subject to agreement.

Table 5.7.1 : Mechanical properties of offshore mooring chain and accessories

Grade	Yield stress [N/mm^2] min. (Note 1)	Tensile strength [N/mm^2] min. (Note 1)	Elonga-tion % min.	Reduc-tion of area % min. (Note 3)	Charpy V-notch impact test		
					Test temp. °C (Note 2)	Average energy J min.	Average energy flash weld J min.
R3	410	690	17	50	0 -20	60 40	50 30
R3S	490	770	15	50	0 -20	65 45	53 33
R4	580	860	12	50	-20	50	36
R4S (Note 4)	700	960	12	50	-20	56	40
R5 (Note 4)	760	1000	12	50	-20	58	42

Notes:

1 Aim value of yield to tensile ratio: 0.92 max.

2 At the option of IRS the impact test of Grade R3 and R3S may be carried out at either 0°C or minus 20°C.

3 Reduction of area of cast steel is to be for Grades R3 and R3S: min. 40%, for R4, R4S and R5 : min. 35% (see 5.9.4).

4 Aim maximum hardness for R4S is HB330 and R5, HB340.

5.8 Forged steel

5.8.1 Manufacture

5.8.1.1 Forged steels used for the manufacture of accessories are to be in compliance with approved specifications and the submitted test reports approved by IRS. Steel is to be manufactured by basic oxygen, electric furnace or such other process as may be specially approved. All steel is to be killed and fine grain treated. The austenitic grain size is to be 6 or finer in accordance with ASTM E112.

5.8.1.2 Steel for forgings intended for R4S and R5 chain is to be vacuum degassed.

5.8.1.3 For steel intended for R4S and R5 accessories the following information is to be supplied by the steel manufacturer to the mooring accessory manufacturer and the results included in the accessory documentation:

a) Each heat is to be examined for non-metallic inclusions. The level of micro inclusions is to be quantified and assessed, to be sure inclusion levels are acceptable for the final product.

b) A sample from each heat is to be macroetched according to ASTM E381 or equivalent, to be sure there is no injurious segregation or porosity.

c) Jominy hardenability data, according to ASTM A255 or equivalent, is to be supplied with each heat.

5.8.2 Chemical composition

For acceptance tests, the chemical composition of ladle samples of each heat is to be determined by the bar manufacturer and is to comply with the approved specification (see 5.5.2).

5.8.3 Heat treatment

Finished forgings are to be properly heat treated in compliance with specifications approved by IRS.

5.8.4 Mechanical properties

The forgings are to comply with the mechanical properties given in Table 5.7.1, when properly heat treated.

5.8.5 Mechanical tests

For test sampling, forgings of similar dimensions (diameters do not differ by more than 25 mm) originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit. From each test unit one tensile and three impact test specimens are to be taken and tested. For the location of the test specimens see Sec. 2, Fig.2.4.1.

5.8.6 Ultrasonic examination

5.8.6.1 Non-destructive examination is to be performed in accordance with recognized standards and the non-destructive examination procedures, together with rejection / acceptance criteria are to be submitted to IRS.

5.8.6.2 Non-destructive examination operators are to be appropriately qualified (to a minimum level II in accordance with a recognized standard such as ISO 9712, SNT-TC-1A, EN 473 or ASNT Central Certification Program) in the method of non-destructive examination.

5.8.6.3 The forgings are to be subjected to 100 percent ultrasonic examination at an appropriate stage of manufacture and in compliance with the standard approved by IRS.

5.8.7 Marking

Marking is to be similar to that specified in 5.7.6.

5.9 Cast steel

5.9.1 Manufacture

5.9.1.1 Cast steels used for the manufacture of accessories are to be in compliance with approved specifications and the submitted test reports approved by IRS. Steel is to be manufactured by basic oxygen, electric furnace or such other process as may be specially approved. All steel is to be killed and fine grain treated. The austenitic grain size is to be 6 or finer in accordance with ASTM E112.

5.9.1.2 Steel for castings intended for R4S and R5 accessories is to be vacuum degassed.

5.9.1.3 For steel intended for R4S and R5 accessories the following information is to be obtained and the results included in the accessory documentation:

a) Each heat is to be examined for non-metallic inclusions. The level of micro inclusions is to be quantified and assessed to be sure inclusion levels are acceptable for the final product.

b) A sample from each heat is to be macro etched according to ASTM E381 or equivalent to be sure there is no injurious segregation or porosity.

c) Jominy hardenability data, according to ASTM A255, or equivalent is to be supplied with each heat.

5.9.2 Chemical composition

For acceptance tests, the chemical composition of ladle samples of each heat is to be determined by the bar manufacturer and is to comply with the approved specification (see 5.5.2).

5.9.3 Heat treatment

All castings are to be properly heat treated in compliance with specifications approved by IRS.

5.9.4 Mechanical properties

The castings are to comply with the mechanical properties given in Table 5.7.1. The requirement for reduction of area is, however, reduced to 40 per cent for grades R3 and R3S and 35 per cent for grade R4, R4S and R5.

5.9.5 Mechanical tests

For test sampling, castings of similar dimensions originating from the same heat treatment charge and the same heat of steel are to be combined into one test unit. From each test unit one tensile and three impact test specimens are to be taken and tested. For the location of the test specimens see Sec. 2, Fig.2.4.1.

5.9.6 Ultrasonic examination

5.9.6.1 Non-destructive examination is to be performed in accordance with recognized standards and the non-destructive examination procedures, together with rejection / acceptance criteria are to be submitted to IRS.

5.9.6.2 Non-destructive examination operators are to be appropriately qualified (to a minimum level II in accordance with a recognized standard such as ISO 9712, SNT-TC-1A, EN 473 or ASNT Central Certification Program) in the method of non-destructive examination.

5.9.6.3 The castings are to be subjected to 100 percent ultrasonic examination in compliance with the standard approved by IRS.

5.9.7 Marking

Marking is to be similar to that specified in 5.7.6.

5.10 Materials for studs

5.10.1 The studs intended for stud link chain cable are to be made of steel corresponding to that of the chain or in compliance with specifications approved by IRS. In general, the carbon content is not to exceed 0.25 per cent if the studs are to be welded in place.

5.11 Design

5.11.1 Plans with design calculations, giving detailed design of chain and accessories made by or supplied through the chain manufacturer are to be submitted for approval. Typical designs are given in ISO 1704 (see Sec. 2, Fig.2.3.1 to 2.3.6). For studless chain the shape and proportions are to comply with the requirements of this section. Other studless proportions are to be specially approved. It should be considered that new or non-standard designs of chain, shackles or fittings, may require a fatigue analysis and possible performance, fatigue or corrosion fatigue testing.

5.11.2 In addition for stud link chain, plans showing the detailed design of the stud are to be submitted for information. The stud is to give an impression in the chain link which is sufficiently deep to secure the position of the stud, but the combined effect of shape and depth of the impression is to be such as not to cause any harmful notch effect or stress concentration in the chain link.

5.11.3 Machining of Kenter shackles is to result in fillet radius of minimum 3 per cent of nominal diameter.

5.12 Chain cable manufacturing process

5.12.1 General

Offshore mooring chains are to be manufactured in continuous lengths by flash butt welding and are to be heat treated in a continuous furnace; batch heat treatment is not permitted. The use of joining shackles to replace defective links is subject to the written approval of the end purchaser in terms of the number and type permitted. The use of connecting common links is restricted to 3 links in each 100 m of chain.

5.12.2 Manufacturing process records

Records of bar heating, flash welding and heat treatment are to be made available for inspection by the Surveyor.

5.12.3 Bar heating

a) For electric resistance heating, the heating phase is to be controlled by an optical heat sensor. The controller is to be checked at least once every 8 hours and the records are to be maintained.

b) For furnace heating, the heat is to be controlled and the temperature continuously recorded using thermocouples in close proximity to the bars. The controls are to be checked at least once every 8 hours and the records are to be maintained.

5.12.4 Flash welding

The following welding parameters are to be controlled during welding of each link:

a) Platen motion;

b) Current as a function of time;

c) Hydraulic pressure.

The controls are to be checked at least every 4 hours and records are to be maintained.

5.12.5 Heat treatment

a) Chain is to be austenitized, above the upper transformation temperature, at a combination of temperature and time within the limits established.

b) When applicable, chain is to be tempered at a combination of temperature and time within the limits established. Cooling after tempering is to be appropriate to avoid temper embrittlement.

c) Temperature and time or temperature and chain speed are to be controlled and continuously recorded.

5.12.6 Mechanical properties

The mechanical properties of finished chain and accessories are to be in accordance with Table 5.7.1. For the location of test specimens see Sec. 2, Fig.2.4.1.

5.12.7 Proof and breaking test loads

Chains and accessories are to withstand the proof and break test loads given in Table 5.12.1.

Table 5.12.1 : Formulae for proof and break test loads, weight and length over 5 links

Grade Type	Proof load [kN]	Break load [kN]
Grade R3 Stud Link	$0.0148\ d^2\ (44 - 0.08d)$	$0.0223\ d^2\ (44 - 0.08d)$
Grade R3S Stud Link	$0.0180\ d^2\ (44 - 0.08d)$	$0.0249\ d^2\ (44 - 0.08d)$
Grade R4 Stud Link	$0.0216\ d^2\ (44 - 0.08d)$	$0.0274\ d^2\ (44 - 0.08d)$
Grade R4S Stud Link	$0.0240\ d^2\ (44 - 0.08d)$	$0.0304\ d^2\ (44 - 0.08d)$
Grade R5 Stud Link	$0.0251\ d^2\ (44 - 0.08d)$	$0.0320\ d^2\ (44 - 0.08d)$
Grade R3 Studless	$0.0148\ d^2\ (44 - 0.08d)$	$0.0223\ d^2\ (44 - 0.08d)$
Grade R3S Studless	$0.0174\ d^2\ (44 - 0.08d)$	$0.0249\ d^2\ (44 - 0.08d)$
Grade R4 Studless	$0.0192\ d^2\ (44 - 0.08d)$	$0.0274\ d^2\ (44 - 0.08d)$
Grade R4S Studless	$0.0213\ d^2\ (44 - 0.08d)$	$0.0304\ d^2\ (44 - 0.08d)$
Grade R5 Studless	$0.0223\ d^2\ (44 - 0.08d)$	$0.0320\ d^2\ (44 - 0.08d)$
Chain Weight [kg/m]	Stud link = $0.0219\ d^2$	
Chain Weight [kg/m]	Studless chain weight calculations for each design are to be submitted	
Pitch Length :	Five link measure	
Minimum	22d	
Maximum	22.55d	

5.12.8 Freedom from defects

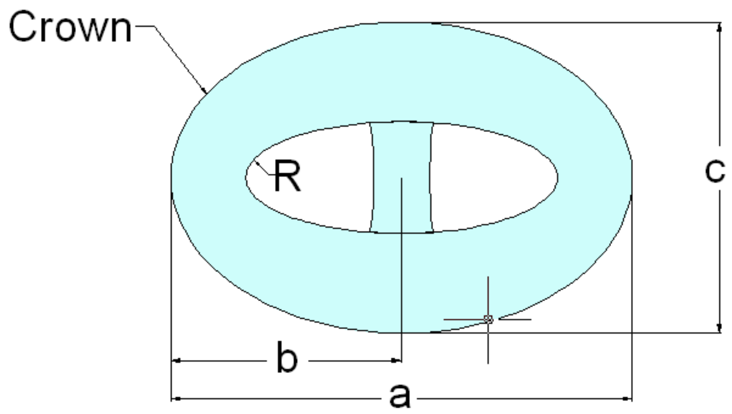
All chains are to have a workmanlike finish consistent with the method of manufacture and be free from defects. Each link is to be examined in accordance with 5.15.5 using approved procedures.

5.12.9 Dimensions and dimensional tolerances

The form and proportion of links and accessories are to be in accordance with the approved design. The tolerances given in Sec. 2, Cl. 2.3 are applicable, in general.

In addition, the tolerances for stud link and studless common links are to be measured in accordance with Fig.5.12.9a) and b).

a) **Stud Link** – The internal link radii (R) and external radii should be uniform

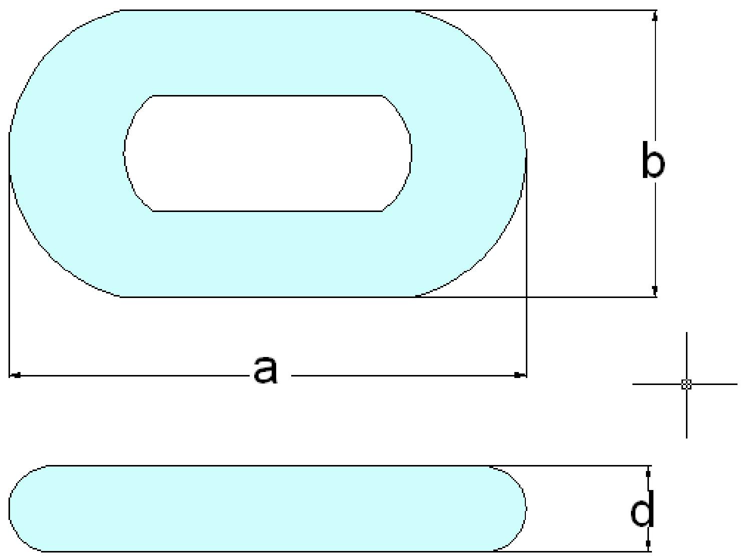


Designation [1)]	**Description**	**Nominal Dimension of the Link**	**Minus Tolerance**	**Plus Tolerance**
a	Link length	6d	0.15d	0.15d
b	Link half length	a*/2	0.1d	0.1d
c	Link width	3.6d	0.09d	0.09d
e	Stud angular misalignment	0 degrees	4 degrees	4 degrees
R	Inner radius	0.65d	0	----

Notes : 1 Dimension designation is shown in above figure
d = Nominal diameter of chain, (Refer Fig.2.3.1) a* = Actual link length

Fig.5.12.9a) : Stud Link common link, proportions dimensions and tolerances

b) **Studless** – The internal link radii (R) and external radii should be uniform.



Designation [1)]	Description	Nominal Dimension of the Link	Minus Tolerance	Plus Tolerance
a	Link length	6d	0.15d	0.15d
b	Link width	3.35d	0.09d	0.09d
R	Inner radius	0.60d	0	----

Notes : 1 Dimension designation is shown in above figure
d = Nominal diameter of chain
2 Other dimension ratios are subject to special approval.

Fig.5.12.9b) : Stud less common link, proportions dimensions and tolerances

5.12.10 Welding of studs

a) A welded stud may be accepted for grade R3 and R3S chains. Welding of studs in grade R4 chain is not permitted unless specially approved.

b) Where studs are welded into the links, the welding is to be completed before the chain is heat treated.

c) The stud ends must be a good fit inside the link and the weld is to be confined to the stud end opposite to the flash butt weld. The full periphery of the stud end is to be welded unless otherwise approved.

d) Welding of studs at both ends is not permitted unless specially approved.

e) The welds are to be made by qualified welders using an approved procedure and low-hydrogen approved consumables.

f) The size of the fillet weld is, as a minimum, to be as per API Specification 2F.

g) The welds are to be of good quality and free from defects such as cracks, lack of fusion, gross porosity and undercuts exceeding 1 mm.

h) All stud welds are to be visually examined. At least 10 per cent of all stud welds within each length of chain are to be examined by dye penetrant or magnetic particles after proof load testing. If cracks or lack of fusion are found, all stud welds in that length are to be examined.

5.12.11 Connecting common links (splice links)

.1 Single links to substitute for test links or defective links without the necessity for re-heat treatment of the whole length are to be made in accordance with an approved procedure. Separate approvals are required for each grade of chain and the tests are to be made on the maximum size of chain for which approval is sought.

.2 Manufacture and heat treatment of connecting common link is not to affect the properties of the adjoining links. The temperature reached by these links is nowhere to exceed 250°C.

.3 Each link is to be subjected to the appropriate proof load and non-destructive examination as detailed in Table 5.12.1 and 5.13.5 respectively. A second link is to be made identical to the connecting common link; the link is to be tested and inspected as per 5.13.4 and 5.14.5.

.4 Each connecting common link is to be marked either on the stud for stud link chain, or on the outer straight length on the side opposite the flash butt weld for studless chain. This marking is to be in accordance with 5.13.7 plus a unique number for the link. The adjoining links are also to be marked on the studs or straight length as above.

5.13 Testing and inspection of finished chain

5.13.1 General

a) This section applies to but is not limited to finished chain cable such as common stud and studless links, end links, enlarged end links and connecting common links (splice links).

b) All chains are to be subjected to proof load tests, sample break load tests and sample mechanical tests after final heat treatment in the presence of Surveyor. Where the manufacturer has a procedure to record proof loads and the Surveyor is satisfied with the adequacy of the recording system, he may not witness all proof load tests. The Surveyor is to satisfy himself that the testing machines are calibrated and maintained in a satisfactory condition.

c) Prior to testing and inspection chains are to be free from scale, paint or other coating. The chains are to be sand- or shot blasted to meet this requirement.

5.13.2 Proof and break load tests

a) The entire length of chain is to withstand the proof load specified in Table 5.12.1 without fracture and without crack in the flash weld. The load applied is not to exceed the proof load by more than 10 per cent when stretching the chain. Where plastic straining is used to set studs, the applied load is not to be greater than that qualified in approval tests.

b) A break-test specimen consisting of at least 3 links is to be either taken from the chain or produced at the same time and in the same manner as the chain. The test frequency is to be based on tests at sampling intervals according to Table 5.13.1 provided that every cast is represented. Each specimen is to be capable of withstanding the break load specified without fracture and without crack in the flash weld. It will be considered acceptable if the specimen is loaded to the specified value and maintained at that load for 30 seconds.

c) For chain diameters over 100 [mm], alternative break-test proposals to the above break-test will be considered whereby a one link specimen is used. Alternatives are to be approved by IRS. Every heat is to be represented, the test frequency is to be in accordance with Table 5.13.1 and it is to be demonstrated and proven that the alternative test represents an equivalent load application to the three link test.

d) If the loading capacity of the testing machine is insufficient, another equivalent method will be considered by IRS.

Table 5.13.1 : Frequency of break and mechanical tests

Nominal chain diameter (mm)	Maximum sampling interval (m)
Min - 48	91
49 - 60	110
61 - 73	131
74 - 85	152
86 - 98	175
99 - 111	198
112 - 124	222
125 - 137	250
138 - 149	274
150 - 162	297
163 - 175	322
176 – 186	346
187 – 199	370
200 - 210	395

5.13.3 Dimensions and dimensional tolerances

After proof load testing, measurements are to be taken on at least 5 per cent of the links in accordance with 5.12.9.

The entire chain is to be checked for the length, five links at a time. By the five link check the first five links are to be measured. In the next set of five links, at least two links from the previous five links set are to be included. This procedure is to be followed for the entire chain length. The measurements are to be taken preferably while the chain is loaded to 5 - 10 per cent of the minimum proof load. The links held in the end blocks may be excluded from this measurement.

5.13.4 Mechanical tests

a) Links of samples detached from finished, heat treated chain are to be sectioned for determination of mechanical properties. A test unit is to consist of one tensile and nine impact specimens. The tensile specimen is to be taken in the side opposite the flash weld. Three impact specimens are to be taken across the flash weld with the notch centered in the middle. Three impact specimens are to be taken across the unwelded side and three impact specimens are to be taken from the bend region.

b) The test frequency is to be based on tests at sampling intervals according to Table 5.13.1 provided that every cast is represented. Mechanical properties are to be as specified in Table 5.7.1.

c) The frequency of impact testing in the bend may be reduced at the discretion of the Surveyor provided it is verified by statistical means that the required toughness is consistently achieved.

5.13.5 Non-destructive examination

a) After proof load testing, all surfaces of every link are to be visually examined. Burrs, irregularities and rough edges are to be contour ground. Links are to be free from mill defects, surface cracks, dents and cuts, especially in the vicinity where gripped by clamping dies during flash welding. Studs are to be securely fastened. Chain is to be positioned in order to have good access to all surfaces.

b) Testing is to be performed in accordance with a recognized standard and the procedures, together with acceptance / rejection criteria are to be submitted to IRS for review. Operators are to be appropriately qualified, in the method of inspection, to at least level II in accordance with a recognized standard such as ISO 9712, SNT-TC-1A, EN 473 or ASNT Central Certification Program.

c) Magnetic particle testing is to be employed to examine the flash welded area including the area gripped by the clamping dies. Approved procedures and equipment are to be used. Every link is to be examined. Additionally, 10% of links are to be tested on all accessible surfaces.

Link surface at the flash weld is to be free from cracks, lack of fusion and gross porosity.

d) Ultrasonic testing is to be employed to examine the flash weld fusion. Approved procedures and equipment are to be used. On-site calibration standards for chain configurations are to be approved.

Every link is to be examined.

The flash weld is to be free from defects causing ultrasonic back reflections equal to or greater than the calibration standard.

e) If link diameter, length, width and stud alignment do not conform to the required dimensions, these are to be compared to the dimensions of 40 more links; 20 on each side of the affected link. If a single particular dimension fails to meet the required dimensional tolerance in more than 2 of the sample links, all links are to be examined and requirements of 5.13.6(b) are applied.

5.13.6 Retest, rejection and repair criteria

a) If the length over 5 links is short, the chain may be stretched by loading above the proof test load specified provided that the applied load is not greater than that approved and that only random lengths of the chain need stretching. If the length exceeds the specified tolerance, the overlength chain links are to be cut out and the requirements of 5.13.6(b) applied.

b) If single links are found to be defective or to not meet other applicable requirements, defective links may be cut out and a connecting common link inserted in their place. The individual heat treatment and inspection procedure of connecting common links is subject to the approval of the Surveyor. Other methods of repair are subject to approval of the Surveyor and the end purchaser.

c) If a crack, cut or defect in the flash weld is found by visual or magnetic particle examination, it is to be ground down no more than 5 per cent of the link diameter in depth and streamlined to avoid any sharp contours. However the final dimensions are to conform to the agreed standard.

d) If indications of interior flash weld defects in reference to the accepted calibration standards are detected during ultrasonic examination, requirements of 5.13.6(b) are applied.

f) If a break load test fails, a thorough examination is to be carried out to identify the cause of failure. Two additional break test specimens representing the same sampling length of chain are to be subjected to the break load test. Based upon satisfactory results of the additional tests and the results of the failure investigation, it will be decided what lengths of chain can be accepted. Failure of either or both additional tests will result in rejection of the sampling length of chain represented and requirements of 5.13.6(b) are applied.

g) If a link fails during proof load testing, a thorough examination is to be carried out to identify the probable cause of failure of the proof load test. In the event that two or more links in the proof loaded length fail, that length is to be rejected.

The above mentioned failure investigation is to especially aim at ascertaining the presence in other lengths of factors or conditions thought to be causal to failure.

In addition, a break test specimen is to be taken from each side of the one failed link and subjected to the breaking test. Based upon satisfactory results of both break tests and the results of the failure investigation, it will be decided what length of chain can be considered for acceptance. Failure of either or both breaking tests will result in rejection of the same proof loaded length.

Replacement of defective links is to be in accordance with the requirements of 5.13.6(b).

h) If the tensile test fails to meet the requirements, a retest of two further specimens selected from the same sample will be permissible. Failure to meet the specified requirements of either or both additional tests will result in rejection of the sampling length of chain represented and requirements of 5.13.6(b) are applied.

i) If the impact test requirements are not achieved, a retest of three further specimens selected from the same sample will be permissible. The results are to be added to those previously obtained to form a new average. The new average is to comply with the requirements. No more than two individual results are to be lower than the required average and no more than one result is to be below 70 per cent of the specified average value.

Failure to meet the requirements will result in rejection of the sampling length represented and requirements of 5.13.6(b) are applied.

5.13.7 Marking

.1 The chain is to be marked at the following places:

- At each end.
- At intervals not exceeding 100 m.
- On connecting common links.
- On links next to shackles or connecting common links.

All marked links are to be stated on the certificate, and the marking is to make it possible to recognize leading and tail end of the chain. In addition to the above required marking, the first and last common link of each individual charge used in the continuous length is to be traceable and adequately marked.

The marking is to be permanent and legible throughout the expected lifetime of the chain.

.2 The chain is to be marked on the studs as follows:

- Chain grade
- Certificate No.
- IRS stamp

The Certificate number may be exchanged against an abbreviation or equivalent, in which case the details are to be stated in the certificate.

The chain certificate will contain information on number and location of connecting common links. The certificate number and replacement link number may be exchanged against an abbreviation or equivalent, in which case, the details are to be stated in the certificate.

5.13.8 Documentation

a) A complete Chain Inspection and Testing Report in booklet form is to be provided by the chain manufacturer for each continuous chain length. This booklet is to include all dimensional checks, test and inspection reports, NDT reports, process records, photographs as well as any nonconformity, corrective action and repair work.

b) Individual certificates are to be issued for each continuous single length of chain.

c) All accompanying documents, appendices and reports are to carry reference to the original certificate number.

d) The manufacturer will be responsible for storing, in a safe and retrievable manner, all documentation produced for a period of at least 10 years.

5.14 Testing and inspection of accessories

5.14.1 General

a) Requirements in 5.14 apply to but is not limited to mooring equipment accessories such as detachable connecting links (shackles), detachable connecting plates (triplates), end shackles, swivels and swivel shackles.

b) Prior to test and inspection the chain accessories are to be free from scale, paint or other coating.

c) All accessories are to be subjected to proof load tests sample, break load tests and sample mechanical tests after final heat treatment in the presence of a Surveyor. Where the manufacturer has a procedure to record proof loads and the Surveyor is satisfied with the adequacy of the recording system, he may not witness all proof load tests. The Surveyor is to satisfy himself that the testing machines are calibrated and maintained in a satisfactory condition.

5.14.2 Proof and break load tests

a) All accessories are to be subjected to the proof load specified for the corresponding stud link chain.

b) Chain accessories are to be tested to the break test loads prescribed for the grade and size of chain for which they are intended. At least one accessory out of every 25 accessories is to be tested.

For individually produced accessories or accessories produced in small batches (less than 5), alternative testing will be subject to special consideration. A batch is defined as accessories that originate from the same heat treatment charge and the same heat of steel. Accessories which have been subjected to a break test are to be scrapped, in general. However, where the accessories are of increased dimensions or alternatively a material with higher strength characteristics is used, they may be included in the outfit at the discretion of IRS provided that:

i) the accessories are successfully tested at the prescribed breaking load appropriate to the chain for which they are intended, and

ii) it is verified by procedure tests that such accessories are so designed that the breaking strength is not less than 1.4 times the prescribed breaking load of the chain for which they are intended.

5.14.3 Dimensions and dimensional tolerances

a) After proof load testing, at least one accessory (of the same type, size and nominal strength) out of 25 is to be checked for dimensions in accordance with 5.12.9. The manufacturer is to provide an adequate evidence indicating compliance with the purchaser's requirements.

b) The following tolerances are applicable to accessories:

- Nominal diameter : +5 percent, -0 percent
- Other dimensions : ± 2 ½ percent.

These tolerances do not apply to machined surfaces.

5.14.4 Mechanical tests

a) Accessories are to be subjected to mechanical testing as described in 5.8 and 5.9. Mechanical tests are to be taken from proof loaded full size accessories that have been heat treated with the production accessories they represent. The use of separate representative coupons is not permitted except as indicated in d) below.

b) Test location of forged shackles. Forged shackle bodies and forged Kenter shackles are to have a set of three impact tests and a tensile test taken from the crown of the shackle. Tensile tests on smaller diameter shackles can be taken from the straight part of the shackle, where the geometry does not permit a tensile specimen from the crown. The tensile properties and impact values are to meet the requirements of Table 5.7.1 in the locations specified in Fig.2.4.1 of Section 2 with the Charpy pieces on the outside radius.

c) The locations of mechanical tests of cast shackles and cast Kenter shackles can be taken from the straight part of the accessory. The tensile properties and impact values are to meet the requirements of Table 5.7.1 in the locations specified in Fig.2.4.1 of Section 2.

d) The locations of mechanical tests of other accessories with complex geometries are to be agreed with IRS.

e) For individually produced accessories or accessories produced in small batches, (less than 5), alternative testing can be proposed to IRS. Each proposal for alternative testing is to be detailed by the manufacturer in a written procedure.

f) A batch is defined as accessories that originate from the same heat treatment charge and the same heat of steel.

g) Mechanical tests of pins are to be taken as per Fig.2.4.1 of Section 2 from the mid length of a sacrificial pin of the same diameter as the final pin. For oval pins the diameter taken is to represent the smaller dimension. Mechanical tests may be taken from an extended pin of the same diameter as the final pin that incorporates a test prolongation and a heat treatment buffer prolongation, where equivalence with mid length test values have been established. The length of the buffer is to be at least equal to 1 pin diameter dimension which is removed after the heat treatment cycle is finished. The test coupon can then be removed from the pin. The buffer and test are to come from the same end of the pin as per Fig.5.14.4 below:

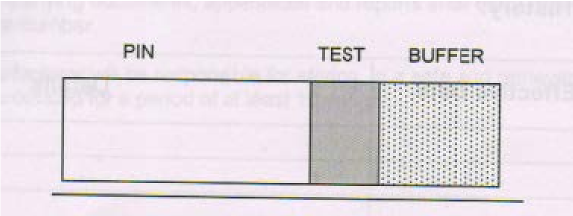


Fig.5.14.4 : Buffer and test piece location

5.14.5 Non-destructive examination

a) After proof load testing all chain accessories are to be subjected to a close visual examination. Special attention is to be paid to machined surfaces and high stress regions. All non-machined surfaces, are to be sand or shot blasted to permit a thorough examination. All accessories are to be checked by magnetic particle or dye penetrant testing.

b) Testing is to be performed in accordance with a recognized standard and the procedures, together with acceptance / rejection criteria are to be submitted to IRS for review. Operators are to be appropriately qualified, in the method of inspection, to at least level II in accordance with a recognized standard such as ISO 9712, SNT-TC-1A, EN 473 or ASNT Central Certification Program.

c) The manufacturer is to provide adequate evidence that non destructive examination has been carried out with satisfactory results together with details of technique used and to the operator's qualification.

5.14.6 Test failures

In the event of a failure of any test the entire batch represented is to be rejected unless the cause of failure is determined and it is demonstrated to the Surveyor's satisfaction that the condition causing the failure is not present in any of the remaining accessories.

5.14.7 Marking

.1 Each accessory is to be marked as follows:

- Chain grade
- Certificate No.
- IRS stamp

.2 All detachable component parts are to be stamped with a serial number to avoid mixing of components.

.3 The Certificate number may be exchanged against an abbreviation or equivalent, in which case, the details are to be stated in the certificate.

5.14.8 Documentation

.1 A complete Inspection and Testing Report in booklet form is to be provided by the manufacturer for each order. This booklet is to include all dimensional checks, test and inspection reports, NDT reports, process records as well as any nonconformity, corrective action and repair work.

.2 Each type of accessory is to be covered by separate certificates.

.3 All accompanying documents, appendices and reports are to carry reference to the original certificate number.

.4 The manufacturer will be responsible for storing, in a safe and retrievable manner, all documentation produced for a period of at least 10 years.

5.15 Chafing chain for single point mooring arrangements

5.15.1 Scope

These requirements apply to short lengths (approximately 8 m) of 76 [mm] diameter chain to be connected to hawsers for the tethering of oil tankers to single point moorings, FPSO’s and similar uses.

5.15.2 Approval of manufacturing

The chafing chain is to be manufactured by works approved by IRS according to 5.3 of this chapter.

5.15.3 Materials

The materials used for the manufacture of the chafing chain are to satisfy the requirements of 5.7 to 5.10 of this chapter.

5.15.4 Design, manufacturing, testing and certification

a) The chafing chain is to be designed, manufactured, tested and certified in accordance with 5.11 to 5.14 except that batch heat treatment is permitted.

b) The arrangement of the end connections is to be of an approved type.

c) The common link is to be of the stud link type and of Grade R3 or R4.

d) The chafing chain is to be capable of withstanding the breaking test loads of 4884 [kN] (Grade R3) and 6001 [kN] (Grade R4).

Documented evidence of satisfactory testing of similar diameter mooring chain in the prior six month period may be used in lieu of break testing subject to agreement with IRS.

e) The chain lengths shall be proof load tested in accordance with 5.13.2. The proof test loads for Grade R3 and Grade R4 are to be 3242 [kN] and 4731 [kN] respectively.

End of Chapter

Chapter 11

Approval of Welding Consumables for Use in Ship Construction

Contents

Section 1

General

1.1 Scope

1.1.1 This Chapter gives the requirements for approval and inspection of welding consumables such as electrodes, wires, fluxes etc. intended for welding of the following types of materials used in ship construction:

a) Normal strength steel for ship structures, Grades A, B, D and E (See Ch.3).

b) Higher strength steels for ship structures Grades AH32, DH32, EH32, AH36, DH36 and EH36 (See Ch.3).

c) Higher strength steels for ship structures with minimum yield strength 390 [N/mm^2] : Grades AH40, DH40 and EH40 (See Ch.3).

d) Higher strength steels for ship structures for low temperature application : Grades FH32, FH36 and FH40 (See Ch.3).

e) Higher strength quenched and tempered steels.

f) Aluminium alloys (See Ch.9).

1.2 Manufacture

1.2.1 The manufacturer's plant and method of production of welding consumables are to be such as to ensure reasonable uniformity in manufacture. IRS is to be notified of any alteration proposed to be made in the process of manufacture subsequent to approval.

1.3 Grading

1.3.1 Welding consumables for steel materials specified in 1.1.1 a) to d) above.

These consumables are divided into 3 strength groups each of which is further graded as per the Charpy V-notch impact test requirements as shown below:

Groups	**Grading**
Normal strength steel	1, 2, 3
Higher strength steel : yield strength upto 355 [N/mm^2]	1Y, 2Y, 3Y, 4Y
Higher strength steels : yield strength upto 390 [N/mm^2]	2Y40, 3Y40, 4Y40
Hydrogen marks Welding consumables of Grades 2 and 3; and of Grades 2Y, 3Y and 4Y and of Grades 2Y 40, 3Y 40 and 4Y 40, for which hydrogen content has been controlled in accordance with Sec.2.5 are identified by the mark H, HH or HHH	
The following suffixes are added after the Grade mark as applicable: S : Semi-automatic T : Two-run technique M : Multi-run technique TM : Both two-run and multi-run technique V : Vertical	

See Table 1.3.1 for correlation of welding consumables to hull structural steel grades.

1.3.2 For grading of consumables for welding higher strength quenched and tempered steels indicated in 1.1.1e) above, refer to Sec.7.

1.3.3 For grading of consumables for welding aluminium alloys indicated in 1.1.1f) above, refer to Sec.8.

Table 1.3.1 : Correlation of welding consumables to hull structural steel grades

Grades of Welding Consumables (see notes)	**Hull structural steel Grades 1)**											
	A	**B**	**D**	**E**	**AH32 /36**	**DH32 /36**	**EH32 /36**	**FH32/ 36**	**AH40**	**DH40**	**EH40**	**FH40**
1, 1S, 1T, 1M, 1TM, 1V	X											
1YS, 1YT, 1YM, 1YTM, 1YV	X				X 3)							
2, 2S, 2T, 2M, 2TM, 2V	X	X	X									
2Y, 2YS, 2YT, 2YM, 2YTM, 2YV	X	X	X	X	X							
2Y40, 2Y40S, 2Y40T, 2Y40M, 2Y40TM, 2Y40V	2)	2)	2)		X	X			X	X		
3, 3S, 3T, 3M, 3TM, 3V	X	X	X	X								
3Y, 3YS, 3YT, 3YM, 3YTM, 3YV	X	X	X	X	X	X	X					
3Y40, 3Y40S, 3Y40T, 3Y40M, 3Y40TM, 3Y40V	2)	2)	2)	2)	X	X	X		X	X	X	
4Y, 4YS, 4YT, 4YM, 4YTM, 4YV	X	X	X	X	X	X	X	X				
4Y40, 4Y40S, 4Y40T, 4Y40M, 4Y40TM, 4Y40V	2)	2)	2)	2)	X	X	X	X	X	X	X	X

1) Requirements for other grades of steels given in ch.3 but not included here will be specially considered.
2) See Note d)
3) See Note e)

a) When joining normal to higher strength structural steel, consumables of the lowest acceptable grade for either material being joined may be used.
b) When joining steels of same strength level but of different toughness grade, consumables of the lowest acceptable grade for either material being joined may be used.
c) It is recommended that controlled low hydrogen type consumables are to be used when joining higher strength structural steels to the same or lower strength level, except that other consumables may be used when the carbon equivalent is below or equal to 0.41%. When other than controlled low hydrogen type electrodes are used appropriate procedure test for hydrogen cracking may be conducted subject to approval of IRS.
d) The welding consumables approved for steel Grades AH40, DH40, EH40 and/or FH40 may also be used for welding of the corresponding grades of normal strength steels subject to the approval of IRS.
e) When joining higher strength steels using Grade 1Y welding consumables, the material thicknesses is not to exceed 25 [mm].

1.4 Approval procedure

1.4.1 Approval of welding consumables will be considered on the basis of the manufacturer's description of the works and detailed description of the method of production control, satisfactory inspection of the works by the Surveyors and compliance with the test requirements detailed in subsequent paragraphs of this Chapter.

1.4.2 When a welding consumable is manufactured in several locations of the same company, the complete series of approval tests would be carried out in one Works only. In other locations, a reduced test programme based upon the requirements of annual testing may be accepted subject to the manufacturer certifying that the materials and the fabrication process used are identical with those of the main unit.

This requirement is also applicable to all manufacturers of welding consumables under license.

Note : In case of wire flux combination for submerged arc welding where a unique powder flux is combined with different wires coming from several factories belonging to the same firm only one test series may be carried out provided the wires conform to the same technical specification.

1.4.3 The test assemblies are to be prepared under the supervision of the Surveyor, and all tests are to be carried out in his presence.

1.4.4 IRS may require, in any particular case, such additional tests or spacing requirements as may be necessary.

1.5 Test assemblies

1.5.1 The test assemblies are to be prepared and tested under the supervision of the Surveyor(s).

1.5.2 When a welded joint is performed, the edges of the plates are to be bevelled either by mechanical machining or by oxygen cutting; in the latter case, a descaling of the edges is necessary.

1.5.3 The welding conditions used such as amperage, voltage, travel speed, etc. are to be within the range recommended by the manufacturer for normal and good welding practice. Where a welding consumable is suitable for both alternating current (AC) and direct current (DC), AC is to be used for the preparation of test assemblies.

1.6 Annual inspection and tests

1.6.1 All establishments, where approved welding consumables are manufactured, and the associated quality control procedures, are to be subjected to annual inspection. On these occasions, samples of the approved consumables are to be selected by the Surveyor and subjected to the tests detailed in the subsequent paragraphs of this Chapter.

1.7 Upgrading and uprating

1.7.1 Upgrading and uprating of welding consumables will be considered only at the manufacturer's request, preferably at the time of annual testing. Generally, for this purpose, tests from butt weld assemblies will be required in addition to the normal annual approval tests.

1.7.2 Upgrading refers to notch toughness of the welding consumable while uprating refers to extension to cover higher strength level steels.

1.7.3 Any alteration to the approved consumable which may result in a change in the chemical composition and the mechanical properties of the deposited metal, must be immediately notified by the manufacturer. Additional tests may be necessary.

1.8 Dimensions of test specimens

1.8.1 Deposited metal tensile test specimens are to be machined to the dimensions shown in Fig.1.8.1. Care is to be taken to ensure that the longitudinal axis of the test piece coincides with the centre of the weld and midthickness of the plates. The test piece may be heated to a temperature not exceeding 250°C for a period not exceeding 16 hours for hydrogen removal, prior to testing.

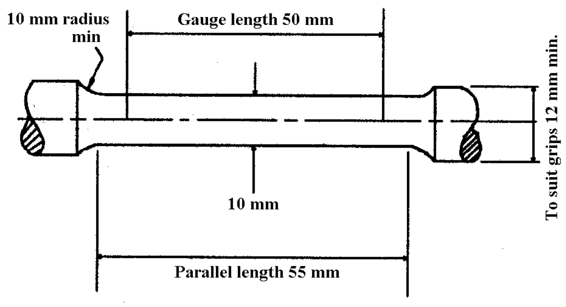

Fig.1.8.1 : Deposited metal tensile test

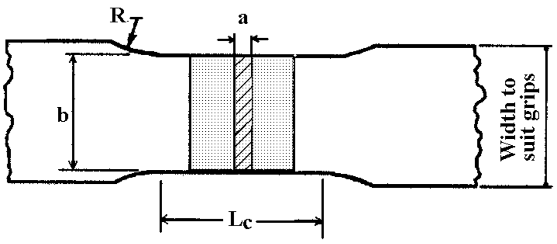

Fig.1.8.2 : Butt weld tensile test specimen

1.8.2 Butt weld tensile test specimens are to be machined to the following dimensions (see Fig.1.8.2).

a = thickness of plate 't'
b = 12 for t ≤ 2 [mm]
= 25 for t > 2 [mm]
L_c = width of weld + 60 [mm]
R > 25 [mm].

The upper and lower surfaces of the weld are to be filed, ground or machined flush with the surface of the plates.

1.8.3 Butt weld bend test specimens are to be 30 [mm] in width. Upper and lower surfaces of the weld are to be filed, ground or machined flush with the surfaces of the plates and sharp corners of the specimens are to be rounded to a radius not exceeding 2 [mm].

1.8.4 All impact test specimens are to be of the standard 10 [mm] x 10 [mm] Charpy V-notch type, machined to the dimensions and tolerances detailed in Ch.2.

1.9 Testing procedures

1.9.1 The procedures used for all tensile and impact tests are to comply with the requirements of Ch.2.

1.9.2 Butt weld bend test specimens are to be tested at ambient temperature. The test specimens are to be capable of withstanding, without fracture, being bent through an angle of 120 degrees over a former having a diameter three times the thickness of the specimen. One specimen from each welded assembly is to be tested with the face of the weld in tension and the other with the root of the weld in tension.
The test pieces can be considered as complying with the requirements if, on completion of the test, no crack or defect at the outer surface of the test specimen can be seen.

1.9.3 Tensile Tests : On deposited metal test specimens, the values of tensile strength, yield stress and elongation are to be recorded. On butt weld specimens, the values of tensile strength and the position of fracture are to be recorded.

1.9.4 Charpy V-notch Impact Tests : A set of three test specimens is to prepared and tested. The average absorbed energy value is to comply with the requirements of subsequent sections. One individual value may be less than the required average value provided that it is not less than 70 per cent of this value.

The test temperature for Grades 2, 2Y and 3, 3Y test pieces is to be controlled within 2°C of the prescribed temperature.

1.10 Re-test procedures

1.10.1 Where the results of a tensile or bend test do not comply with the requirements, duplicate test specimens of the same type are to be prepared and are to be satisfactorily tested. Where insufficient original welded assembly is available, a new assembly is to be prepared using welding consumables from the same batch. If the new assembly is made with the same procedure (particularly the number of runs) as the original assembly, only the duplicate re-test specimens need to be tested. Otherwise, all test specimens are to be prepared and re-tested.

1.10.2 Where the results from a set of three impact test specimens do not comply with the requirements, an additional set of three impact test specimens may be taken provided that not more than two individual values are less than the required average value and, of these, not more than one is less than 70 per cent of the average value. The results obtained are to be combined with the original results to form a new average which, for acceptance, is to be not less than the required value. Additionally, for these combined results not more than two individual values are to be less than the required average value, and of these, not more than one is to be less than 70 per cent of the average value. Further retests may be made at the Surveyor's discretion, but these must be made on a new welded assembly and must include all tests required for the original assembly, even those which were previously satisfactory.

1.11 Chemical composition

1.11.1 The chemical analysis of the weld metal made by the electrode is to be supplied by the manufacturer.

Section 2

Electrodes for Normal Penetration Manual Welding

2.1 General

2.1.1 Based on the results of the Charpy V-notch impact tests, electrodes are divided into the following grades:-

For normal strength steel - Grades 1, 2 and 3

For higher tensile steel with minimum yield strength upto 355 [N/mm^2] - Grades 2Y, 3Y and 4Y. (Grade 1Y not applicable for manual welding).

For higher strength steels with minimum yield strength upto 390 [N/mm^2] - Grades 2Y40, 3Y40 and 4Y40.

2.1.2 If the electrodes are in compliance with the requirements of the hydrogen test given in 2.5, a suffix H, HH or HHH will be added to the grade mark.

2.1.3 For initial approval the tests specified in this Section including hydrogen test, if applicable, are to be carried out.

2.2 Deposited metal tests

2.2.1 Two deposited metal test assemblies are to be prepared in the downhand position as shown in Fig.2.2.1, one using 4 [mm] electrodes and the other using the largest size manufactured. If an electrode is manufactured in one diameter only, one test assembly is sufficient. Any grade of ship structural steel may be used for the preparation of these test assemblies.

2.2.2 The weld metal is to be deposited in single or multi-run layers according to normal practice and the direction of each layer is to alternate from each end of the plate, each run of the weld metal being not less than 2 [mm] and not more than 4 [mm] thick. Between each run the assembly is to be left in still air until it has cooled to 250°C but not less than 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded the test assemblies are not to be subjected to any heat treatment.

2.2.3 One tensile and three impact test specimens are to be taken from each test assembly as shown in Fig.2.2.1. The impact test specimens are to be cut perpendicular to the weld, with their axes 10 [mm] from the upper surface of the plate. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.

2.2.4 The chemical analysis of the deposited weld metal in each test assembly is to be supplied by the manufacturer and is to include the content of all significant alloying elements.

2.2.5 The results of all tests are to comply with the requirements of Table 2.2.1 as appropriate.

Table 2.2.1 : Requirements for deposited metal tests (covered electrodes)					
Grade	**Yield stress [N/mm^2] min.**	**Tensile strength [N/mm^2]**	**Minimum elongation on 50 mm gauge length [%]**	**Impact Tests**	
				Test temp. °C	**Average energy J min.**
1 2 3	305	400 - 560	22	20 0 -20	47
2Y 3Y 4Y	375	490 - 660	22	0 -20 -40	47
2Y40 3Y40 4Y40	400	510 - 690	22	0 -20 -40	47

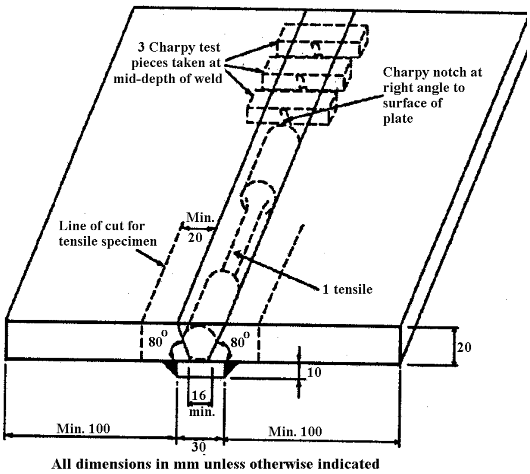

Fig.2.2.1 : Deposited metal test assembly

2.3 Butt weld tests

2.3.1 Butt weld assemblies as shown in Fig.2.3.1 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward and overhead) for which the electrode is recommended by the manufacturer, except that electrodes satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position.

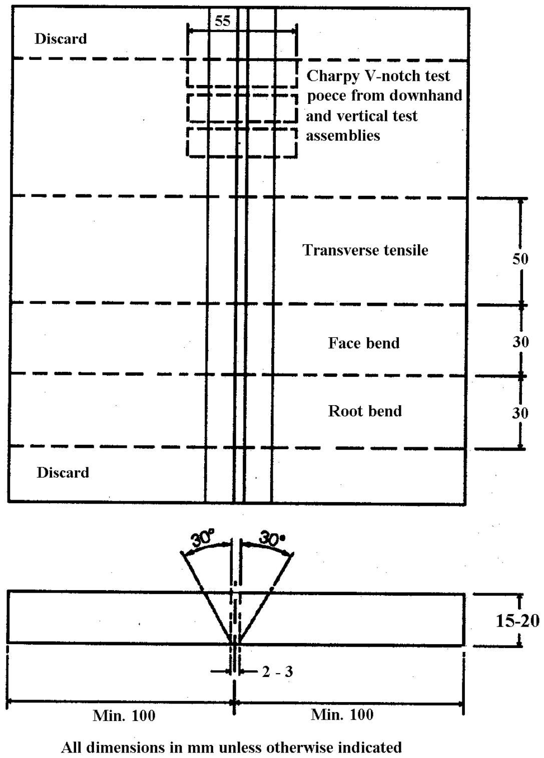

Fig.2.3.1 : Butt weld test assembly

Table 2.3.1 : Requirements for butt weld test (covered electrodes)

Grade	Tensile strength [N/mm^2] min. (transverse test)	Charpy V-notch impact test		
		Test temp. °C	Average energy J min.	
			Down-hand horizon-tal vertical, over-head	Vertical (upward and down-ward)
1 2 3	400	20 0 -20	47	34
2Y 3Y 4Y	490	0 -20 -40	47	34
2Y40 3Y40 4Y40	510	0 -20 -40	47	39

2.3.2 Where the electrode is only to be approved in the downhand position an additional test assembly is to be prepared in that position.

2.3.3 The grades of steels used for the preparation of the test assemblies are to be as follows:

Grade 1 electrodes	A
Grade 2 electrodes	A, B, D
Grade 3 electrode	A, B, D, E
Grade 2Y electrode	AH32, AH36, D32, D36
Grade 3Y electrode	AH32, AH36, DH32, DH36, EH32, EH36
Grade 4Y electrodes	AH32, AH36, DH32, DH36, EH32, EH36, FH32, FH36
Grade 2Y40 electrodes	AH40, DH40
Grade 3Y40 electrodes	AH40, DH40, EH40
Grade 4Y40 electrodes	AH40, DH40, EH40, FH40

2.3.4 Where higher strength steel with minimum yield strength 315 [N/mm^2] is used for grade 2Y, 3Y and 4Y electrodes, the actual tensile strength of the steel is to be not less than 490 [N/mm^2]. The chemical composition including the content of grain refining elements is to be reported.

2.3.5 The following welding procedure should be adopted in making the test assemblies:-

DOWNHAND (a)

First run with 4 [mm] diameter electrode. Remaining runs (except last two layers) with 5 [mm] diameter electrodes or above according to the normal welding practice with the electrodes. The runs of the last two layers with the largest size of electrode manufactured.

DOWNHAND (b)

Where a second downhand test is required:-

First run with 4 [mm] diameter electrode. Next run with an intermediate size electrode 5 [mm] or 6 [mm] diameter and the remaining runs with the largest size of electrode manufactured.

HORIZONTAL-VERTICAL

First run with 4 [mm] or 5 [mm] diameter electrode, subsequent runs with 5 [mm] diameter electrodes.

VERTICAL UPWARDS AND OVERHEAD

First run with 3.25 [mm] diameter electrode. Remaining runs with 4 [mm] diameter electrodes or possibly 5 [mm] diameter electrodes if this is recommended by the manufacturer for the positions concerned.

VERTICAL DOWNWARD

The method to be adopted is to be as recommended by the manufacturer.

2.3.6 In all cases the back sealing runs are to be made with 4 [mm] diameter electrodes in the welding position appropriate to each test sample after cutting out the root run to clean metal. For electrodes suitable for downhand welding only, the test assemblies may be turned over to carry out the back sealing run.

2.3.7 The butts are to be welded using normal welding practice and between each run the assembly is to be left in still air until it has cooled to 250°C but not below 100°C, the temperature being taken in the centre of the weld, on the surface of the seam.

2.3.8 After being welded, the test assemblies are not to be subjected to any heat treatment.

2.3.9 It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain any defects in the weld prior to testing.

2.3.10 From each test assembly one tensile, one face and one root bend and a set of three Charpy V-notch test specimens are to be prepared, except that the impact test specimens need not be prepared for test assemblies welded in the overhead position.

2.3.11 The results of all mechanical testing are to comply with the requirements of Table 2.3.1. The position of the fracture in the transverse tensile test is to be reported. The bend test specimens can be considered as complying with the requirements if, after bending, no crack or defect having dimensions exceeding 3 [mm] can be seen on the outer surface of the test specimen.

2.4 Fillet weld tests

2.4.1 When an electrode is submitted for approval for fillet welding only and to which butt weld tests, as per 2.3, are not considered applicable, the initial approval tests are to consist of the fillet weld test, described herein, and the deposited metal test as per 2.2. When the electrode is submitted for approval for both butt and fillet welding, the initial approval is to include one fillet weld test as detailed hereunder and welded in the horizontal-vertical position in addition to the tests required by 2.2 and 2.3.

2.4.2 Fillet weld assemblies as shown in Fig.2.4.1 are to be prepared for each welding position (horizontal-vertical, vertical-upwards, vertical- downwards or overhead) for which the electrode is recommended by the manufacturer. The grade of steel used is to be in accordance with 2.3.3 as appropriate. The test assemblies are to be welded using an electrode of a diameter recommended by the manufacturer. The length of the test assembly, L, is to be sufficient to allow at least the deposition of the entire length of the electrode being tested.

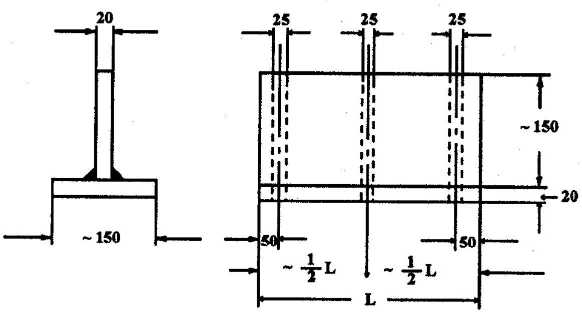

Fig.2.4.1 : Fillet weld test assembly

The first side is to be welded using the maximum size of electrode manufactured and the second side is to be welded using the minimum size of electrode manufactured and recommended for fillet welding. The fillet size will in general be determined by the electrode size and the welding current employed during testing.

2.4.3 The assembly is to be sectioned to form three macro sections each about 25 [mm] thick and the hardness readings are to be made in each section as indicated in Fig.2.4.2. The hardness of the weld is to be determined and is to meet the following listed equivalent values:-

a) Diamond Pyramid Hardness (98 N load) = 150 minimum

b) Rockwell (980 N load) B = 80 minimum

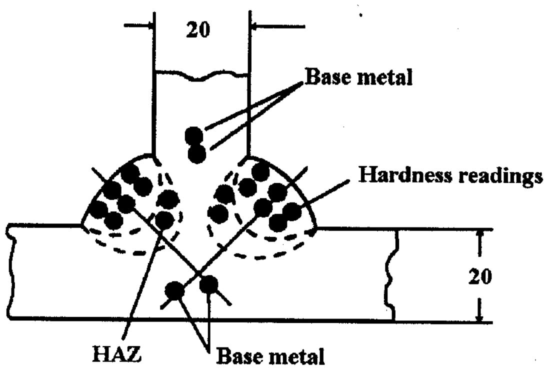

Fig.2.4.2 : Hardness tests for fillet weld test

2.4.4 The hardness of both heat affected zone and base metal is also to be determined and is to be reported for information.

2.4.5 One of the remaining sections of the assembly is to have the weld on the first side gouged or machined to facilitate breaking the fillet weld on the second side by closing the two plates together, subjecting the root of the weld to tension. On the other remaining section the weld on the second side is to be gouged or machined and the section fractured using the same procedure. The fractured surfaces are to be examined and there should be no evidence of incomplete penetrations, nor internal cracking and they should be reasonably free from porosity.

2.5 Hydrogen test

2.5.1 At the request of the manufacturer, electrodes may be submitted to a hydrogen test. A suffix H, HH or HHH will be added to the grade number to indicate compliance with the requirements of this test.

2.5.2 The mercury method as specified in the Standard ISO 3690-2000, or any method which correlates to that method may be used. Alternatively, the glycerine method as described below is to be used.

2.5.3 Glycerine method

a) Four test specimens are to be prepared measuring 12 x 25 [mm] in cross- section by about 125 [mm] in length. The parent metal may be any grade of ship building steel and, before welding, the specimens are to be weighed to the nearest 0.1 gram. On the 25 [mm] surface of each test specimen a single bead of welding is to be deposited about 100 [mm] in length by a 4 [mm] electrode using about 150 [mm] of the electrode. The welding is to be carried out with as short an arc as possible and with a current of about 150 amperes. The electrode prior to welding, can be submitted to the normal drying process recommended by the manufacturer.

b) Within thirty seconds of the completion of welding of each specimen the slag is to be removed and the specimen quenched in water at approximately 20°C. After a further thirty seconds the specimens are to be cleaned and placed in an apparatus suitable for the collection of hydrogen by displacement of glycerine. The glycerine is to be kept at a temperature of 45°C during the test. All the four specimens are to be welded and placed in the hydrogen collecting apparatus within 30 minutes.

c) The specimens are to be kept immersed in the glycerine for a period of 48 hours and, after removal, are to be cleaned in water and spirit, dried and weighed to the nearest 0.1 gram to determine the amount of weld deposited. The amount of gas evolved is to be measured to the nearest 0.05 [cm^3] and corrected for temperature and pressure to 20C and 760 [mm] Hg.

2.5.4 The individual and average diffusible hydrogen contents of the four specimens are to be reported, and the average value in [cm^3] per 100 grams is not to exceed the following:

Mark	Mercury method (ISO 3690-1977)	Glycerine Method
H	15	10
HH	8	5
HHH	5	
Note : For HHH mark, only mercury method is to be used		

2.6 Covered electrodes for gravity or contact welding

2.6.1 Where an electrode is submitted solely for approval for use in contact welding using automatic gravity or similar welding devices, deposited metal tests (see 2.2), fillet weld tests (see 2.4) and, where appropriate, butt weld tests (see 2.3) similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer.

2.6.2 Where an electrode is submitted for approval for use in contact welding using automatic gravity or similar welding devices in addition to normal manual welding, fillet weld tests (see 2.4) and, where appropriate, butt weld tests (see 2.3) similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer and these tests are to be in addition to the normal approval tests.

2.6.3 In the case of approval of a fillet welding electrode using automatic gravity or similar contact welding devices, the fillet welding is to be carried out using the welding process recommended by the manufacturer, with the longest size of electrode manufactured. The manufacturer's recommended current range is to be reported for each electrode.

2.6.4 Where approval is requested for the welding of both normal strength and higher tensile steels, the assemblies are to be prepared using higher tensile steel.

2.7 Annual tests

2.7.1 For normal penetration electrodes, the annual tests are to consist of two deposited metal test assemblies. These are to be prepared and tested in accordance with 2.2. If an electrode is available in one diameter only, one test assembly is sufficient.

2.7.2 Where an electrode is approved solely for gravity or contact welding, the annual test is to consist of one deposited metal test assembly using the gravity or other contact device as recommended by the manufacturer.

2.8 Upgrading and uprating

2.8.1 Upgrading and uprating will be considered only at the manufacturer's request and preferably at the time of annual testing. Tests on butt weld assemblies, in addition to the requirements of annual testing, are to be carried out.

2.9 Certification

2.9.1 Each carton or package of approved electrode is to contain a certificate from the manufacturer generally in accordance with the following:-

"The .... company certifies that composition and quality of these electrodes conform with those of the electrodes used in making the test pieces submitted to and approved by Indian Register of Shipping."

Section 3

Deep Penetration Electrodes for Manual Welding

3.1 General

3.1.1 Where an electrode is designed solely for the deep penetration welding of downhand butt joints and horizontal-vertical fillets, only the test detailed in 3.2 and 3.3 are required for initial approval purposes.

3.1.2 Deep penetration electrodes will only be approved as complying with Grade 1 requirements. The suffix D.P. will be added.

3.1.3 Where a manufacturer recommends that an electrode having deep penetrating properties can also be used for downhand butt welding of thicker plates with prepared edges, the electrode will be treated as normal penetration electrode, and the full series of tests in the downhand position is to be carried out as per normal penetration electrode, together with deep penetration tests given in 3.2 and 3.3.

3.1.4 Where a manufacturer desires to demonstrate that an electrode in addition to its use as normal penetration electrode also has deep penetrating properties when used for downhand butt welding and horizontal - vertical fillet welding, the additional tests given in 3.2 and 3.3 are to be carried out.

3.1.5 Where the manufacturer prescribes a different welding current and procedure for the electrode when used as a deep penetration electrode and a normal penetration electrode, the recommended current and procedure are to be used when making the test specimens in each case.

3.2 Deep penetration butt weld tests

3.2.1 Two plates of thickness equal to twice the diameter of the core of the electrode plus 2 [mm] are to be butt welded together with one downhand run of welding from each side. The plates are to be not less than 100 [mm] wide and of sufficient length to allow the cutting out of the test specimens of the correct number and size as shown in Fig.3.2.1. Grade A steel is to be used for these test assemblies. The joint edges are to be prepared square and smooth and, after tacking, the gap is not to exceed 0.25 [mm].

3.2.2 The test assembly is to be welded using a 8 [mm] diameter electrode or the largest diameter size manufactured if this is less than 8 [mm].

3.2.3 After welding the test assembly is to be cut to form two transverse tensile test pieces, two bend test pieces and three Charpy V-notch test pieces as shown in Fig.3.2.1. The results of tensile and impact testing are to comply with the requirements of Table 2.3.1 for Grade 1 electrodes.

3.2.4 The discards at the end of the welded assemblies are to be not more than 35 [mm] wide. The joints of these discards are to be polished and etched and must show complete fusion and interpenetration of the welds. At each cut in the test assembly the joints are also to be examined to ensure that complete fusion has taken place.

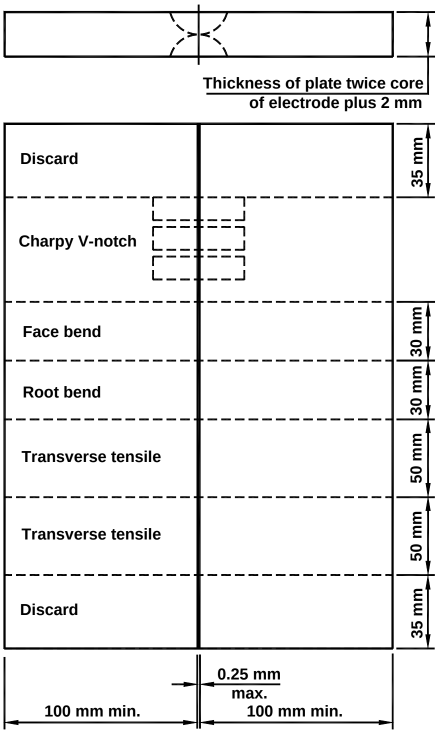

Fig. 3.2.1 : Deep penetration butt weld test assembly

3.3 Deep penetration fillet weld test

3.3.1 A fillet weld assembly is to be prepared as shown in Fig.3.3.1 with plates about 12.5 [mm] in thickness. The welding is to be carried out with one run for each fillet with plate A in the horizontal plane during the welding operations. The length of the fillet is to be 160 [mm] and the gap between the plates is to be not more than 0.25 [mm]. Grade A steel is to be used for these test assemblies.

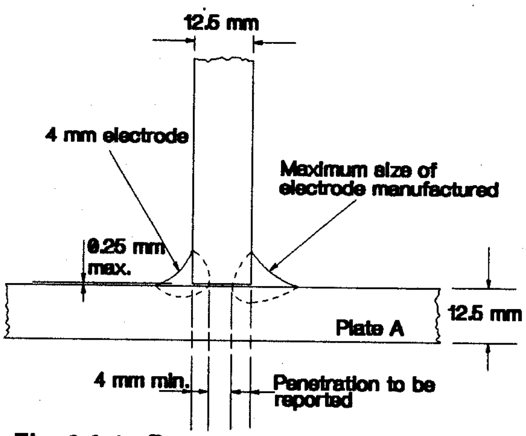

Fig. 3.3.1 : Deep penetration fillet weld test assembly

3.3.2 The fillet weld on one side of the assembly is to be carried out with 4 [mm] electrode and that on the other side with the maximum size of the electrode manufactured. The welding current used is to be within the range recommended by the manufacturer and the welding is to be carried out using normal welding practice.

3.3.3 The welded assembly is to be cut by sawing or machining within 35 [mm] of the ends of the fillet welds and the joints are to be polished and etched. The welding of the fillet made with a 4 [mm] electrode is to show a penetration of 4 [mm] (See Fig.3.3.1) and the corresponding penetration of the fillet made with the maximum size of electrode manufactured is to be reported.

3.4 Electrodes designed for gravity or contact welding

3.4.1 This type of approval is available for welding only normal strength and higher tensile steels with minimum specified yield strengths up to 345 [N/mm^2].

3.4.2 Where an electrode is submitted solely for approval for use in contact welding using automatic gravity or similar welding devices, deposited metal tests, and where appropriate, fillet weld tests similar to those for normal manual electrodes are to be carried out using the process for which the electrode is recommended by the manufacturer.

3.4.3 Where an electrode is submitted for approval for use in contact welding using automatic gravity or similar welding devices in addition to normal manual welding, butt weld and, where appropriate, fillet weld tests, using gravity or other contact device as recommended by the manufacturer, are to be carried out in addition to the normal approval tests.

3.5 Annual tests

3.5.1 Where an electrode is approved only for deep penetration welding, the annual test is to consist of one butt welded test assembly in accordance with 3.2.

3.5.2 Where an electrode is approved for both normal and deep penetration welding, annual tests are to consist of following:-

a) Two deposited metal test assemblies in accordance with 2.2; and

b) One butt welded test assembly in accordance with 3.2.

3.5.3 Where an electrode is approved solely for gravity or contact welding, the annual test is to consist of one deposited metal test assembly using the gravity or other contact device as recommended by the manufacturer.

3.6 Certification

3.6.1 Each carton or package of approved electrodes is to contain a certificate from the manufacturer generally in accordance with 2.9.

Section 4

Wire-flux Combinations for Submerged Arc Automatic Welding

4.1 General

4.1.1 Wire-flux combinations for single electrode submerged-arc automatic or semi-automatic welding are divided into following two categories:-

a) For use with multi-run technique;

b) For use with two-run technique.

Where wire-flux combinations are suitable for welding with both the techniques, tests are to be carried out for each technique.

Wire-flux combinations for multiple electrode submerged arc welding will be subject to separate approval tests. They are to be carried out generally in accordance with the requirements of this section.

4.1.2 Dependent on the results of impact tests, wire-flux combinations are divided into the following grades:-

For normal strength steel - Grades 1, 2 or 3;

For higher strength steel with minimum yield strength upto 355 [N/mm^2] - Grades 1Y, 2Y, 3Y or 4Y.

For higher strength steels with minimum yield strength upto 390 [N/mm^2] - Grades 2Y40, 3Y40 or 4Y40.

4.1.3 The suffixes T, M or TM will be added to the grade mark to indicate two-run technique, multi-run technique or both techniques respectively.

4.1.4 The welding current may be either a.c. or d.c. (electrode positive or negative) according to the recommendation of the manufacturer. If both a.c. and d.c. are recommended, a.c. is to be used for the tests.

4.2 Multi-run technique

4.2.1 When approval for use with multi-run technique is required, deposited metal and butt weld tests are to be carried out in accordance with 4.3 and 4.4 respectively.

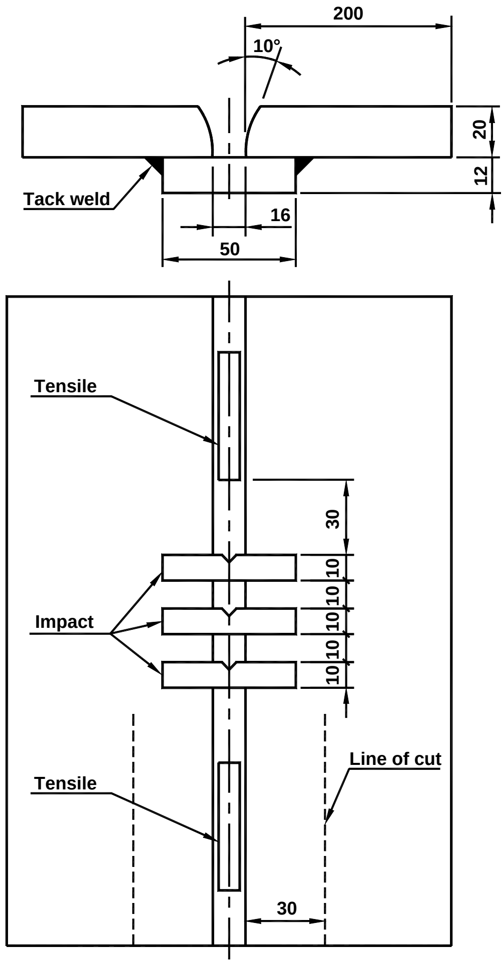
4.3 Deposited metal tests

4.3.1 An all weld metal test assembly is to be prepared in the downhand position as shown in Fig.4.3.1, using any grade of hull structural steel.

4.3.2 The bevelling of the plate edges is to be carried out by machining or mechanized gas cutting. In the latter case any remaining scale is to be removed from the bevelled edges.

4.3.3 The direction of deposition of each run is to alternate from each end of the plate and after completion of each run the flux and welding slag is to be removed. Between each run the assembly is to be left in still air until it has cooled to 250°C but not below 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. The thickness of the layer is to be not less than the diameter of the wire but not less than 4 [mm].

4.3.4 The welding conditions (amperage, voltage and rate of travel) are to be in accordance with the recommendations of the manufacturer and are to conform with normal good welding practice for multi-run welding.



All dimensions in mm unless otherwise indicated

Fig. 4.3.1 : Deposited metal test assembly

4.3.5 The welded assembly is to be cut longitudinally at a distance of 30 [mm] from the edges of the weld and then cut transversely.

4.3.6 Two longitudinal tensile and three impact test specimens are to be taken from each test assembly as shown in Fig.4.3.1. Care is to be taken that the axes of the tensile test specimens coincide with the centre of the weld and the midthickness of the plates. The impact test specimens are to be cut perpendicular to the weld with their axes 10 [mm] from the upper surface. The notch is to be positioned in the centre of the weld and cut in the face of the test specimen perpendicular to the surface of the plate.

4.3.7 The results of all tests are to comply with requirements of Table 4.3.1 as appropriate. The chemical analysis of the deposited weld metal including the content of the significant alloying elements is to be submitted by the manufacturer.

Table 4.3.1 : Requirements for deposited metal tests (wire-flux combinations)

Grade	Yield stress [N/mm^2]	Tensile strength [N/mm^2]	Elongation on 50 mm gauge length % min.	Charpy V-notch impact	
				Test temp. °C	Avg. energy - J min.
1 2 3	305	400 - 560	22	20 0 -20	34
1Y 2Y 3Y 4Y	375	490 - 660	22	20 0 -20 -40	34
2Y40 3Y40 4Y40	400	510 - 690	22	0 -20 -40	39

4.4 Butt weld test (two-run technique)

4.4.1 Two welded assemblies for each grade of wire-flux combination are to be prepared in accordance with Fig.4.4.1, using the following plate thicknesses:-

For Grades 1 and 1Y	12 to 15 [mm] and 20 to 25 [mm]
For Grades 2, 2Y, 3, 3Y and 4Y	20 to 25 [mm] and 30 to 35 [mm]
For Grades 2Y40, 3Y40 and 4Y40	20 to 25 [mm] and 30 to 35 [mm]

A limitation of the approval to the medium range (upto the maximum welded plate thickness) may be agreed in which case the test assemblies are to be welded using plates of 12 to 15 [mm] and 20 to 25 [mm] irrespective of the grade for which the approval is requested.

Where approval is requested for welding of both normal strength and higher tensile steel, two assemblies are to be prepared using higher tensile steel.

4.4.2 The maximum diameter of wire, grades of steel plate and edge preparation to be used are to be in accordance with Table 4.4.2. Small deviations in the edge preparation may be allowed if requested by the manufacturer. The bevelling of the plate edges is to be performed by machining or mechanized gas cutting. In the latter case any remaining scale is to be removed from the bevelled edges. The root gap should not exceed 1.0 [mm].

Table 4.4.2 : Butt weld test assemblies (two-run technique)

Plate thick-ness [mm]	Recommended preparation [mm]	Max. diameter of wire [mm]	Grade of wire-flux combi-nation	Grade of normal strength steel	Grade of higher strength steel
About 12 -15		5	1	A	-
			1Y	-	AH32 AH36
About 20 - 25		6	1	A	-
			1Y	-	AH32, AH36
			2	A,B or D	-
			2Y	-	AH32, AH36, DH32, DH36
			2Y40	-	AH40, DH40
			3	A,B,D or E	-
			3Y	-	AH32, AH36, DH32 DH36, EH32, EH36
			3Y40	-	AH40, DH40, EH40
			4Y	-	AH32, AH36, DH32, DH36 EH32, EH36, FH32, FH36
			4Y40	-	AH40, DH40, EH40, FH40
About 30 - 35		7	2	A, B or D	-
			2Y	-	AH32, AH36, DH32, DH36
			2Y40	-	AH40, DH40
			3	A, B, D or E	-
			3Y	-	H32, AH36, DH32, DH36, EH32, EH36
			3Y40	-	AH40, DH40, EH40
			4Y	-	AH32, AH36, DH32, DH36, EH32, EH36, FH32, FH36
			4Y40	-	AH40, DH40, EH40, FH40

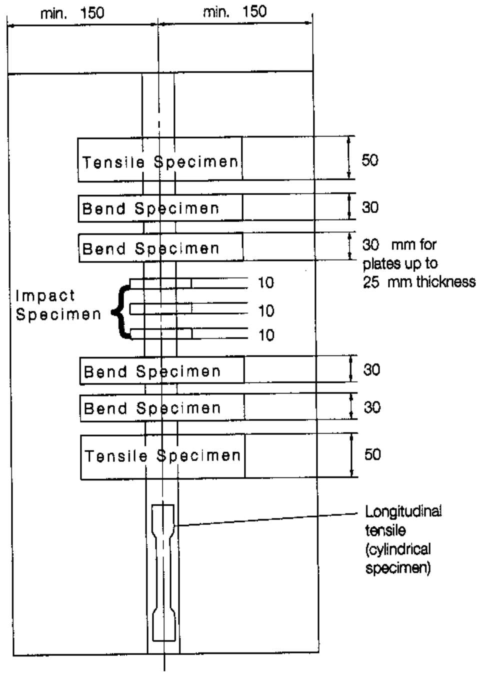


Fig.4.4.1 : Butt weld test assembly (two-run technique)

4.4.3 The welding current may be either a.c. or d.c. (electrode positive or negative) according to the recommendation of the manufacturer. If both a.c. and d.c. are recommended a.c. is to be used for test pieces.

4.4.4 Each butt weld is to be welded in two runs, one from each side, using amperages, voltages and travel speeds in accordance with the recommendations of the manufacturer and normal good welding practice.

4.4.5 After completion of the first run, the flux and welding slag are to be removed and the assembly is to be left in still air until it has cooled to 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. After being welded the test assemblies are not to be subjected to any heat treatment.

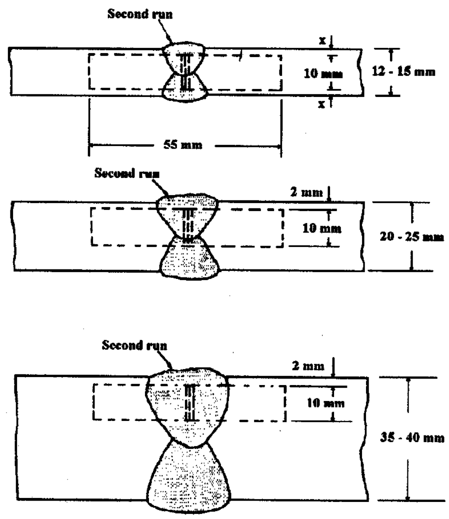

Fig. 4.4.3 : Butt weld test assemblies - two-run technique : position of impact test specimens

4.4.6 It is recommended that welded assemblies be subjected to radiographic examination to ascertain any defects in the weld prior to testing.

4.4.7 The assemblies are to be cut transversely, to form two tensile test pieces and two bend test pieces as shown in Fig.4.4.1, three impact test pieces as shown in Fig.4.4.1 and Fig.4.4.3. The edges of all test pieces and also the discards are to be examined to ensure complete fusion and interpenetration of welds.

4.4.8 Where the wire-flux combination is to be used for two-run technique only, a longitudinal test is also to be made in accordance with Fig.4.5.1 on the thicker plate tested.

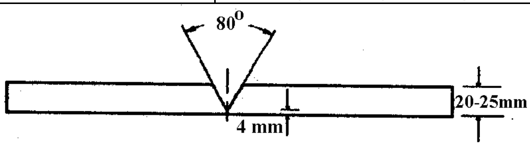
4.4.9 The results of the transverse tensile and impact tests are to comply with the requirements of Table 4.5.1 as appropriate. The results of longitudinal tensile test are to comply with the requirements of Table 4.3.1 as appropriate except that for Grades 1Y, 2Y and 3Y the tensile strength is not to be less than 490 [N/mm^2].

4.5 Butt weld test (multi-run technique)

4.5.1 A butt weld assembly, as shown in Fig.4.5.1, is to be prepared in the downhand position by welding together two 20 [mm] thick plates of not less than 150 [mm] in width and of sufficient length to allow the cutting out of test specimens of the prescribed number and size.

4.5.2 The grade of steel used for the preparation of the test assembly is to be as follows:-

Grade 1 wire-flux combination	Grade A
Grade 2 wire-flux combinations	Grade A, B, D
Grade 3 wire-flux combinations	Grade A, B, D, E
Grade 1Y wire-flux combinations	Grade AH32, AH36
Grade 2Y wire-flux combinations	AH32, AH36, DH32, DH36
Grade 3Y wire-flux combinations	AH32, AH36, DH32, DH36, EH32, EH36
Grade 4Y wire-flux combinations	AH32, AH36, DH32, DH36, EH32, EH36, FH32, FH36
Grade 2Y40 wire-flux combinations	AH40, DH40
Grade 3Y40 wire-flux combinations	AH40, DH40, EH40
Grade 4Y40 wire-flux combinations	AH40, DH40, EH40, FH40



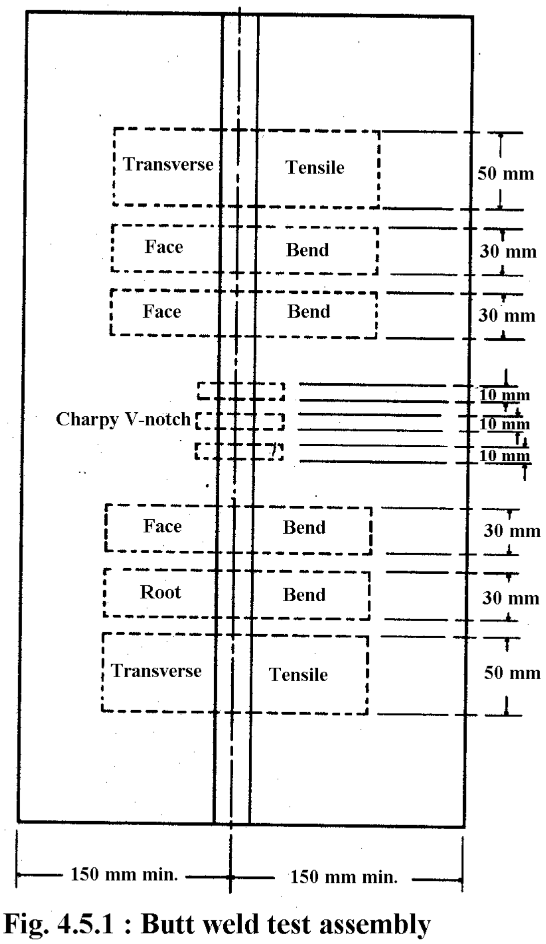


Fig. 4.5.1 : Butt weld test assembly (multi-run technique)

4.5.3 Welding is to be carried out in the downhand position, and the direction of deposition of each run is to alternate from each end of the plate. After completion of each run, the flux and welding slag is to be removed. Between each run the assembly is to be left in still air until it has cooled to less than 250°C but not below 100°C, the temperature being taken in the centre of the weld, on the surface of the seam. The thickness of the layer is to be not less than the diameter of the wire nor less than 4 [mm].

4.5.4 The plate edges are to be prepared to form a single vee joint, the included angle between the fusion faces being 60 degrees and the root face being 4 [mm]. The bevelling of the plate edges is to be carried out by machining or mechanized gas cutting. In the latter case, any remaining scale is to be removed from the bevelled edges.

4.5.5 The welding is to be carried out by the multi-run technique and the welding conditions are to be the same as those adopted for the deposited metal test assembly.

4.5.6 The back sealing run is to be applied in the downhand position after cutting out the root run to clean metal. After being welded the test assembly is not to be subjected to any heat treatment.

4.5.7 It is recommended that the welded assembly be subjected to radiographic examination to ascertain any defects in the weld prior to testing.

4.5.8 The test assembly is to be cut to form two tensile; two face bend; two root bend; three impact test pieces as shown in Fig.4.5.1.

4.5.9 The results of all tensile and impact test specimens are to comply with the requirements of Table 4.5.1 as appropriate. The position of the fracture of the transverse tensile test is to be reported.

Table 4.5.1 : Requirements for butt weld tests (wire flux-combination)

Grade	Tensile strength (transverse test) [N/mm^2] min.	Charpy V-notch impact test	
		Test temp. °C	Avg. energy J min. (See note)
1 2 3	400	20 0 -20	34
1Y 2Y 3Y 4Y	490	20 0 -20 -40	34
2Y40 3Y40 4Y40	510	0 -20 -40	39
Note : No individual impact test value is to be less than 23J			

4.6 Annual tests

4.6.1 Following tests on wire-flux combinations are to be carried out at the time of annual inspection:-

a) For two-run technique :- On butt weld assembly with 20 [mm] minimum plate thickness : One transverse tensile, two transverse bends and three impact tests. One longitudinal tensile test specimen is also to be prepared where the wire-flux combination is approved solely for the two-run technique.

b) For multi-run technique :- Deposited metal Tests - One tensile and three impact tests in accordance with 4.3.

4.6.2 The specimens are to be prepared and tested in accordance with, and on grades of steel specified for initial approval tests and the results are to comply with the results of the approved grade.

4.7 Upgrading and uprating

4.7.1 Requests for upgrading and uprating will generally be considered at the time of annual testing and additional tests in accordance with the requirements of 2.8 would be required.

Section 5

Wires and Wire-gas Combinations for Semi-automatic and Automatic Welding

5.1 General

5.1.1 Wire-gas combinations and flux-cored or flux-coated wires (for use with or without a shielding gas) are divided into following categories for the purposes of approval testing:-

a) For use in semi-automatic multi-run welding;

b) For use in single electrode multi-run automatic welding; and

c) For use in single electrode two-run automatic welding.

5.1.2 The term 'semi-automatic' is used to describe processes in which the weld is made manually by a welder holding a gun through which the wire is continuously fed. A suffix S will be added after the grade mark to indicate approval for semi-automatic multi-run welding.

5.1.3 Dependent on the results of impact tests, wires and wire-gas combinations are divided into the following grades:-

For normal strength steel	Grades 1, 2 and 3
For higher strength steel with minimum yield strength upto 355 [N/mm^2]	Grades 1Y, 2Y, 3Y and 4Y.
For higher strength steels with minimum yield strength upto 390 [N/mm^2]	Grades 2Y40, 3Y40 and 4Y40

5.1.4 For wires intended for automatic welding, the suffixes T, M or TM will be added after the grade mark to indicate approval for two-run, multi- run or both welding techniques, respectively.

5.1.5 For wires intended for both semi-automatic and automatic welding, the suffixes will be added in combination.

5.1.6 Where applicable, the composition of the shielding gas is to be reported. Unless otherwise agreed, additional approval tests are required when the shielding gas is different from that used for the original approval tests.

Where a wire in combination with any particular gas has been approved, usage of the same wire with another gas in the same group as defined in Table 5.1.6 may be considered.

5.1.7 Flux-cored or flux-coated wires which have satisfied the requirements for Grades 2, 2Y, 2Y40, 3, 3Y, 3Y40, 4Y or 4Y40 may, at the option of the manufacturer, be submitted to the hydrogen test as detailed in 2.5 using the manufacturer's recommended welding conditions and adjusting the deposition rate to give a weight of weld deposit per sample similar to that deposited when using manual electrodes. A suffix H, HH or HHH will be added to the grade mark, in the same conditions as for manual arc welding electrodes to indicate compliance with the requirements of the test.

Table 5.1.6 : Compositional limits of designated groups of gas types and mixtures

Group		Gas Composition (Vol. %)			
		CO_2	O_2	H_2	Ar
M1	1	> 0 to 5	-	> 0 to 5	Rest 1) 2)
	2	> 0 to 5	-	-	
	3	-	> 0 to 3	-	
	4	> 0 to 5	> 0 to 3	-	
M1	1	> 5 to 25	-	-	Rest 1) 2)
	2	-	3 to 10	-	
	3	> 5 to 25	> 0 to 3	-	
M1	1	> 25 to 50	-	-	Rest 1) 2)
	2	-	> 10 to 15	-	
	3	> 5 to 50	> 8 to 15	-	
C	1	100	-	-	Rest 1) 2)
	2	Rest	> 0 to 30	-	

1) Argon may be substituted by Helium upto 95% of the Argon content.

2) Approval covers gas mixtures with equal or higher Helium contents only.

5.2 Approval tests for two-run automatic welding

5.2.1 Approval tests for two-run automatic welding are to be carried out generally in accordance with the requirements of Sec.4 using the two-run automatic welding technique for the preparation of all test assemblies.

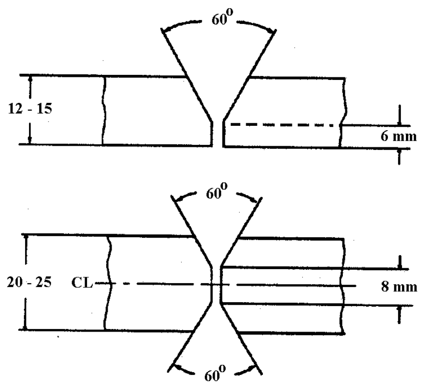

Fig.5.2.1 : Recommended edge preparation for two-run butt weld test assemblies

5.2.2 Two butt weld test assemblies are to be prepared generally as detailed in 4.4.1 and 4.4.2 using plates 12-15 [mm] and 20-25 [mm] in thickness.

5.2.3 If approval is requested for welding plates thicker than 25 [mm], one assembly is to be prepared using plates approximately 20 [mm] in thickness and the other using plates of maximum thickness for which approval is requested.

5.2.4 The edge preparation of test assemblies is to be as shown in Fig.5.2.1. Small deviations in the edge preparation may be allowed, if requested by the manufacturer. For assemblies using plates over 25 [mm] in thickness, the edge preparation is to be reported for information.

5.3 Approval tests for semi-automatic multi-run welding

5.3.1 Approval tests for semi-automatic multi-run welding are to be carried out generally in accordance with the requirements of Sec.2, using the semi-automatic multi-run technique for the preparation of all test assemblies.

5.3.2 Two deposited metal test assemblies are to be prepared in the downhand position as shown in Fig.2.2.1, one using the smallest diameter, and the other using the largest diameter of the wire intended for the welding of ship structures. The weld metal is to be deposited according to the practice recommended by the manufacturer, and the thickness of each layer of weld metal is to be between 2 [mm] and 6 [mm]. Where only one diameter is manufactured, only one deposited metal assembly is to be prepared.

5.3.3 Butt weld assemblies as shown in Fig.2.3.1 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upwards, vertical-downwards and overhead) for which the wire is recommended by the manufacturer.

5.3.4 The downhand assembly is to be welded using, for the first run, wire of 1.2 [mm] diameter or of the smallest diameter manufactured and, for the remaining runs, wire of 2.4 [mm] diameter or the largest diameter manufactured.

5.3.5 Where approval is requested only in the downhand position, an additional butt weld assembly is to be prepared in that position using wires of different diameter from those required by 5.3.4.

5.3.6 The butt weld assemblies, in positions other than downhand, are to be welded using for the first run, wire of 1.2 [mm] diameter or of the smallest diameter manufactured, and for the remaining runs, the largest diameter of wire recommended by the manufacturer for the position concerned.

5.3.7 Fillet weld test in accordance with Sec.2 is to be carried out.

5.4 Approval tests for multi-run automatic welding

5.4.1 Approval tests for multi-run automatic welding are to be carried out generally in accordance with the requirements of Sec.4 using the multi-run automatic welding technique for the preparation of all test assemblies.

5.4.2 One deposited metal test assembly is to be prepared as shown in Fig.4.3.1. Welding is to be as detailed in Sec.4 except that thickness of each layer is to be not less than 3 [mm].

5.4.3 A butt weld assembly is to be prepared, as shown in Fig.4.5.1.

5.5 Annual tests

5.5.1 The annual tests are to consist of at least the following:-

a) Wires approved for semi-automatic or for both semi-automatic and automatic multi-run welding: One deposited metal test assembly prepared in accordance with 5.3 using a wire of diameter within the range intended for the welding of the ship structures;

b) Wires approved for automatic multi-run welding: One deposited metal test assembly prepared in accordance with 5.4 using a wire of diameter within the range intended for the welding of the ship structure;

c) Wires approved for two-run automatic welding: One butt weld test assembly prepared in accordance with 5.2 using plates 20 to 25 [mm] in thickness. The diameter of the wire used is to be reported.

5.5.2 From the test assemblies prepared in accordance with 5.5.1, only the following tests are to be carried out:-

a) For deposited metal assemblies: One tensile and three impact tests;

b) For butt weld assemblies: One transverse tensile, two bend and three impact tests. One longitudinal tensile test is also required where the wire is approved solely for two-run automatic welding.

5.6 Upgrading and uprating

5.6.1 Requests for upgrading and uprating will generally be considered at the time of annual testing and additional tests in accordance with the requirements of 2.8 would be required.

Section 6

Consumables for use in Electro-slag and Electro-gas Vertical Welding

6.1 General

6.1.1 The requirements for the two-run technique as detailed in Sec.4 are applicable for the approval of special consumable used in electro-slag and electro-gas vertical welding with or without consumable nozzles except as otherwise required by the following requirements especially as regards the number and kind of the test-pieces used for the mechanical tests and taken from the butt welded assemblies.

6.1.2 For Grades 1Y, 2Y, 3Y, 4Y, 2Y40, 3Y40 and 4T40 approval of the consumables may be restricted for use only with specific types of higher tensile steel. This is in respect of the content of grain refining elements, and if general approval is required, a niobium treated steel is to be used for the approval tests.

6.1.3 For these special welding consumables, the requirements of 1.3 may not be entirely applicable for technical reasons.

Where approval is requested for welding of both normal strength and higher tensile steel two assemblies are to be prepared using higher tensile steel. Two assemblies prepared using normal strength steel may also be required at the discretion of IRS.

6.2 Butt weld tests

6.2.1 Preparation of test assemblies

- Two butt weld test assemblies are to be prepared, one of them with plates 20/25 [mm] thick, the other with plates 35/40 [mm] thick or more. The grade of the steel to be used for each one of these assemblies must be selected according to the requirements given in the Table 4.4.2.

- The chemical composition of the plate, including the content of grain refining elements is to be reported.

- The welding conditions and the edges preparation are to be those recommended by the welding consumable manufacturer and are to be reported.

6.2.2 Radiographic examination

It is recommended that the welded assemblies be subjected to a radiographic examination to ascertain if there are any defects in the weld prior to the preparation of test specimens.

6.2.3 Test series

- Each assembly shall be cut to give test specimens according to Fig.6.2.1.

The length of the assembly should be sufficient to allow the selection of all the following test specimens :

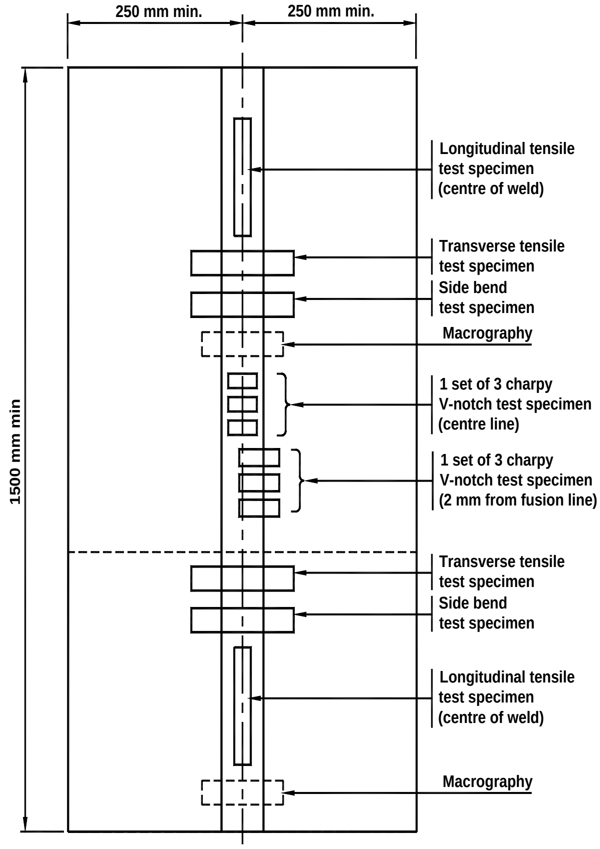

Fig. 6.2.1 : Butt weld test assembly

- 2 longitudinal tensile test specimens with their axis at the centre of the weld;

- 2 transverse tensile test specimens;

- 2 side bend test specimens;

- 2 sets of 3 Charpy-V notch impact test specimens in accordance with Fig.6.2.1 comprising of :

- 1 set with the notch in the axes of the weld;

- 1 set with the notch at 2 [mm] from the fusion line in the deposited metal; and

- 2 macro-sections of the weld (towards the middle of the weld and towards one end).

6.2.4 Results to be obtained

The results of the tensile, bend and impact tests are to comply with the requirements of 4.4 (two-run welding) for the class of filler product in question.

6.3 Annual tests

6.3.1 One test assembly must be prepared from plates 20/25 [mm] thick, and tested as indicated in 6.2.

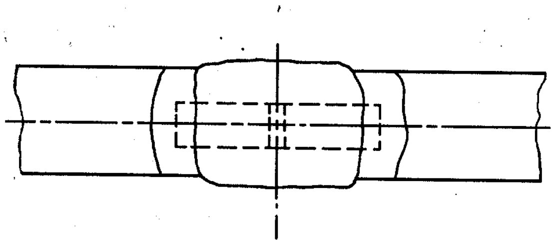
The following specimens are to be selected :

- 1 longitudinal tensile specimen from the axis of the weld:
- 1 transverse tensile specimen;
- 2 side bend specimens;
- 3 Charpy-V specimens notched at the centre of the weld (position 1 Fig.6.3.1);
- 3 Charpy-V specimens cut out transverse to the weld with their notches at 2 [mm] from the fusion line, in the weld; and
- macro section.

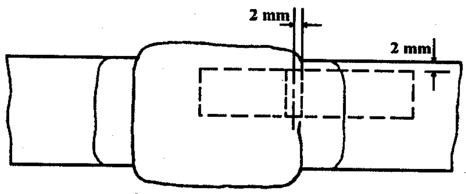
6.3.2 The results to be obtained should meet the requirements given in 4.4 (two-run welding) for the class of the consumables in question.

6.4 Upgrading and uprating

6.4.1 Upgrading and uprating will be considered only at the manufacturers request, preferably at the time of annual testing. Generally, for this purpose, full tests from butt weld assemblies as indicated in 6.2 will be required, irrespective of the other tests requested if the concerned consumable is also approved (and possibly upgraded or uprated) according to Sec.4 or Sec.5.



(1) In the centre of the weld metal



(2) In the weld metal, 2 mm from the fusion line

Fig.6.3.1 : Position of Charpy V-notch impact test specimens

Section 7

Welding Consumables for High Strength Quenched and Tempered and TMCP Steels for Welded Structures

7.1 General

7.1.1 Scope

7.1.1.1 These requirements supplement the requirements of Sections 1 to 6 and give the conditions of approval and inspection of welding consumables used for high strength quenched and tempered or TMCP steels for welded structures according to Ch.3, Sec.4 with yield strength levels from 420 [N/mm^2] upto 690 [N/mm^2] and impact grades AH, DH, EH and FH.

Where no special requirements are given, those of Sections 1 to 6 apply in analogous manner.

7.1.1.2 The welding consumables preferably to be used for the steels concerned are divided into several categories as follows:

- covered electrodes for manual welding,
- wire-flux combinations for multirun submerged arc welding,
- solid wire-gas combinations for arc welding (including rods for gas tungsten arc welding),
- flux cored wire with or without gas for arc welding.

7.1.2 Grading, Designation

7.1.2.1 Based on the yield strength of the weld metal, the welding consumables concerned are divided into six (yield) strength groups:

Y42 for welding steels with minimum yield strength 420 [N/mm^2]

Y46 for welding steels with minimum yield strength 460 [N/mm^2]

Y50 for welding steels with minimum yield strength 500 [N/mm^2]

Y55 for welding steels with minimum yield strength 550 [N/mm^2]

Y62 for welding steels with minimum yield strength 620 [N/mm^2]

Y69 for welding steels with minimum yield strength 690 [N/mm^2]

Wire-flux combinations for single or two-run technique are subject to special consideration of IRS.

7.1.2.2 Each of the six (yield) strength groups is further divided into three main grades in respect of charpy V-notch impact test requirements (test temperatures):

Grade	Test temperature
3	- 20°C
4	- 40°C
5	- 60°C

7.1.2.3 Analogously to the designation scheme used in Section 1 to 6 the welding consumables for high strength quenched and tempered steels are subject to additional designation and approval as follows:

- According to 7.1.2.2 with the quality grades 3, 4 or 5.
- With the added symbol Y and an appended code number designating the minimum yield strength of the weld metal corresponding to 7.1.2.1 : Y42, Y46, Y50, Y55, Y62 and Y69.
- With the added symbol HH or HHH for controlled hydrogen content of the weld metal.
- With the added symbol S (= semi-automatic) for semi-mechanised welding.
- With the added symbol M designating multirun technique and is applicable only to welding consumables for fully mechanised welding).

7.1.2.4 Each higher quality grade includes the one (or those) below, AH, DH steels according to Ch.3, Sec.4 are to be welded using welding consumables of at least quality grade, 3, grade EH steels using at least quality grade 4 and grade FH steels using at least quality grade 5, as per the following table:

Consumables Grade	Steel Grades covered
3Y..	DH..
4Y..	EH..and FH..
5Y..	FH.., EH.. and DH..

7.1.2.5 Welding consumables approved with grades ..Y42, ..Y46 and ..Y50 are also considered suitable for welding steels in the two strength levels below that for which they have been approved. Welding consumables approved with grades ..Y55, ..Y62 and ..Y69 are also considered suitable for welding steels in the strength level below that for which they have been approved.

7.1.2.6 IRS may, in individual cases, restrict the range of application in (up to) such a way, that approval for any one strength level does not justify approval for any other strength level.

7.1.3 Manufacture, testing and approval procedure

7.1.3.1 Manufacturer's plant, production methods and quality control measures shall be such as to ensure reasonable uniformity in manufacture, see also Sec.1.

7.1.3.2 Testing and approval procedure shall be in accordance with Sec.1 and as required in Section 1 to 6 for the individual categories (types) of welding consumables mentioned in 7.1.1.2 above.

7.2 Testing of the weld metal

7.2.1 For testing the deposited weld metal, test pieces analogous to those called for in Sections 1 to 6 respectively shall be prepared, depending on the type of the welding consumables (and according to the welding process). The base metal used shall be a fine-gained structural steel compatible with the properties of the weld metal, or the side walls of the weld shall be buttered with a weld metal of the same composition.

7.2.2 The chemical composition of the deposited weld metal shall be determined and certified in a manner analogous to that prescribed in Sec.2, Cl.2.2.4. The results of the analysis shall not exceed the limit values specified in the standards or by the manufacturer, the narrower tolerances being applicable in each case.

7.2.3 Depending on the type of the welding consumables (and according to the welding process), the test specimens prescribed in Sections 1 to 6 respectively shall be taken from the weld metal test pieces in a similar manner.

7.2.4 The mechanical properties must meet the requirements stated in Table 7.2.1 and Table 7.2.2. The provisions of Sections 1 to 6 apply in analogous manner to the performance of the tests, including in particular the maintenance of the test temperature in the notched bar impact test and the carrying out of results.

7.2.5 Specifications of welding consumables used for welding high strength extremely thick steel plates of thickness more than 50 [mm] but not exceeding 100[mm] of EH47 grade used in container carriers are to be in accordance with Table 7.2.3

7.3 Testing on welded joints

7.3.1 Depending on the type of the welding consumables (and according to the welding process), the testing on the welded joints shall be performed on butt-weld test pieces in a manner analogous to that called for in Sections 1 to 6.

7.3.2 Depending on the type of the welding consumables (and according to the welding process), the butt-weld test pieces called for in para 7.3.1 shall be welded in a manner analogous to that prescribed in Sections 1 to 6. The base metal used shall be a high-strength fine-grained structural steel with an appropriate minimum yield strength and tensile strength and compatible with the added symbol for which application is made.

7.3.3 Depending on the type of the welding consumables (and according to the welding process), the test specimens described in Sections 1 to 6 shall be taken from the butt-weld test pieces.

7.3.4 The mechanical properties must meet the requirements stated in Table 7.3.1. The provisions of Sections 1 to 6 apply in analogous manner to the performance of the tests, including in particular the maintenance of the test temperatures in the notched bar impact test and the requirements regarding the retest specimens.

Table 7.2.1 : Required toughness properties of the weld metal

Quality Grade	Test temp.°C	Min. notch impact energy [J] 1)
3	- 20	Y42: ≥ 47 Y46: ≥ 47
4	- 40	Y50: ≥ 50 Y55: ≥ 55
5	- 60	Y62: ≥ 62 Y69: ≥ 69

1) Charpy V-notch impact test specimen, mean value of three specimens; for requirements regarding minimum individual values and retests, See Section 1

Table 7.2.2 : Required strength properties of the weld metal

Symbols added to quality grade	Min. yield strength or 0.2% proof stress [N/mm^2]	Tensile Strength 1) [N/mm^2]	Minimum elongation [%]
Y42	420	530 - 680	20
Y46	460	570 - 720	20
Y50	500	610 - 770	18
Y55	550	670 - 830	18
Y62	620	720 - 890	18
Y69	690	770 - 940	17

1) The tensile strength of the weld metal may be upto 10% below the requirements, provided that the results obtained with the transverse tensile specimens taken from the welded joints meet the minimum tensile strength requirements stated in Table 7.3.1. The elongation is to be stated in the test report.

Note: For welding very large plate thicknesses where the "supporting effect" of the base material on either side of the weld no longer applies and the tensile strength of the weld metal also determines the tensile strength of the welded joint, it may be necessary, when applying footnote 1), to chose welding consumables of the next higher strength category (next higher added symbol).

Table 7.2.3 : Required strength properties for deposited metal used to weld high strength extremely thick steel plates of thickness more than 50[mm] but not exceeding 100[mm], of EH47 grade used in container carriers,

Mechanical Properties			Impact Test	
Yield Strength [N/mm^2] min.	Tensile Strength [N/mm^2]	Elongation (%) min	Test Temp. [^{o}C]	Average Impact Energy [J] min.
460	570/720	19	-20	53

7.3.5 Where the bending angle required in Table 7.3.1 is not achieved, the specimen may be considered as fulfilling the requirements, if the bending elongation on a gauge length Lo fulfills the minimum elongation requirements stated in Table 7.2.2. The gauge length Lo = Ls + t (Ls = width of weld, t = specimen thickness), see Fig.7.3.1.

7.3.6 Mechanical Properties for Butt weld tests for high strength extremely thick steel plates of thickness more than 50[mm] but not exceeding 100[mm], of EH47 grade used in container carriers are to be as per Table 7.3.2

Table 7.3.1 : Required properties of welded joints

Quality Grade	Added symbol	Min. tensile strength [N/mm^2]	Min. notch impact energy, test temperature	Minimum bending angle [1]	Bend ratio D/t [2]
3 to 5 in accordance with Table 7.2.1	Y42 Y46 Y50 Y55 Y62 Y69	530 570 610 670 720 770	Depending on the quality grade and yield strength in accordance with Table 7.2.1	120°	4 4 4 5 5 5

1) Bending angle attained before the first incipient crack, minor pore exposures upto a maximum length of 3 mm allowed.

2) D = Mandrel diameter, t = specimen thickness

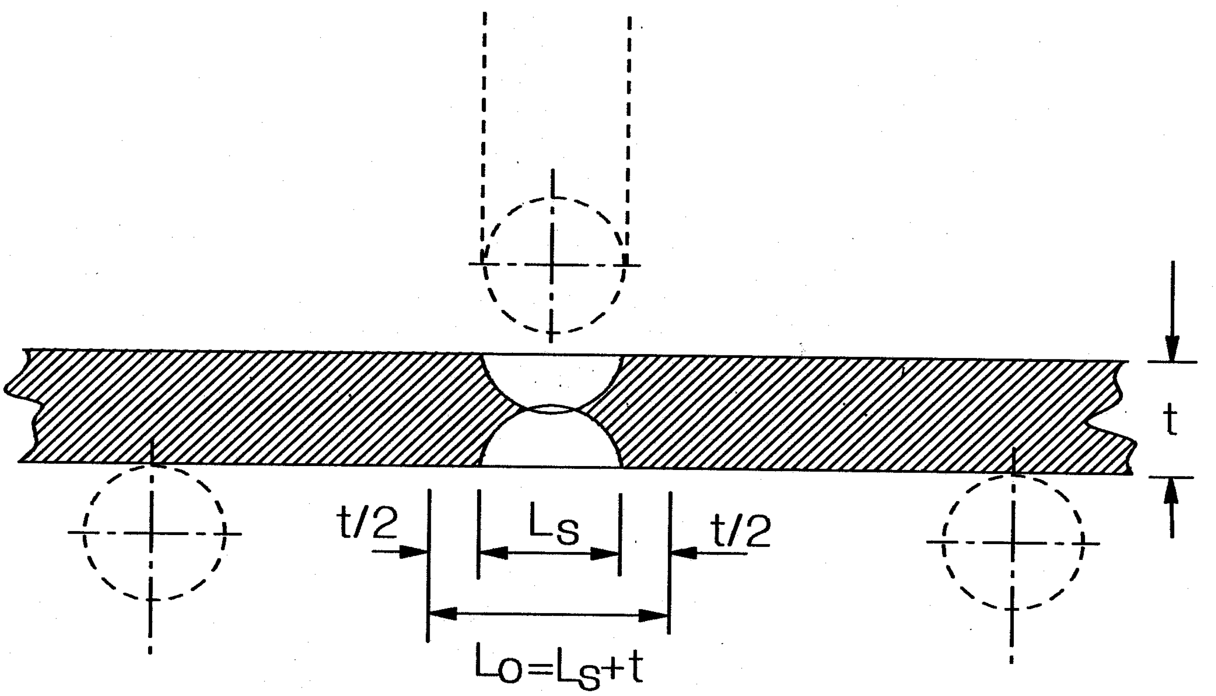


Fig.7.3.1 : Required proportion of welded joints

Table 7.3.2 : Mechanical Properties for Butt weld tests for high strength extremely thick steel plates of thickness more than 50[mm] but not exceeding 100[mm], of EH47 grade used in container carriers

Tensile Strength [N/mm^2]	Bend Test Ratio: D/t	Charpy V-notch Impact Tests		
		Test Temperature (^{o}C)	Average Energy (J) min.	
			Downhand, horizontal-vertical, overhead	Vertical (Upward and Downward)
570-720	4	-20	53	53

7.4 Hydrogen test

7.4.1 The welding consumables, other than solid wire-gas combinations, shall be subjected to a hydrogen test in accordance with the mercury method to ISO 3690, or any other method such as the gas chromatographic method which correlates with that method, in respect of cooling rate and delay times during preparation of the weld samples, and the hydrogen volume determinations.

7.4.2 The diffusible hydrogen content of the weld metal determined in accordance with the provisions of Sec.2, Para 2.5 shall not exceed the limits given in Table 7.4.1.

Table 7.4.1 : Allowable diffusible hydrogen content

Yield strength group	Hydrogen symbol	Max. hydrogen content [cm^3/100 g deposited weld metal]
Y42 Y46 Y50	H 10 (HH)	10

7.5 Annual tests

7.5.1 The annual repeat tests specified in Sections 1 to 6 shall entail the preparation and testing of weld metal test pieces as prescribed under 7.2. In special cases, IRS may require more extensive tests.

Section 8

Consumables for Welding of Aluminium Alloys

8.1 General

8.1.1 Tests for the approval of consumables intended for welding the aluminium alloys detailed in Ch.9 are to be carried out generally in accordance with the requirements of Secs.1,2 and 5, except as otherwise detailed in this Section.

8.1.2 The welding consumables are divided into two categories as follows:

W = wire electrode, wire - gas combinations for metal arc inert gas welding (MIG, 131 according to ISO 4063), tungsten inert gas welding (TIG, 141) or plasma arc welding (15)

R = rod - gas combinations for tungsten inert gas arc welding (TIG, 141) or plasma arc welding (15)

8.1.3 Approval will be indicated by the grade as shown in Table 8.1.3.

Table 8.1.3 : Consumables grades and base materials for the approval test

Consumable quality grade (Symbol)	Base material for the tests	
	Alloy Designation	
	Numerical	Chem-Symbol
RA/WA	5754	AlMg3
RB/WB	5086	AlMg4
RC/WC	5083	AlMg4.5 Mn0.7
	5383	AlMg4.5 Mn0.9
	5456	AlMg5
	5059	-
RD/WD	6082	AlSi1MgMn
	6005A	AlSiMg(A)
	6061	AlMg1SiCu
Note: Approval on higher strength AlMg base materials covers also the lower strength AlMg grades and their combination with AlSi grades		

8.1.4 The welding technique will be indicated in the approval grading by a letter as under:

m - manual multi-run welding (GTAW);
S - semi-automatic multi-run welding (GMAW);
M - automatic multi-run welding (GTAW or GMAW);
T - automatic two-run welding (GMAW).

8.1.5 The compositions, of the shielding gas and the filler/electrode wire are to be reported.

8.1.6 Approval of a wire or a rod will be granted in conjunction with a specific shielding gas according to Table 8.1.6 or defined in terms of composition and purity of "special" gas to be designated with group sign "S". The composition of the shielding gas is to be reported. Where a wire in combination with any particular gas has been approved, usage of the same wire with another gas in the same group as defined in Table 8.1.6 may be considered.

Table 8.1.6 : Compositional limits of shielding gases and mixtures to be used

Group	Gas composition (Vol.%)[1])	
	Argon	Helium
I - 1	100	-
I - 2	-	100
I - 3	Rest	> 0 to 33
I - 4	Rest	> 33 to 66
I - 5	Rest	> 66 to 95
S	Special gas, composition to be specified, See 8.1.6	

1) Gases of other chemical composition (mixed gases) may be considered as "special gases" and covered by a separate test.

8.1.7 On completion of welding, assemblies must be allowed to cool naturally to ambient temperature. Welded test assemblies and test specimens must not be subjected to any heat treatment after welding except for the alloy Grades 6005A, 6061 and 6082. These are to be

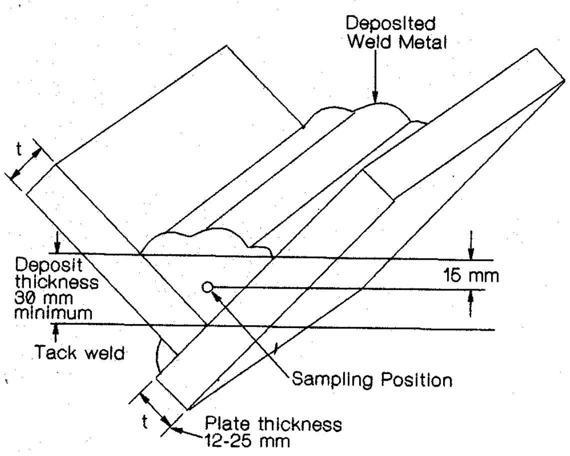

Fig.8.3.1 : Deposited metal test assembly

allowed to naturally age at ambient temperature for a period of 72 hours from the completion of welding, before the testing is carried out. A second solution heat treatment is not permitted. The time and temperature of any ageing treatment is to be reported in detail.

8.2 Initial approval tests for manual, semi-automatic and automatic multi-run techniques

8.2.1 Plate of the corresponding type of aluminium alloy and of appropriate thickness is to be used for the preparation of the weld test assemblies.

8.2.2 The welding current and power requirements are to be within the range recommended by the manufacturer and are to be reported.

8.2.3 Welded assemblies are to be prepared and tested in accordance with 8.3, 8.4 and 8.5.

8.3 Deposited metal test assemblies

8.3.1 One assembly is to be prepared in the downhand position as shown in Fig.8.3.1.

8.3.2 The chemical composition of the plate used for the assembly is to be compatible with the weld metal.

8.3.3 The thickness of the plate used and the length of the assembly are to be appropriate to the welding process. The plate thickness is to be not less than 12 [mm].

8.3.4 For the approval of filler wire/gas and electrode wire/gas combinations for manual or semi-automatic welding by GTAW or GMAW, one test assembly is to be welded using any size of wire within the range for which approval is sought.

8.3.5 For automatic multi-run approval, one test assembly is to be welded by the respective process using the recommended diameter of wire.

8.3.6 The weld metal is to be deposited in multi-run layers in accordance with normal practice. The direction of deposition of each layer is to alternate from each end of the plate.

8.3.7 The deposited weld metal in each test assembly is to be analysed and reported including the contents of all significant elements.

The elements reported will be dependent on the type of aluminium alloy for which approval of the consumables is requested. The results of the analysis are to be within the tolerances specified in the standards and by the manufacturer.

8.4 Butt weld test assemblies

8.4.1 Plate of the corresponding type of aluminium alloy and of an appropriate thickness is to be used for the preparation of the test assemblies.

Table 8.4.1 : Requirements for the transverse tensile and bend tests

Grade	Base material used for the test	Tensile strength R_m [N/mm^2] min.	Former diameter	Bending angle 1) [°] min.
RA/WA	5754	190	3t	
RB/WB	5086	240	6t	
RC/WC	5083	275		
	5383 or 5456	290	6t	180
	5059	330		
RD/WD	6061, 6005A or 6082	170	6t	

1) During testing, the test specimen shall not reveal any one single flaw greater than 3 [mm] in any direction. Flaws appearing at the corners of a test specimen shall be ignored in the evaluation, unless there is evidence that they result from lack fusion.

8.4.2 In order to ensure sound and representative welds, it is essential that test assemblies are cleaned and degreased prior to welding. Assemblies as shown in Fig.8.4.2 are to be prepared for each welding position (downhand, horizontal-vertical, vertical-upward, vertical-downward and overhead) for which the consumable is recommended by the manufacturer; except that consumables satisfying the requirements for downhand and vertical-upward positions will be considered as also complying with the requirements for the horizontal-vertical position.

Back sealing runs are allowed in single V weld assemblies. In case of double V assembly both sides shall be welded with the same welding position.

8.4.3 One additional assembly, as shown in Fig.8.4.3, is to be prepared for welding in the downhand position. The assembly is to be welded using, for the first run, wire of the smallest diameter recommended by the manufacturer and for the remaining runs, wire of the largest diameter to be approved.

8.4.4 The manufacturer's recommended procedures are to be used in making the welds and are to be reported.

8.4.5 The welded assemblies should be subjected to both radiographic and visual examination, aided where necessary by dye penetrant testing, to ensure that the welds are free from cracks and porosity.

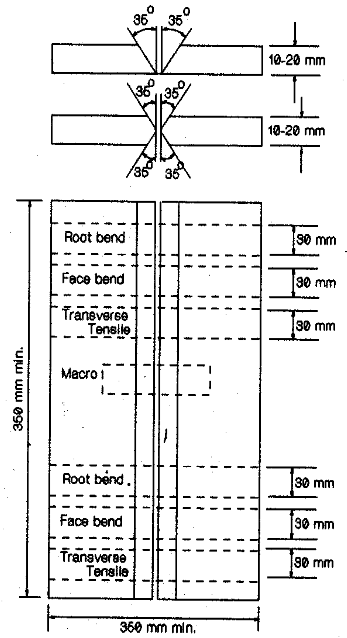

Fig.8.4.2 : Butt weld test assembly (positional welding)

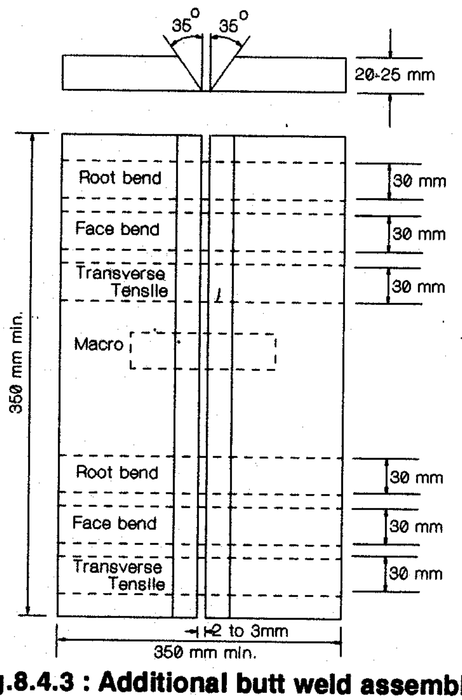

Fig.8.4.3 : Additional butt weld assembly (downhand)

8.4.6 The test specimens are to be taken from the welded assemblies as shown in Fig.8.4.2 and Fig.8.4.3. For each assembly they are to comprise:

2 transverse tensile specimens;
1 macro specimen;
2 face bend specimens; and
2 root bend specimens.

8.4.7 All tensile test specimens should have a tensile strength not less than the respective value shown in Table 8.4.1. The position of each fracture is to be reported.

8.4.8 The bend test specimens are to be bent around a former having a diameter not more than the number of times the thickness (t) of the test specimen as shown in Table 8.4.1.

8.5 Fillet weld test assemblies

8.5.1 Assemblies are to be prepared and tested in accordance with the appropriate requirements of 2.4 except that the plates are to be of the aluminium alloy for which approval is required, that no hardness tests are required and that for automatic multi-run approval only one fillet weld bead is to be made using the recommended wire diameter. In this case, the bead size should be as large as the maximum single bead size recommended by the manufacturer for fillet welding.

8.5.2 The results of examination of the macro specimens and the fractured fillet welds are to be reported in accordance with 2.4.3 and 2.4.5. Particular attention is to be given to the presence of any porosity.

8.6 Initial approval tests for two-run technique

8.6.1 Two butt weld test assemblies are to be prepared using the following plate thicknesses as shown in Fig.8.7.1:

a) one with the maximum thickness for which approval is requested;

b) one with a thickness approximately one half to two thirds that of the maximum thickness.

8.7 Annual tests

8.7.1 Annual repeat tests are to consist of preparation and testing of the deposited weld metal test assembly as prescribed in 8.3 (Fig.8.3.1) and of the downhand buttweld assembly according to 8.4 (Fig.8.4.2).

Section 1

General

1.1 Scope

1.1.1 The Rules in this part apply to all-welded, single hull sea going steel ships of normal form, proportions and speed.

1.1.2 For additional class notations relating to various ship types, requirements as per Pt.5 are to be complied with.

1.1.3 Ships of unconventional forms and proportions or intended for carriage of cargoes not covered by the Rules or to be engaged in special service will receive individual consideration based on the general principles of the Rules. In these cases, however, additional calculations and/or model testing may be required to be carried out and submitted for approval.

1.1.4 Proposals for use of alternative materials e.g. aluminium, wood, etc. for some parts of the ship shall receive special consideration.

1.2 Equivalence

1.2.1 Alternative arrangements, scantlings and equipment may be accepted provided they can be shown to be equivalent to the overall safety and strength standard of the Rules. Direct calculations for the derivation of the scantlings as an alternative to those derived by the Rule formulae, may be accepted on special consideration. The calculation procedure and the assumptions made are to be submitted for approval.

1.3 National and international regulations

1.3.1 While the Rules cover requirements for the classification of ships, the attention of all concerned is drawn to requirements of various local, national or international Regulations, Codes and Recommendations which the vessel may also have to comply with.

1.4 Stability

1.4.1 All ships will be assigned class only after it has been demonstrated that their intact stability and damage stability (where applicable) are in compliance with the standards laid down by the National Statutory Authority.

The level of intact stability for ships with a length of 24 [m] and above in any case is not to be less than that required by Part A of the International Code on Intact Stability, 2008 (IMO Resolution MSC 267(85), as amended) as applicable to the type of ship being considered.

Damage stability requirements in IMO instruments as listed in 1.4.3 are also to be complied with, as applicable to the type and size of ship.

Where other criteria for stability are accepted by the Administration concerned, these criteria may be used for the purpose of classification.

Where the Administration has not specified criteria of stability for ships of less than 24 [m] in length, appropriate criteria for the type of ship may be applied which is acceptable to IRS.

1.4.2 For pontoons of all sizes, in case the Administration concerned has not laid down criteria for intact stability, it is recommended that the criteria indicated below or equivalent are satisfied:

- Ch.2, Sec 2.2 of Part B of the International Code on Intact Stability, 2008 (Resolution MSC 267(85)).

1.4.3 All ships are required to comply with the applicable damage stability requirements in accordance with the following:

a) Part B and Part B-1 through B-4 of Chapter II-1 of SOLAS 1974 as adopted by IMO Resolution MSC 216(82) for passenger ships regardless of length and cargo ships having load line length "L_L" of 80 [m] and above.

   Cargo ships which are shown to comply with any other damage stability regulations indicated in the following (1.4.3 b) to g)) are excluded from the applicability of the above.

b) Regulation 27 of ILLC 1966 as applied to tankers and dry cargo vessels in compliance with Resolutions A.320(IX) and A.514(13) provided that in the case of ships to which regulation 27(9) applies, main transverse watertight bulkheads, to be considered effective, are spaced according to paragraph 12(f) of resolution A.320(IX). Compliance with Reg.27 of ILLC Protocol 1988 is accepted as equivalent to the above.

   In case ships for which Reg.27 of ILLC applies are intended to carry deck cargo also, then a limiting GM or KG curve is to be provided to the master in the stability manual based on compliance with the probabilistic damage stability analysis of SOLAS Chapter II-1 Part B-1. In such cases the KG used for demonstrating compliance with the deterministic damage stability requirements of ILLC Reg.27 should be same as that used for the probabilistic damage stability calculations required by SOLAS Ch.II-1 Part B-1 at the deepest subdivision loadline.

c) Annex I (Regulation 28) of MARPOL 1973/78, for Oil Tankers except that combination carriers with Type B freeboard are not excluded.

d) IBC Code, as amended for Chemical Tankers in general.

e) IGC Code, as amended for Liquefied Gas Carriers.

f) Resolution MSC 235(82) for Offshore Supply Vessels.

g) Resolution MSC 266(84) for Special Purpose Ships.

1.4.4 An approved stability information manual is to be available on board for guidance to the master as to the stability of the ship under varying conditions of service. This is to be prepared on the basis of MSC Circular 920 "Model Loading and Stability Manual".

Additionally, full details of the stability criteria appropriate to the ship under all anticipated conditions of service are to be clearly stated in text supplemented by diagrams using the nomenclature adopted in the manual. Full details of any requirements for wind and/or wave forces and ice accretion specified by the Administration are also to be provided.

1.5 Damage control plan and booklet for dry cargo and passenger ships

1.5.1 **Plan** : The damage control plan is to include inboard profile, plan views of each deck and transverse sections to the extent necessary to show the following:

- the watertight boundaries of the ship;

- the locations and arrangements of cross-flooding systems and any other system for correction of list;

- the locations of all internal watertight closing appliances including on ro-ro ships, internal ramps or doors and their controls, position indicators, alarms and special precautions required, if any, for the closing appliances during voyage;

- the locations of all doors in the shell of the ship, position indicators, leakage detection and surveillance devices;

- the locations of all weathertight closing appliances in local subdivision boundaries above the bulkhead deck and on the lowest exposed weather decks, together with locations of controls and position indicators, if applicable;

- the locations, arrangement and control positions of the entire bilge and ballast system.

1.5.2 **Booklet** : The damage control booklet is to contain aforementioned information as in the plan and in addition general instructions for controlling the consequential effects of damage as follows:

- shutting off the closing appliances;
- ensuring the safety of personnel onboard;
- ascertaining extent of damage and rates of flooding by sounding;
- cautionary advise regarding causes of any list; required liquid transfer operations to lessen list or trim and the resulting effects of additional free surfaces;
- initiating pumping operations to control the ingress of water;

The booklet should provide:

- details of sounding devices, tank vents and overflows;
- pump capacities and piping diagrams;
- operating procedure of cross-flooding system;
- locations of non-watertight openings with non-automatic closing devices through which progressive flooding can occur;
- details of access and means of escape for personnel to and from compartments;
- procedure for alerting ship management and other organisations for obtaining and co-ordinating assistance;

1.5.3 For passenger ships, the plan is to be permanently exhibited on the navigating bridge, as well as in the ship's control station, or equivalent.

1.5.4 For cargo ships the plan is to be permanently exhibited or readily available on the navigating bridge and in the cargo control room, where applicable.

1.6 Protective location of fuel oil tanks

1.6.1 All ships with an aggregate oil fuel capacity of 600 [m^3] and above are to satisfy the requirements for oil fuel tank protection as given in MARPOL Reg.I/12A. For this purpose, the distances of the oil fuel tanks above the bottom shell and inboard of the side shell are to be not less than the values specified in the above MARPOL Regulation.

Alternatively, such ships may comply with the accidental oil outflow performance standard specified in paragraph 11 of MARPOL Reg. I/12A.

1.6.2 Small oil fuel tanks of capacity not greater than 30 [m^3] are exempted from the requirements for protective location of the above MARPOL Regulation provided the aggregate capacity of such exempted tanks is not greater than 600 [m^3].

1.7 Assumptions

1.7.1 It is assumed that significant dynamic excitation of major orders from propellers and machinery do not fall close to any natural frequency of the hull.

1.7.2 It is assumed that the ships will be competently handled and loaded as per the approved loading manuals.

Section 2

Definitions

2.1 Principal particulars

2.1.1 The forward perpendicular, F.P., is the perpendicular drawn at the intersection of the summer load water line with the fore side of the stem.

In ships with unusual bow arrangement the position of the F.P. will be specially considered.

2.1.2 The after perpendicular, A.P., is the perpendicular drawn at the intersection of the summer load waterline with the after side of the rudder post or the centreline of the rudder stock if there is no rudder post.

In ships with unusual stern arrangement the position of the A.P. will be specially considered.

2.1.3 Rule length, L, is the distance, [m], between the forward and after perpendiculars. However L is to be not less than 96 per cent, and need not be greater than 97 per cent of the extreme length on the summer load waterline.

In ships with unusual bow and/or stern arrangement the Rule length, L, will be specially considered.

2.1.4 "Amidship" is at 0.5L aft of the F.P.

2.1.5 Breadth, B, is the greatest moulded breadth [m].

2.1.6 Depth, D, is the moulded depth [m], measured amidships from top of the keel to the moulded deck line of the uppermost continuous deck at side. When a rounded gunwale is arranged the depth is to be measured to the continuation of the moulded deck line.

2.1.7 Draught, T, is the moulded draught amidships corresponding to the summer load waterline, [m].

2.1.8 The block co-efficient, Cb, is the moulded block co-efficient calculated as follows :-

$$C_b = \frac{\text{moulded displacement } [\text{m}^3] \text{ at draught } T}{LBT}$$

2.1.9 Load line length, L_L , is to be taken as 96 per cent of the total length [m], on a waterline at 85 per cent of the least moulded depth measured from the top of the keel, or as the length from the fore side of the stem to the axis of the rudder stock on that waterline, if that is greater. In ships designed with a rake of keel, the waterline on which this length is measured is to be parallel to the designed waterline.

2.1.10 Speed, V, is the maximum service speed in knots on draught T.

2.2 Structural terms

2.2.1 The general terms used in the Rules for various structural parts of the ships are defined as under:

- *Strength Deck* : In general the uppermost continuous deck. Where a superstructure deck has within 0.4L amidships, a continuous length equal to or greater than (1.5B + 3H), it is to be regarded as the strength deck instead of the covered part of the uppermost continuous deck. (H is the height of the superstructure, [m]).

- *Freeboard Deck* : The freeboard deck is normally the uppermost complete deck exposed to weather and sea, which has permanent means of closing all openings in the weather part and below which all openings on the sides of the ship are fitted with means for watertight closing.

- *Superstructure* : A decked structure on freeboard deck extending from side to side of the ship or with the side plating not inboard of shell plating by more than 4 per cent of the breadth B.

- *Deckhouse* : A decked structure above the freeboard deck with the side plating being inboard of the shell plating by more than 4 per cent of the breadth B.

- *Bottom Structure* : Shell plating with stiffeners and girders below the upper turn of bilge and all other elements below and including the inner bottom plating in case of the double bottom. Sloping hopper tank top is to be regarded as a bulkhead.

- *Side Structure* : Shell plating with stiffeners and girders between the upper turn of bilge and the uppermost continuous deck at side. A rounded gunwale is included in the side structure.

- *Deck Structure* : Deck plating with stiffeners, girders, and supporting pillars.

- *Girder* : A collective term for the primary supporting members, other terms include :

  - Transverses - transverse girders under the deck.

  - Web frames - side vertical girders.

  - Hatch end beams - transverse deck girders at the ends of the hatch.

  - Stringers - horizontal girders.

  - Cross-ties - girders connecting two vertical girders in a deep tank.

  - Floor - bottom transverse girders.

- *Stiffener* : A collective term for secondary supporting members; other terms being :

  - Frames.

  - Bottom, inner bottom, side or deck longitudinals.

  - Reverse frame - transverse stiffener on the inner bottom.

  - Horizontal or vertical bulkhead stiffeners.

- Other terms are defined in the appropriate Chapters.

2.3 Material factor

2.3.1 Material factor, k, a factor depending on material strength is defined in Ch.2.

Section 3

Documentation

3.1 General

3.1.1 Documentation is to be submitted as per the following paragraphs. In case of certain ship types additional documentation may be required as per Pt.5.

3.1.2 The documents should be submitted in triplicate, one copy of which shall be returned.

3.2 Plans for information

3.2.1 The following supporting plans and calculations are to be submitted for information :

- General arrangement.

- Tank plan.

- Capacity plan.

- Lines plan and Hydrostatic curves or tables.

- Docking plan.

3.3 Additional information

3.3.1 The following additional information is to be submitted as necessary for strength calculations:

- Maximum values of still water bending moments and shear forces.

- Lightship weight and its longitudinal distribution.

- Bonjeans data.

- Stowage factor and angle of repose of bulk cargoes to be carried.

- Masses and unbalanced moments of heavy machinery components e.g. engines, cranes, winches etc.

3.4 Plans for approval

3.4.1 Plans as relevant are to be submitted for approval as indicated in Table 3.4.1. These should as far as practicable be complete in all necessary details.

3.5 Plans to be kept on board

3.5.1 A set of as built construction drawings and other plans showing any subsequent structural alterations are to be kept on board. The set of plans are to include the following:

a) Main plans

- i) General arrangement
- ii) Capacity plan
- iii) Hydrostatic curves
- iv) Loading manual, where required

b) Structural plans

- i) Midship section
- ii) Scantling profile
- iii) Decks
- iv) Shell expansion
- v) Transverse bulkheads
- vi) Rudder and rudder stock
- vii) Cargo hatch covers, when applicable

c) Bilge ballast and cargo piping diagrams.

An additional set of such drawings are to be kept ashore by the company responsible for the operation of the ship.

3.5.2 To facilitate the ordering of materials for repairs, the above plans are to show the disposition and extent of high strength steel and steel of grades other than Grade A, along with the information relating to their physical and mechanical properties, recommended working, treatment and welding procedures etc.

3.5.3 A ship construction file is required to be maintained on board the ship to facilitate inspection (survey) and repair and maintenance in future.

The ship construction file to contain :

a) Plans as mentioned at 3.5.1;

b) Essential certificates and records;

c) Manuals required for classification and statutory requirements;

d) Details of equipment forming part of the watertight and weathertight integrity of the ship;

e) Tank testing plan including details of the test requirements;

f) Corrosion protection specifications;

g) Details for the in-water survey, if applicable, information for divers, clearances measurements instructions etc. tank and compartment boundaries;

h) Docking plan and details of all penetrations normally examined at drydocking;

i) Coating technical file, for ships subject to compliance with the IMO Coating Performance Standard (PSPC). (See Part 3, Chapter 2, Section 3.6).

Table 3.4.1 : Plans for approval

Plan	**Including Information On**
Loading manual [1)]	details of loading in all contemplated loading conditions and resulting SWBM, SF and Torsional Moments (TM) design values of SWBM, SF & TM
Midship section Other transverse sections Longitudinal sections & decks Shell expansion & framing plan Pillar arrangements Wash bulkheads	main particulars (L, B, D, T, C_b, V) equipment specification complete class notation applied for spacing of stiffeners Density of cargo Standard construction details deck loads, if other than those specified in the Rules openings on the deck minimum ballast draught(s) extent of flat part of bottom forward openings on the shell Flat of bottom, flat of side material grades
Double bottom	indication of access height and location of overflows loading on inner bottom
Watertight subdivision bulkheads & watertight tunnels	openings and their closing appliances
Plan of water tight doors	Electrical diagram of power control and position indication circuits.
Plan of weather tight or outer doors and hatchways	-
Aft-end structure Stern frame or sternpost Propeller shaft brackets Aft peak tank	propeller outline propeller thrust structural details in way of rudder and propeller bearings height and location of overflow
Engine room structure Engine and thrust block seatings	type, power and r.p.m. of propulsion machinery weight of machinery, boilers, etc.
Transverse thruster, if any, general arrangement, tunnel structure, connections of thruster with tunnel and hull structures.	-
Fore-end construction Fore peak tank	openings on non-watertight bulkheads and diaphragm plates height and location of overflows
Oil tight/water tight and partition bulkheads in cargo tanks, ballast tanks and deep tanks	intended tank contents & their densities height and location of overflow/air pipes tanks intended to be partially filled corrosion protection; if any
Superstructures, deckhouses and machinery castings	height of sills from deck and closing appliances for companionways Extension and mechanical properties of the aluminum alloy used (where applicable)
Bulwarks and freeing ports	Arrangements and dimensions of bulwarks and freeing ports on the freeboard deck and the superstructure deck.
Windows and side scuttles,	arrangement and details
Scuppers and sanitary discharges	-
Hatchways Hatch covers Bow & stern doors Side ports	position and type loads if different from those specified in the rules sealing and securing arrangement, spacing of bolts or wedges Distance of hatch covers from summer load waterline and from fore end.

Table 3.4.1 : (Contd.)

Plan	**Including Information On**
Rudder, stock and tiller Steering gear arrangement	speed of the ship (head & astern) material of bearings, coupling bolts, stock and the locking device rudder carrier
Supporting structure and foundations for ship board fitting associated with mooring and towing operations.	Design loads and directions of load actions, rated pull and holding load for mooring winches Reaction forces Details of connection of the foundations to the deck, including specifications for holding down bolts for mooring winches Material specifications and welding
Supporting structure and foundations for windlasses and chain stoppers.	Design loads and directions of load actions Reaction forces Details of connection of the foundations to the deck, including specifications for holding down bolts for windlasses Material specifications and welding
Plan for access to and escape from spaces	-
Plan for ventilation including ventilators and tank vents	Use of spaces and location and height of air vents outlets of various compartments.
Masts & derrick posts Support structure for masts, derrick posts & cranes	derrick length and loading dimensions and positions of stays and shrouds quality of material maximum sea state in offshore operation, if any connections to hull structure
Supporting structure for life saving appliances	Design loads, SWL and self weight, connections to hull structure.
Bilge keel	material grade details of connection to hull structure
Testing plan of tanks & bulkheads	Test procedure for various compartments Height of pipes for testing
Equipment number calculation	Geometric elements for calculation List of equipments Construction and breaking load of steel wires Material, construction, breaking load and relevant elongation of synthetic ropes
Anchoring arrangement	-
Mooring and towing arrangement	-
Welding details	

Note:

1) See Chapter 5, Section 6.
2) One drawing may contain more than one of the items from each group.
3) Where other steering or propulsion systems are adopted (eg. Steering nozzles or azimuth propulsion systems), the plans showing the relevant arrangement and structural scantlings are to be submitted.
4) The information is to be included as indicated in the 2nd column are required for approval of plans given in the 1st column of the Table. However, approval of plans mentioned in the 1st column does not necessarily mean that all the information given in 2nd column are also approved or need approval.

End of Chapter

Chapter 2

Materials of Construction

Contents

Section 1

General

1.1 Scope

1.1.1 The Rules relate, in general, to the construction of steel ships. Consideration will however be given to the use of other materials also.

1.1.2 The materials used in the construction of the ship are to be manufactured and tested in accordance with the requirements of Pt.2. Materials for which provision is not made in Pt.2 may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

1.2 Steel

1.2.1 Ordinary hull structural steel is a hull structural steel with a minimum yield stress of 235 [N/mm^2] and a tensile strength generally in the range of 400-490 [N/mm^2].

For ordinary hull structural steel, the **material factor `k'** is to be taken as 1.0.

1.2.2 Steels having a yield stress of 265 [N/mm^2] and higher, are regarded as higher tensile steels. Where higher tensile steel is used, the hull girder section modulus and the local scantlings may be reduced in accordance with the relevant requirement of the Rules. For this purpose, a material factor 'k', is to be taken as follows:

k = 0.78 for steel with a minimum yield stress of 315 [N/mm^2]

k = 0.72 for steel with minimum yield stress of 355 [N/mm^2]

k = 0.68 for steel with minimum yield stress of 390 [N/mm^2].

1.2.3 Where steel castings or forgings are used for sternframes, rudderframes, rudder stocks, propeller shaft brackets and other major structural items, they are to comply with Pt.2 as appropriate.

1.3 Aluminium

1.3.1 Where seawater resisting aluminium alloys manufactured and tested in accordance with the requirements of Pt.2 are used for super-structures, deckhouses, hatch covers, helicopter decks or other structural components, scantlings equivalent to steel are to be derived as follows:

plating thickness, $t_a = t_s \sqrt{k_a}$

section modulus of stiffeners, $Z_a = Z_s.k_a$

where,

t_a, t_s = plating thickness of aluminium and mild steel respectively.

Z_a, Z_s = section modulus of aluminium and mild steel stiffeners respectively.

$$k_a = \frac{235}{\sigma_a}$$

σ_a = 0.2% proof stress of the aluminium alloy in the welded condition or 70% of the ultimate strength in the welded condition, whichever is lesser [N/mm^2].

1.3.2 The smaller modulus of elasticity of aluminium is to be taken into account, when determining the buckling strength of structural elements subjected to compression and the deflections, where relevant.

Section 2

Use of Steel Grades

2.1 Grades of steel

2.1.1 The resistance to fracture is controlled, in part, by the notch toughness of the steel used in the structure. Steels with different levels of notch toughness are specified in Pt.2. The grade of steel to be used is, in general, related to the air temperature in the area of operation, thickness of the material and the stress pattern associated with its location.

2.1.2 The grades of steel to be used for structures of ships in normal world wide service and those exposed to low air temperatures ($\leq$ -20°C), are given in Sec 2.2 and 2.3 respectively. The grades of steel to be used for certain hull members in refrigerated spaces are given in Sec 2.4.

2.1.3 Where tee or cruciform connections employ full penetration welds, and the plate material is subject to significant strains in a direction perpendicular to the rolled surfaces, it is recommended that consideration be given to the use of special plate material with specified through thickness properties, as detailed in Pt.2.

2.2 Ships in normal world wide service

2.2.1 Materials in the various strength members are not to be of lower grade than those corresponding to material classes and grades specified in Tables 2.2.1a) to 2.2.1f) and Table 2.2.2.

General requirements are given in Table 2.2.1a), while additional minimum requirements are given in the following:

- Table 2.2.1b): For ships, excluding liquefied gas carriers covered in Table 2.2.1c), with length exceeding 150 [m] and single strength deck,
- Table 2.2.1c): For membrane type liquefied gas carriers with length exceeding 150[m].
- Table 2.2.1d): For ships with length exceeding 250[m],
- Table 2.2.1e): For single side bulk carriers subject to SOLAS regulation XII/6.4.3
- Table 2.2.1f) For ships with ice strengthening.

2.2.2 The material grade requirements for hull members of each class depending on thickness are defined in Table 2.2.2.

2.2.3 For strength members not mentioned in Tables 2.2.1a) to 2.2.1f), Grade A/AH may generally be used.

2.2.4 The steel grade is to correspond to the as-built plate thickness and material class.

2.2.5 Plating materials for stern-frames supporting the rudder and propeller boss, rudders, rudder horns and shaft brackets are in general not to be of lower grades than corresponding to Class II. For rudder and rudder body plates subjected to stress concentrations (e.g. in way of lower support of semi-spade rudders or at upper part of spade rudders) Class III is to be applied.

Table 2.2.1a) : Material classes and grades for ships in general

Structural member category	Material class/grade
SECONDARY:	
Longitudinal bulkhead strakes, other than that belonging to the primary category	- Class I within 0.4L amidships - Grade A/AH outside 0.4L amidships
Deck plating exposed to weather, other than that belonging to the primary or special category	
Side plating	
PRIMARY:	
Bottom plating, including keel plate	- Class II within 0.4L amidships - Grade A/AH outside 0.4L amidships
Strength deck plating, excluding that belong to the special category	
Continuous longitudinal plating of strength members above strength deck, excluding hatch coamings	
Uppermost strake in longitudinal bulkhead	
Vertical strake (hatch side girder) and uppermost sloped strake in top wing tank	
SPECIAL:	
Sheer strake at strength deck (1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
Stringer plate in strength deck (1)	
Deck strake at longitudinal bulkhead, excluding deck plating in way of inner skin bulkhead of double hull ships (1)	
Strength deck plating at outboard corners of cargo hatch openings in container carriers and other ships with similar hatch opening configurations	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Min. class III within cargo region
Strength deck plating at corners of cargo hatch openings in bulk carriers, ore carriers combination carriers and other ships with similar hatch opening configurations Trunk deck and inner deck plating at corners of openings for liquid and gas domes in membrane type liquefied gas carriers	- Class III within 0.6L amidships - Class II within rest of cargo region
Bilge strake in ships with double bottom over the full breadth and length less than 150 m (1)	- Class II within 0.6L amidships - Class I outside 0.6L amidships
Bilge strake in other ships (1)	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships
Longitudinal hatch coamings of length greater than 0.15L including coaming top plate and flange	- Class III within 0.4L amidships - Class II outside 0.4L amidships - Class I outside 0.6L amidships - Not to be less than Grade D/DH
End brackets and deck house transition of longitudinal cargo hatch coamings	
(1) Single strakes required to be of Class III within 0.4L amidships are to have breadths not less than 800+5L [mm], need not be greater than 1800 [mm], unless limited by the geometry of the ship's design.	

Table 2.2.1b) : Minimum material grades for ships with length exceeding 150 [m] and single strength deck

Structural member category	Material grade
Longitudinal plating of strength deck where contributing to the longitudinal strength	Grade B/AH within 0.4L amidships
Continuous longitudinal plating of strength members above strength deck	Grade B/AH within 0.4L amidships
Single side strakes for ships without inner continuous longitudinal bulkhead(s) between bottom and the strength deck	Grade B/AH within cargo region

2.3 Structures exposed to low air temperatures

2.3.1 For ships intended to operate in areas with low air temperatures (below and including -20°C), e.g. regular service during winter seasons to Arctic or Antarctic waters, the materials in exposed structures are to be selected based on the design temperature t_D as defined in 2.3.2.

2.3.2 The design temperature t_D is to be taken as the lowest mean daily average air temperature in the area of operation as illustrated in Fig.2.3.2.

Mean : Statistical mean over observation period (at least 20 years).

Average : Average during one day and night.

Lowest : Lowest during year.

MDHT = Mean Daily High (or maximum) Temperature

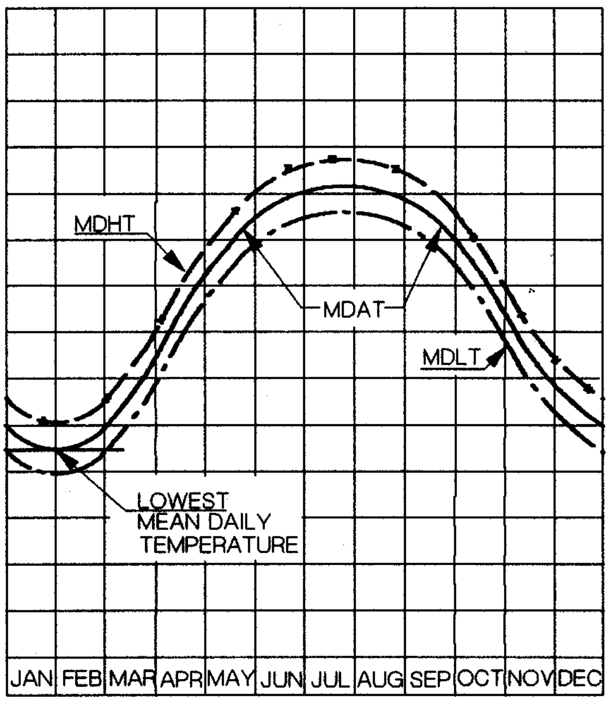
MDAT = Mean Daily Average Temperature

MDLT = Mean Daily Low (or minimum) Temperature.

For seasonally restricted service the lowest value within the period of operation would be applicable.

2.3.3 Materials in the various strength members above the lowest ballast water line (BWL) exposed to air are not to be of lower grades than those corresponding to classes I, II and III as given in Table 2.3.3, depending on the categories of structural members (SECONDARY, PRIMARY and SPECIAL). For non-exposed structures and structures below the lowest ballast water line, See 2.2.

2.3.4 The material grade requirements for hull members of each class depending on thickness and design temperature are defined in Table 2.3.5. For design temperatures t_D < -55°C, materials will be specially considered.



MDHT = Mean Daily High (or maximum) Temperature.
MDAT = Maen Daily Average Temperature.
MDLT = Mean Daily Low (or Minimum) Temperature.

Fig.2.3.2

Table 2.3.3 : Application of material classes and grades -
Structures exposed to low temperatures

	Material class/grade	
Structural member category	**Within 0.4L amidships**	**Outside 0.4L amidships**
SECONDARY: • Deck plating exposed to weather, in general • Side plating above BWL • Transverse bulkheads above BWL	I	I
PRIMARY: • Strength deck plating (see Note 1) • Continuous longitudinal members above strength deck, excluding longitudinal hatch coamings • Longitudinal bulkhead above BWL • Top wing tank bulkhead above NWL	II	I
SPECIAL: • Sheer strake at strength deck (see Note 2) • Stringer plate in strength deck (see Note 2) • Deck strake at longitudinal bulkhead (see Note 3) • Continuous longitudinal hatch coamings (see Note 4)	III	II

Notes:

1. Plating at corners of large hatch openings to be specially considered. Class III or grade E/EH to be applied in positions where high local stresses may occur.
2. Not to be less than grade E/EH within 0.4L amidships in ships with length exceeding 250 [m].
3. In ships with breadth exceeding 70 [m] at least three deck strakes to be class III.
4. Not to be less than grade D/DH.

Table 2.3.4 : Material grade requirements for classes I, II and III at low temperatures

Class I

Plate thickness [mm]	-20/-25°C		-26/-35°C		-36/-45°C		-46/-55°C	
	MS	**HT**	**MS**	**HT**	**MS**	**HT**	**MS**	**HT**
$t \leq 10$	A	AH	B	AH	D	DH	D	DH
$10 < t \leq 15$	B	AH	D	DH	D	DH	D	DH
$15 < t \leq 20$	B	AH	D	DH	D	DH	E	EH
$20 < t \leq 25$	D	DH	D	DH	D	DH	E	EH
$25 < t \leq 30$	D	DH	D	DH	E	EH	E	EH
$30 < t \leq 35$	D	DH	D	DH	E	EH	E	EH
$35 < t \leq 45$	D	DH	E	EH	E	EH	X	FH
$45 < t \leq 50$	E	EH	E	EH	X	EH	X	FH

Class II

Plate thickness [mm]	-20/-25°C		-26/-35°C		-36/-45°C		-46/-55°C	
	MS	**HT**	**MS**	**HT**	**MS**	**HT**	**MS**	**HT**
$t \leq 10$	B	AH	D	DH	D	DH	E	EH
$10 < t \leq 20$	D	DH	D	DH	E	EH	E	EH
$20 < t \leq 30$	D	DH	E	EH	E	EH	X	FH
$30 < t \leq 40$	E	EH	E	EH	X	FH	X	FH
$40 < t \leq 45$	E	EH	X	FH	X	FH	X	X
$45 < t \leq 50$	E	EH	X	FH	X	FH	X	X

Class III

Plate thickness [mm]	-20/-25°C		-26/-35°C		-36/-45°C		-46/-55°C	
	MS	**HT**	**MS**	**HT**	**MS**	**HT**	**MS**	**HT**
$t \leq 10$	D	DH	D	DH	E	EH	E	EH
$10 < t \leq 20$	D	DH	E	EH	E	EH	X	FH
$20 < t \leq 25$	E	EH	E	EH	X	FH	X	FH
$25 < t \leq 30$	E	EH	E	EH	X	FH	X	FH
$30 < t \leq 35$	E	EH	X	FH	X	FH	X	X
$35 < t \leq 40$	E	EH	X	FH	X	FH	X	X
$40 < t \leq 50$	X	FH	X	FH	X	X	X	X

Table 2.3.4 (Contd.)

Notes:

1. X = Not applicable.
2. Single strakes required to be of class III or of grade E/EH of FH are to have breadths not less than 800 + 5.L [mm] maximum 1800 [mm].
3. Plating materials for sternframes rudder horns, rudders and shaft brackets are not to be of lower grades than those corresponding to the material classes given in Sec.2.2.

2.4 Refrigerated spaces

2.4.1 Where the minimum design temperature of the steel falls below 0°C in refrigerated spaces, in addition to the requirements of 2.2.1, the grade of steel for the following items is to comply, in general, with the requirements of Table 2.4.1:

- Deck plating.
- Webs of deck girders.
- Longitudinal bulkhead strakes attached to deck.
- Shelf plates and their face bars supporting hatch covers.

2.4.2 Unless a temperature gradient calculation is carried out to assess the design temperature in the items defined in 2.4.1, the temperature to which the steel deck may be subjected is to be assessed as shown in Table 2.4.2.

Table 2.4.1 : Grades of steel for minimum design temperatures below 0°C

Min. design temp. in °C	Thickness, in mm	Grades of steel
0 to -10	$t \leq 12.5$ $12.5 \leq t \leq 25.5$ $t > 25.5$	B/AH D/DH E/EH
-10 to -25	$t \leq 12.5$ $t > 12.5$	D/DH E/EH
-25 to -40	$t \leq 12.5$ $t > 12.5$	E/EH C-Mn LT 60 or 1/2 Ni steels

Table 2.4.2 : Assessment of deck temperature

	Arrangement	Deck temperature
1)	Deck not covered with insulation in the refrigerated space	Temperature of the refrigerated space
2)	Deck covered with insulation in the refrigerated space and not insulated on the other side	Temperature of the space on the un-insulated side
3)	Deck covered with insulation on both sides	
	a) Temperature difference less than or equal to 11°C b) Temperature difference greater than 11°C but not greater than 33°C c) Temperature difference greater than 33°C	Mean of the temperatures of the spaces above and below the deck Mean of the temperatures of the spaces above and below the deck less 3°C Deck temperature will be specially assessed
Note: Where one of the internal spaces concerned is not refrigerated, the temperature of the space is to be taken as 5°C.		

Section 3

Corrosion Protection

3.1 General

3.1.1 All steelwork, except inside tanks intended for the carriage of oil or bitumen, is to be protected against corrosion by application of suitable coating.

For protection required in salt water ballast spaces, See 3.6.

For protection required in holds of dry bulk cargo carriers, see Pt.5, Ch.1, Sec. 2.11.

For the protection required in tanks carrying chemicals or other special cargoes, See Pt. 5, Ch.3.

3.1.2 Where bimetallic connections are made, measures are to be incorporated to preclude galvanic corrosion.

3.2 Surface preparation, prefabrication primers and paints or coatings

3.2.1 Steelwork is to be cleared of millscale and suitably cleaned before the application of surface paints and coatings. It is recommended that blast cleaning or other equally effective means be employed for this purpose.

3.2.2 Where a primer is used to coat steel after surface preparation and prior to fabrication, the composition of the coating is to be such that it will have no significant deleterious effect on subsequent welding work and that it is compatible with the paints or other coatings subsequently applied.

3.2.3 To determine the influence of the primer coating on the characteristics of welds, tests are to be made as detailed in 3.2.4 to 3.2.6.

3.2.4 Three butt weld assemblies are to be tested using plate material 20 to 25 [mm] thick. A 'V' preparation is to be used and, prior to welding, the surfaces and edges are to be treated as follows:-

a) Assembly 1 - Coated in accordance with the manufacturer's instructions.

b) Assembly 2 - Coated to a thickness approximately twice the manufacturer's instructions.

c) Assembly 3 - Uncoated.

3.2.5 Tests as follows are to be taken from each test assembly:-

a) Radiographs - These are to have a sensitivity of better than 2 per cent of the plate thickness under examination, as shown by an image quality indicator.

b) Photo-macrographs - These may be of actual size and are to be taken from near each end and from the centre of the weld.

c) Face and reverse bend test - The test specimens are to be bent by pressure or hammer blows round a former of diameter equal to 3 times the plate thickness.

d) Impact tests - These are to be carried out at ambient temperature, on three Charpy V-notch test specimens prepared in accordance with Pt.2. The specimens are to be notched at the centreline of the weld, perpendicular to the plate surface.

3.2.6 The tests are to be carried out in the presence of a Surveyor of IRS or by an independent laboratory specializing in such work. A copy of the test report is to be submitted, together with radiographs and macrographs.

3.2.7 Paints or other coatings are to be suitable for the intended purpose in the locations where they are to be used. Unless previously agreed, at least two coats are to be applied.

3.2.8 The paint or coating is to be compatible with any previously applied primer, See 3.2.2.

3.2.9 Paints, varnishes and similar preparations having a nitrocellulose or other highly flammable base, are not to be used in accommodation or machinery spaces.

3.2.10 In ships intended for the carriage of oil cargoes having a flash point below 60°C (closed cup test), paint containing aluminium should not in general be used in cargo tanks, adjacent ballast tanks, cofferdams, pump rooms as well as on deck above the mentioned spaces, nor in any other areas where cargo vapours may accumulate, unless it has been shown by appropriate tests that the paint to be used does not increase the incentive sparking hazard.

3.3 Internal cathodic protection

3.3.1 Impressed current cathodic protection systems are not permitted in any tank.

When a cathodic protection system is to be fitted in tanks for the carriage of liquid cargo with flash point not exceeding 60°C, a plan showing details of the locations and attachment of anodes is to be submitted. The arrangements will be considered for safety against fire and explosion aspects only.

3.3.2 Particular attention is to be given to the locations of anodes in relation to the structural arrangements and openings of the tank.

3.3.3 Anodes are to be of approved design and sufficiently rigid to avoid resonance in the anode support. Weldable steel cores are to be fitted, and these are to be so designed as to retain the anode even when the anode is wasted.

3.3.4 Anodes are to be attached to the structure in such a way that they remain secure both initially and during service. The following methods of attachment would be acceptable :

a) Steel core connected to the structure by continuous welding of adequate section.

b) Steel core bolted to separate supports, provided that a minimum of two bolts with lock nuts are used at each support. The separate supports are to be connected to the structure by continuous welding of adequate section.

c) Approved means of mechanical clamping.

3.3.5 Anodes are to be attached to stiffeners, or may be aligned in way of stiffeners on plane bulkhead plating, but they are not to be attached to the shell. The two ends are not to be attached to separate members which are capable of relative movement.

3.3.6 Where cores or supports are welded to the main structure, they are to be kept clear of the toes of brackets and similar stress raisers. Where they are welded to asymmetrical stiffeners, they are to be connected to the web with the welding kept at least 25 [mm] away from the edge of the web. In the case of stiffeners or girders with symmetrical face plates, the connection may be made to the web or to the centreline of the face plate but well clear of the free edges. However, it is recommended that anodes are not fitted to face plates of high strength steel longitudinals.

3.4 Aluminium and magnesium anodes

3.4.1 Aluminium and aluminium alloy anodes are permitted in oil cargo tanks and also in tanks adjacent to oil cargo tanks only at locations where the potential energy does not exceed 275 [J] (i.e. 28 [kgf m]). The weight of the anode is to be taken as the weight at the time of fitting, including any inserts and fitting devices.

3.4.2 The height of the anode is, in general, to be measured from the bottom of the tank to the centre of the anode. Where the anode is located on or closely above a horizontal surface (such as a bulkhead girder) not less than 1 [m] wide, provided with an upstanding flange or face plate projecting not less than 75 [mm] above the horizontal surface, the height of the anode may be measured above that surface.

3.4.3 Aluminium anodes are not to be located under tank hatches or tank cleaning openings unless protected by adjacent structure.

3.4.4 Magnesium or magnesium alloy anodes are not permitted in oil cargo tanks and in tanks adjacent to oil cargo tanks.

3.5 External hull protection

3.5.1 Suitable protection for the underwater portion of the hull is to be provided.

3.5.2 Where an impressed current cathodic protection system is fitted, plans showing the proposed layout of anodes, reference cells, wiring diagram and the means of bonding-in of the rudder and propeller, are to be submitted.

3.5.3 The arrangements for glands, where cables pass through the shell, are to include a small cofferdam. Cables to anodes are not to be led through tanks intended for the carriage of low flash point oils. Where cables are led through cofferdams or clean ballast tanks of tankers, they are to be enclosed in a substantial steel tube of about 10 [mm] thickness.

3.6 Corrosion protection coatings for salt water ballast spaces and double side skin spaces

3.6.1 The following spaces are to be coated during construction in accordance with the Performance Standards for Protective Coatings (PSPC) adopted by the IMO by Resolution

MSC.215(82), as per applicability indicated in 3.6.2.

a) Dedicated salt water ballast tanks in all ships of 500 GT and above.

b) Double side skin spaces in bulk carriers of $L_L \geq 150$ m.

The following tanks are not considered to be dedicated salt water ballast tanks and therefore need not comply with the requirement of IMO PSPC:

i) Salt water ballast tanks identified as “Spaces included in Net Tonnage” in the 1969 International Tonnage Convention Certificate;

ii) Salt water ballast tanks in passenger vessels also designated for the carriage of grey water.

3.6.2 The IMO Performance Standards for Protective Coatings (PSPC) are to be applied to ships as follows:

i) In case of bulk carriers and tankers that are subject to the IACS common structural rules:

- which are contracted for construction on or after 8 December, 2006.

ii) In case of all ships other than those mentioned in i) above:

- Which are contracted for construction on or after 1 July 2008, or
- In the absence of a building contract, the keels of which are laid or which are at a similar stage of construction on or after 1 January 2009, or
- The delivery of which is on or after 1 July 2012.

3.6.3 For oil tankers and bulk carriers constructed on or after 1 July 1998 and for which 3.6.1 and 3.6.2 are not applicable, the following are to be complied with:

a) All salt water ballast spaces are to have an efficient corrosion protection hard coating, epoxy or equivalent, applied in accordance with the manufacturer's requirements. The durability of the coatings could affect the frequency of survey of the spaces and light coloured coatings would assist in improving the effectiveness of subsequent surveys. It is therefore recommended that these aspects be taken into account by those agreeing to the specifications for the coatings and their application.

b) The scheme for the selection, application and maintenance of the coating system to follow the requirements of IMO Resolution A.798(19) and contain, as a minimum the following documentation:

- Owner’s, coating manufacturer’s and shipyard’s explicit agreement to the scheme for coating selection, application and maintenance.

- List of seawater ballast tanks identifying the coating system for each tank, including coating color and whether coating system is a hard coating.

- Details of anodes, if used.

- Manufacturer’s technical product data sheet for each product.

- Manufacturer’s evidence of product quality and ability to meet owner’s requirements.

- Evidence of shipyard’s and/or its subcontractor’s experience in coating application.

- Surface preparation procedures and standards, including inspection points and methods.

- Application procedures and standards, including inspection points and methods.

- Format for inspection reports on surface preparation and coating application.

- Manufacturer’s product safety data sheets for each product and owner’s, coating manufacturer’s and shipyard’s explicit agreement to take all precautions to reduce health and other safety risks which are required by the authorities.

- Maintenance requirements for the coating system.

3.7 Corrosion protection for Cargo Oil tanks of Crude Oil Tankers

3.7.1 Cargo oil tanks of crude oil tankers are to be :

i) Coated during construction in accordance with the Performance

Standards for Protective Coating (PSPC-COT) adopted by the IMO by Resolution MSC. 288(87). ; or

ii) Protected by alternative means of corrosion protection or utilization of corrosion resistance material to maintain required structural integrity for 25 years in accordance with the performance standard for alternative means of corrosion protection for cargo oil tanks of crude oil tankers, adopted by the IMO by Resolution MSC. 289(87).

3.7.2 The requirements given in 3.7.1 are to be applied for crude oil tanker greater than 5000 tonnes deadweight where :

i) Building contract is placed on or after 1st January 2013;

ii) In absence of building contract, the keels of which are laid or which are at a similar stage of construction on or after 1st July 2013;

iii) Or the delivery of which is on or after 1st January 2016.

3.7.3 The Administration may exempt a crude oil tanker from the requirements of 3.7.1 to allow the use of prototype alternatives to the coating system specified in 3.7.1 i), for testing, provided they are subject to suitable controls, regular assessment and acknowledgement of the need of immediate remedial action if the system fails or is shown to be failing. Such exemption is to be recorded on an exemption certificate.

3.7.4 The Administration may exempt a crude oil tanker from the requirement of 3.7.1 if the ship is built to be engaged solely in the carriage of cargoes and cargo handling operations not causing corrosion. Such exemption and conditions for which it is granted is to be recorded on an exemption certificate. (See MSC.1/Circ.1421 "Guidelines on exemption for crude oil tankers solely engaged in the carriage of cargoes and cargo handling operations not causing corrosion").

Section 4

Deck Covering

4.1 General

4.1.1 Where plated decks are sheathed with wood or an approved composition, reductions in plate thickness may be allowed.

4.1.2 The steel deck is to be coated with a suitable material in order to prevent corrosive action, and the sheathing or composition is to be effectively secured to the deck.

4.1.3 Deck coverings in the following positions are to be of a type which will not readily ignite where used on decks :

a) forming the crown of machinery or cargo spaces within accommodation spaces of cargo ships

b) within accommodation spaces, control stations, stairways and corridors of passenger ships.

End of Chapter

Chapter 3

Principles for Scantlings and Structural Details

Contents

Section 1

General

1.1 Application

1.1.1 Scantlings of various platings, stiffeners and girders to meet the local strength requirements are to be determined in accordance with the general principles given in this Chapter.

The design values of loads to be considered are given in Ch.4.

1.1.2 Scantlings of hull members contributing to the longitudinal strength are also to comply with the requirements of Ch.5.

1.1.3 Scantlings of hull members subjected to compressive stresses are also to comply with the requirements of Sec.6.

1.2 Symbols

p = design pressure [N/mm^2] as per Ch.4.

s = stiffener spacing [mm], measured along the plating.

l =span of the stiffener, [m], in accordance with 4.1.1.

r = radius of curvature [mm].

S = span of the girder [m], in accordance with 4.1.2.

b = mean breadth [m], of the load area supported by the girder.

h_W = height of web, [mm].

b_f = width of flange, [mm].

t_w, t_f = net thickness of web and flange [mm], respectively after deduction of t_c as given in 2.1.1. For bulb sections, t_f is to be based on the mean thickness of the bulb.

σ = allowable bending stress, [N/mm^2] as given in the relevant Chapters.

σy = minimum yield stress of material, [N/mm^2], may be taken as 235 [N/mm^2] for normal strength steel.

k = material factor as defined in Ch.2, Sec.1.2.

E = modulus of elasticity, 2.06 x 10^5 [N/mm^2] for steel.

1.3 Frame spacing

1.3.1 The normal frame spacing between aft peak and 0.2L from F.P. may be taken as:

450 + 2L [mm] for transverse framing

550 + 2L [mm] for longitudinal framing.
However, it is generally not to exceed 1000 [mm].

1.3.2 Elsewhere, the frame spacing is generally not to exceed the following:

- In peaks and cruiser sterns:

600 [mm] or as in 1.3.1, whichever is lesser.

- Between collision bulkhead and 0.2L from F.P.:

700 [mm] or as in 1.3.1, whichever is lesser.

1.3.3 Where the actual frame spacing is higher than that mentioned above, the minimum thicknesses of various structural members as given in the Rules may require to be increased.

Section 2

Corrosion Additions

2.1 General

2.1.1 The thickness of plates, stiffeners and girders in tanks for water ballast and/or cargo oil and in holds of dry bulk cargo carriers is to be increased by a corrosion addition 't_c' as given in Table 2.1.1.

2.1.2 The required corrosion addition 'Zc' to the section modulus of stiffeners and girders due to the thickness addition 't_c' mentioned above may be approximated as:

$$Z_c = \frac{t_c h_w (b_f + 0.3 h_w)}{1000} \ [\mathrm{cm}^3]$$

Table 2.1.1 : Corrosion addition t_c [mm]

Item	Space Category	Vertical Surfaces		Horizontal Surfaces	
		Standard	Min-max.	Standard	Min-max.
Internal members within and plate boundary between spaces of the given category	Ballast tank	0.1 t_n	2-3 [1a)]	0.15 t_n	2-4 [1a)]
	Cargo oil tank only	0.1 t_n	2-3	0.15 t_n	2-4
	Hold of dry bulk cargo carriers	0.2 t_n	2.5[4] - 3.5	0.2 t_n	2.5[4] - 3.5
Plate boundary between the two given space categories	Ballast tank/Cargo oil tanks only	0.1 t_n	2-3 [1a)]	0.15 t_n	2-4 [1b)]
	Ballast tank/Hold of dry bulk cargo carrier	0.15 t_n	2-3	0.15 t_n	2-4
	Ballast tank/Other category space	0.05 t_n	0.5 - 1.0 [1c)]	0.1 t_n	2-3
	Cargo oil tank only/Other category space	0.05 t_n	0.5 - 1.0	0.1 t_n	2-3
	Hold of dry bulk cargo carrier/Other category space	0.1 t_n	1.5 - 2.0	0.1 t_n	1.5 - 2.0

Notes:

1 Where the relevant ballast or liquid cargo tanks extend upto the exposed weather deck, the minimum corrosion addition in the region extending upto 1.5 [m] below the weather deck is also to be not less than that indicated below against the symbols 1a, 1b, 1c used in the table.
1a) 3.0 [mm] 1b) 2.0 [mm] 1c) 2.0 [mm]

2 t_n = net plate thickness required [mm].

3 The term ballast tank also includes combined ballast and cargo oil tanks, but not cargo oil tanks which may carry water ballast on exceptional circumstances according to Regulation 13(3) of MARPOL 73/78.

4 Hold of dry bulk cargo carriers refers to the cargo holds of vessels with class notations **BC-A, BC-B, BC-C** or **Ore Carrier**. For single skin bulk carriers of length ≥ 150 [m], t_c min = 3.5 [mm].

5 Other category space denotes the hull exterior and all spaces other than water ballast and cargo oil tanks and holds of dry bulk cargo carriers.

Section 3

Plating

3.1 General

3.1.1 Minimum requirements of thickness of various platings are given in relevant chapters.

3.1.2 The thickness 't' of plating subjected to lateral pressure is not to be less than

$$t = f_a f_r \frac{s\sqrt{p}}{2\sqrt{\sigma}} + t_c \ \text{[mm]}$$

where,

f_a = correction factor for aspect ratio of plate field;

$$= \sqrt{1.10 - 0.5(s/1000\ l)^2};$$

however, not to be taken more than 1.0.

f_r = correction factor for curvature perpendicular to the stiffeners

= (1 - 0.5 s/r)

3.1.3 Any tapering of thickness of platings contributing to the longitudinal strength is to be based upon linear variation of stress σ allowed at specified regions.

Section 4

Stiffeners and Girders

4.1 Determination of span

4.1.1 For stiffeners, the span 'l' [m] is to be taken as the length of the stiffener between the two supporting members less the depth of stiffener on crossing panel if any. Where brackets larger than those required in 5.1.2 are fitted, the span may be determined as shown in Fig.4.1.1.

For curved stiffeners, 'l' may be based on the chord length.

4.1.2 For girders, the span 'S' [m] is to be taken as the length of the girder between the two supporting members, less the web height of in-plane girder if any, and the correction for bracket 'b_c', as shown in Fig.4.1.2.

4.2 Effective width of attached plating

4.2.1 The area of the attached plating, to be used in the calculation of sectional properties of the stiffeners and girders, is to be taken as the cross-sectional area within the effective width of the attached plating.

4.2.2 The effective width of plating attached to a stiffener may be taken as the mean of spacings on either side of the stiffener.

4.2.3 The effective width of plating attached to a girder, 'b_e' is to be taken as per the following:

b_e = c. b

where,

c = c_1, for girders with uniformly distributed loads or with six or more evenly spaced point loads

= c_2, for girders with three or less evenly spaced point loads.

Table 4.2.3 : Values of "c"

a/b	0.5	1.0	2.0	3.0	4.0	5.0	6.0	≥7.0
C_1	0.19	0.38	0.67	0.84	0.93	0.97	0.99	1.00
C_2	0.11	0.22	0.40	0.52	0.65	0.73	0.78	0.80

For intermediate values of a/b and number of point loads, values of 'c' may be obtained by interpolation.

a = span of the girder, for simply supported girders, [m].

= 60 per cent of span of the girder, for girders fixed at both ends, [m].

4.2.4 In case of girders on corrugated bulkheads which run across the corrugations, the effective width of attached plating is to be taken as 10% of that obtained from 4.2.3.

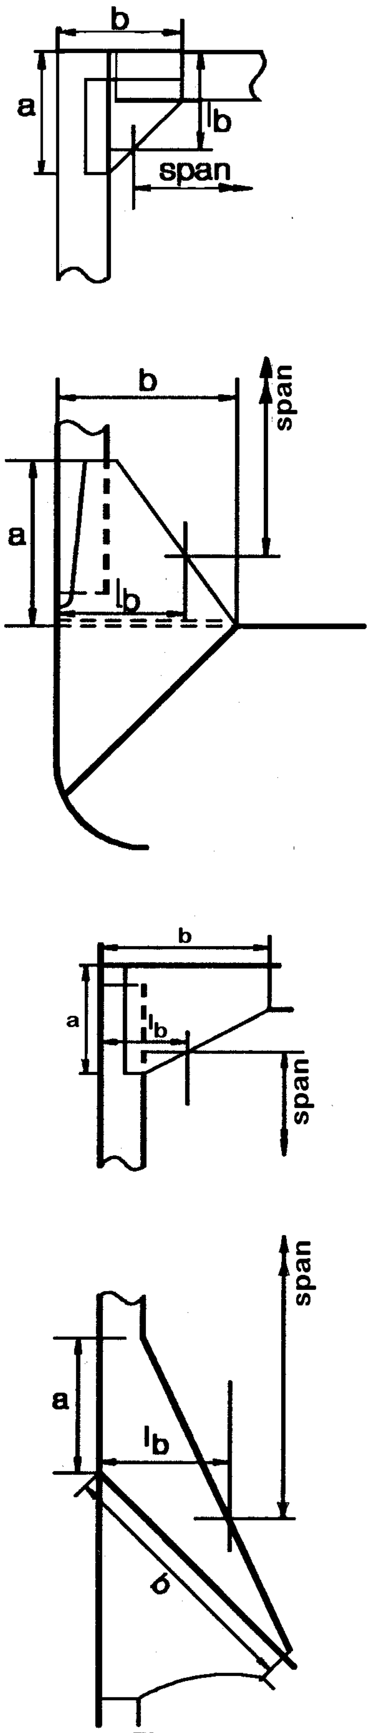


Fig.4.1.1

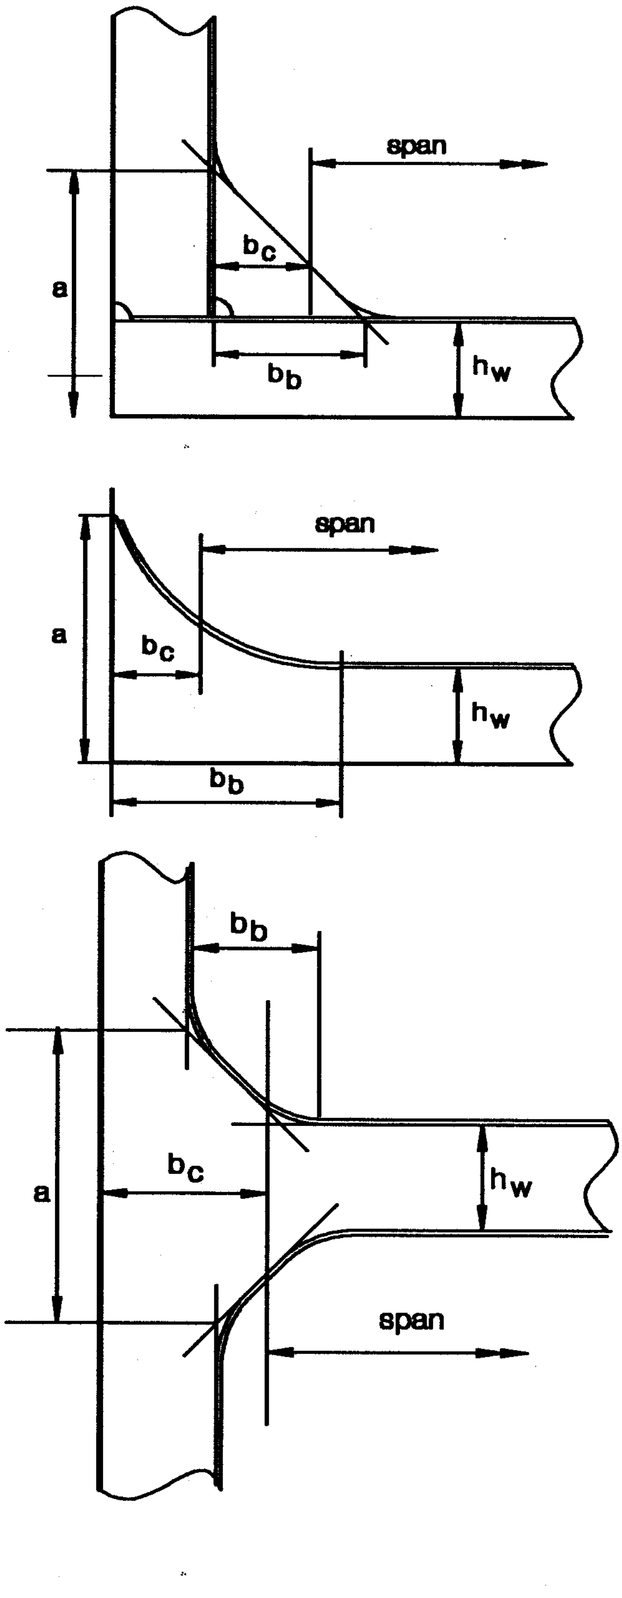

$$b_c = b_b\,(1 - h_w/a)$$

Fig.4.1.2

4.2.5 The effective cross sectional area of the attached plating is not to be less than that of the face plate.

4.3 Scantlings of stiffeners

4.3.1 The section modulus 'Z' of stiffeners subjected to lateral pressure is not to be less than:

$$Z = \frac{s.p.l^2.10^3}{m\sigma} + Z_c \ [cm^3] \text{ or } 15\ [cm^3]$$

whichever is greater.

where,

m = bending moment factor depending on the arrangement at the supports and variation of lateral pressure as given in the relevant chapters. Where not stated, the `m' value may generally be taken as:

= 12 for continuous longitudinal stiffeners.

= 10 for transverse, vertical and non-continuous longitudinal stiffeners fixed at both ends.

= 8 for stiffeners simply supported at both ends.

4.3.2 Where stiffeners are not perpendicular to the plating, the section modulus as obtained from 4.3.1 is to be increased by the factor (1/cos α), α being the angle between the stiffener web and the plane perpendicular to the plating.

4.4 Scantlings of girders

4.4.1 The scantlings of simple girders subjected to lateral pressure which can be considered as conforming to the general beam theory are to satisfy the requirements given in 4.4.2 and 4.4.3.

4.4.2 The section modulus 'Z' of girders subjected to lateral pressure is not to be less than:

$$Z = \frac{b.p.S^2.10^6}{m\sigma} + Z_c \ [cm^3]$$

where,

m = bending moment factor depending upon the arrangement at supports and variation of lateral pressure as given in the relevant chapters. Where not stated, the 'm' value may generally be taken as 12 for continuous longitudinal girders and 10 for all other girders.

4.4.3 The effective cross sectional area of the girder web is to be taken as :

$$A_W = 0.01\ h_n\ t_W \ [cm^2]$$

where,

h_n = net girder height, [mm], after deduction of cutouts at the section under consideration.

Where an opening is located at a distance less than $h_W/3$ from the cross section under consideration, h_n is to be taken as the smaller of the net height and the distance through the opening (h_{n1} + h_{n2}) (See Fig.4.4.3).

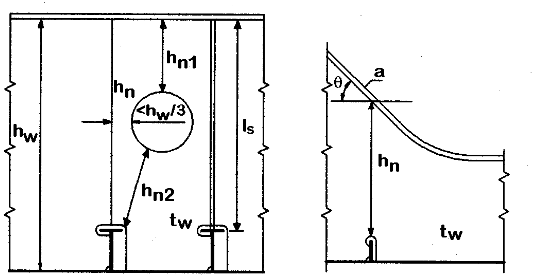

Fig.4.4.3 : Effective web area of girders

Where the girder flange is at angle θ to the length of the girder, A_w may be taken as:

$A_W = 0.01\ h_n\ t_W + 1.3\ a\ \text{Sin}\ 2\theta\ \text{Sin}\ \theta\ [cm^2]$

where,

a = area of flange, [cm^2]

The requirement of effective web area of various girders are given in the relevant Chapters.

4.4.4 The thickness of the girder web t_w is not to be less than:

$t_w = (6 + 0.02L) + t_c$ [mm] or

$t_w = \frac{S_w}{55} + t_c$ [mm], whichever is greater.

where,

S_w = web depth or spacing [mm], of the first web stiffener parallel to the face plate. In case of deep girders, value of S_w may be taken as 90% of the actual spacing.

The web stiffeners may be flat bars of same thickness as that of the web and 1/10 of the height of girder, in depth.

4.4.5 Where openings are cut in the girder web, they are to be away from the girder ends and scallops for stiffeners; with their centre located as near to the neutral axis of the girder as practicable. Openings of depth exceeding 25% of the girder depth or 300 [mm] and, of length exceeding the depth of the girder or 60% of the secondary stiffener spacing, are to be reinforced all around at the edge; or alternatively by providing horizontal and vertical stiffeners.

4.4.6 Girders are to be provided with adequate lateral stability by tripping brackets fitted generally at every alternate stiffener in case of asymmetrical section or at every fourth stiffener in case of symmetrical section. Tripping brackets are also to be fitted at the toes of end brackets and in way of concentrated loads such as heels of pillars or cross ties.

Where the width of face plate on one side of the web exceeds 15 t_f, the tripping brackets are to be connected to the face plate.

The tripping brackets are to be adequately dimensioned at base and are to have a smooth transition to the adjoining stiffeners. The free edge of the tripping bracket is to be stiffened if it's length exceeds 60t [mm]. Additional stiffeners are to be fitted parallel to the free edge to ensure that the arm length of an unstiffened triangular end panel does not exceed 100t [mm].

Section 5

End Attachments

5.1 End attachments of stiffeners

5.1.1 All stiffeners participating in the longitudinal strength are generally to be continuous over transverse members within 0.5L amidships. Proposals of longitudinals abutting at transverse members may be accepted outside 0.5L amidships region and in ships less than 150 [m] in length, provided the brackets connecting the ends of the longitudinals are continuous and of adequate size.

5.1.2 Scantlings of brackets fitted on stiffeners not participating in the longitudinal strength are not to be less than the following:

- The arm lengths, 'a and b' (See Fig.4.1.1) are to be such that:

i) a, b ≥ 0.8 l_b

and

ii) a+b ≥ 2.0 l_b

where,

$l_b = 24\sqrt{Z} + 75$ [mm]

- Thickness of unflanged bracket is to be not less than:

$$t = (4.0 + 0.3\sqrt{Z})\ \sqrt{(k_b/k_s)} + t_c\ \ [mm]$$

- Thickness of flanged bracket is to be not less than:

$$t = (3.0 + 0.25\sqrt{Z})\ \sqrt{(k_b/k_s)} + t_c\ \ [mm]$$

but need not be taken greater than 13.5 [mm]

- Width of flange, w ≥ 40 + Z/25 [mm], but not to be less than 50 [mm].

where,

Z is the section modulus [cm^3], of the smaller stiffener, being connected.

k_b, k_s are the material factors for the bracket and the stiffener, respectively.

5.2 End attachments of girders

5.2.1 The end attachments and supporting structure of the girders are to provide adequate resistance against rotation and displacement of the joint and effective distribution of the load from the member. Supporting members to which the girders are being connected, may require additional strengthening to provide adequate stiffness to resist rotation of the joint. Where the end attachment provides only a low degree of restraint against rotation, the girder is generally to be extended beyond the point of support by at least two frame spaces before being gradually tapered.

Connections between girders forming a ring system are to be such as to minimize stress concentrations at the junctions. Integral brackets are generally to be radiused or well rounded at the toes.

Where the face plate of the girder is not continuous over the bracket, the free edge of the bracket is to be stiffened and the face plate of the girder is to be extended well beyond the toe of the bracket.

5.2.2 The thickness 't' of brackets on girder is not to be less than that of the girder web.

The arm length 'a' including the depth of girder is not to be less than:

$$a = 83\sqrt{(Z/t)}\ \text{[mm]};$$

where,

Z = the section modulus [cm^3], of the girder to which the bracket is connected.

The cross sectional area 'A_f' of the face plate on the girder bracket is not to be less than:

$$A_f = 0.001\ l_f\ t\ [\text{cm}^2]$$

where, l_f is the length [mm], of the free edge of the bracket.

Additional stiffeners parallel to the bracket face plate are to be fitted on webs of large brackets. The arm length of an unstiffened triangular end panel of bracket is generally not to exceed 100t [mm].

5.3 Bracketless end connections

5.3.1 Two member connection

5.3.1.1 The thickness (t_b) of the common web at the joint of two member bracketless connection (Fig 5.3.1) is not to be less than the greater of the following:

$$t_b = \left(\frac{\sigma_1 A_1}{h_2} - t_2\tau_2\right)\frac{k}{110} \qquad [mm]$$

$$t_b = \left(\frac{\sigma_2 A_2}{h_1} - t_1\tau_1\right)\frac{k}{110} \qquad [mm]$$

and also, t_b is not to be less than t_1 and t_2

where,

A_1, A_2 = minimum required flange area of member 1 and 2 respectively [mm^2]

h_1, h_2 = web height of member 1 and 2 respectively [mm]

t_1, t_2 = minimum required thickness of web of member 1 and 2 respectively [mm]

τ_1, τ_2 = average shear stress in member 1 and 2 respectively [N/mm^2]

σ_1, σ_2 = bending stress at flange area of member 1 and 2 respectively [N/mm^2]

k = material factor for common web at corner as given in Pt. 3 Ch.2 Sec. 1.2.

5.3.1.2 Bending and shear stress computation is to be carried out by considering each member separately as a beam with appropriate boundary conditions. The corner joint between the members is to be considered as fixed joint.

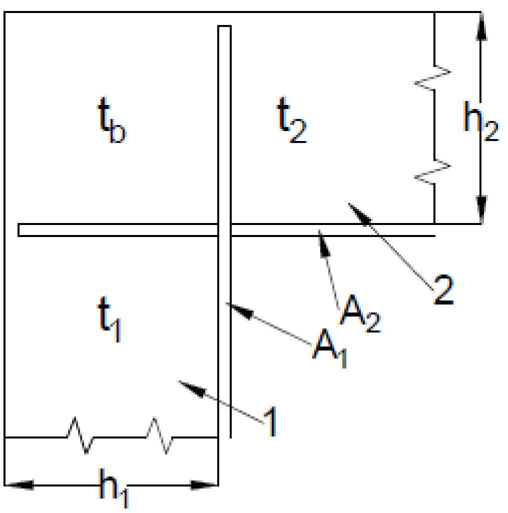

Fig.5.3.1 Bracketless end connection for two members

5.3.2 Three Member Connection

5.3.2.1 In the case of three member bracketless connection, when the flanges of member 1 and member 3 are continuous (Fig. 5.3.2), the thickness (t_b) of the common web at the joint is not to be less than the following:

$$t_b = \left(\frac{\sigma_2 A_2}{h_1} - t_1 \tau_1\right)\frac{k}{110} \qquad [mm]$$

and also, t_b is not to be less than t_1 and t_2.

5.3.2.2 In the case of three member bracketless connection, when the flanges of member 1 and member 3 are not continuous, the thickness (t_b) of the common web at the joint is to be determined as given by 5.3.1.1 and 5.3.1.2.

5.3.3 When the web height of member 1 and member 2 is more than $100t_b$, the common part of the corner web is to be stiffened.

5.3.4 Welding of the extended face plates of the joining members to the common web at the corner is to be of sufficient length and size to transfer the axial loads from the face plates to the common web.

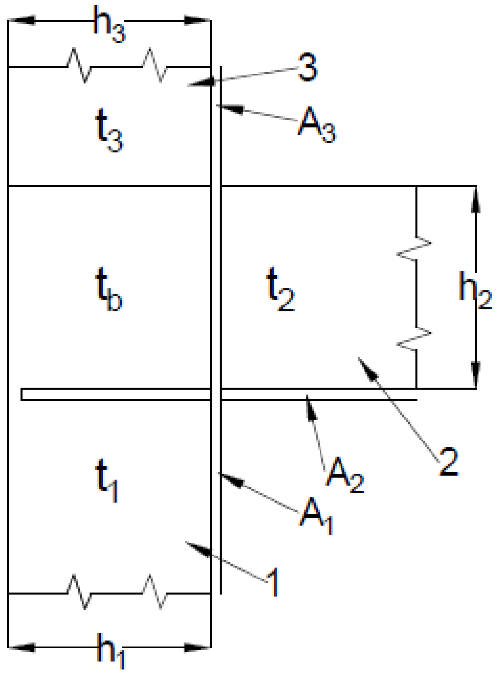

Fig.5.3.2 Bracketless end connection for three members

Section 6

Buckling

6.1 General

6.1.1 The critical buckling stress 'σ_{cr}' of plate panels and stiffeners and other members to compressive loads is to be such that:

$$\sigma_{cr} \geq \frac{\sigma_c}{\eta}$$

where,

σc = compressive stress to be considered as per Sec.6.3

η = 1.0 for deck, longitudinally stiffened side shell and single bottom plating

η = 0.9 for bottom, inner bottom plating in double bottom and transversely stiffened side shell plating

= 1.0 for local plate panels where an extreme load level is applied (e.g. impact pressure)

= 0.8 for local plate panels where a normal load level is applied

= 0.85 for lateral buckling mode of longitudinals

= 0.9 for torsional and web buckling mode of longitudinals

$$= \frac{0.7}{1 + l_m/i}$$ (need not be taken smaller than 0.3);

- for axially loaded members such as pillars, cross-ties, panting beams etc., in general. - to be reduced by 15 per cent where the loads are primarily dynamic in nature.

- for 'l_m' and 'i' See 6.2.6.

6.1.2 The critical compressive buckling stress 'σ_{cr}' may be determined as follows :

$$\sigma_{cr} = \sigma_E \quad \text{when} \quad \sigma_E \leq 0.5\,\sigma_y$$

$$= \sigma_y \left(1 - \frac{\sigma_y}{4\sigma_E}\right) \text{when}\, \sigma_E > 0.5\sigma_y$$

where,

σ_E = ideal elastic buckling stress as per Sec.6.2.

6.1.3 The critical shear stress of plate panels, stiffeners and other members to be such that

$$\tau_{cr} \geq \tau_c/\eta$$

where,

τ_c = Actual shear stress calculated for the plate panels

The shear stresses in plate panels of side shell and longitudinal bulkheads are given in Ch.5, Sec.4.2.

η = 0.90 for ship's side and longitudinal bulkhead subject to hull girder shear forces

= 0.85 for local panels in girder webs when nominal shear stresses are calculated (τ_c = Q/A)

= 0.90 for local panels in girder webs where shear stresses are determined by finite element calculation.

6.1.4 The critical shear buckling stress, 'τ_{cr}' may be determined as follows:

$$\tau_{cr} = \tau_E \quad \text{when} \quad \tau_E \leq 0.5\,\tau_y$$

$$= \tau_y \left(1 - \frac{\tau_y}{4\tau_E}\right) \text{when}\, \tau_E > 0.5\,\tau_y$$

where,

τ_E = ideal elastic shear buckling stress [N/mm^2], as per 6.2.2.

τ_y = yield stress in shear of the material [N/mm^2] = $\sigma_y/\sqrt{3}$.

6.2 Ideal elastic buckling stress

6.2.1 The σ_E value for platings may be taken as:

$$\sigma_E = 0.9\,K\,E\left[(t - t_c)/s\right]^2 \ [\text{N/mm}^2]$$

where,

$$K = \frac{8.4}{\Psi + 1.1}$$

- for plating with stiffeners in the direction of the compressive stress

$$= C\left[1 + \left(\frac{s}{1000\,l}\right)^2\right]^2 \ \frac{2.1}{\Psi + 1.1}$$

- for platings with stiffeners in the direction perpendicular to the compressive stress

ψ = ratio between the smaller and the larger values of the compressive stress assuming a linear variation (See Fig.6.2.1)

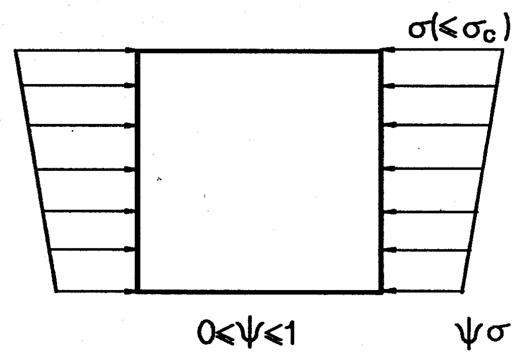

Fig.6.2.1

C = 1.30 when plating is stiffened by floors or deep girders

= 1.21 when stiffeners are angles or T sections

= 1.10 when stiffeners are bulb flats

= 1.05 when stiffeners are flat bars

s = shorter side of plate panel, [mm]

l = longer side of plate panel, [m]

6.2.2 The ideal elastic buckling stress for plate panels in shear may be taken as:

$\tau_E = 0.9\,K_s\,E\,[(t - t_c)/s]^2$ [N/mm^2]

where,

$K_s = 5.34 + 4\,(s/1000\,l)^2$

6.2.3 The value for the lateral buckling mode of longitudinals may be taken as:

$\sigma_E = 0.001\ E\ I_a / (A.l^2)$ [N/mm²]

where,

I_a = moment of inertia [cm⁴], of the longitudinal about the neutral axis parallel to the plating

A = cross sectional area [cm²], of the longitudinal

In the calculation of I_a and A, attached plating area corresponding to the longitudinal spacing and net thickness is to be included.

6.2.4 The σ_E value for the torsional mode of longitudinals may be taken as:

$$\sigma_E = \frac{\pi^2 E I_w}{10^4 I_p l^2}\left(m^2 + \frac{K}{m^2}\right) + 0.385 E \frac{I_t}{I_p} [\mathrm{N/mm^2}]$$

where,

$$K = \frac{C l^4}{\pi^4 E I_w} 10^6$$

m = number of deformation half waves depending on K, as per Table 6.2.4.

I_t = St Venant's moment of inertia, [cm⁴], of profile (without plate flange)

$$= \frac{h_w t_w^{\ 3}}{3} 10^{-4} \text{ for flat bars (slabs)}$$

$$= \tfrac{1}{3}\left[h_w t_w^3 + b_f t_f^{\ 3}\left(1 - 0.63\frac{t_f}{b_f}\right)\right] 10^{-4}$$

- for flanged profiles

I_p =polar moment of inertia, [cm⁴], of profile about connection of stiffener to plate

$$= \frac{h_w^3 t_w}{3} 10^{-4} \text{ for flat bars (slabs)}$$

$$= \left(\frac{h_w^3 t_w}{3} + h_w^2 b_f t_f\right) 10^{-4} \text{ for flanged profiles}$$

I_W = sectorial moment of inertia, [cm⁶], of profile about connection of stiffener to plate

$$= \frac{h_w^3 t_w^3}{36} 10^{-6} \text{ for flat bars (slabs)}$$

$$= \frac{t_f b_f^{\ 3} h_w^2}{12} 10^{-6} \text{ for 'Tee' profiles}$$

$$= \frac{b_f^3 h_w^2 [t_f \left(b_f^2 + 2 b_f h_w + 4 h_w^2\right) + 3 t_w b_f h_w] 10^{-6}}{12 (b_f + h_w)^2}$$

- for angles and bulb profiles

C = spring stiffness exerted by supporting plate panel

$$= \frac{k_p E t_p^3 t_w^3}{\left(3 s t_w^3 + 4 k_p h_w t_p^3\right)}$$

$k_p = 1 - \eta_p$, not to be taken less than zero; and for flanged profiles need not be taken less than 0.1.

t_p = net plate thickness, [mm], after deduction of 't_c' as given in 2.1.1.

$$\eta_p = \frac{\sigma_c}{\sigma_{Ep}}$$

σ_c = calculated compressive stress for longitudinals as per Sec.6.3.

σ_{Ep} = elastic buckling stress of supporting plate calculated as per 6.2.1.

6.2.5 The σ_E value for the web buckling mode of longitudinals may be taken as :

$$\sigma_E = 3.8 E \left(\frac{t_w}{h_w}\right)^2 [\mathrm{N/mm^2}]$$

Buckling of flanges on angles and T-sections of longitudinals is taken care of if the as built flange thickness is not less than 1/15 of the flange width on one side of the web.

6.2.6 The σ_E value for axially loaded members may be taken as:

$\sigma_E = 0.001\ C\ E\ (i / l_m)^2$ [N/mm²]
C = 1.0 for both ends hinged
= 2.0 for one end fixed
= 4.0 for both ends fixed

Table 6.2.4				
	0 < K < 4	4 < K < 36	36 < K < 144	$(m-1)^2\ m^2 < K \le m^2\ (m+1)^2$
m	1	2	3	m

i = radius of gyration of the member, [cm]

$$= \sqrt{(I/a)}$$

I = moment of inertia of the member, [cm^4], about the axis perpendicular to the direction of buckling being considered

a = cross sectional area of the member, [cm^2]

l_m = length of the member, [m].

Where end connections of a member are different with respect to the two principal axes, σ_E is to be found out for both cases using appropriate values of 'C' and 'I'.

6.3 Compressive stress, σ_c

6.3.1 The σ_c value for plate panels and stiffeners taking part in the longitudinal strength is to be taken as :

$$\sigma_c = (M_s + M_w)\frac{z}{I_n}10^5\ [N/mm^2];$$

but not to be taken less than 30/k [N/mm^2]

where,

M_s = still water bending moment [kN-m] as per Pt.3, Ch.5

M_w = wave bending moment [kN-m] as per Pt.3, Ch.5

Values of sagging moments (M_s and M_w) are to be considered for members above the neutral axis and the hogging values for members below the neutral axis.

I_n = moment of inertia of the hull girder about the neutral axis, [cm^4]

z = vertical distance [m], from the neutral axis of the hull girder to the member under consideration.

For ships with high speed and large flare in the forebody, σ_c as obtained from above is to be increased by σ_{ca} in the region forward of 0.3L abaft of F.P. The value of σ_{ca} is to be taken as :

σ_{ca} = 0 for C_{af} < 0.4

$$= \frac{50}{k}\left(1 - \frac{x}{0.3L}\right)[N/mm^2]\,\text{for } C_{af} > 0.5$$

where,

x = distance [m], from F.P., however need not be taken as smaller than 0.1L

C_{af} = factor as defined in Pt.3, Ch.5, 2.2.2.

For intermediate values of C_{af}, σ_{ca} is to be obtained by interpolation.

6.3.2 The σ_c value for axially loaded members is to be taken as :

$$\sigma_c = \frac{10.F}{a}\ [N/mm^2]$$

where,

a = cross - sectional area of the member, [cm^2].

F = Nominal axial force in the member;

= A_L . p . 10^3 [kN]

A_L = Load area, [m^2], being supported by the member

In the calculation of axial force F for deck pillars, contributions, if any, from the decks above are also to be considered.

In the calculation of axial force F for cross ties or panting beams, the larger of the design pressure 'p' at the either ends of the member is to be considered.

End of Chapter

Chapter 4

Design Loads

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The scantlings of various hull members are to be based on the design values of ship motions, accelerations, lateral pressures and forces given in this Chapter.

The design values of pressure caused by slamming, bow impact and sloshing have been given in the relevant Chapters dealing with specific structures.

1.2 Symbols

1.2.1 L, B, T, V, C_b are as defined in Ch.1, Sec.2.

g_o = Standard acceleration due to gravity

= 9.81 [m/s^2]

ρ = density of liquid cargo or dry cargo, [t/m^3].

p = design pressure [N/mm^2]

C_w = 0.0856L for L $\leq$ 90 [m]

= 10.75 - [(300-L)/100]$^{3/2}$ for 90 < L< 300 [m]

= 10.75 for 300 $\leq$ L $\leq$ 350 [m]

= 10.75 - [(L-350)/150]$^{3/2}$ for L > 350 [m]

a_o = common acceleration parameter

$$= \frac{3C_w}{L} + \frac{C_v V}{\sqrt{L}}$$

where,

$$C_v = \frac{\sqrt{L}}{50} \text{ for } L < 100 [m]$$

= 0.2 for L $\geq$ 100 [m]

1.2.2 For ships with service limitations, the wave bending moments and shear forces and the dynamic components of external sea pressures are to be reduced by application of the reduction factor 'R_s' as given below:

R_s = 1.0 for unrestricted service
= 0.75 for coastal service
= 0.65 for restricted service
= 0.55 for sheltered water service.

For definitions of service limitations, see Pt.1 Ch.1.

Section 2

Ship Motions and Accelerations

2.1 Roll and pitch angles

2.1.1 The values of single amplitudes of roll and pitch angles (corresponding to their periods T_r and T_p respectively), are normally to be taken as:

- The roll angle, $\Phi = \frac{50\,c}{B+75}$ [radians]

where,

$c = (1.25 - 0.025\,T_r)\,d$

d = 1.2 for ships without bilge keel

= 1.0 for ships with bilge keel having area equal to 2.5% of LxB

For other percentages of bilge keel areas 'd' is to be interpolated.

T_r is not to be taken greater than 30 [s]

- the pitch angle, $\theta = 0.25\,\frac{a_o}{C_b}$ [radians]

2.2 Acceleration components

2.2.1 The design values of various acceleration components are normally to be taken as :

- the surge acceleration,

$a_x = 0.2\,g_o a_o\,\sqrt{C_b}$ [m/s^2]

- the combined sway/yaw acceleration

$a_y = 0.3\,g_o\,a_o$ [m/s^2]

- the heave acceleration

$$a_z = \frac{0.7 g_o a_o}{\sqrt{C_b}}\ [\mathrm{m/s^2}]$$

- the tangential roll acceleration, (excluding gravity)

$$a_r = \phi\left\{\frac{2\pi}{T_r}\right\}^2\ R_r\ [\mathrm{m/s^2}]$$

where,

ϕ = roll angle as given in 2.1.1

T_r = period of roll. [s].

= ($2k_r / \sqrt{GM}$)

k_r = roll radius of gyration, [m].

GM = metacentric height, [m].

Minimum value of T_r resulting from various possible combinations of k_r and GM is to be used.

In case detailed calculations for k_r and GM have not been carried out, the following values may be used.

k_r = 0.39B for ships with even transverse distribution of mass

= 0.35B for tanker in ballast

= 0.25B for ships loaded with ore between longitudinal bulkheads.

GM = 0.07B

R_r = distance from the centre of the mass under consideration to the axis of rotation, [m].

The axis of rotation for roll may be taken on the centre line of the ship and at a height 'z' above base line

where,

$$z = \left[\frac{D}{4} + \frac{T}{2}\right]\ [\mathrm{m}]\ \text{or,}$$

$$= \frac{D}{2}\ [\mathrm{m}]$$

whichever is smaller.

- the radial roll acceleration may normally be neglected.

The tangential pitch acceleration, (excluding gravity):

$$a_p = \theta \left[\frac{2\pi}{T_p} \right]^2 R_p \ [\mathrm{m/s^2}]$$

where,

θ = pitch angle as given in 2.1.1

$$T_p = 1.8\sqrt{(L/g_o)}\ [\mathrm{s}]$$

R_p = distance from the centre of the mass under consideration to the axis of rotation [m].The axis of rotation for pitch may be taken at 0.45L from A.P. and 'z' [m] above base line.

- the radial pitch acceleration may normally be neglected.

2.3 Combined accelerations

2.3.1 The combined accelerations in the ship's vertical, transverse, and longitudinal directions are to be taken as:

- the combined vertical acceleration (combined effect of heave, pitch and roll; excluding gravity)

$$a_V = \sqrt{\left(a_Z^2 + a_{rz}^2 + a_{pz}^2\right)}\ [\mathrm{m/s^2}]$$

where,

a_z = heave acceleration as given in 2.2.1

a_{rz} = vertical component of the tangential roll acceleration as given in 2.2.1

a_{pz} = vertical component of the tangential pitch acceleration as given in 2.2.1.

It may be noted that the components a_{rz} and a_{pz} may be obtained from the formulae given in 2.2.1 using the horizontal projections of the distances R_r and R_p as given below :

Horizontal projection of R_r = R_{rh} = Transverse distance between horizontal coordinate of the centre of mass under consideration to axis of rotation for roll

Horizontal projection of R_p = R_{ph} = Longitudinal distance between longitudinal coordinate of the centre of mass under consideration to axis of rotation for pitch (see Fig.2.3 (a))

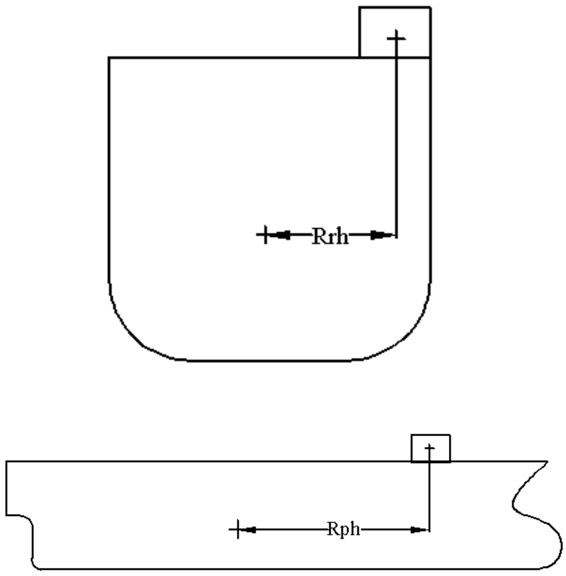

Fig.2.3 (a) : R_{rh} and R_{ph} Distances

- a_v may be approximated as

$$a_v = k_v \frac{g_o a_o}{C_b}\ [\mathrm{m/s^2}]$$

where,

k_v = 1.3 aft of A.P.

= 0.7 between 0.3L and 0.6L from A.P.

= 1.5 forward of F.P.

Between these specified regions k_v may be obtained by linear interpolation.

- the combined transverse acceleration, (combined effect of sway, yaw & roll)

$$a_t = \sqrt{\left[a_y^2 + \left(g_o \mathrm{Sin}\varphi + a_{ry}\right)^2\right]}\ [\mathrm{m/s^2}]$$

where,

a_y = sway/yaw acceleration as given in Sec.2.2.1

a_{ry} = transverse component of tangential roll acceleration given in Sec.2.2.1, the same may be obtained by using in the formula the vertical projection of the distance R_r as given below :

Vertical projection of R_r = R_{rv} = Vertical distance between vertical coordinate of the centre of mass under consideration to axis of rotation for roll (see Fig.2.3 (b))

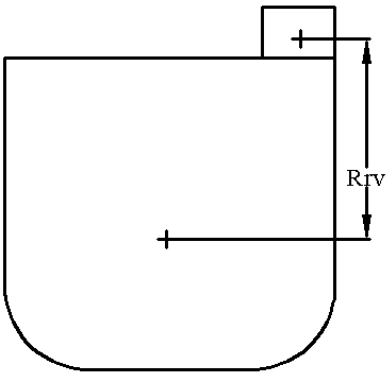

Fig.2.3 (b) : R_{rv} Distance

- the combined longitudinal acceleration, (combined effect of surge and pitch)

$$a_l = \sqrt{\left[a_x^2 + \left(g_o \mathrm{Sin}\theta + a_{px}\right)^2\right]}\ [\mathrm{m/s^2}]$$

where,

a_x = surge acceleration given in 2.2.1

a_{px} = longitudinal component of the tangential pitch acceleration given in 2.2.1, the same may be obtained by using in the formula the vertical projection of the distance R_p as given below :

Vertical projection of R_p =R_{pv}= vertical distance between vertical coordinate of the centre of mass under consideration to axis of rotation for pitch (see Fig.2.3 (c))

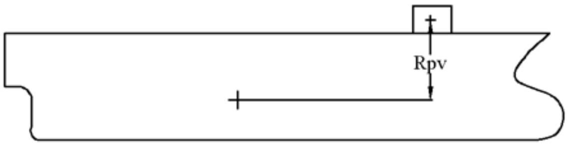

Fig.2.3 (c) : R_{pv} Distance

Section 3

Design Pressures and Forces

3.1 General

3.1.1 The scantlings of shell and weather deck panels are to be based upon the external sea pressures given in Sec.3.2, or internal pressure, in way of tanks as given in Sec.3.3 if these be greater. While determining internal pressures on shell panels, external sea pressure at ballast draught given in 3.2.4 may be deducted.

Inner bottoms, decks and hatch covers supporting dry cargo, stores and accommodation spaces are to be based upon design pressures given in Sec.3.4.

The gravity and acceleration forces from heavy units of cargo and equipment which may influence scantlings are given in Sec.3.5.

3.1.2 The design pressures are to be calculated at the loadpoint which is defined for various strength members as follows.

Loadpoint for plates

- midpoint of horizontally stiffened plate field

- half the stiffener spacing above the lower support of vertically stiffened plate field, or at the lower edge of plate when the thickness is changed within the plate field.

Loadpoint for stiffeners

- midpoint of span.

(when the pressure variation over the length of the span is not linear, the design pressure to be used is to be taken as the greater of p_m and $1/2(p_a+p_b)$ where, p_m = calculated pressure at midpoint
p_a, p_b = calculated pressures at two ends of the span)

Loadpoint for girders

- midpoint of load area supported by the girder

3.2 External sea pressures

3.2.1 All decks or parts of decks, which are exposed to the wash of sea are to be treated as weather decks.

3.2.2 The pressure 'p' acting on the ships' side, bottom and weather decks is to be taken as:

- for load point below summer load waterline

$$\rho = 0.01\,h_o + \left(k_s - \frac{1.5h_o}{T}\right)C_w . R_s .10^{-3}\ [\mathrm{N/mm^2}]$$

- for load point above summer load waterline

$p = R_s \,.\, k_s\,(C_w - 0.8\,h_o)\,.\,10^{-3}$ [N/mm^2]

where,

h_o = vertical distance [m] ,from the summer load waterline to the loadpoint.

k_s = 6 aft of A.P.

= 3.5 between 0.2L and 0.7L from A.P.

= 8/C_b forward of F.P.

Elsewhere the value of k_s may be obtained by linear interpolation.

'p' is not to be taken as less than:

0.01 [N/mm^2] for ship sides

0.015 [N/mm^2] for weather decks forward of 0.15L from F.P. or forward of deckhouse front, whichever is the foremost position.

0.005 [N/mm^2] for weather decks elsewhere.

3.2.3 The design pressure 'p' on inner bottom (double bottom flooded) is to be taken as

p = 0.01 T [N/mm^2]

3.2.4 The external sea pressure 'p' at ballast draught which may be deducted from internal pressures acting on shell panels as given in 3.3 is not to be taken greater than:

$p = 0.01\,(T_b - z) + (k_s - 1.5)\,C_w \,.\, R_s\,.10^{-3}$ [N/mm^2]

- for open sea conditions;

$p = 0.01(T_b - z)$ [N/mm^2]

- for harbour conditions.

p is not to be taken as less than zero.

where,

T_b = lowest design ballast draught amidships [m]. For preliminary purposes T_b may be taken as 0.35 T for cargo vessels and (2 + 0.02L) for tankers.

z = vertical distance [m] from the baseline to the loadpoint.

3.3 Internal pressures on tank structures

3.3.1 In case of tanks for crude oil or bunkers the liquid cargo density 'ρ is not to be taken less than that of sea water (ρ=1.025 [t/m^3]).

3.3.2 The pressure 'p', [N/mm^2] , in full tanks is to be taken as the greater of:

$p = \rho\,(g_o+0.5a_v)h_s\,.\,10^{-3}$ (1)

$p = 0.67\,\rho\,g_o(h_s+\phi b)\,.10^{-3}$ (2)

$p = 0.67\,\rho\,g_o(h_s+\theta l)\,.10^{-3}$ (3)

$p = 0.67\,\rho\,g_o\,h_p\,.\,10^{-3}$ (4)

$p = \rho\,g_o\,h_s\,.\,10^{-3} + p_o$ (5)

where,

a_v = combined vertical acceleration as given in 2.3.1

ϕ = roll angle as given in 2.1.1

θ = pitch angle as given in 2.1.1

h_s = vertical distance [m], from the load point to the top of cargo hatchway

b = the largest athwartship distance [m] ,from the load point to the tank corner at the top of the tank which is furthermost away from the load point. For tank tops with stepped contour, the uppermost tank corner will normally be decisive.

l = the largest longitudinal distance [m] ,from the load point to the tank corner at the top of the tank which is furthermost away from the load point. For tank tops with stepped contour, the uppermost tank corner will normally be decisive.

h_p = vertical distance [m], from the load point to the top of the air pipe.

p_o = 0.01 [N/mm^2] for L ≤ 20 [m]

$= 0.024$ [N/mm^2] for $L \geq 90$ [m]

For L between 20 [m] and 90 [m] the value of 'p_o' is to be obtained by linear interpolation.

However, in mechanically propelled cargo ships of 500 GT and above and passenger ships, for tanks forming part of the watertight subdivision, (See Ch.10, Cl.4.2.1) p_0 is to be taken as not less than 0.024 [N/mm^2].

Where automatic pressure valves are fitted, p_o is not to be taken as less than valve setting pressure.

The formulae which normally give the greatest internal pressure p are indicated in Fig.3.3.2a, Fig.3.3.2b and Fig.3.3.2c for various tank types.

The external sea pressure at ballast draught for open sea conditions as per 3.2.4 may be deducted from that given by formulae (1),(2) and (3) above.

The external sea pressure at ballast draught for harbour conditions as per 3.2.4 may be deducted from that given by formulae (4) and (5) above.

3.3.3 The pressure 'p' in tanks which may be filled between 20 per cent and 90 per cent of the tank heights is to be taken as the greater of that according to 3.3.2 and the relevant values given below:

- for strength members located within 0.25 l_t from the end bulkheads 'p' is not to be taken as less than:

$p = \rho\ [4 - 0.005L]\ l_t\ 10^{-3}$ [N/mm^2]

where,

l_t = distance [m], between transverse tank bulkheads or effective transverse wash bulkheads at the height at which the strength member is located. Transverse webframes covering part of the tank cross-section (e.g. wing tank structures in tankers) may be regarded as wash bulkheads for this purpose.

for strength members located within 0.25 b_t from the tank side bulkheads the pressure 'p' is not to be taken as less than:

$p = \rho\ [3 - 0.01B]\ b_t\ 10^{-3}$ [N/mm^2]

where,

b_t = distance [m], between tank side bulkheads or effective wash bulkhead at the height at which the strength member is located.

- for tanks with $l_t > 0.13L$ and/or $b_t > 0.56B$, p will be specially considered.

3.3.4 The pressure 'p' acting on girder web panels in cargo tanks or ballast tanks is not to be taken as less than 0.02 [N/mm^2].

3.4 Pressures due to dry cargoes, stores, equipment and accommodation

3.4.1 The pressure 'p' on inner bottom, decks or hatchcovers is to be taken as:

$p = q(g_o + 0.5\ a_v) \times 10^{-3}$ [N/mm^2]

where,

q = deck cargo load [t/m^2].

The standard values of `q' are given in Table 3.4.1. Where approval is sought for loadings higher than the standard loading, the same is to be indicated on the plans.

3.4.2 Weather deck and weather deck hatch covers intended to carry deck cargo are to be designed for external sea pressure as given in 3.2.2 or pressure due to deck cargo as given in 3.4.1, whichever is greater.

When the design stowage height of weather deck cargo is smaller than 2.3 [m], an appropriate combination of the two loads is to be considered.

3.4.3 The pressure 'p' from bulk cargoes on sloping and vertical sides or bulkheads is to be taken as:

$$p = C.\rho.h_c(g_o + 0.5\ a_v)\ .\ 10^{-3}\ \text{[N/mm}^2\text{]}$$

where,

$C = \sin^2\alpha\ \tan^2(45 - \delta/2) + \cos^2\alpha$

α = angle made by the panel under consideration with the horizontal plane, [degree]

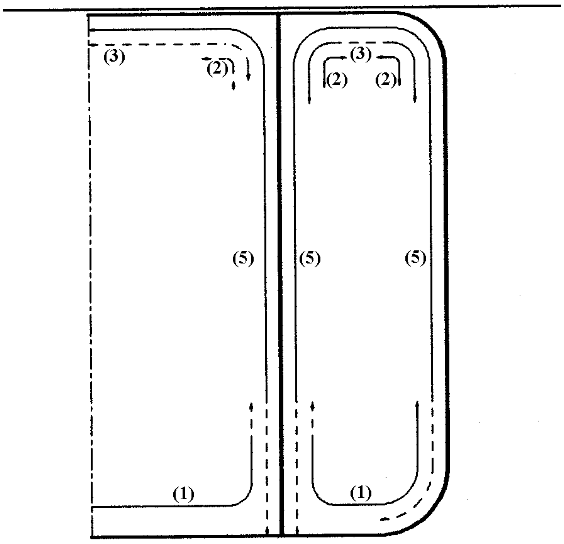

Fig. 3.3.2 (a) : Section in cargo tanks

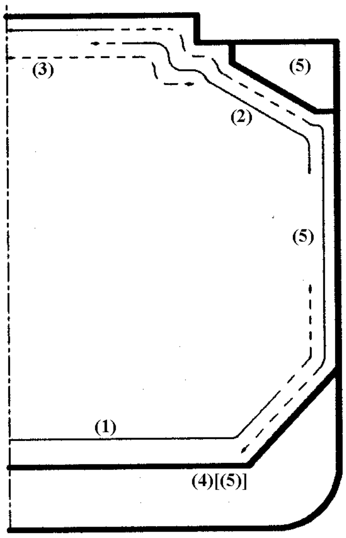

Fig. 3.3.2 (b) : Section in bulk cargo hold

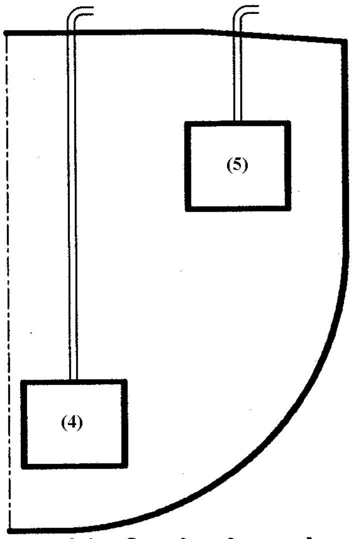

Fig. 3.3.2 (c) : Section in engine room

Table 3.4.1 : Standard deck loads

Decks	q[tonnes/m^2]
Weather deck and weather deck hatch covers intended for cargo	$q = 1.0$ t/m^2 for $L \leq 100$ m $= 1.3$ t/m^2 on superstructure deck for $L > 150$ m $= 1.75$ t/m^2 on freeboard deck for $L > 150$ m For L between 100 m and 150 m the standard value of q is to be obtained by linear interpolation
Tween deck, tween deck hatch covers and inner bottom in way of cargo and stores	$q = \rho.H.t/m^2$ $\rho = 0.7$ t/m^3 (see note) where, H = tween deck height in m or height measured upto the top of hatchway coaming above
Platform deck in machinery space	$q = 1.6$ t/m^2
Accommodation decks	$q = 0.35$ t/m^2
Note In case of ships where due to large volumetric capacity of cargo spaces the stowage rate is less than 0.7 [t/m^3], a reduction in the value of 'ρ' may be considered, if requested for.	

δ = angle of repose of cargo [degree], not to be taken greater than the following:
- 20° for light bulk cargo (e.g. coal, grain)
- 25° for bulk cement cargo
- 35° for heavy bulk cargo (e.g. ore)

h_c = vertical distance [m], from the load point to the mean horizontal plane corresponding to actual volume of cargo being considered.

For vessels designed to carry heavy bulk cargoes which are also required to carry lighter cargoes, the pressure 'p' based on maximum mass of cargo to be carried in the hold and filled up to the top of hatch coaming would also require to be considered.

3.5 Forces due to heavy units of cargo and equipment

3.5.1 The forces acting on supporting structures and securing systems for heavy units of cargo, equipment etc. are normally to be taken as:

- vertical force, alone:

$F_v = M (g_o + 0.5a_v)$ [N]

- vertical force in combination with transverse force:

$F_v = M.g_o$ [N]

$F_t = 0.67\ M.a_t$ [N]

- vertical force in combination with longitudinal force:

$F_v = M(g_o + 0.5a_v)$ [N]

$F_l = 0.67\ M.a_l$ [N]

where,

M = mass of the unit [kg].

F_v, F_t, F_l = forces acting in the vertical, transverse
and longitudinal directions respectively.

F_t and F_l need not be regarded as acting simultaneously.

a_v, a_t, a_l = combined accelerations in the vertical, transverse and longitudinal directions respectively, as given in 2.3.1.

End of Chapter

Chapter 5

Longitudinal Strength

Contents

Section

Section 1

General

1.1 Application

1.1.1 Scantlings of hull members contributing to longitudinal strength are to comply with the requirements given in this Chapter. These members are also to comply with the requirements of buckling strength given in Ch.3, Sec.6 and of local strength given in relevant chapters of Pt.3.

1.1.2 For ships with small block coefficient, high speed and large flare (in particular where L>120 [m] and speed V>17 knots), the section modulus in the forebody is to be specially considered based on the distribution of still water and vertical wave bending moments given in Sec.2.1 and Sec.2.2 respectively.

1.1.3 For ships with narrow beams the combined effects of vertical and horizontal bending of hull girder may have to be specially considered as given in 3.3.4.

1.1.4 For ships with large deck openings the combined effects of hull girder bending and torsion related possible local bending and shear stresses may have to be specially considered.

1.1.5 In addition to the above, ships of unusual type, design or proportions ($L/B \le 5$, $B/D \ge 2.5$, $L \ge 500$ [m]), will be specially considered.

1.1.6 Longitudinal strength requirements given in this section do not apply to Container Ships. Requirements given in Pt 5 Ch 5 Sec 4 are applicable to container ships.

1.2 Symbols

L, B, D, T, V, C_b, k as defined in Ch.1, Sec.2.

C_w, R_s as defined in Ch.4, Sec.1.

I_n = moment of inertia of hull girder, [cm^4], about the transverse neutral axis at the section under consideration.

I_c = moment of inertia of hull girders, [cm^4], about the vertical neutral axis at the section under consideration.

S_n = first moment of area, [cm^3], taken about the neutral axis, of the effective longitudinal material between the vertical level at which the shear is being determined and the vertical extremity of effective longitudinal material (deck or bottom as applicable), at the section under consideration.

Z_n = vertical distance [m] of the horizontal neutral axis above base line.

M_s = design still water bending moment [kN-m] as given in 2.1.2 and 2.1.3.

M_w = rule wave bending moment [kN-m] as given in 2.2.1 and 2.2.2.

Q_s = design still water shear force [kN] as given in 2.1.4.

Q_w = rule wave shear force [kN] as given in 2.2.3.

1.3 Terms

1.3.1 Effective longitudinal bulkhead :

A longitudinal bulkhead extending from bottom to deck and which is connected to the ship's side by transverse bulkheads both forward and aft.

Loading Manual:

A document which describes:-

- the loading conditions on which the design of the ship has been based, including permissible limits of still water bending moment and shear force
- the results of the calculations of still water bending moments, shear forces and where applicable, limitations due to torsional and lateral loads
- the allowable local loadings for the structure (hatch covers, decks, double bottom, etc.)

An operation manual is always to be provided with the loading instrument.

Loading Instrument:

An instrument, which unless otherwise stated is digital, by means of which it can be easily and quickly ascertained that, at specified read-out points, the still water bending moments, shear forces, and the still water torsional and lateral loads, where applicable, in any loaded or ballast condition will not exceed the specified permissible values.

Category I Ships :

Ships with large deck openings where combined stresses due to vertical and horizontal hull girder bending, torsional and lateral loads have to be considered; e.g. container ships.

Ships liable to carry non-homogeneous loadings, where the cargo and/or ballast may be unevenly distributed; e.g. bulk carriers, tankers. Ships less than 120 [m] in length, when their design takes into account uneven distribution of cargo or ballast, belong to Category II.

Chemical tankers and gas carriers.

Category II Ships :

Ships with arrangement giving small possibilities for variation in the distribution of cargo and ballast, and ships on regular and fixed trading pattern where the Loading Manual gives sufficient guidance, and in addition those exceptions given under Category I.

Section 2

Vertical Bending Moments and Shear Forces

2.1 Still water bending moment and shear force

2.1.1 Still water bending moments, M_s [kN-m], and still water shear forces, Q_s [kN], are to be calculated at each section along the ship length for design cargo and ballast loading conditions as specified in 2.1.2. For these calculations, downward loads are assumed to be taken as positive values, and are to be integrated in the forward direction from the aft end of L. The sign conventions of Ms and Qs are as shown in Fig.2.1.1.

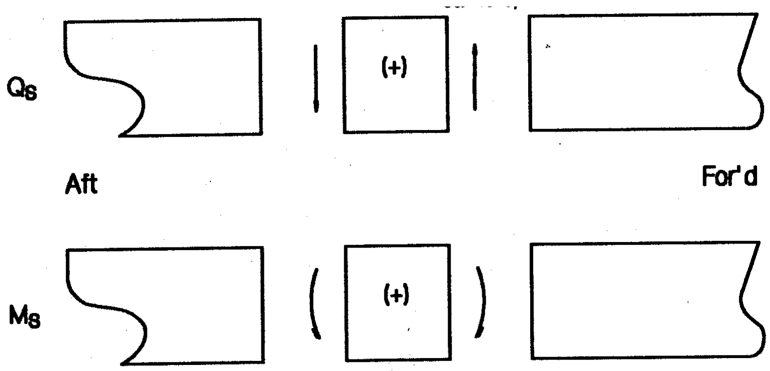

Fig. 2.1.1 : Sign conventions of M_s and Q_s

2.1.2 In general the following conditions (based on the amounts of bunker, fresh water, stores etc. at departure and arrival), are to be considered for the calculations of M_s and Q_s. Where the amount and disposition of consumables at any intermediate stage of the voyage are considered more severe, calculations for such intermediate conditions are to be submitted in addition to those for departure and arrival conditions. Also, where any ballasting and/or deballasting is intended during voyage, calculations of the intermediate condition just before and just after ballasting and/or deballasting any ballast tank are to be submitted and where approved, included in the loading manual for guidance.

a) General cargo ships, container ships, roll-on/roll-off and refrigerated cargo carriers, bulk carriers, ore carriers:

- Homogeneous loading conditions at maximum draught
- Ballast conditions
- Special loading conditions e.g. container or light load conditions at less than maximum draught, heavy cargo, empty holds or non-homogeneous cargo conditions, deck cargo conditions etc., where applicable
- Short voyage or harbour conditions, where applicable
- Docking condition afloat
- Loading and unloading transitory conditions, where applicable.

b) Oil tankers:

- Homogeneous loading conditions (excluding dry and clean ballast tanks) and ballast or part loaded conditions.
- Any specified non-uniform distribution of loading.
- Mid-voyage conditions relating to tank cleaning or other operations where these differ significantly from the ballast conditions.
- Docking condition afloat
- Loading and unloading transitory conditions.

c) Chemical tankers:

- Conditions as specified for oil tankers.
- Conditions for high density or heated cargo and segregated cargo, where these are included in the approved cargo list.

d) Liquefied gas carriers:

- Homogeneous loading conditions for all approved cargoes.
- Ballast conditions.
- Cargo conditions where one or more tanks are empty or partially filled or where more than one type of cargo having significantly different densities are carried.
- Harbour condition for which an increased vapour pressure has been approved.
- Docking condition afloat.

e) Combination carriers:

- Conditions as specified for oil tanker and cargo ships.

In addition to the above, any other loading condition likely to result in high bending moments or shear forces may require to be investigated.

For permissible use of partially filled ballast tanks in design loading conditions, See 2.1.3 and 2.1.4.

2.1.3 Ballast loading conditions involving partially filled peaks and/or other ballast tanks at departure, arrival or during intermediate conditions are not to be used as design conditions unless:

- permissible bending and shear stresses are not exceeded for all filling levels between empty and full; and
- for bulk carriers, the requirement for longitudinal strength of hull girder in flooded conditions as per Pt.5, Ch.1, Sec.2.2 are complied with for all filling levels between empty and full.

To demonstrate compliance with all filling levels between empty and full, it will be acceptable if, in each condition at departure, arrival and where required by 2.1.2 any intermediate condition, the tanks intended to be partially filled are assumed to be:

- empty
- full
- partially filled at intended level.

Where multiple tanks are intended to be partially filled, all combinations of empty, full or partially filled at intended level for those tanks are to be investigated.

The maximum and minimum filling levels of the above mentioned pairs of wing water ballast tanks are to be indicated in the loading manual.

2.1.4 In cargo loading conditions involving partially filled ballast tanks, the requirements given in 2.1.3 above need be applied in respect of peak tanks only.

2.1.5 Sequential ballast water exchange : Requirements of 2.1.3 and 2.1.4 above are not applicable to ballast water exchange using the sequential method. However, bending moment and shear force calculations for each de-ballasting or ballasting stage in the ballast water exchange sequence are to be included in the loading manual or ballast water management plan of any vessel that intends to employ the sequential ballast water exchange method.

However, for conventional ore carriers with large wing water ballast tanks in the cargo area, where empty or full ballast water filling levels of one or maximum two pairs of these tanks lead to the ship's trim exceeding one of the following conditions, it is sufficient to demonstrate compliance with maximum, minimum and intended partial filling levels of these one or maximum two pairs of ballast tanks such that the ship's condition does not exceed any of these trim limits. Filling levels of all other wing ballast tanks are to be considered between empty and full. The trim conditions mentioned above are:

- trim by stern of 3% of the ship's length, or
- trim by bow of 1.5% of ship's length, or
- any trim that cannot maintain propeller immersion (I/D) not less than 25%, where:
  - I = the distance from propeller centerline to the waterline
  - D = propeller diameter
  - (see Fig. 2.1.3).

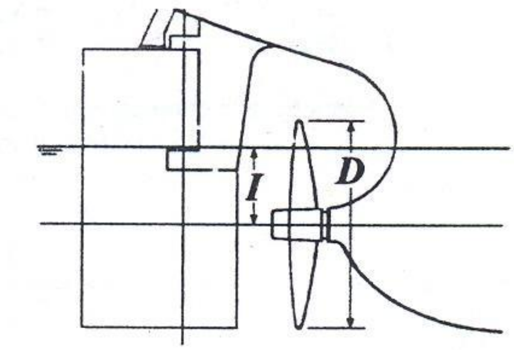

Fig.2.1.3

2.1.6 The design still water bending moment at amidships M_{so} (sagging and hogging), is to be taken equal to the maximum of sagging or hogging still water bending moments obtained for the loading conditions specified in Sec.2.1.2.

At locations other than amidships, 0.4L, the design still water bending moment Ms (sagging and hogging) is normally to be taken as:

$$M_s = K_{sm}.M_{so} \text{ [kN-m]}$$

where,

K_{sm} = 0.0 at A.P. and F.P.
= 0.15 at 0.1L from A.P. and F.P.
= 1.0 within 0.4L amidships.

Between the specified locations the value of K_{sm} is to be obtained by linear interpolation.

The longitudinal extent of the constant design still water bending moment amidships may be adjusted after special consideration based on the sagging and hogging moment envelopes embracing all the still water bending moment curves derived for loading conditions as specified in 2.1.2.

2.1.7 The design vertical still water shear force, Q_s, across any transverse section along the length of the ship is to be taken as the maximum of shear forces obtained at that location for the loading conditions specified in Sec.2.1.2.

2.2 Wave bending moment and shear force

2.2.1 The rule vertical wave bending moment M_{wo}, amidships is to be taken as

$M_{wo} = -0.11\ C_w L^2\ B(C_b + 0.7)\ R_s$ [kN-m]

- for sagging condition

$= +0.19\ C_w L^2\ B\ C_b R_s$ [kN-m]

- for hogging condition

C_b is not to be taken as less than 0.6

2.2.2 At locations other than amidships, the rule wave bending moment M_w (sagging and hogging) is to be taken as:

$M_w = K_{wm}.M_{wo}$

K_{wm} = 1.0 between 0.40L and 0.65L from A.P.

= 0.0 at A.P. and F.P.

Between the specified locations, K_{wm} is to be obtained by linear interpolation. This is indicated by curve 'A' of Fig.2.2.2.

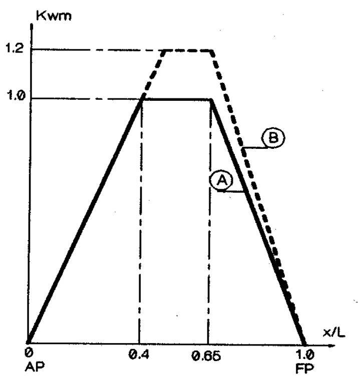

Fig. 2.2.2 : K_{wm} Distribution

However, for ships with high speed and/or large flare in the forebody, the value of K_{wm} is to be modified as per Table 2.2.2 using curves 'A' and 'B' of Fig.2.2.2 based on C_{av} and C_{af} given below:

$$C_{av} = \frac{C_v \cdot V}{\sqrt{L}}$$

$$C_{af} = C_v \frac{V}{\sqrt{L}} + \frac{A_{dk} - A_{wp}}{L\, z_{fp}}$$

$$C_v = \frac{\sqrt{L}}{50} \text{ for } L < 100$$

= 0.2 for $L \geq 100$

A_{dk} = projected area in horizontal plane of uppermost deck (including forecastle deck if any), forward of 0.2L from F.P., [m^2]

A_{wp} = area of waterplane at draught T, forward of 0.2L abaft of F.P. [m^2]

z_{fp} = vertical distance, [m], measured at F.P., from summer load water line to the deckline.

Table 2.2.2 : Modification to K_{wm} and K_{wq} values for high speed/flare

K_{wm}, K_{wq} values to be used as per the curve specified below:				
	$C_{av} \leq 0.28$		$C_{av} \geq 0.32$	
	Load condition	Curve	Load condition	Curve
$C_{af} \leq 0.4$	Hogging	A	Hogging	B
	Sagging	A	Sagging	A
$C_{af} \geq 0.5$	Hogging	A	Hogging	A
	Sagging	B	Sagging	B

For intermediate values of C_{av} and/or C_{af}, values of K_{wm}, K_{wq} are to be obtained by linear interpolation between specified curves

2.2.3 The rule vertical wave shear force Q_w at any section along the length of the ship is to be taken as:

$Q_w = 0.3\ K_{wq}\ C_w\ LB\ (C_b+0.7)\ R_s$ [kN] where, the distribution of K_{wq} for +ve and -ve shear forces, is to be obtained as per Table 2.2.3:

Between the specified locations K_{wq} is to be obtained by linear interpolation. This is indicated by curve 'A' of Fig.2.2.3.

However, for ships with high speed and/or large flare in the forebody, the value of k_{wq} is to be modified as per Table 2.2.2 using curves 'A' and 'B' of Fig.2.2.3 based on C_{av} and C_{af}.

Table 2.2.3

Location from A.P.	Positive Shear Force K_{wq} (+)	Negative Shear Force K_{wq} (-)
A.P.	0.0	0.0
0.2L to 0.3L	$\frac{1.589\,C_b}{(C_b+0.7)}$	-0.92
0.4L to 0.6L	0.70	-0.70

Section 3

Hull Section Modulus and Moment of Inertia

3.1 Calculation of section properties

3.1.1 When calculating the moment of inertia and section moduli, the effective sectional area (net area after deduction for openings as given in 5.2) of all continuous longitudinal strength members is to be taken into account.

Superstructures not forming strength deck (See Ch.1, Sec.2.2), deckhouses, bulwarks and non-continuous longitudinal hatch coamings are not to be included in the above calculations.

In case of ships with multi-hatchways athwartships, the effective sectional area of strength members between the hatch openings is normally to be taken as 0.6 times the net area of the members.

In case of ships with continuous trunks or longitudinal hatch coamings, their net sectional area may be included in the calculations provided they are effectively supported by longitudinal bulkheads or deep girders. The section modulus at deck however, is then to be calculated as given in 3.1.3.

3.1.2 The main strength members included in the calculation of hull moment of inertia and section modulus are to extend continuously through the cargo region and sufficiently far towards the ends of the ship. Longitudinal bulkheads are to terminate at effective transverse bulkheads and large transition brackets are to be fitted in line with the longitudinal bulkheads. Where significant changes in structural arrangement occur adequate transitional structure is to be provided.

3.1.3 The midship section modulus 'Z' at deck or bottom about the transverse neutral axis is to be obtained as follows:

$$Z = I_n / (100.z) \ \ [cm^3]$$

where,

z = the vertical distance [m] from the horizontal neutral axis upto the strength deck at side or the base line, as relevant.

However, in case of ships where continuous trunks or longitudinal hatch coamings are to be included in the section modulus calculation as per Sec.3.1.1, the distance z for calculation of modulus at deck is to be taken as the greater of the following:

z = z as above
$z = z_n$ [0.9 + 0.2 y/B]

where,

z_n = the vertical distance from the horizontal neutral axis to top of continuous strength member.

y = athwartship distance from the centreline of the ship to the side of the strength member.

z_n and y are to be measured to the point giving the largest value of z.

3.2 Extent of high strength steel

3.2.1 Where high strength steels are used in the main hull structure in order to reduce the section modulus requirement, the vertical and longitudinal extent of its use is to be such that adjacent structure made of ordinary hull structural steel is not stressed beyond the stress level permissible for ordinary steel.

3.2.2 The vertical extent of the high strength steel used in deck or bottom structure is to be as shown in the Fig.3.2.2, the distance z_o is not to be more than

$$z_o = I_n / (100.Z_{Ro}) \ \ [m]$$

where,

Z_{Ro} = Rule midship section modulus required for ordinary steel (k=1.0) as given in 3.3.1 and 3.3.2.

For narrow beam ships the vertical extent of high strength steel may have to be increased after special consideration.

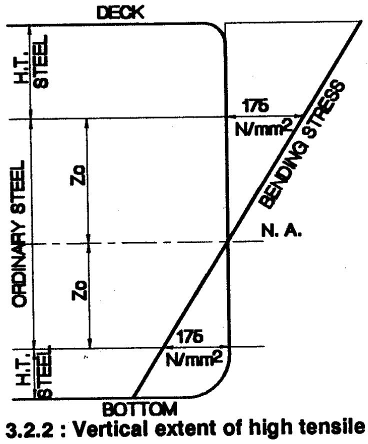

Fig. 3.2.2 : Vertical extent of high tensile steel

3.2.3 The longitudinal extent of the high strength steel is to be 0.4L amidships and beyond, such that at the junction with ordinary steel the scantlings are equal to those required for an identical ship built of ordinary steel. At the junction, continuity in scantlings is to be maintained.

3.3 Section modulus requirement

3.3.1 At any transverse section, the hull section modulus Z, about the transverse neutral axis for the still water bending moments Ms given in 2.1 and wave bending moments Mw given in 2.2, is not to be less than:

$$Z = \left(\frac{M_s + M_w}{\sigma_L} \right) \text{ x } 10^3 \ [\text{cm}^3]$$

where,

σ_L = permissible bending stress

= 175/k [N/mm^2] within 0.4L amidships

= 125/k [N/mm^2] within 0.1L from A.P. and F.P.

Between the specified regions σ_L is to be obtained by linear interpolation.

3.3.2 The minimum requirement of hull section modulus Z about the transverse neutral axis, at midship, is given by:

$$Z = k\ C_1\ L^2\ B\ (C_b+0.7)\ (0.5 + R_s/2)\ [\text{cm}^3]$$

where,

$C_1 = 4 + 0.0412\ L$ for L < 90 [m]

$C_1 = 10.75 - [(300-L)/100]^{3/2}$ for 90 [m] ≤ L < 300 [m]

= 10.75 for 300 [m] ≤ L ≤ 350 [m]

= $10.75 - [(L-350)/150]^{3/2}$ for L > 350 [m]

C_b is not to be taken as less than 0.6.

3.3.3 Scantlings of all continuous longitudinal members of hull girder based on the section modulus requirement 3.3.1 are to be maintained within 0.4L amidships.

However, in special cases, based on consideration of type of ship, hull form and loading conditions, the scantlings may be gradually reduced towards the ends of the 0.4L amidships part, bearing in mind the desire not to inhibit the vessel's loading flexibility.

In the region outside 0.4L amidships, the scantlings are to be gradually tapered to the local requirements at ends.

3.3.4 For ships mentioned in 1.1.3, the hull section modulus Z_h about vertical neutral axis, at midship, is to be such that the combined stress σ_{vh} as given below at deck and bilge corners does not exceed 195/k [N/mm^2].

$$\sigma_{vh} = \sigma_s + \sqrt{(\sigma_w^2+\sigma_{wh}^2)}$$

where,

σ_s = stress due to M_s

σ_w = stress due to M_w

σ_{wh} = stress due to horizontal wave bending moment M_{wh} given by

$Mwh = 0.44L^{2.25}\ (T + 0.3\ B)\ C_b\ R_s$ [kN-m]
- at midship;

= 0 at ends;

For intermediate locations the value of M_{wh} is to be obtained by linear interpolation.

The above requirement is normally satisfied when Z_h is not less than

$$Z_h = 5\ k\ L^{2.25}\ (T + 0.3\ B)\ C_b\ R_s\ [\text{cm}^3]$$

3.4 Moment of inertia requirement

3.4.1 The moment of inertia In of the hull section about the transverse neutral axis, at midship, is not to be less than:

$$I_n = 3\ C_1\ L^3\ B\ (C_b+0.7)\ R_s\ [\text{cm}^4].$$

3.5 Bending strength outside amidships

The required bending strength outside 0.4L amidships is to be determined as specified in 3.3.1

As a minimum, hull girder bending strength checks are to be carried out specifically at the following locations:

- In way of the forward end of the engine room.
- In way of the forward end of the foremost cargo hold.
- At any locations where there are significant changes in hull cross-section.
- At any locations where there are changes in the framing system.

Buckling strength of members contributing to the longitudinal strength and subjected to compressive and shear stresses is to be checked, in particular in regions where changes in the framing system or significant changes in the hull cross-section occur. The buckling evaluation criteria is given in Ch.3, Sec.6.

For ships with large deck openings such as containerships, sections at or near to the aft and forward quarter length positions are to be checked. For such ships with cargo holds aft of the superstructure, deckhouse or engine room, strength checks of sections in way of the aft end of the aft-most holds and the aft end of the deckhouse or engine room are to be performed.

Section 4

Shear Strength

4.1 General

4.1.1 The shear stress 'τ' in ship's sides and longitudinal bulkheads based on the total shear force (Q_s+Q_w) is not to exceed 110/k [N/mm^2].

4.2 Side shell and longitudinal bulkheads thickness requirement

4.2.1 The thickness of the side shell (or combined thickness of the inner and outer shell in case of double skin construction) and longitudinal bulkheads, where fitted, is not to be less than that given by:

$$t = \frac{|\phi(Q_s + Q_w) + \Delta Q_s|}{\tau}(S_n/I_n).10^2 \text{ [mm]}$$

where,

ϕ = shear force distribution factor

= 0.5 for ships without effective longitudinal bulkheads

= as given in Table 4.2.1, for the item under consideration, for ships with effective longitudinal bulkheads

ΔQ_s = shear correction due to uneven load distribution and shear carrying longitudinal bottom members and may be taken as:

ΔQ_s = 0 for nearly uniform loading conditions

- For bulk carriers of conventional design:

$$\Delta Q_s = \frac{B.l_h.B_h.P_c}{2.2(B + l_h)} \text{ [kN]}$$

where,

l_h = length of the hold [m]

B_h = breadth of the flat part of the double bottom [m]

P_c = net downward loading on the flat part of the double bottom [kN/m^2] as given below.

- For ships with effective longitudinal bulkheads

$$\Delta Q_s = n\,(l_b \,.\, F_t - l_e \,.\, F_p) \text{ [kN]}$$

where,

F_t, F_p = as given in Table 4.2.1 for the item under consideration, [kN/m]

l_b = length between tank bulkheads [m]

Transverse wash bulkheads with openings more than 20% are to be considered ineffective for the purpose of determining lb.

l_e = l_b - S

S = spacing of bottom transverses, [m]

n = 0.5 at aft end of l_b

= –0.5 at fore end of l_b

A_S = sectional area of the side shell plating (or combined area of the inner and outer shell plating), [cm^2].

A_L, A_C = Sectional area of the longitudinal wing bulkhead plating and centre line bulkhead plating respectively, [cm^2]. In case of corrugated bulkheads the area is to be taken as the product of mean thickness and the depth.

c, w, d = breadths of the centre tank (or flat portion of hold between hopper tanks), wing tank and double side tank respectively, [m].

P_c, P_w, P_d = net (downward +ve) static loading [kN/m^2] on bottom in centre tank (or flat portion of hold between hopper tanks), wing tank and double side tank respectively.

The net loading is to be arrived at considering the downward loading of solid or liquid cargo above inner bottom together with that of ballast, if any, in double bottom tanks below and the upward buoyancy loading corresponding to the draught at midpoint of the part concerned in the loading condition under consideration.

β = 0.7 where a substantially deep girder has been provided on centre line of the ship.

= 1.0 in other cases.

Table 4.2.1 : Shear force distribution factors (ϕ_S, ϕ_L, ϕ_C) and correction factors (F_t, F_p) for ships with effective longitudinal bulkheads

Cross Section	Item	ϕ	F_t	F_p
	Side shell	$\phi_S = 0.5\,(1 - \phi_C)$	$2\,P_w \cdot w$	$0.5\,P_w \cdot w$
	C.L. Bhd.	$\phi_C = \dfrac{1.15A_C}{2A_S + A_C}$		$P_w \cdot w$
	Double skin	$\phi_S = 0.5\,(1 - \phi_C)$	$2\,(P_d \cdot d + P_w \cdot w)$	$P_d \cdot d + 0.5\,P_w \cdot w$
	C.L. Bhd.	$\phi_C = \dfrac{1.35A_C}{2A_S + A_C}$		$P_w \cdot w$
	Double skin	$\phi_S = 0.5$	$2\,P_d \cdot d + P_c \cdot c$	$P_d \cdot d + 0.5\,\beta \cdot P_c \cdot c$
	Side shell	$\phi_S = 0.5 - \phi_L$	$2\,P_w + P_c \cdot c$	$0.5\,P_w \cdot w$
	longl. bhd.	$\phi_L = \dfrac{0.55A_L}{A_S + A_L}$		$0.5\,(P_w \cdot w + \beta \cdot P_c \cdot c)$
	Double skin side	$\phi_S = 0.5 - \phi_L$	$2\,P_d \cdot d + 2\,P_w \cdot w + P_c \cdot c$	$P_d \cdot d + 0.5\,P_w \cdot w$
	Longl. bhd.	$\phi_L = \dfrac{0.615A_L}{A_S + A_L}$		$0.5\,(P_w \cdot w + \beta \cdot P_c \cdot c)$

Section 5

Openings in Longitudinal Strength Members

5.1 Locations

5.1.1 The keel plate is normally not to have any openings.

In the bilge plate, within 0.6L amidships, openings are to be avoided as far as practicable. Any necessary openings in the bilge plate are to be kept well clear of the bilge keel.

5.1.2 Openings in the strength deck within 0.6L amidships (within the cargo hold region for ships with large hatch openings) are as far as practicable to be located inside the line of large hatch openings. Necessary openings outside this line are to be kept well clear of the ship's side and hatch corners.

Openings in lower decks are to be kept well clear of the main hatch corners and other areas of high stresses.

5.1.3 Openings in the side shell, longitudinal bulkheads and longitudinal girders are not to be located within twice the opening breadth below the strength deck.

5.1.4 Small openings are generally to be kept well clear of other openings in the longitudinal strength members. The transverse distance between any two adjacent unreinforced openings is not to be less than four times the breadth of the larger opening.

5.2 Deductions for openings

5.2.1 Openings exceeding 2.5 m in length or 1.2 [m] in breadth and scallops, where scallop-welding is applied, are to be deducted from the sectional areas used in the section modulus calculation.

5.2.2 Smaller openings (manholes, lightening holes, single scallops in way of seams etc.) need not be deducted provided that the sum of their breadths or shadow area breadths in one transverse section does not reduce the section modulus at deck or bottom by more than 3 per cent and provided that the height of lightening holes, draining holes and single scallops in longitudinals or longitudinal girders does not exceed 25 per cent of the web depth, (for scallops maximum height 75 [mm]). In longitudinals the distance between single openings or group of openings is not to be less than ten times the height of openings.

A deduction free sum of smaller opening breadths or their shadow area breadths in one transverse section in the bottom or deck area equal to 0.06(B-Σb) may be considered equivalent to the above reduction in section modulus (Σb = sum of the breadths of large deductible openings).

The shadow area representing the imaginary longitudinal extension of an opening is obtained by drawing two tangent lines with an opening angle of 30° as shown in Fig.5.2.2.

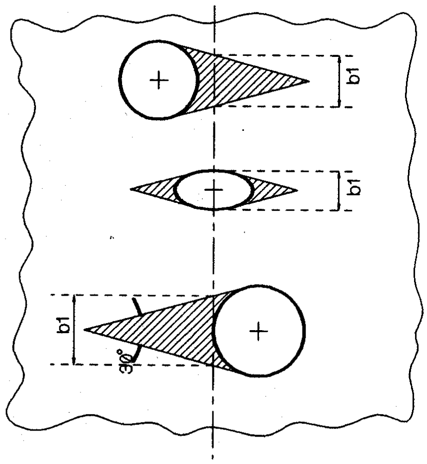

Fig. 5.2.2 : Shadow areas

5.3 Reinforcements

5.3.1 All openings are to be adequately framed; attention is to be paid to structural continuity, and abrupt changes of shape, section or plate thickness are to be avoided. Arrangements in way of corners and openings are to be such as to minimize the creation of stress concentrations.

Corners of hatchways are to be reinforced as given in Ch.9, Sec.2. Smaller openings in the strength deck and outer bottom within 0.6L amidships (within the cargo hold region for ships with large hatch openings) are to be reinforced as given in 5.3.2 to 5.3.5 below. The area of these reinforcements is not to be included in the sectional areas used in the section modulus calculation.

5.3.2 Circular openings with diameter equal to or greater than 0.325 m are to have edge reinforcement. The sectional area A of the edge reinforcement is not to be less than

$$A = 2.5 \text{ b.t. } [cm^2]$$

where,

b = diameter of the opening [m]

t = thickness of the plating [mm].

The reinforcement is normally to be of a vertical ring welded to the plate edge. Alternative arrangements may be accepted provided the reinforcement is within a distance of 0.05b from the plate edge.

5.3.3 Elliptical openings are to have their major axis in the fore and aft direction. Where the ratio of the major axis to minor axis is less than 2 the openings are to be reinforced as given in 5.3.2 taking b as the breadth of the opening (minor axis).

5.3.4 Rectangular openings are to have their corners well rounded. Where corners are of circular shape the radius is not to be less than 20 per cent of the breadth of the opening and the edges are to be reinforced as given in 5.3.2 taking b as the breadth of the opening.

Where corners are of elliptical shape as given in 5.3.3 or of streamlined shape as given in 5.4, the reinforcement will generally not be required provided that the transverse extension of the curvature, a, shown in Fig.5.4.2 is not less than

$$a = 0.15b \ [m]$$

5.3.5 Openings in side shell subjected to large shear stresses are to be of circular shape and are to be reinforced as given in 5.3.2 irrespective of the size of opening.

5.4 Hatchway corners

5.4.1 Where corners are of circular shape, the radius r within 0.6L amidships is not to be less than

$$r = 0.03 \ (1.5 + l / b) \ (B - b) \ [m]$$

where,

l = longitudinal distance between adjacent hatchways [m]

b = breadth of the hatchway [m]

In the above formulae l/b need not be taken as greater than 1.0 and (B - b) is not to be taken as less than 7.5 [m] nor need be taken as greater than 15 [m].

5.4.2 Where corners are of streamlined shape, as given by Fig.5.4.2, the transverse extension of the curvature, a, is not to be less than:

$$a = 0.025 \ (1.5 + l / b) \ (B - b) \ [m]$$

where,

l,b are as defined in 5.4.1.

Section 6

Loading Guidance Information

6.1 General

6.1.1 An approved loading manual is to be provided for ships covered by Regulation 10 of the Load Line Convention except those belonging to Category II and of length less than 90 [m] for which the maximum deadweight does not exceed 30% of the displacement at summer loadline draft.

6.1.2 In addition to the Loading Manual all ships of Category I of 100 [m] in length and above are to be provided with an approved loading instrument.

For additional requirements for bulk carriers, ore carriers and combination carriers of $L \geq 150$ [m], see Pt.5, Ch.1.

For chemical carriers and gas carriers existing analog computer may be retained.

6.2 Conditions of approval of loading manuals

6.2.1 The approved Loading Manual is to be based on the final data of the ship. The Manual is to include the design loading and ballast conditions, sub divided into departure and arrival conditions, upon which the approval of the hull scantlings is based.

6.2.2 In case of modifications implying changes in the main data of the ship, a new Loading Manual is to be issued duly approved.

6.2.3 The Loading Manual must be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

6.3 Conditions of approval of loading instruments

6.3.1 The loading instrument and its operation manual are subject to approval. The approval includes:

- Verification of type approval, if any
- Verification that the final data of the ship has been used
- Acceptance of number and position of read-out points
- Acceptance of relevant limits for all read-out points
- Checking of proper installation and operation of the instrument on board in accordance with the agreed test conditions; and that a copy of the approved operation manual is available.

6.3.2 In case of modifications implying changes in the main data of the ship, the loading instrument is to be modified accordingly and approved.

6.3.3 The operation manual and the instrument output must be prepared in a language understood by the users. If this language is not English, a translation into English is to be included.

End of Chapter

Chapter 6

Bar Keel, Stem and Sternframes

Contents

Section

Section 1

General

1.1 Scope

1.1.1 For ships with various Ice Class notations, additional requirements given in Pt.5, Ch.2 are to be complied with.

1.2 Material

1.2.1 All steel plates and sections, castings and forgings used in the constructions are to be tested and approved in accordance with the requirements of Pt.2, Ch.3, Ch.4 and Ch.5 respectively. Material grades for plates and sections are to be selected as defined in Pt.3, Ch.2.

1.2.2 Bar keels and stems may either be steel castings or steel forgings.

1.2.3 Sternframes, rudder horns and shaft brackets may be constructed of cast or forged steel or may be fabricated from plates.

1.3 Symbols

1.3.1 L, T as defined in Ch.1, Sec.2.

Section 2

Bar Keel

2.1 Scantlings

2.1.1 The scantlings of bar keel are not to be less than :

Depth = 100 + 1.5 L [mm]

Thickness = 10 + 0.6 L [mm]

Minor deviations from the above values may be accepted provided the required sectional area is maintained.

Section 3

Stem

3.1 Bar stem

3.1.1 The cross sectional area 'A' of a bar stem, below the summer load waterline, is not to be less than

$A = 1.2L$ [cm^2] for $L \leq 75$ [m]

$= 1.6L - 30$ [cm^2] for $L \geq 75$ [m]

3.1.2 Above the summer load waterline the cross sectional area of the bar stem may be gradually reduced to 0.75 A [cm^2] at the stem head.

3.2 Plate stem

3.2.1 The thickness 't' of the plate stem below the summer load waterline is not to be less than:

$$t = (0.08\,L + 5.5)\,\sqrt{k}\ \text{[mm]}$$

However 't' need not exceed 25.0 [mm].

3.2.2 The thickness of the plate stem may be gradually reduced to that of the side shell at the stem head.

3.2.3 The plate stems are to be supported by horizontal diaphragms spaced not more than 1.0 [m] apart. Where the stem plate radius is large, a centreline stiffener or web is to be provided.

3.3 Strengthening against bow impact

3.3.1 The region forward of 0.1L abaft of F.P. and above the summer load waterline, is to be strengthened for bow impact pressure 'p_i' [N/mm^2], the design value of which is to be taken as :

$$p_i = (2.2 + 1.5\tan\alpha) \times (0.4V\sin\beta + 0.6\sqrt{L})^2 .10^{-3}\ \text{[N/mm}^2\text{]}$$

In the above formula L need not be taken greater than 250 [m].

V = maximum service speed (knots). as defined in Ch.1, Sec.2.1.10.

α = flare angle, taken as the angle between the side plating and the vertical axis, measured in the plane 'y-y' (see Fig.3.3.1).

β = angle made by the tangent to waterline with the centreline of the ship at the point under consideration. (see Fig.3.3.1).

3.3.2 The scantlings of plates and stiffeners are not to be less than the following :

Plate thickness

$t = 0.028\, f_a\, f_r\, s\, \sqrt{(p_i\, k)} + t_c$ [mm.]

Section modulus of stiffeners

$Z = 0.15\, s\, p_i\, l^2\, k + Z_c$ [cm^3]

where,

s = spacing of stiffeners [mm].

l = span of stiffeners [m].

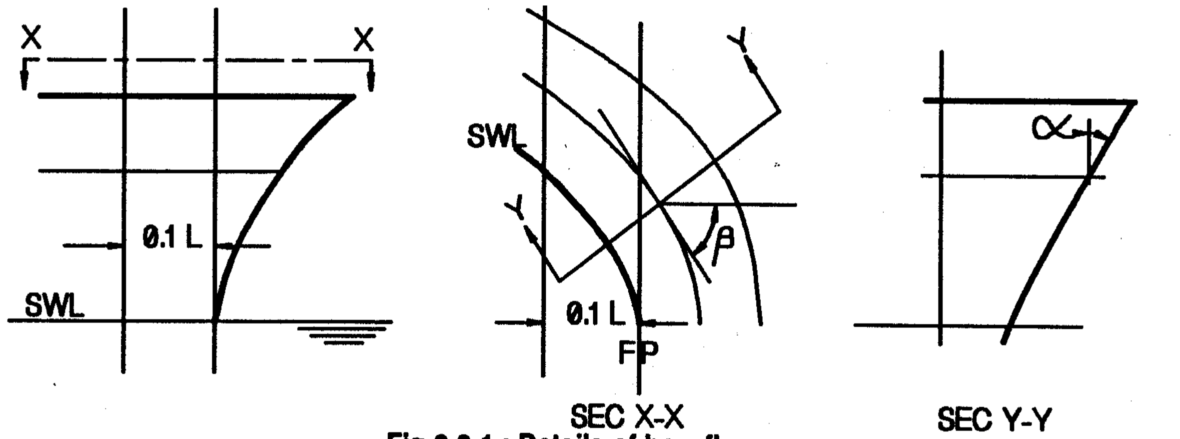

Fig.3.3.1 : Details of bow flare

f_a,f_r are correction factors for aspect ratio and curvature, respectively, as defined in Pt.3, Ch.3.

t_c,Z_c are corrosion additions to thickness and section modulus of stiffeners as defined in Pt.3, Ch.3.

3.3.3 Outside the region specified above, the scantlings of side plating and stiffeners may be gradually reduced to the general requirements.

3.3.4 Stiffeners are to be connected at ends. Where stiffener webs are not perpendicular to the shell plating adequate tripping brackets are to be fitted.

3.3.5 Thickness 't' of primary members is not to be less than:

$$t = (6.5 + 4.75 \sqrt{p_i}) \sqrt{k} + t_c \text{ [mm]}$$

3.3.6 Near the shell plating, the spacing of stiffeners on decks or webs of girders is not to exceed 90 times the thickness of the deck or web plating.

3.3.7 The cross sectional area 'A' of the webs at ends of local girders in the region specified in 3.3.1 is not to be less than :

$$A = 30\ b\ p_i\ S\ k + 0.01\ h\ t_c \text{ [cm}^2\text{]}$$

where,

b = mean breadth, [m], of the load area supported by the girder.

S = Span of the girder, [m].

h = girder height, [mm].

3.4 Bulbous bow

3.4.1 Where a bulbous bow is fitted, the structural arrangements are to be such that the bulb is adequately supported and integrated into the fore peak structure.

3.4.2 At the fore end of the bulb the structure is generally to be supported by horizontal diaphragms spaced not more than 1.0 [m] apart in conjunction with a deep centreline web.

3.4.3 In general, vertical transverse diaphragm plates are to be arranged in way of the transition from the peak framing to the framing of the bulb.

3.4.4 A centreline wash bulkhead is generally to be fitted in way of wide bulbs. Similarly transverse wash bulkheads or substantial web frames spaced approximately 5 frame spaces apart are to be fitted in way of long bulbs.

3.4.5 The shell plating thickness at the fore end of the bulb and in other areas likely to be damaged by the anchors and chain cables is not to be less than that required for plate stems as defined in 3.2.1.

Section 4

Stern Frames and Rudder Horns

4.1 General

4.1.1 Sternframes, rudder horns, shaft brackets etc. are to be designed such that they are effectively integrated into the ship's structure.

4.1.2 In castings, sudden changes of section or possible constrictions to the flow of metal during castings are to be avoided. All fillets are to have adequate radii, which in general should not be less than 50 to 75 [mm], depending on the size of the casting.

4.1.3 Fabricated and cast steel sternframes are to be strengthened at intervals by webs. In way of the upper part of the sternframe arch, these webs are to line up with the floors.

4.1.4 Rudder posts and propeller posts are to be connected to floors of increased thickness.

4.1.5 It is recommended that the after body of the ship be so shaped as to ensure adequate flow of water to the propeller so as to prevent uneven formation of eddies, as far as possible.

For a moderately cavitating propeller the following minimum values of propeller hull clearances may be used as a guidance. (See Fig.4.1.5)

For single screw ships:

$a \geq 0.2\ R$ [m]

$b \geq (0.7 - 0.04\ N_b)\ R$ [m]

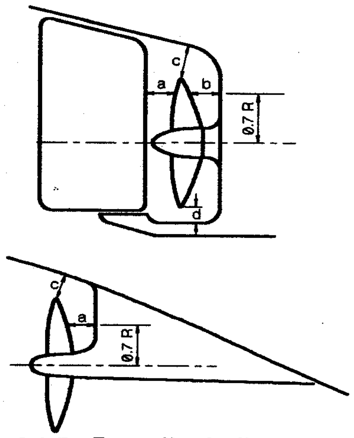

Fig.4.1.5 : Propeller hull clearances

$c \geq (0.48 - 0.02\ N_b)\ R$ [m]

$d \geq 0.07\ R$ [m]

For twin screw ships:

$b \geq (0.5 - 0.03\ N_b)\ R$ [m]

$c \geq (0.6 - 0.02\ N_b)\ R$ [m]

where,

R = Propeller radius [m]

N_b = Number of propeller blades.

4.2 Sternframes

4.2.1 The scantlings of the propeller posts are not to be less than the following:

Forged propeller posts (see Fig.4.2.1 (a))

$A = (10 + 0.5L)\ T$ [cm^2] for L < 60 [m]

$= 40\ T\ k$ [cm^2] for L > 60 [m]

$w = 40\ \sqrt{T}$ [mm]

Fabricated propeller posts (see Fig.4.2.1 (b))

$l = 200\ \sqrt{T}$ [mm]

$w = 140\ \sqrt{T}$ [mm]

$r = 18\ \sqrt{T}$ [mm]

$t_1 = 12\ \sqrt{(Tk)}$ [mm]

$t_w = 6\sqrt{(Tk)}$ [mm], however need not exceed 30 [mm].

Cast steel propeller posts - (See Fig.4.2.1 (c))

$l = 165\ \sqrt{T}$ [mm]

$w = 115\ \sqrt{T}$ [mm]

$r = 20\ \sqrt{T}$ [mm]

$t_1 = 12\sqrt{(Tk)}$, [mm] however not less than 19 [mm].

$t_2 = 16\sqrt{(Tk)}$, [mm] however not less than 25 [mm].

$t_w = 8\sqrt{(Tk)}$, [mm] however need not exceed 38 [mm].

Where the sections adopted differ from the above, the section modulus about the

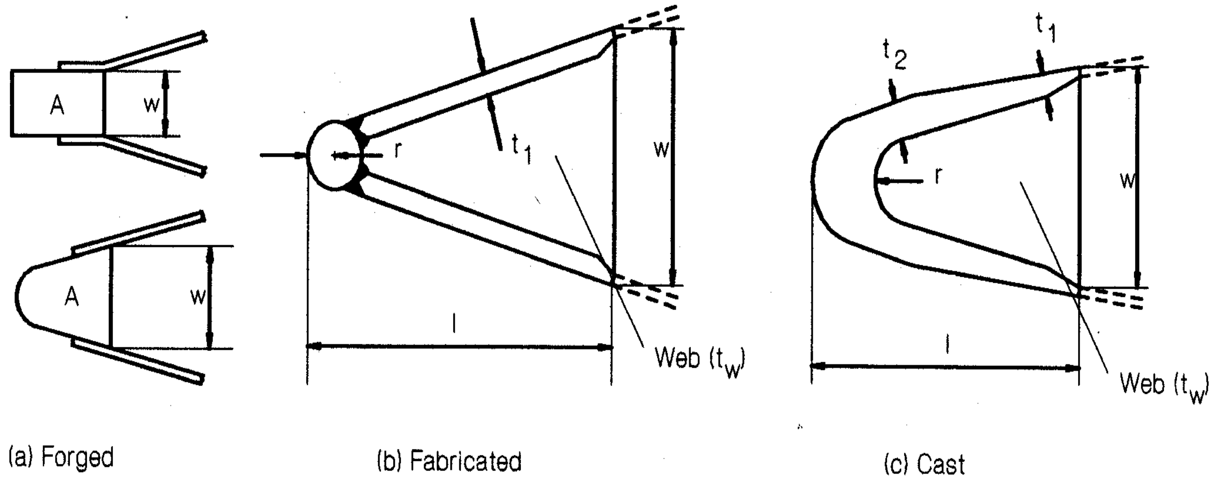

Fig.4.2.1 : Types of propeller posts

longitudinal axis is to be equivalent to that with the Rule scantlings. However the thickness t_1 is neither to be less than (minimum of 19 [mm] for cast steel propeller posts) nor less than $8\sqrt{(Tk)}$ the increased thickness of shell plating adjacent to sternframe.

On sternframes without solepieces, the modulus of the propeller post, about the longitudinal axis, may be gradually reduced by 15 per cent below the propeller boss, provided the thicknesses are maintained as above.

4.2.2 The wall thickness of the boss 't_b' in the propeller post is not to be less than :

$t_b = 0.16\ d_{ts} + 30$ [mm] for $d_{ts} \leq 300$ [mm]

$= 5\ \sqrt{(d_{ts} - 60)}$ [mm] for $d_{ts} > 300$ [mm]

where,

d_{ts} = Rule diameter of tail shaft, [mm].

In fabricated stern frames the connection of the propeller post to the boss is to be by full penetration welds.

4.2.3 The section modulus of the rudder post 'Z_T' about the longitudinal axis is not to be less than:

$$Z_T = \frac{F_r l}{1000}\ [\mathrm{cm}^3]$$

where,

F_r = Rudder force [N] as defined in Pt.3, Ch.14, Sec.3.

l = Unsupported span of the rudder post, [m] (See Fig.4.2.3).

Where, due to low rigidity of the sole piece in the transverse direction, the bottom support for the rudder post can not be regarded as efficient, direct calculations are to be carried out and the section modulus of the rudder post increased to limit the bending stress to 85 [N/mm^2].

4.2.4 The diameter of rudder shaft 'dl', at the lower bearing is not to be less than :

$$d_l = 3.9\ \sqrt[3]{\left(\frac{F_r\ .c\,(l - c)}{l} k\right)}\ [\mathrm{mm}]$$

where,

F_r = Rudder force [N] as defined in Pt.3, Ch.14, Sec.3

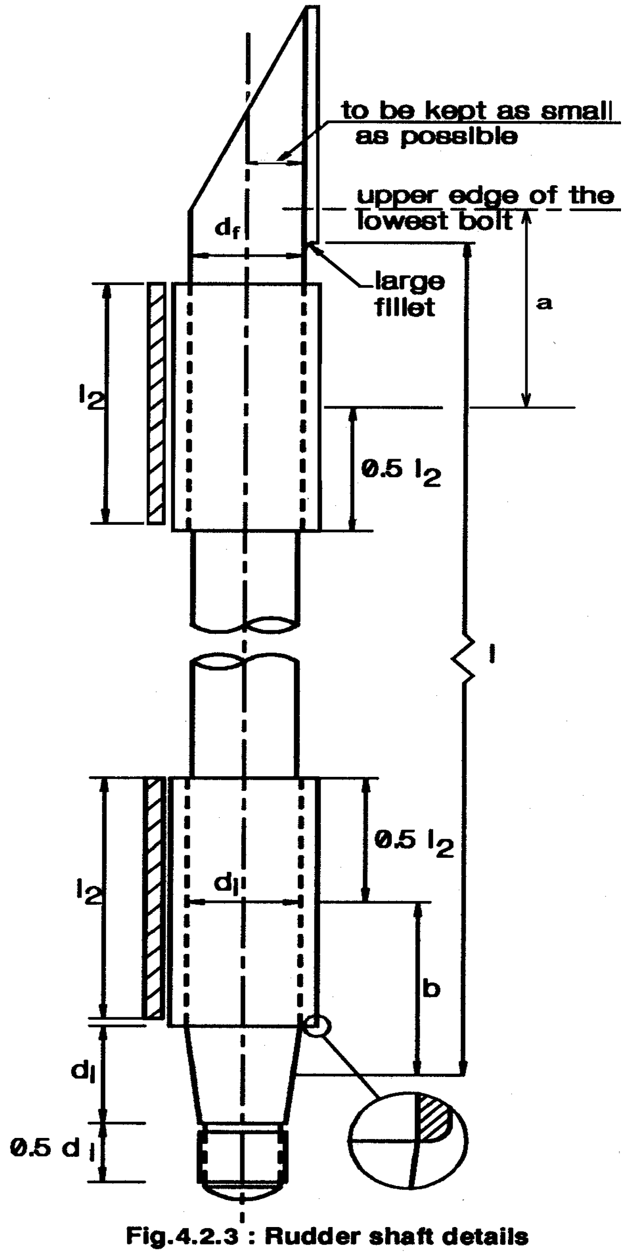

Fig.4.2.3 : Rudder shaft details

$$c = \frac{a + b}{2}$$

a, b and l are as given in Fig.4.2.3, [m].

The diameter 'd_l' may have to be increased on account of low rigidity of sole piece, as described for the rudder post in Sec.4.2.3.

The diameter d_f below the coupling flange is to be 10 per cent greater than dl unless the rudder axle is protected by a corrosion-resistant composition above the upper bearing.

The details of taper, nut etc. at the lower end of the rudder axle, are to be similar to those of rudder stock cone couplings given in Ch.14.

The scantlings and arrangements of vertical coupling at the upper end of the rudder axle are to be similar to those of horizontal bolted couplings of rudder given in Pt.3, Ch.14, Sec. 6.1. In the formula the axle diameter 'd_l' is to be used in place of rudder stock diameter 'd_s'.

The bearing depth l_2 is not to be less than 1.2 d_l [mm].

4.3 Sole piece

4.3.1 Requirements for structural strength of sole pieces are given in Pt.3, Ch.14.

4.3.2 The sole piece is to extend at least two frame spaces forward of the forward edge of the propeller boss and beyond this the cross section of the extension is to be gradually reduced to that necessary for an efficient connection to the keel plate. Fabricated solepieces are to have adequate internal stiffening.

4.4 Shaft brackets

4.4.1 Where the propeller shafting is exposed to the sea for some distance clear of the main hull, it is generally to be supported adjacent to the propeller by independent brackets having two arms. It is recommended that the angle included between the arms differs from the angle included between the propeller blades. In very small ships the use of single arm brackets will be considered.

4.4.2 Fabricated brackets are to be designed to avoid or reduce the effect of hard spots and ensure a satisfactory connection to the hull structure. The connection of the arms to the bearing boss is to be by full penetration welding.

4.4.3 Generally bracket arms are to be carried through the shell plating and attached to floors or girders of increased thickness. The shell plating in way of shaft brackets is to be increased in thickness to a minimum of 1.5 times the Rule bottom shell plating thickness amidships. In way of struts, an insert plate is to be provided of thickness not less than:

$t = 1.9 \sqrt{d_{ts}}$ where d_{ts} is the tailshaft diameter. The connection of the struts to the shell plating is to be by full penetration welding.

4.4.4 The scantlings of solid or built-up shaft brackets are to comply with the following:

$t = 0.4 \, d_{ts}$ [mm]

$A = 4.5 \, d_{ts}^2 \, . \, 10^{-3}$ [cm^2]

$Z_T = 30 \, d_{ts}^3 \, . \, 10^{-6}$ [cm^3]

where,

t = thickness of the strut

A = cross sectional area of the strut

Z_T = Section modulus of the strut against transverse bending.

4.5 Rudder horns

4.5.1 Requirements for structural strength of rudder horns are given in Pt.3, Ch.14.

4.5.2 Rudder horns supporting semi-spade type rudders are to be efficiently integrated into the main hull structure, and additional web frames or side transverses may be required in the 'tween deck above.

4.5.3 The shell plating is to be increased in thickness in way of the horn, and the radius at the shell connection is not to be less than (150 + 0.8L) [mm].

Section 5

Propeller Nozzles

5.1 General

5.1.1 The requirements for scantlings and arrangements of propeller nozzles given in this section apply, in general, to nozzles of numeral N_N, not greater than 200. Nozzles of numeral greater than 200 will be specially considered.

Nozzle numeral $N_N = 0.01$ P.D

where,

P = Power transmitted to the propeller [kW]

D = Diameter of the propeller [m].

Additional requirements for scantlings and arrangements applicable to steerable nozzles and fixed nozzles are given in 5.3 and 5.4 respectively.

For additional requirements applicable to Azimuth Thrusters see Pt.4, Ch.4, Sec.9.

5.1.2 All materials used in the construction of the nozzle-body, stocks, pintles, keys and bolts are to be similar to rudders as per Ch.14, Sec.1.

5.2 Nozzle scantlings and construction details

5.2.1 Nozzle scantlings are to be as per Table 5.2.1.

Table 5.2.1 : Nozzle scantling requirements

Item		Requirement
1)	Shroud plating in way of propeller blade tips	- For $N_N \leq 63$ $t_s = (11 + 0.1\ N_N)$ [mm] - For $N_N > 63$ $t_s = (14 + 0.052\ N_N)$ [mm]
2)	Shroud plating clear of blade tips, flare and cone plating, wall thickness of leading and trailing edge members	$t_p = (t_s - 7)$ [mm] but not less than 8 [mm]
3)	Webs and ring webs - iwo head box and pintle support - elsewhere	 $t_w = (t_s + 4)$ [mm] As for item (2)
Symbols		
N_N = Nozzle numeral as given in 5.1.1 t_s = thickness of shroud plating in way of propeller tips [mm] t_p = thickness of plating [mm] t_w = thickness of webs and ring webs in way of headbox and pintle support [mm]		
NOTE : Thickness given are for mild steel. When corrosion resistant material is used, the plate thicknesses may be reduced by 15%, however, thickness is not to be less than minimum thickness as applicable.		

5.2.2 If the ship has ice class notation, nozzle scantlings will be specially considered; however, the part of the outer shell of the nozzle which is situated within the ice belt is to have a plate thickness not less than that of the shell plating in way.

5.2.3 The shroud plating in way of the propeller tips is to be carried well forward and aft of the propeller tips, due allowance being made on steering nozzles for the rotation of the nozzle in relation to the propeller, however, shroud plate width is not to be less than $(L_N/4)$, where L_N is the length of the nozzle (See Fig.5.2.3).

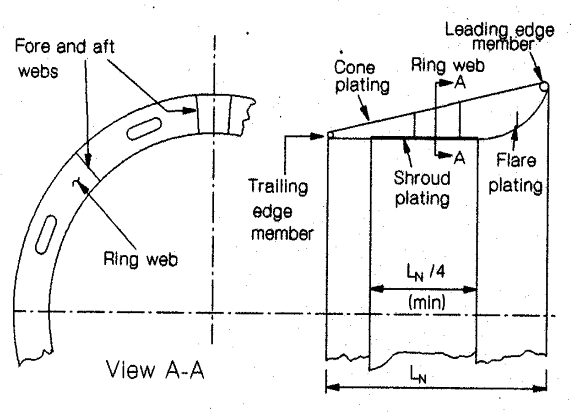

Fig.5.2.3 : Nozzle sectional views

5.2.4 The transverse strength of the nozzle is to be maintained by fitting adequate number of ring webs. At least two ring webs are to be fitted in way of shroud plating, spaced approximately 400 [mm]. Fore and aft of these webs the spacing of ring webs is generally not to exceed 600 [mm]. Ring webs are to be increased in thickness in way of the headbox and pintle support structure in accordance with Table 5.2.1 and the increased thickness is to be maintained to the adjacent fore and aft web.

5.2.5 Local stiffening is to be fitted in way of the top and bottom supports which are to be integrated with the webs and ring webs. Continuity of bending strength is to be maintained in these regions.

5.2.6 Weld details of nozzle plating, webs, coupling flanges etc. are to be as given in Sec.4 of Ch.14 'Rudders' and also as per Ch.17 'Welding'.

5.2.7 Leak testing of the nozzle is to be as required for rudders as per Ch.18.

5.2.8 Arrangement is to be provided to drain the nozzle completely. Drain plugs are to be provided with efficient packing.

5.2.9 Internal surfaces of nozzles are to be efficiently coated for corrosion protection after completion of fabrication and testing. Where it is intended to fill the nozzle with plastic foam, details of the foam material is to be submitted.

5.3 Steerable nozzles

5.3.1 The nozzle stock, couplings, pintles and bearings are to be designed analogusly with the requirements given in Ch.14, Sections 5 and 6 using the design values of lateral force, Fr and turning moment Qr as given below:

$$Fr = 376\ A\ .\ V^2\ [N]$$

$$Qr = Fr\ .\ r\ [N\text{-}m]$$

where,

A = projected area of nozzle [M^2]

V = Maximum service speed [knots] with the ship on summer load waterline. When the speed is less than 10 knots. V is to be replaced by the expression Vmin = (V + 20)/3.

r = the horizontal distance from centre line of stock to centre of pressure of nozzle, but not to be taken less than 10% of the chord length of the nozzle.

5.3.2 Effective means are to be provided for supporting the weight of the nozzle. Where the support is provided by a carrier bearing attached to the nozzle head, the structure in way of the bearing is to be adequately strengthened. The shell plating in way of nozzle head is to be increased in thickness by 50%.

5.3.3 All nozzle bearings are to be accessible for measuring wear without lifting or unshipping the nozzle.

5.3.4 Satisfactory arrangement is to be provided to prevent water from entering the steering gear compartment and lubricant from being washed away from the nozzle carrier. A seal or stuffing box is to be fitted above the deepest load water line for this purpose, however, two separate seals or stuffing boxes are to be provided when the nozzle carrier is below the deepest load water line.

5.4 Fixed nozzles

5.4.1 The nozzle is to be adequately supported preferably by closed box structures of necessary enclosed area to withstand the lateral force Fr and Torque Qr given in 5.3.1 and its own weight. The resultant stresses are not to exceed the following:

Bending stress σ_b = 75/k [N/mm^2]

Torsional shear stress τ_t = 50/k [N/mm^2]

Shear stress τ = 50/k [N/mm^2]

Equivalent stress

$$\sigma_{e1} = \sqrt{\sigma^2 + 3\tau^2} = 100/\mathrm{k}\ [\mathrm{N/mm}^2]$$

$$\sigma_{e2} = \sqrt{\sigma + 3\tau_\tau{}^2} = 90/\mathrm{k}\ [\mathrm{N/mm}^2]$$

5.4.2 The nozzle support box structure is to be well integrated to the webs and ring webs in the nozzle and to the hull structure. Structural continuity is to be maintained between the webs in the nozzle, the top box structure and local girders/floors inside the hull.

End of Chapter

Chapter 7

Bottom Structure

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The scantlings and arrangement of bottom structure as defined in Ch.1, Sec.2 are to comply with the requirements given in this Chapter.

1.2 Symbols

L,B,T,C_b,k as defined in Ch.1, Sec.2.

t_c,Z_c are corrosion additions to the thickness and section modulus respectively, as given in Ch.3, Sec.2.1.

f_a,f_r are correction factors for aspect ratio and curvature, respectively, as defined in Ch.3, Sec.3.1.

C_w, a_o, k_v and k_s as defined in Ch.4, Sec.1.2, Sec.2.3 and Sec.3.2.

T_b = lowest design ballast draught amidships, [m]. For preliminary purposes, T_b may be taken as 0.35T for cargo vessels and (2+0.02L) for tankers.

s = spacing of stiffeners, [mm]

l = span of stiffeners, [m]

b = spacing of girders, [m]

S = span of girders, [m]

$$f_B = \frac{Z_R}{Z_B}$$

where,

Z_R = Rule midship section modulus [cm^3] as required by Ch.5, Sec.3.3.1.

Z_B = Actual midship section modulus [cm^3] provided at bottom.

$$f_z = \frac{z}{z_n}$$

where,

z_n = vertical distance [m], from the neutral axis of the hull girder to the base line.

z = vertical distance [m], from the neutral axis of hull girder to the free flange of the stiffener or girder.

Section 2

Structural Arrangement and Details

2.1 General

2.1.1 Except as specified in 2.1.6, passenger ships and cargo ships other than tankers, are to be fitted with a double bottom extending from the collision bulkhead to the after peak bulkhead as far as this is practical and compatible with the design and proper working of the ship.

Note: For the purpose of this requirement, a “tanker” is a cargo ship constructed or adapted for the carriage in bulk of liquid cargoes of an inflammable nature.

For oil tankers, chemical carriers and liquefied gas carriers, the requirements indicated in Pt.5, Ch.2, Ch.3 and Ch.4 respectively regarding double bottom and location of wells above bottom shell are to be complied with.

2.1.2 Where a double bottom is required to be fitted, its depth is to be as per 6.1.1 and the inner bottom is to be continued to the ships side in such a manner as to protect the bottom to the turn of the bilge.

2.1.3 Small wells constructed in the double bottom, in connection with the drainage arrangement of holds, are not to extend in depth more than necessary. A well extending to the outer bottom, may be permitted at the after end of the shaft tunnel of the ship. Other wells may be considered provided the arrangements give protection equivalent to that offered by a double bottom. In no case the vertical distance from the bottom of such a well to the plane coinciding with the keel line be less than 500 [mm].

2.1.4 A double bottom need not be fitted in way of watertight compartments used exclusively for the carriage of liquids, provided the safety of the ship is not impaired in the event of bottom damage.

2.1.5 Any part of a passenger ship or a cargo ship other than tanker that is not fitted with a double bottom in accordance with 2.1.1 or 2.1.4 is to be capable of withstanding bottom damages as specified in para 8 of SOLAS II-1 Reg.9.

2.1.6 A double bottom need not be fitted on the following ships:

(a) Cargo ships of less than 500 tons gross tonnage.

(b) Ships not propelled by mechanical means.

(c) Fishing vessels.

2.1.7 The engine room of all ships having L > 90 [m] is to have a double bottom.

2.1.8 For ships of L > 90 [m], single bottoms within the cargo region, where permitted, are normally to be longitudinally stiffened.

2.1.9 For ships of L > 150 [m] and for ships strengthened for heavy cargoes, double bottoms within the cargo region are normally to be longitudinally stiffened.

2.1.10 The continuity of the bottom, bilge and inner bottom longitudinals is to be maintained in accordance with Ch.3, Sec.5.1.1.

2.1.11 The bilge keel and the ground bar to which it is attached, are to be gradually tapered at ends and arranged to finish in way of suitable internal stiffening. Butt welds in the bilge keel and the ground bar are to be well clear of each other and those in the shell plating.

2.1.12 The weld connections are to comply with the requirements of Ch.17.

2.2 Access ventilation and drainage

2.2.1 Adequate access is to be provided to all parts of the double bottom. The vertical dimension of lightening holes is not to exceed 50 per cent of the girder height. The diameter of lightening holes in the bracket floors is not to exceed 1/3 of the breadth of the brackets. Lightening holes or manholes are normally not to be cut in floors or girders towards their ends and under large pillars or supporting structures. Manholes in inner bottom are to have reinforcement rings, and the man hole covers in the inner bottom plating in cargo holds are to be effectively protected. The edges of all holes are to be smooth.

2.2.2 To ensure the free passage of air and water from all parts of the tanks to air pipes and suctions, air and drain holes are to be provided in all non-watertight members. The air holes are to be placed as near to the inner bottom as possible and their total area is to be greater than the area of the filling pipes. The drain holes are to be placed as near to the bottom as possible.

2.2.3 The access opening to pipe tunnel is to be visible above the floor plates and is to be fitted with a rigid watertight closing device. A notice board stating that the access opening to the pipe tunnel is to be kept closed, is to be fitted near the opening. The opening is to be regarded as an opening in watertight bulkhead.

Section 3

Design Loads

3.1 Bottom shell

3.1.1 The design pressure 'p' on outer bottom is to be taken as

$p = 0.01T + (k_s - 1.5)\ C_w\ R_s\ .\ 10^{-3}$ [N/mm^2].

In way of tanks, the design pressure is not to be taken less than net internal pressure 'p_i' given below:

p_i = Internal pressure in tanks as given in Ch.4, Sec.3.3.2 less applicable external sea pressure as given in Ch.4, Sec.3.2.4.

Net 'p_i' on the outer bottom for vessels of L < 90 [m], may be approximated as:

$p_i = 0.01\ (h_s - T_b) + p_o$ [N/mm^2]

where,

h_s = vertical distance [m], from the load point to top of the tank.

p_o = 0.01 [N/mm^2] for L $\leq$ 20 [m]

= 0.024 [N/mm^2] for L $\geq$ 90 [m].

For L between 20 [m] and 90 [m], 'p_o' is to be obtained by linear interpolation.

However, in mechanically propelled cargo ships of 500 GT and above and passenger ships, for tanks forming part of the watertight subdivision, (See Ch.10, Cl.4.2.1) p_0 is to be taken as not less than 0.024 [N/mm^2].

3.2 Watertight floors and girders

3.2.1 The design pressure 'p' on watertight floors and girders in double bottom tanks is to be taken as the greater of:

$p = 6.7\ h_p \times 10^{-3}$ [N/mm^2]

$p = 0.01\ h_s + p_o$ [N/mm^2]

$p = 0.01\ D_f$ [N/mm^2]

where,

h_p = vertical distance [m], from the load point to the top of air pipe.

h_s, p_o as given in 3.1.1.

D_f = depth to freeboard deck [m].

3.3 Inner bottom

3.3.1 The design pressure 'p' on the inner bottom is to be taken as the greater of that given in 3.2.1 and the following:

- In way of cargo holds, the design pressure 'p' is not to be taken as less than:

$$p = \rho.H.\left(1 + 0.5\frac{k_v a_o}{C_b}\right).10^{-2}\ [\mathrm{N/mm^2}]$$

where,

ρ = cargo density [t/m^3] normally not to be taken as less than 0.7 [t/m^3]

H = height [m], to tween deck or top of hatchway coaming.

- In way of holds for ballast, the design pressure is not to be taken as less than:

$$p = h_s\ .\left(1 + 0.5\frac{k_v a_o}{C_b}\right).10^{-2}\ [\mathrm{N/mm^2}]$$

where,

h_s = vertical distance [m], from inner bottom to top of hatch coaming.

Section 4

Bottom and Inner Bottom Plating

4.1 Keel plate

4.1.1 The width of the plate keel is not to be less than (800+5L) [mm], nor greater than 1800 [mm]. The thickness is to be 2 [mm] greater than that required for the adjacent bottom plating.

4.2 Bottom, bilge and inner bottom plating

4.2.1 The thickness 't' of the bottom plating is not to be less than the minimum requirement given in 4.2.2, nor less than:

$$t = f_a \, . f_r \, . \frac{s\sqrt{p}}{2\sqrt{\sigma}} + t_c \; [\text{mm}]$$

where,

p = applicable design pressure, [N/mm^2], as given in 3.1.1 and 3.3.1 for outer bottom and inner bottom respectively.

s = stiffener spacing, [mm].

σ = allowable bending stress, [N/mm^2], as per Table 4.2.1.

Table 4.2.1 : σ values for bottom, bilge and inner bottom plating [N/mm^2]

		Single Bottom	Double Bottom	
Region	Framing	Bottom and bilge	Bottom and bilge	Inner bottom 1)
0.4L amidships	Transverse	($175-120f_B$)/k max. 120/k	($170-120 f_B$)/k max. 120/k	($200-110f_B$)/k max. 160/k
	Longitudinal	($185-100f_B$)/k max. 120/k	($180-100f_B$)/k max. 120/k	($220-100f_B$)/k max. 160/k
Within 0.1L from ends	160/k			
Elsewhere	To be obtained by linear interpolation between allowable values at regions specified above			

Note : 1) In way of hold tanks amidships intended for ballast or cargo oil the value of σ is to be reduced by 10/k [N/mm^2]

4.2.2 The minimum thickness requirement of the bottom and inner bottom plating is given by

t = (t_o+0.04L) $\sqrt{k}$ + t_c [mm] for bottom plating

= (t_o+0.03L) $\sqrt{k}$ + t_c [mm] for inner bottom plating.

L need not be taken as more than 250 [m].

t_o = 5.0 [mm], in general.

= 7.0 [mm], for inner bottom plating below dry cargo hatchway openings where ceiling is not fitted.

= 6.0 [mm], for inner bottom plating elsewhere where ceiling is not fitted.

4.2.3 The bottom bilge and inner bottom plating is also to comply with the requirements of buckling strength given in Ch.3, Sec.6.

For ships of L > 90 [m], the thickness of these platings within 0.4L amidships, corresponding to the buckling strength requirement may be approximated as :

- For longitudinally stiffened plating

$$t = \frac{0.009s\sqrt{k}}{\sqrt{(1 - 0.75 f_B . f_z)}} + t_c \text{ [mm]}$$

- For transversely stiffened plating

$$t = \frac{0.0164s\sqrt{k}}{[1 + (s/1000l)^2]\sqrt{(1 - 0.75 f_{B.} f_z)}} + t_c \text{ [mm]}$$

4.2.4 For ships discharged by grabs, the plating thickness 't' of the inner bottom and exposed parts of sloping bulkheads is not to be less than:

t = 0.0115 (s+800) √k + t_c [mm]

Where ceiling is fitted, the above requirement may be reduced by 2 [mm].

4.2.5 Where the inner bottom is subjected to wheel loads from cargo handling vehicles, the scantlings are also to comply with the requirements given in Ch.9, Sec.6.

Section 5

Single Bottom

5.1 Transverse framing

5.1.1 Plate floors of following scantlings are to be fitted at every frame

depth at centre line, d = 40(B+T) [mm]

thickness of web, t = (d/100+3) √k [mm]

face plate area, a = 3.5 T.√k [cm^2]

The thickness of face plate is not to be less than 1/15 of the face width.

The top of floors, in general, is to be level from side to side. However, in ships having considerable rise of floor, the depth of web at 10 per cent of the span from ends, is not to be less than 1/2 d [mm].

5.1.2 On all ships one centre girder is to be fitted and in addition side girders are to be fitted such that the spacing of girders does not exceed 2.5 [m]. The girders are to extend as far forward and aft as practicable and where they are cut at transverse bulkheads the longitudinal strength is to be maintained. Where the bottom structure changes into a double bottom structure, the bottom girders are to extend at least 3 frame spaces into double bottom structures.

The scantlings of the bottom girders, within 0.5L amidships, are not to be less than the following:

Centre girder -

web thickness, t = (5.5+0.06L) √k [mm]

face plate area, a = (5+0.65L)k. [cm^2]

Side girders -

web thickness, t = (5+0.04L) √k [mm].

face plate area, a = (5+0.35L)k [cm^2].

The thickness of face plates is not to be less than 1/15 of the face width.

Towards the fore and after ends, the scantlings of the bottom girders may be reduced by 10 per cent.

5.1.3 In the engine room, the thickness of floors webs and the face plate area as given in 5.1.1 are to be increased by 1 [mm] and 50 per cent respectively. The floors are not to be flanged.

If the height of floors is reduced in way of crankcase, the face plate area is to be suitably increased, however the reduced height is normally not to be less than 2/3 of 'd' as given in 5.1.1.

5.1.4 In the after peak of single screw ships, the height of the floors is to be increased such that their upper edge is well above the stern tube.

5.1.5 Where single bottom in the cargo region is stiffened by transverse frames supported by longitudinal girders, the scantlings of the frames and longitudinal girders are to be determined in accordance with 6.2.3 and 5.2.3, 5.2.4 respectively.

5.2 Longitudinal framing

5.2.1 The spacing of bottom transverses is normally not to exceed the greater of 0.02L [m] or 3.6 [m]. The bottom transverses are to be supported by primary girders or longitudinal bulkheads. Where the design does not incorporate a centreline bulkhead, at least a docking girder is to be provided. The scantlings of simple girders and transverses are to be obtained in accordance with 5.2.3. The scantlings of a complex girder system are to be based on a direct stress analysis.

5.2.2 The section modulus 'Z' of the bottom longitudinals is not to be less than:

$$Z = \frac{s\,p\,l^2 .10^3}{12\sigma} + Z_c \ \ [cm^3]$$

where,

p = applicable design pressure as given in 3.1.1.

σ = (215 - 135f_B.f_z)/k, max.160/k [N/mm^2] within 0.4L amidships

= 160/k [N/mm^2] within 0.1L from ends.

Elsewhere σ may be obtained by linear interpolation.

The longitudinals are also to comply with the requirements of buckling strength given in Ch.3, Sec.6.

5.2.3 The section modulus 'Z' of bottom girders is not to be less than:

$$Z = \frac{10^6\, b\,p\,S^2}{m\sigma} + Z_c \ \ [cm^3]$$

where,

m = 10 in general

p = applicable design pressure as given in 3.1.1.

σ = (190 - 135 f_B.f_z)/k, max. 160/k [N/mm^2]
for continuous longitudinal girders within 0.4L amidships.

= 160/k [N/mm^2]
for longitudinal girder within 0.1L from ends and for transverse girders in general.

Elsewhere σ may be obtained by linear interpolation.

5.2.4 The effective cross sectional area 'A' of the girder web at ends obtained as per Ch.3, Sec.4.4 is not to be less than:

A = 70 S b p k + 0.01h.t_c [cm^2]

where,

h = girder height [mm].

The web area at middle of the span is not to be less than 0.5A.

5.2.5 The girders are to be satisfactorily stiffened against buckling in accordance with the requirements given in Ch.3, Sec.6. Tripping brackets are to be fitted in accordance with the requirements given in Ch.3, Sec.4.

Section 6

Double Bottom

6.1 General

6.1.1 Where double bottom spaces are used as tanks, the centre girder is to be watertight unless the double bottom is divided by watertight side girders or the tanks are narrow.

The depth 'd' of the centre girder is not to be less than:

d = 250 + 20B + 50T [mm], with a minimum of 760 [mm].

In addition to the above, for passenger ships and cargo ships other than tankers (See 2.1.1) :

d = 50 B [mm], which need not be taken more than 2000 [mm].
In case of ships with considerable rise of floors the depth 'd' may have to be increased.

6.1.2 The thickness 't' of the bottom girders and floors is not to be less than

t = (0.008d + 4) √k [mm], for centre girder;

t = (0.008d + 1) √k [mm], for side girders and plate floors.

6.1.3 The thickness 't' of girders and floors forming boundaries of double bottom tanks is not to be less than that obtained from 6.1.2 and that given below:

$$t = \frac{s\sqrt{p}}{2\sqrt{\sigma}} + t_c \ [mm]$$

where,

p = design pressure as given in 3.2.1.

σ = (200 - 100 f_B)/k, max. 160/k [N/mm^2], for longitudinally stiffened longitudinal girders within 0.4L amidships

= (185 - 115 f_B)/k, max.160/k [N/mm^2], for vertically stiffened longitudinal girders within 0.4L amidships

= 160/k [N/mm^2] for longitudinal girders within 0.1L from ends, and for plate floors.

Between the regions specified above, σ may be obtained by linear interpolation.

6.1.4 The section modulus 'Z' of the stiffeners on girders and floors forming boundaries of double bottom tanks is not to be less than

$$Z = \frac{spl^2 .10^2}{\sigma} + Z_c \ [cm^3]$$

where,

p = design pressure as given in 3.2.1;

σ = (210 - 120 f_B)/k, max. 160/k [N/mm^2] for longitudinal stiffeners within 0.4L amidships

= 160/k [N/mm^2] for longitudinal stiffeners within 0.1L from ends and for transverse or vertical stiffeners in general.

Between the regions specified above σ for longitudinal stiffeners may be obtained by linear interpolation.

Longitudinal stiffeners are to have end connections, other stiffeners may be sniped at ends provided the section modulus Z is increased by 25 per cent.

6.1.5 The longitudinal girders are to be satisfactorily stiffened against buckling in accordance with the requirements given in Ch.3, Sec.6.

6.2 Transverse framing

6.2.1 The side girders are normally to be fitted at a spacing not exceeding 4.0 [m] and are to be extended as far forward and aft as practicable. The girders are to be stiffened at every bracket floor by a vertical stiffener of depth same as that of reverse frame and thickness that of the girder.

6.2.2 Plate floors are to be fitted under bulkheads, pillars, thrust seating, boiler bearers and in way of change of depth of double bottom. In engine room, plate floors are to be fitted at every frame. Elsewhere the spacing of plate floors is not to exceed that given by Table 6.2.2.

Table 6.2.2 : Spacing of plate floors (Transverse framing)

Draught T [m]	Under deep tanks (See Note 1)	Clear of deep tanks (maximum 3.0 [m])
$T \leq 2$	Every 4th frame	Every 6th frame
$2 < T \leq 5.4$	Every 3rd frame	Every 5th frame
$5.4 < T \leq 8.1$	Every 3rd frame	Every 4th frame
$T > 8.1$	Every 2nd frame	Every 3rd frame
Note 1 : Under tanks with height greater than 0.7 times the distance between inner bottom and main deck		

6.2.3 Where bracket floors are fitted the section modulus 'Z' of the bottom frames and reverse frames is not to be less than:

$$Z = \frac{spl^2\ k}{1.6} + Z_c \ [cm^3]$$

where,

p = applicable design pressure as given in 3.1.1 and 3.3.1 for bottom frames and reverse frames respectively.

l = span of frames [m] measured between girder or brackets.

Where vertical struts according to 6.2.4 are fitted, the section modulus of bottom and reverse frames may be reduced by 35 per cent.

6.2.4 The cross sectional area 'A' of the struts is not to be less than

$A = c \cdot k \cdot l \cdot s \cdot T \cdot [cm^2]$

where,

$c = 7 \times 10^{-4}$ in way of ballast tanks

$= 6 \times 10^{-4}$ elsewhere

l = actual span [m], without considering the strut.

The moment of inertia I of the struts is not to be less than

$I = 2.5\ A \cdot d^2 \times 10^{-6}\ [cm^4]$

where,

d = depth of double bottom, [mm].

6.2.5 The bottom frames and reverse frames are to be attached to the centre girder and margin plate by means of brackets of same thickness as that of the plate floors. The breadth of the brackets is not to be less than 0.75 times the depth of the centre girder and the brackets are to be flanged 75 [mm] at their free edges.

6.3 Longitudinal framing

6.3.1 The side girders are normally to be fitted at a spacing not exceeding 5.0 [m] and are to be extended as far forward and aft as practicable.

6.3.2 The plate floors are to be fitted under bulkheads, pillars, thrust seating and boiler bearers. In engine room, plate floors are to be fitted at every second side frames. Additionally, under the main engine seatings, floors extending to the first side girder outside the engine seating, are to be fitted at intermediate frames. Under deep tanks with height greater than 0.7 times the distance between inner bottom and main deck, the spacing of floors is normally not to exceed 2.5 [m]. Elsewhere, the spacing is normally not to exceed 3.6 [m].

6.3.3 The plate floors are to be stiffened at every longitudinal by a vertical stiffener of depth same as that of the inner bottom longitudinal and thickness as that of the floor. Between plate floors, transverse brackets are to be fitted at every frame at the margin plate and at a spacing not exceeding 1.25 [m] on either side of the centre girder. The thickness of brackets is to be same as that of the plate floors. The brackets are to extend upto the adjacent longitudinal and are to be flanged 75 [mm] at their free edges.

6.3.4 The section modulus 'Z' of the bottom and inner bottom longitudinals is not to be less than

$$Z = \frac{spl^2\ .10^3}{12\sigma} + Z_c \ [cm^3]$$

where,

p = applicable design pressure as given in 3.1.1 and 3.3.1 for bottom longitudinals and inner bottom longitudinals respectively;

l = span of longitudinals [m], measured between the plate floors

$\sigma = (210 - 135\ f_B.f_z)/k$ [N/mm^2], max. 160/k [N/mm^2], within 0.4L amidships generally

$= (185 - 135\ f_B.f_z)/k$ [N/mm^2], max. 160/k [N/mm^2] within 0.4L amidships, for inner bottom longitudinals in way of holds/tanks intended for ballast/cargo oil;

= 160/k [N/mm^2] within 0.1L from ends.

Between the regions specified above, σ may be obtained by linear interpolation.

Where vertical struts according to 6.2.4 are fitted, the section modulus of the bottom and inner bottom longitudinals may be reduced by 35 per cent.

Section 7

Additional Strengthening against Slamming

7.1 General

7.1.1 Where the minimum design ballast draught at F.P. is less than 0.04L [m] (maximum 8.5 [m]), the bottom forward is to be additionally strengthened as given in Sec.7.2 and Sec.7.3.

7.1.2 Where the shape of the after sections is such that there are large flat areas of bottom shell, additional stiffening and/or increased shell plate thickness may be required.

7.1.3 Where a ship is classed for 'Restricted Service' or 'Sheltered water service', compliance with the requirements of this section may be modified or waived altogether.

7.2 Spacing of floors and girders

7.2.1 The floors and girders in the region forward of 0.25L abaft of F.P. are to be spaced as given in 7.2.2 and 7.2.3.

7.2.2 Where transverse framing is adopted, floors are to be fitted at every frame. The spacing of longitudinal girders is not to exceed 3 times the transverse frame spacing. In addition, intermediate half height girders or equivalent longitudinals are to be fitted.

7.2.3 Where longitudinal framing system is adopted, the plate floors are to be fitted at alternate frames. The spacing of longitudinal girders is not to exceed 3 times the longitudinal frame spacing. In case of longitudinally stiffened single bottoms, the arrangements and scantlings will be specially considered.

7.3 Plating and stiffeners

7.3.1 The scantlings of bottom plating, stiffeners and girders upto (0.05 T_{bf}) above base line (upto bilge curvature in case of ships with rise of floor) are to be based on the design slamming pressure P_{SL} given below:

P_{SL} = 0.162 $\sqrt{L}$. c_1 . c_2 . c_s [N/mm^2]

for L $\leq$ 150 [m]

P_{SL} = 1.984 (1.3 - 0.002L) c_1 . c_2 . c_s [N/mm^2]

for L > 150 [m];

where,

$$c_1 = 3.6 - 6.5\left[\frac{T_{bf}}{L}\right]^{0.2}$$

c_1 need not be taken more than 1.0

T_{bf} = minimum design ballast draft [m] at F.P.

c_2 = distribution factor (see also Fig.7.3.1)
c_2 = 0 for x/L $\leq$ 0.5

$$c_2 = \left(\frac{x}{L} - 0.5\right) / c_3 \text{ for } 0.5 < \frac{x}{L} \leq (0.5 + c_3)$$

$$c_2 = 1.0 \text{ for } (0.5 + c_3) < \frac{x}{L} \leq (0.65 + c_3)$$

$$c_2 = 0.5\left[1 + \frac{1 - x/L}{0.35 - c_3}\right] \text{ for } \frac{x}{L} > (0.65 + c_3)$$

where,

$$c_3 = 0.33 . C_b + \frac{L}{2500};$$

c_3 need not be taken greater than 0.35

x = distance of the load point from A.P. [m].

For self propelled vessels:

c_s= 1.0 for V/$\sqrt{L}$ $\geq$ 1.2

= 0.6 for V/$\sqrt{L}$ $\leq$ 0.9

For intermediate values to be obtained by linear interpolation

For non-self propelled vessels:

c_s = 0.4.

If the minimum design ballast draught T_{bf} is achieved by means of full ballast tanks in forebody resulting in internal loads on bottom shell panels, the design slamming pressure PSL on the corresponding panels may be reduced by (0.014 h) [N/mm^2], where, 'h' is the height of the ballast tank [m].

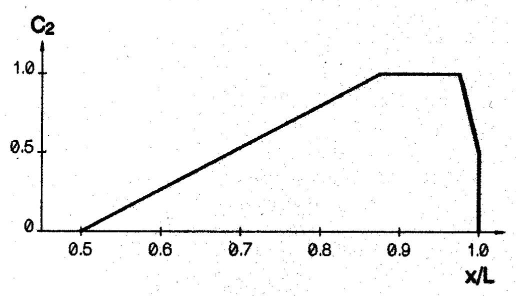

Fig.7.3.1

7.3.2 The thickness 't' of the bottom plating is not to be less than:

$t = 0.028\ f_a.f_r.s.\ \sqrt{P_{SL}}.\sqrt{k} + t_c$ [mm]

Above the region mentioned in 7.3.1 the thickness may be gradually reduced to the general requirement.

7.3.3 The section modulus 'Z' of bottom longitudinals or frames is not to be less than

$Z = 0.15\ s.\ P_{SL}\ .\ l^2\ .\ k + Z_c$ [cm^3]

The shear area, 'A_s' of the stiffeners is not to be less than

$A_s = 0.028(l - \frac{s}{1000}).s.P_{SL}.k + 0.01h\ t_c$ [cm^2]

where,

h = stiffener height [mm].

For stiffeners which are continuous at girders, the net weld area is to satisfy the following expression

$(1.7\ A_f + A_w) \geq 2\ A_s$

where,

A_f = net weld area at flange, [cm^2].

A_w = net weld area at web, [cm^2].

7.3.4 Near the shell plating, the spacing of stiffeners on the girder webs or bulkheads is not to exceed 90 times the thickness of the web or bulkhead plating.

7.3.5 The sum 'A_s' of the shear areas at the ends of the girder or girder system supporting any specified area of the bottom is not to be less than

$A_s = C_4\ S.b.P_{SL}\ .k$ [cm^2]

where,

$$C_4 = 50\left(1 - \frac{10\,S\,b}{LB}\right),$$

- but not to be taken less than 25.

S,b = The length and breadth [m] respectively of the load area supported by the girder or girder system. The design slamming pressure P_{SL} is to be calculated at the middle of the load area under consideration.

Section 8

Engine Seatings

8.1 General

8.1.1 It is recommended that the depth of the floors or double bottom in way of engine foundations be increased.

8.1.2 Sufficient fore and aft girders are to be arranged in way of the main machinery to effectively distribute its weight and to ensure adequate rigidity of the structure. The girders are generally to extend over the full length of the engine room and are to be suitably scarphed into the bottom structure beyond.

8.1.3 The scantlings of engine seatings are to be adequate to resist gravitational, thrust, torque, dynamic and vibratory forces which may be imposed on them. The recommendations given by the engine manufacturer are also to be taken into account.

8.1.4 In case of higher power oil engines or turbine installations, the seating should generally be integral with the double bottom structure. The tank top plating in way of the engine foundation plate or the turbine gear case and the thrust bearing is to be substantially increased in thickness.

8.1.5 Where the top plate of the engine seating is situated above the floors or the inner bottom, adequate transverse strength by means of brackets in line with the floors is to be ensured. In way of the recess for crankcase, brackets as large as practicable are to be fitted.

8.1.6 Lightening holes in engine foundations are to be kept as small as practicable and the edges are to be suitably reinforced.

8.2 Recommended scantlings

8.2.1 In general, the scantlings of engine girder face plate, web and floors in way of engine seatings may be calculated as given below:

where,

P = maximum power of the engine [kW]

R = rpm of engine at maximum power

l = effective length of engine foundation plate [m], required for bolting the engine to the seating.

8.2.2 For engines of P > 7000 [kW], the top plate is to be generally supported on two girders on each side.

8.2.3 The top plate area for one side of the seat is to be not less than:

A = 50+85 $\left(\frac{P}{Rl}\right)$ [cm^2] for $\left(\frac{P}{Rl}\right) \geq 2.0$

= 90+65 $\left(\frac{P}{Rl}\right)$ [cm^2] for $\left(\frac{P}{Rl}\right)$ < 2.0

8.2.4 The thickness of top plates is to be not less than:

$$t_p = \left[220\left(\frac{P}{Rl}\right) + 300\right]^{0.5} + t_o \text{ [mm]}$$

t_o = 6 where one girder is fitted on each side;

= 0 where two girders are fitted on each side.

8.2.5 The sum of the girder web thicknesses where two girders are fitted is to be not less than:

$$t_{g2} = \left[270\left(\frac{P}{Rl}\right) + 400\right]^{0.5} \text{ [mm]}$$

where single girder is fitted each side, the thickness is to be not less than:

t_{g1} = 0.55 t_{g2} [mm]

8.2.6 The thickness of floor plates below the bed plate is not to be less than:

$$t_f = \left[52\left(\frac{P}{Rl}\right) + 65\right]^{0.5} \text{ [mm]}$$

8.2.7 For high speed engines of less than 1500 [kW] and medium speed engines of less than 750 [kW] the following may be used instead of the values specified in 8.2.3 to 8.2.6 above.

Top plate area; A = 20 + 120 $\left(\frac{P}{R}\right)$ [cm^2]

Thickness of top plate; t_p = 0.1A + 14 [mm]

Girder web thickness; t_{g1} = 0.043A + 7 [mm]

Floor web thickness; t_f = 0.02A + 6 [mm].

End of Chapter

Chapter 8

Side Structure

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The scantlings and arrangement of side structure as defined in Ch.1, Sec.2 and also those of sides of the superstructures are to comply with the requirements of this Chapter.

1.2 Symbols

L, B, T, C_b, k as defined in Ch.1, Sec.2.

t_c, Z_c are corrosion additions to thickness and section modulus respectively, as given in Ch.3, Sec.2.1

f_a,f_r are correction factors for aspect ratio and curvature respectively, as defined in Ch.3, Sec.3.1.

C_w, a_o, k_s as defined in Ch.4, Sec.1.2 and Sec.3.2.

T_b = lowest design ballast draught [m]. For preliminary purposes, T_b may be taken as 0.35T [m] for cargo vessels and (2 + 0.02 L) [m] for tankers.

s = spacing of stiffeners, [mm].

l = span of stiffeners, [m].

b = spacing of girders, [m].

S = span of girders, [m].

$$f_D = \frac{Z_R}{Z_D}$$

$$f_B = \frac{Z_R}{Z_B}$$

$f_S = f_D$ for side shell area above neutral axis

$= f_B$ for side shell area below neutral axis

where,

Z_R = Rule midship section modulus [cm^3] as required by Ch.5, Sec.3.3.1.

Z_D, Z_B = Actual midship section moduli [cm^3] provided at deck and bottom respectively; calculated as per Ch.5,Sec.3.1.

$$f_z = \frac{z}{z_n}$$

where,

z_n = vertical distance [m], from the neutral axis of the hull girder to the strength deck or bottom, as relevant.

z = vertical distance [m], from the neutral axis of the hull girder to the stiffener or girder.

ϕ= roll angle [radian], as given in Ch.4, Sec.2.

Section 2

Structural Arrangement and Details

2.1 General

2.1.1 The ship's side shell may be stiffened longitudinally or vertically.

2.1.2 Where the side shell is stiffened longitudinally, the continuity of the side longitudinals within a distance of 0.15D from bottom or from strength deck is to be maintained in accordance with Ch.3, Sec.5.1.1. The web frames are to be fitted in line with the bottom transverses or plate floors.

2.1.3 The position, shape and reinforcement of sea inlets or other openings in side shell are to be in accordance with the requirements of Ch.5, Sec.5.

2.1.4 In the case of superstructures exceeding 0.15L in length and ending within 0.5L amidships, the side plating of the superstructures is to be increased by 25 per cent in way of the break. Also see Ch.11, Sec.4.1.5.

2.1.5 The thickness of the shell plating is to be increased locally by 50 per cent in way of sternframe, propeller brackets and rudder horn. For reinforcements in way of anchor pockets, hawse pipes etc. refer to Ch.15, Sec.2.1.

2.1.6 The weld connections are to comply with the requirements of Ch.17.

2.2 Sheer strake

2.2.1 The thickness of sheer strake as obtained from 4.1.5 is to be increased by 30 per cent on each side of a superstructure end bulkhead located within 0.5L amidships if the superstructure deck is a partial strength deck.

2.2.2 Where a rounded sheer strake is adopted the radius in general, is not to be less than 15 times the plate thickness.

2.2.3 Bulwarks are generally not to be welded to the top of the sheer strake within 0.6L amidships.

2.2.4 Where the sheer strake extends above the deck stringer plate, the top edge of the sheer strake is to be kept free from notches and isolated welded fittings, and is to be ground smooth with rounded edges. Drainage openings with smooth transition in the longitudinal direction may be allowed on special consideration.

2.2.5 The welding of deck fittings to rounded sheer strake within 0.6L amidships is not permitted, unless approved in each case.

Section 3

Design Loads

3.1 External sea pressure

3.1.1 The design pressure 'p' on side shell is to be taken as:

- for load points below the summer load waterline

$$p = 0.01 h_o + \left(k_s - \frac{1.5 h_o}{T}\right) C_w . R_s . 10^{-3} \ [\text{N/mm}^2]$$

- for load points above the summer load waterline

$$p = R_s \, k_s \, (C_w - 0.8 \, h_o) \, . \, 10^{-3} \ [\text{N/mm}^2]$$

where,

h_o = vertical distance [m], from the summer load waterline to the loadpoint.

'p' is not to be taken as less than 0.01 [N/mm^2].

3.2 Internal tank pressure

3.2.1 Where the side shell forms a boundary of a tank, the design pressure 'p' is to be taken as the greater of external sea pressure given by Sec.3.1 and the net internal tank pressure 'p_i' given by 3.2.2.

3.2.2 The net internal tank pressure 'pi' is to be taken as:

p_i = Internal pressure due to liquid cargo in tanks as given in Ch.4, Sec.3.3.2 less the applicable external sea pressure at lowest design ballast draught 'T_b' as given in Ch.4, Sec.3.2.4.

- For side shell above draught T_b, p_i may be taken as the greater of:

$p_i = 0.01\ h_s + p_o$ [N/mm^2], or

$= 6.7\ (h_s + \phi b)\ .10^{-3}$ [N/mm^2], or

$= 6.7\ h_p\ .\ 10^{-3}$ [N/mm^2]

where,

h_s, b = The vertical and athwartship distance [m], respectively, from the load point to the tank corner at the top of tank which is furthermost away.

h_p = vertical distance [m], from the load point to the top of air pipe.

$p_o = 0.01$ for $L \leq 20$ [m]

$= 0.024$ for $L \geq 90$ [m]

For L between 20 [m] and 90 [m] 'p_o' to be obtained by linear interpolation.

However, in mechanically propelled cargo ships of 500 GT and above and passenger ships, for tanks forming part of the watertight subdivision, (See Ch.10, Cl.4.2.1) p_0 is to be taken as not less than 0.024 [N/mm^2].

In case of tanks with stepped upper contour, the largest value of 'pi' resulting from h_s, b measurements to various tank top corners is to be considered (See Fig.3.2.2).

- For vessels of L<90 [m], for side shell below draught T_b, p_i, may be, approximated as the greater of :

$p_i = 0.01\ (h_s - h_b) + p_o$ [N/mm^2], or

$= (6.7h_p - 10h_b) \times 10^{-3}$ [N/mm^2]

where,

h_s, h_p, p_o = as given above

h_b = vertical distance [m], from the load point to the waterline corresponding to draught T_b.

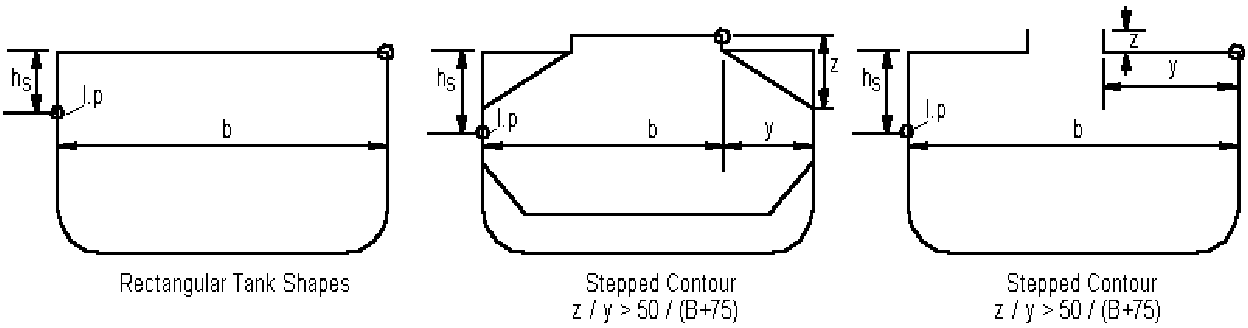

Fig.3.2.2 : Tank shapes for internal tank pressure

Section 4

Side Shell Plating and Stiffeners

4.1 Side shell plating

4.1.1 The thickness 't' of side shell is not to be less than the minimum requirement given in 4.1.4 nor less than:

$$t = f_a f_r \frac{s\sqrt{p}}{2\sqrt{\sigma}} + t_c \ [mm]$$

where,

p = applicable design pressure [N/mm^2], as given in Sec.3

σ = allowable bending stress [N/mm^2], as per Table 4.1.1.

Table 4.1.1 : σ values for side shell plating [N/mm^2]

Region	Framing system	At neutral axis	At strength deck or bottom	Between neutral axis and strength deck or bottom
0.4L amidships	Vertical	120/k	(175 - 120 f_S)/k max. 120/k	To be obtained by linear interpolation between values at neutral axis and at deck or bottom
	Longitudinal	140/k	(185 - 100 f_S)/k max. 120/k	
Within 0.05L from F.P. and 0.1L from A.P.	160/k			
Elsewhere	To be obtained by linear interpolation between allowable values at regions specified above			

4.1.2 In way of large shear forces, the side shell plating thickness is to be adequate to meet the shear strength requirements given in Ch.5, Sec.4.

4.1.3 The side shell plating is also to comply with the requirements of buckling strength given in Ch.3, Sec.6. For approximate thickness corresponding to the buckling strength requirements at deck and bottom, refer to Ch.7, Sec.4.2.3 and Ch.9, Sec.4.1.4 respectively.

4.1.4 The minimum thickness requirement of the side shell plating is given by

t = (5.0 + c.L) √k + t_c [mm]

c = 0.04 up to 4.6 [m] above the summer load waterline. For each 2.3 [m] above this level, 'c' may be reduced by 0.01 without being less than zero.

L need not be taken as more than 250 [m].

4.1.5 The breadth of the sheer strake is not to be less than (800+5L) [mm], however for ships of L < 90 [m], it need not exceed 200 D [mm].

Where the thickness of the strength deck plating is greater than that required for side plating, the sheer strake thickness is not to be less than the mean of the two values.

4.2 Side shell longitudinals

4.2.1 The section modulus 'Z' of side longitudinals is not to be less than:

$$Z = \frac{s\,p\,l^2 .10^3}{12\sigma} + Z_c \ [cm^3]$$

where,

p = applicable design pressure at midpoint of the span [N/mm^2].

σ = (215 - 135 f_S . f_z) /k, maximum 160/k [N/mm^2] for side longitudinals up to depth 'D' and within 0.4L amidships.

= 160/k [N/mm^2] within 0.1L from ends and at the level of short superstructure decks.

Between the regions specified above `σ' may be obtained by linear interpolation.

For longitudinals supported by side verticals in single deck constructions, `σ' is not to be taken as greater than 135/k [N/mm^2].

4.3 Main frames

4.3.1 Frames located between the collision bulkhead and the after peak bulkhead, connected to the floors or the double bottom and extending upto the lowest deck or shipside stringer are to be considered as main frames.

4.3.2 The section modulus 'Z' of the main frames bracketed at both ends as per 4.3.4 is not to be less than :

$$Z = \frac{s\,p\,l^2\,k}{2.4} + Z_c \;\; [cm^3] \text{ and}$$

= 6.5 √(L.k) [cm^3]

where,

p = applicable design pressure at midpoint of the span or mean of the pressures at two ends, whichever is greater, [N/mm^2].

4.3.3 The section modulus of a main frame however, is not to be less than that required for the tween deck frame above.

4.3.4 Main frame brackets are to be as follows:

length of the bracket : for upper bracket : 70 *l* [mm]

- for lower bracket : 120 *l* [mm]

section modulus at end (including bracket) - for upper bracket : 1.7 Z [cm^3]

- for lower bracket : 2.0 Z [cm^3]

where,

Z = section modulus of main frame as given in 4.3.2.

Where the free edge of the bracket exceeds 40 times the bracket thickness, the brackets are to be flanged. The flange width is to be at least 1/15 of the length of the free edge.

4.3.5 Brackets at ends of the main frame may be omitted provided the frame is carried through the supporting members and the section modulus obtained as per 4.3.2 is increased by 75 per cent.

4.4 Tween deck frames, super structure frames

4.4.1 Tween deck frames and superstructure frames located between the collision bulkhead and the after peak bulkhead are to have section modulus 'Z' not less than:

$$Z = \frac{s\,p\,l^2\,k}{1.6} + Z_c \;\; [cm^3] \text{ and}$$

= 4.0 √(L.k) [cm^3]

where,

p = applicable design pressure as given in Sec.3.

4.4.2 The lower end of the tween deck and superstructure frames is to be connected to the bracket or frame below or else it is to be bracketed above the deck. The upper end is to be bracketed to the deck beam or longitudinal.

4.5 Peak frames

4.5.1 Vertical peak frames forward of the collision bulkhead and aft of the after peak bulkhead are to have section modulus 'Z' not less than

$$Z = \frac{s\,p\,l^2\,k}{1.6} + Z_c \;\; [cm^3] \text{ and}$$

= 6.5 √(L.k) [cm^3]

where,

p = applicable design pressure [N/mm^2], as given in Sec.3.

4.5.2 Peak frames are to be bracketed at top and bottom and in way of side stringers, the connection is to provide adequate shear strength.

4.6 Tripping brackets

4.6.1 Where the span of frames exceeds 5 [m] and/or the flange width is less than 1/20 of the span 'l', tripping brackets are to be fitted at the middle of the span.

4.6.2 Forward of 0.15L from F.P., the tripping brackets are to be fitted on frames as shown in Fig.4.6.2. The spacing between tripping brackets is not to exceed 2.5 [m] vertically.

4.6.3 The thickness of tripping brackets is to be same as that of the frame web, however it need not exceed 10 [mm].

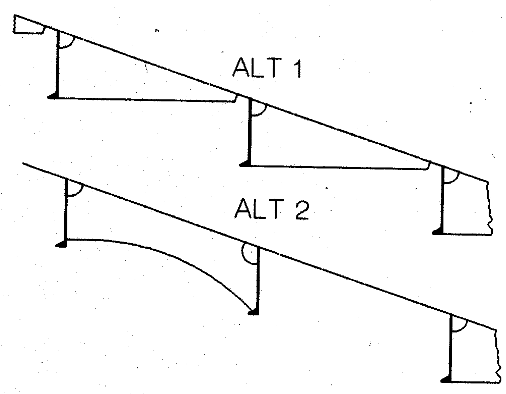

Fig. 4.6.2 : Tripping brackets

Section 5

Girders

5.1 General

5.1.1 Web frames are to be fitted in way of hatch end beams and deck transverses.

5.1.2 In the engine and boiler room, web frames are to be fitted at the forward and aft end of the engine and every 5th frame in general. In addition, where the engine room is situated aft and the span of the frames up to the lowest deck exceeds 6.5 [m], a side stringer is to be provided. The section modulus `Z' of the web frames and side stringers is to be obtained as per 5.1.5 taking 'b' as the mean of the web frame or stringer spacings respectively, on either side. The depth of the webs and stringers are not to be less than 2.5 times the depth of the ordinary frames.

Adequate deep beams are to be provided in line with the web frames.

5.1.3 In peak spaces, side stringers supporting vertical peak frames are normally to be fitted at every 2.6 [m]. The section modulus `Z' of the stringers is to be obtained as per 5.1.5. The stringers are to be supported by web frames.

Alternatively in fore peak spaces, unflanged stringers supported by panting beams at alternate frames may be provided. The scantlings of these stringers is not to be less than the following :

- width = 75 $\sqrt{L}$ [mm]

- thickness = 6 + 0.025L [mm]

The panting beams are to comply with buckling strength requirement given in Ch.3, Sec.6 and are to be bracketed to the frames. Intermediate frames are to be bracketed to the stringers.

5.1.4 The scantlings of simple girders and web frames supporting frames and longitudinals are to be in accordance with 5.1.5. The scantlings of webs supporting fully effective side stringers are to based on point loadings and 'σ' values given in 5.1.5. The scantlings of the complex girder system are to be based on a direct stress analysis. The buckling strength of the cross ties, where fitted, is to comply with the requirements given in Ch.3, Sec.6.

5.1.5 The section modulus 'Z' of simple girders and web frames is not to be less than :

$$Z = \frac{b\,p\,S^2 .10^6}{m\sigma} + Z_c \ [cm^3]$$

where,

p = applicable design pressure [N/mm^2], as given in Sec 3.

m = 12 for continuous longitudinal girders with end attachments in accordance with Ch.3, Sec.5.

= 10 for other girders with end attachments in accordance with Ch.3, Sec.5.

σ = (190 - 135 f_S . f_z)/k, max 160/k [N/mm^2], for continuous longitudinal girders within 0.4L amidships.

= 160/k [N/mm^2] for longitudinal girders within 0.1L from ends and for web frames in general.

Between the regions specified above, σ may be obtained by linear interpolation.

5.1.6 The effective cross sectional area 'A' of the girder web at ends obtained as per Ch.3, Sec.4.4 is not to be less than

A = 60 Sbpk + 0.01 h t_c [cm^2] for stringers and upper ends of the web frames.

= 80 Sbpk + 0.01 h t_c [cm^2] for lower ends of the web frames.

where,

h = girder height [mm].

5.1.7 The girders are to be satisfactorily stiffened against buckling in accordance with the requirements given in Ch.3, Sec.6. Tripping brackets are to be fitted in accordance with the requirements given in Ch.3, Sec.4.

End of Chapter

Chapter 9

Deck Structure

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The scantlings and arrangement of deck structure as defined in Ch.1, Sec.2 are to comply with the requirements given in this Chapter.

1.2 Symbols

L,B,T,C_b,k as defined in Ch.1, Sec.2.

t_c,Z_c = corrosion additions to thickness and section modulus respectively as given in Ch.3, Sec.2.1.

f_a, the correction factor for aspect ratio as defined in Ch.3, Sec.3.1.

C_w, a_o, k_v and k_s as defined in Ch.4, Sec.1.2, Sec.2.3 and Sec.3.2.

s = spacing of stiffeners, [mm]

l = span of stiffeners, [m]

b = spacing of girders, [m]

S = span of girders, [m]

$$f_D = \frac{Z_R}{Z_D}$$

where,

Z_R = Rule midship section modulus [cm3], as required by Ch.5, Sec.3.3.1.

Z_D = actual midship section modulus [cm3], provided at deck calculated as per Ch.5, Sec.3.1.

$$f_z = \frac{z}{z_n}$$

where,

z_n = vertical distance [m], from the neutral axis of the hull girder to the strength deck, in general. For ships with continuous trunks refer to Ch.5, Sec.3.1.3.

z = vertical distance [m], from the neutral axis of the hull girder to the deck under consideration or to the free flange of the deck longitudinal or girder as relevant.

ϕ= roll angle [radians], as given in Ch.4, Sec.2.

Section 2

Structural Arrangement and Details

2.1 General

2.1.1 In tankers, the deck is normally to be stiffened longitudinally in the cargo tank region, however, where L does not exceed 75 [m], consideration may be given to transversely stiffened decks.

2.1.2 In dry cargo ships of L>150 [m], the strength deck outside the line of hatchway openings is normally to be longitudinally stiffened.

2.1.3 The continuity of the deck longitudinals is to be maintained in accordance with Ch.3, Sec.5.1.1.

2.1.4 The deck within the line of hatchway openings is preferably to be stiffened transversely or alternatively the arrangements are to provide adequate transverse buckling strength. Where the deck outside the line of hatchway openings is framed longitudinally, the transverse beams or buckling stiffeners between the hatchways are to extend at least upto the second longitudinal from the hatch side or equivalent.

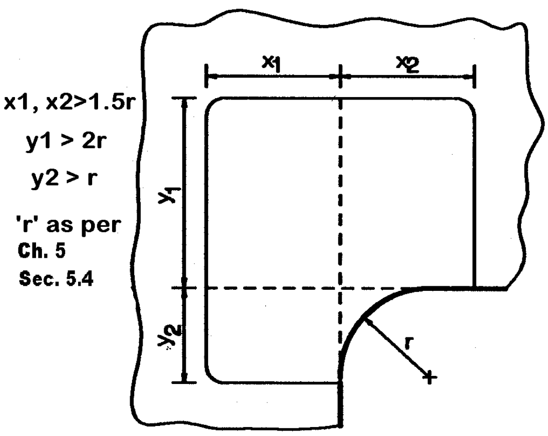

Fig.2.1.6 : Extent of insert plate

2.1.5 In ships with large hatch openings, the effective cross-sectional area of the deck between the hatchways is to be sufficient to withstand the transverse load acting on the ship's sides. Bending and shear stresses arising as a result of loading on the transverse bulkhead supported by the deck area and also as a result of displacements caused by torsion of the hull girder, are to be considered and the necessary reinforcements are to be provided.

The following items may be included in the effective cross-sectional area of the decks; corrosion additions, if any, are to be deducted:

- deck plating
- transverse beams and deck transverses
- hatch end beams (upon special conside-ration)
- cross section of stool at top of transverse bulkhead
- cross section of transverse bulkhead (if plane or horizontally corrugated) down to base of top wing tank or to 0.15 D from deck.

The compressive stress in the above mentioned items is not to be greater than 120/k [N/mm^2], nor 80 per cent of the critical buckling stress found in accordance with Ch.3, Sec.6.

2.1.6 Hatchway corners are to be of streamlined, elliptical or circular shape as given in Ch.5, Sec.5.4. Where shapes other than the streamlined shape or equivalent are adopted, insert plates are to be fitted at the hatch corners in strength deck. The insert plates are to be 25 per cent thicker than the deck plating outside the line of hatchways and are to extend as shown in

Fig.2.1.6. The butts of insert plates are to be well clear of those in coaming.

2.1.7 The weld connections are to comply with the requirements of Ch.17.

Section 3

Design Loads

3.1 Weather deck

3.1.1 The design pressure 'p' on decks or parts of decks which are exposed to the wash of the sea is to be taken as:

$p = R_s\, k_s\, (C_w - 0.8\, h_o)\, .\, 10^{-3}$ [N/mm^2]

where,

h_o = vertical distance [m], from the summer load waterline to the deck.

'p' is not to be taken as less than

- 0.015 [N/mm^2] for weather decks forward of 0.15L from F.P. or forward of deckhouse front whichever is the foremost position
- 0.005 [N/mm^2] for weather decks elsewhere.

3.1.2 For weather decks except those forming crowns of tanks in dry cargo ships, the design pressure 'p' is to be taken as the greater of that given by 3.1.1 and 3.2.1, taking deck load `q' as not less than:

q = 1.0 [t/m^2] for L $\leq$ 100 [m]

= 1.3 [t/m^2] on superstructure deck for L $\geq$ 150 [m]

= 1.75 [t/m^2] on freeboard deck for L $\geq$ 150 [m]

For L between 100 [m] and 150 [m], 'q' is to be obtained by linear interpolation.

Where the design stowage height of weather deck cargo is smaller than 2.3 [m], an appropriate combination of the two loads is to be considered.

3.1.3 For weather decks forming crowns of tanks, the design pressure 'p' is to be taken as the greater of that given by 3.1.1 and 3.3.2.

3.2 Tween decks, platform decks and accommodation decks

3.2.1 The design pressure 'p' on tween decks, platform decks and accommodation decks is to be taken as :

$$p = q\left(1 + \frac{0.5\, k_v\, a_o}{C_b}\right).10^{-2}\ \text{[N/mm}^2\text{]}$$

where,

q = deck cargo load [t/m^2].

= ρ.H [t/m^2] for tween decks

= 1.6 [t/m^2] for platform decks in machinery spaces

= 0.35 [t/m^2] for accommodation decks.

H = tween deck height or height measured upto the top of hatchway coaming, [m].

ρ = cargo density [t/m^3], not to be taken as less than 0.7 [t/m^3] except as specified in Ch.4, Sec.3.4.1.

3.2.2 For decks forming crowns of tanks the design pressure 'p' is to be taken as the greater of that given by 3.2.1 and 3.3.2.

3.3 Decks forming tank boundaries

3.3.1 The design pressure 'p' for decks forming the bottom of a tank may be taken as the greater of the following:

$p = 6.7\, h_p\, .\, 10^{-3}$ [N/mm^2] or

$= 0.01\, h_s + p_o$ [N/mm^2]

where,

h_p = vertical distance [m], from the deck to the top of air pipe

h_s = vertical distance [m], from the deck to the top of the tank

p_o = 0.01 [N/mm^2] for L $\leq$ 20 [m]

= 0.024 [N/mm^2] for L $\geq$ 90 [m]

For L between 20 [m] and 90 [m], 'po' is to be obtained by linear interpolation.

However, in mechanically propelled cargo ships of 500 GT and above and passenger ships, for tanks forming part of the watertight subdivision, (See Ch.10, Cl.4.2.1) p_0 is to be taken as not less than 0.024 [N/mm^2].

3.3.2 The design pressure 'p' for decks forming the crown of a tank may be taken as the greater of the following:

p = 6.7 h_p . 10^{-3} [N/mm^2] or

= 6.7 (h_s + ϕb) . 10^{-3} [N/mm^2]

= 0.01 h_s + p_o [N/mm^2]

where, h_p and p_o are as given in 3.3.1.

h_s, b = the vertical and athwartship distance, [m] respectively, from the point of deck under consideration to the tank corner at the top of the tank which is furthermost away.

In case of tanks with stepped upper contour, the largest value of 'p' resulting from the h_s, b, measurements to various tank top corners is to be considered.

Section 4

Deck Platings and Stiffeners

4.1 Deck platings

4.1.1 The thickness of the strength deck plating outside the line of hatchway openings is to be adequate to give the necessary hull section modulus and moment of inertia required by Ch.5.

4.1.2 The thickness 't' of deck platings is not to be less than the minimum requirement given in 4.1.3 nor less than:

$$t = \frac{f_a \cdot s\sqrt{p}}{2\sqrt{\sigma}} + t_c \ \text{[mm]}$$

where,

p = applicable design pressure [N/mm^2] as given in Sec.3.

σ = allowable bending stress [N/mm^2] as per Table 4.1.2.

4.1.3 The minimum thickness requirement of the deck platings is given by:

t = (t_o+0.02L) $\sqrt{k}$ + t_c [mm]

L need not be taken as more than 250 [m].

where,

t_o = 6 for strength decks and forecastle decks

= 5.5 for tween decks and first tier of erections

= 5.0 for other decks.

Where deck coverings in accordance with Ch.2, Sec.4 are provided, the deck thickness may be reduced by 10 per cent without being less than 5.0 [mm].

Table 4.1.2 : σ values for deck plating [N/mm²]				
Region	**Framing system**	**Strength deck**	**Other continuous decks**	**Short decks**
0.4L amidships	Transverse	(175 - 120 f_D)/k max. 120/k	(175 - 120 f_D.f_z)/k max. 160/k	160/k
	Longitudinal	(185 - 100 f_D)/k max. 120/k	(185 - 100 f_D.f_z)/k max. 160/k	160/k
Within 0.1L from ends	160/k			
Elsewhere	To be obtained by linear interpolation between allowable values at regions specified above			

4.1.4 The strength deck plating outside the line of hatchways is also to comply with the requirements of buckling strength given in Ch.3, Sec.6.

For ships of L > 90 [m], thickness 't' of the strength deck plating within 0.4L amidships, corresponding to the buckling strength requirement may be approximated as:

$$t = \frac{0.009\,s\sqrt{k}}{\sqrt{(1-0.75\,f_D)}} + t_c \ \text{[mm]}$$

- for longitudinally stiffened decks and

$$\frac{0.0164\,s\sqrt{k}}{[1+(s/1000l)^2]\ \sqrt{(1-0.75\,f_D)}} + t_c \ \text{[mm]}$$

- for transversely stiffened decks.

4.1.5 In way of ends of bridges, poops and forecastles, the thickness of the strength deck stringer strake is to be increased by 20 per cent over four frame spaces fore and also aft of the end bulkheads.

4.2 Deck stiffeners

4.2.1The section modulus 'Z' of deck longitudinals is not to be less than:

$$Z = \frac{s\,p\,l^2\,.10^3}{12\sigma} + Z_c \ [cm^3]$$

where,

p = applicable design pressure [N/mm²] as given in Sec.3.

σ = (215-135f_D.f_z)/k, max. 160/k [N/mm²] for strength deck and decks of long superstructures/deckhouses within 0.4L amidships.

= (225-135f_D.f_z)/k, max. 160/k [N/mm²] for continuous decks below strength deck within 0.4L amidships.

= 160/k [N/mm²] within 0.1L from ends and for short decks.

Elsewhere, σ may be obtained by linear interpolation.

The longitudinals are also to comply with the requirements of buckling strength given in Ch.3, Sec.6.

4.2.2 The section modulus 'Z' of transverse beams is not to be less than

$$Z = \frac{s\,p\,l^2}{1.6} + Z_c \ [cm^3]$$

where,

p = applicable design pressure [N/mm²] as given in Sec.3.

Section 5

Deck Girders and Pillars

5.1 Girders

5.1.1 Deck girders and transverses are to be arranged in line with vertical members of scantlings sufficient to provide adequate support.

5.1.2 The scantlings of simple girders and transverses are to be in accordance with 5.1.3. The scantlings of a complex girder system are to be based on a direct stress analysis.

5.1.3 The section modulus 'Z' of deck girders is not to be less than:

$$Z = \frac{b\,p\,S^2\,.10^6}{m\sigma} + Z_c \ [cm^3]$$

where,

p = applicable design pressure [N/mm^2] as given in Sec.3.

m = 12 for continuous longitudinal girders with end attachments in accordance with Ch.3, Sec.5.

= 10 for other girders with end attachments in accordance with Ch.3, Sec.5.

σ = (190-135f_D.f_z)/k, max. 160/k [N/mm^2] for continuous longitudinal girders within 0.4L amidships.

= 160/k [N/mm^2] for longitudinal girders within 0.1L from ends and for transverse girders in general.

Elsewhere, `σ' may be obtained by linear interpolation.

5.1.4 The effective cross sectional area 'A' of the girder web at ends obtained as per Ch.3, Sec.4.4 is not to be less than:

A = 70.S.b.p k + 0.01h t_c [cm^2]

where,

h = girder height [mm].

5.1.5 The girders are to be satisfactorily stiffened against buckling in accordance with the requirements given in Ch.3, Sec.6. Tripping brackets are to be fitted in accordance with the requirements given in Ch.3, Sec.4.

5.2 Cantilevers

5.2.1 The scantlings of cantilever beams and supportings frame will be specially considered.

5.3 Pillars

5.3.1 The scantlings of the pillars are to be in accordance with the requirements of Ch.3, Sec.6. Axial load, if any, from pillars above is to be added to the load from deck girders.

The minimum wall thickness 't' [mm], of the tubular pillars is not to be less than:

t = 4.5 + 0.015 d for d < 300 [mm]

= 0.03d for d $\geq$ 300 [mm]

where,

d = diameter of the pillar [mm].

5.3.2 Pillars are to be fitted in the same vertical line wherever possible, and arrangements are to be made to effectively distribute the load at the heads and heels. Where pillars support eccentric loads, they are to be strengthened for the additional bending moments imposed upon them. Doubling or insert plates are generally to be fitted at the head and heel of hollow pillars.

5.3.3 The pillars are to have a bearing fit and are to be attached to the head and heel plates by continuous welding.

5.3.4 Where the heels of hold pillars are not directly above the intersection of plate floors and girders, partial floors and intercostal girders are to be fitted as necessary to support the pillars. Lightening holes or manholes are not to be cut in the floors and girders below the heels of pillars.

5.3.5 Inside tanks, hollow pillars are not to be used and strengthening at the heads and heels of pillars is not to be obtained by means of doubling plates. Where hydrostatic pressure may give rise to tensile stresses in the pillars, their sectional area 'A' is not to be less than

$A = 70.A_L.p$ [cm^2]

where,

p = design pressure as given in Sec.3, causing the tensile stress in pillar

A_L = load area of deck [m^2], being supported by the pillar.

Section 6

Decks for Wheel Loading

6.1 General

6.1.1 Where it is proposed either to stow wheeled vehicles on the deck or to use wheeled vehicles for cargo handling, the requirements of this section are to be complied with in addition to those given in the preceding sections.

6.1.2 The requirements given below are based on the assumption that the considered element (Deck plating and/or stiffener) is subjected to one load area only, and that the element is continuous over several evenly spaced supports. The requirements for other loads and/or boundary conditions will be specially considered.

A "load area" is the tyre print area of individual wheels; for closely spaced wheels it may be taken as the enveloped area of the wheel group.

6.1.3 The details of wheel loadings are to be forwarded by the shipbuilder. These details are to include the proposed arrangement and dimensions of tyre prints, axle and wheel spacings, maximum axle load and tyre pressure.

6.2 Wheel loads

6.2.1 The pressure 'p' from the wheels on deck is to be taken as:

$$p = \frac{W}{n.a.b}.(9.81 + 0.5\,a_v).10^3 \ \ [\text{N/mm}^2]$$

where,

W = maximum axle load, [t]. For fork lift trucks, the total weight is to be taken as the axle load.

n = number of "load areas" per axle

a = extent [mm], of the load area parallel to the stiffener (see Fig.6.2.1)

b = extent [mm], of the load area perpendicular to the stiffener (see Fig.6.2.1)

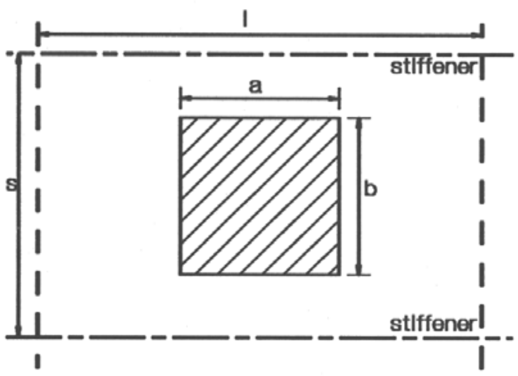

Fig. 6.2.1 : Plate panel and load

a_v = vertical acceleration [m/s^2], as follows:

$$= \frac{9.81.k_v\,a_o}{C_b} \ [\text{m/s}^2]$$

- for stowed vehicles, in sea going condition

$$= \frac{6}{\sqrt{W}} \ \ [\text{m/s}^2]$$

for cargo handling vehicles in harbour condition

6.3 Deck plating

6.3.1 The thickness 't' of deck plating subjected to wheel loadings is not to be less than;

$$t = c_1\,f_a\,\sqrt{\frac{c_2\,b\,s\,p\,k}{m}} + t_c \ \ [\text{mm}]$$

where,

f_a = (1.1 - 0.25 s/l) for s ≤ l, however need not be taken as greater than 1.0

a,b,s,l = deck panel dimensions [mm] (see Fig.6.2.1)

c_1 = 0.137 in general for seagoing conditions

= 0.127 in general for harbour conditions

= As per Table 6.3.1 for upper deck within 0.4L amidships.

Table 6.3.1 : c_1 values for upper deck plating within 0.4Lamidships

Framing system	c_1-seagoing conditions	c_1-harbour conditions
Longitudinal	0.145	0.130
Transverse	0.180	0.145

For upper deck plating between 0.4L amidships and 0.1L from ends, c_1 is to be varied linearly.

$$c_2 = 1.3 - \frac{4.2}{(a/s + 1.8)^2},$$

however, need not be taken as greater than 1.0

$$m = \frac{38}{(b/s)^2 - 4.7\,(b/s) + 6.5} \text{ for } b \le s.$$

6.4 Deck stiffeners

6.4.1 The section modulus 'Z' of deck beams and longitudinals subjected to wheel loadings is not to be less than:

$$Z = \frac{c_3 . a . b . l . p}{m \sigma} 10^{-3} + Z_c \quad [cm^3]$$

where,

c_3 = (1.15 - 0.25 b/s) for $b \le s$, however need not be taken as greater than 1.0

$$m = \frac{r}{(a/l)^2 - 4.7\, a/l + 6.5}$$

r = 29 for continuous stiffeners supported at girders

= 38 when the continuous stiffeners can be considered as rigidly supported at girders against rotation.

σ = 160/k [N/mm^2] in general, for seagoing conditions

= 180/k [N/mm^2] in general, for harbour conditions

= As per Table 6.4.1 for deck longitudinals within 0.4L amidships, but not exceeding the above general values.

For deck longitudinals between 0.4L amidships and 0.1L from ends is to be varied linearly.

Table 6.4.1 : σ Values for longitudinals within 0.4L amidships

Condition	σ [N/mm^2]
Seagoing	$(215\text{-}135 f_D . f_z)/k$
Harbour	$(225\text{-}85\ f_D . f_z)/k$

6.5 Deck girders

6.5.1 The scantlings of girders will be specially considered based on the most severe condition of moving or stowed vehicles. Also see 6.1.3.

End of Chapter

Chapter 10

Bulkheads

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The requirements of this chapter cover the arrangement and scantlings of watertight and deep tank bulkheads.

1.1.2 The requirements also cover the non-watertight bulkheads and shaft tunnels.

1.2 Statutory requirements

1.2.1 Where applicable, the number and disposition of bulkheads are to be arranged to meet the requirements for subdivision, floodability and damage stability in accordance with the requirements of the National Authority of the country in which the ship is registered.

1.3 Definitions and Symbols

1.3.1 *Bulkhead Deck*: In a passenger ship, the uppermost deck at any point in the length of the ship to which the main bulkheads and the ship's shell are carried watertight and the lowermost deck from which passenger and crew evacuation will not be impeded by water in any stage of flooding for damage cases defined in SOLAS Ch II-1 Reg.8 and in SOLAS Ch II-1 Part B-2. The bulkhead deck may be a stepped deck.
In a cargo ship the freeboard deck may be taken as the bulkhead deck.

L, B, T, C_b, k as defined in Ch.1, Sec.2.

t_c, Z_c are corrosion additions to thickness and section modulus respectively as given in Ch.3, Sec.2.1

a_o, k_v are as defined in Ch.4.

s = spacing of stiffeners [mm]

l = span of stiffeners [m]

b = spacing of girders [m]

S = span of girders [m]

$$f_D = \frac{Z_R}{Z_D}$$

$$f_B = \frac{Z_R}{Z_B}$$

where,

Z_R = Rule midship section modulus [cm^3] as required by Ch.5, Sec.3.3.3.

Z_D, Z_B = Actual midship section moduli in [cm^3] provided at deck and bottom respectively calculated as per Ch.5, Sec.3.1.

$f_s = f_D$ for side shell area above neutral axis

$f_s = f_B$ for side shell area below neutral axis

$$f_z = \frac{z}{z_n}$$

where,

z_n = vertical distance [m] from the neutral axis of the hull girder to the strength deck or bottom as relevant.

z = vertical distance [m] from the neutral axis of the hull girder to the stiffener or girder.

Section 2

Subdivision and Arrangement

2.1 Number of bulkheads

2.1.1 The following transverse watertight bulkheads are to be fitted in all ships:

- A collision bulkhead;
- An afterpeak bulkhead;
- A bulkhead at each end of the machinery space.

For ships without longitudinal bulkheads in the cargo region, additional transverse watertight bulkheads are to be fitted so that the total number of bulkheads is not less than that given in Table 2.1.1.

Table 2.1.1: Total no. of bulkheads

	Engine Room Location	
Ship length [m]	**Aft***	**Elsewhere**
$L \leq 65$	3	4
$65 < L \leq 85$	4	4
$85 < L \leq 105$	5	5
$105 < L \leq 115$	5	6
$115 < L \leq 125$	6	6
$125 < L \leq 145$	6	7
$145 < L \leq 165$	7	8
$165 < L \leq 190$	8	9
$L > 190$	Specially considered	
* With aftpeak bulkhead forming after boundary of machinery space		

2.1.2 The ordinary transverse watertight bulkheads in the holds should be spaced at reasonably uniform intervals. Where non-uniform spacing is unavoidable and the length of a hold is unusually large, the transverse strength of the ship is to be maintained by providing additional web frames, increased framing etc.

2.1.3 Proposals to dispense with one or more of these bulkheads will be considered, subject to suitable structural compensation, in case they interfere with the requirements of a special trade.

2.2 Position of collision bulkhead

2.2.1 The distance X_c from the forward perpendicular to the collision bulkhead is to be between the following limits:

$X_{c,min} = 0.05L_L - X_R$ [m] for $L < 200$ [m].

$= 10 - X_R$ [m] for $L \geq 200$ [m].

$X_{c,max} = 0.05\ L_L - X_R + 3$ [m] for $L < 100$ [m].

$= 0.08\ L_L - X_R$ [m] for $L \geq 100$ [m].

For ships with ordinary bow shape;

$X_R = 0$

For ships having any part of the underwater body extending for'd of the forward perpendicular e.g., a bulbous bow;

X_R = the least of :
- G/2;
- 0.015 L_L and
- 3.0 [m].

where,

G = the distance from forward perpendicular to the forward end of the protruded part [m]

L_L = the load line length of the vessel [m], as per International Load Line Convention (see Ch.1).

2.2.2 Consideration will however be given to proposals for the collision bulkhead positioned aft of the limits given in 2.2.1, provided that the application is accompanied by calculations showing that with the ship fully loaded to summer draught on even keel, flooding of space forward of the collision bulkhead will not result in any part of the bulkhead deck / freeboard deck becoming submerged, nor result in any unacceptable loss of stability.

2.2.3 Any recesses or steps in collision bulkheads are to fall within the limits of bulkhead positions given in 2.2.1. Where the bulkhead is extended above the bulkhead deck / freeboard deck, the extension need only be to weathertight standards. If a step occurs at that deck, the deck also need be to only weathertight standards in way of the step unless the step forms the crown of a tank.

2.2.4 In ships fitted with visor or bow doors, in which a sloping loading ramp forms part of the collision bulkhead above the bulkhead deck / freeboard deck, that part of the ramp which is more than 2.3 [m]. above the bulkhead deck / freeboard deck may extend forward of the minimum limit specified in 2.2.1. Such a ramp is to be weathertight over its complete length.

2.3 After peak bulkhead and shaft tunnel

2.3.1 All ships are to have an after peak bulkhead generally enclosing the sterntube and rudder trunk in a watertight compartment. In twin screw ships where the bossing ends forward of the after peak bulkhead, the sterntubes are to be enclosed in suitable watertight spaces inside or aft of the shaft tunnels.

2.3.2 In passenger ships, the stern gland is to be situated in a watertight shaft tunnel or other watertight space separate from the stern tube compartment and of such volume that if flooded by leakage through the stern gland, the bulkhead deck will not be immersed.
In cargo ships, where the inboard end of the stern tube extends into the engine room, provision of an approved watertight/ oil tight gland system for sealing of the inboard end of the stern tube at the aft peak/engine room watertight bulkhead is considered sufficient to minimize danger of water penetrating into the ship in case of damage to stern tube arrangements.
(See also Pt.4, Ch.4, Sec. 6.16).

2.3.3 In ships with engines situated amidships, a watertight shaft tunnel is to be arranged. Openings in the forward end of shaft tunnels are to be fitted with watertight sliding doors capable of being operated from a position above the load water line.

2.4 Height of bulkheads

2.4.1 The watertight bulkheads are in general to extend to the bulkhead deck / freeboard deck. The afterpeak bulkhead however, may terminate at the first deck above the load waterline, provided that this deck is made watertight to the stern or to a watertight transom floor provided the degree of safety of the ship as regards the subdivision is not thereby diminished.

2.4.2 The collision bulkhead is normally to extend to the bulkhead deck / freeboard deck or, in the case of ships with combined bridge and forecastle or a long superstructure that includes a forecastle, to the superstructure deck. However, if a ship is fitted with more than one complete superstructure deck, the collision bulkhead may be terminated at the deck next above the bulkhead deck / freeboard deck. Where the collision bulkhead extends above the bulkhead deck / freeboard deck, the extension need only be to weathertight standard.

2.4.3 In passenger ships of restricted draught and all ships of unusual design, the height of bulkheads will be specially considered.

2.5 Openings in watertight bulkheads and closing appliances - General

2.5.1 Openings may be accepted in watertight bulkheads except in that part of collision bulkhead which is situated below the bulkhead deck / freeboard deck. The number of openings in watertight subdivisions is to be kept to a minimum compatible with the design and proper working of the ship. Where penetrations of watertight bulkheads are necessary for access, piping, ventilation, electrical cables, etc., arrangements are to be made to maintain the watertight integrity. Relaxation in the watertightness of openings above the bulkhead deck / freeboard deck may be considered provided it is demonstrated that any progressive flooding can be easily controlled and that the safety of the ship is not impaired.

2.5.2 Openings in the collision bulkhead above the bulkhead deck / freeboard deck are to have weathertight doors or an equivalent arrangement.

2.5.3 Doors, manholes, permanent access openings or ventilation ducts are not to be cut in the collision bulkhead below the freeboard deck.

2.5.4 Where watertight bulkhead stiffeners are cut in way of watertight doors in the lower part of the bulkhead, the opening is to be suitably framed and reinforced. Where stiffeners are not cut but the spacing between the stiffeners is increased on account of watertight doors, the stiffeners at the sides of the doorways are to be increased in depth and strength so that the efficiency is at least equal to that of the unpierced bulkhead, without taking the stiffeners of the door-frame into consideration.

2.6 Doors in watertight bulkheads for ships where subdivision / damage stability requirements are applicable

2.6.1 The requirements in 2.6.1 to 2.6.16 apply to doors located in way of the internal watertight subdivision boundaries and the external watertight boundaries necessary to ensure compliance with the relevant subdivision and damage stability regulations.

These requirements do not apply to doors located in external boundaries above equilibrium or intermediate waterplanes.

2.6.2 Definitions

For the purpose of the requirements in this subsection (2.6) the following definitions apply:

a) *Watertight* : Capable of preventing the passage of water in any direction under a design head. The design head for any part of a structure shall be determined by reference to its location relative to the bulkhead deck or freeboard deck, as applicable, or to the most unfavourable equilibrium / intermediate waterplane, in accordance with the applicable subdivision and damage stability regulations, whichever is the greater. A watertight door is thus one that will maintain the watertight integrity of the subdivision bulkhead in which it is located.

b) *Equilibrium Waterplane* : The waterplane in still water when, taking account of flooding due to an assumed damage, the weight and buoyancy forces acting on a vessel are in balance. This relates to the final condition when no further flooding takes place or after cross flooding is completed.

c) *Intermediate Waterplane* : The waterplane in still water, which represents the instantaneous floating position of a vessel at some intermediate stage between commencement and completion of flooding when, taking account of the assumed instantaneous state of flooding, the weight and buoyancy forces acting on a vessel are in balance.

d) *Sliding Door or Rolling Door* : A door having a horizontal or vertical motion generally parallel to the plane of the door.

e) *Hinged Door* : A door having a pivoting motion about one vertical or horizontal edge.

2.6.3 Structural design

Doors are to be of approved design and are to be of a strength equivalent to that of the subdivision bulkheads in which they are fitted.

2.6.4 Operation mode, location and outfitting

Doors are to be fitted in accordance with all requirements regarding their operation mode, location and outfitting, i.e. provision of controls, means of indication etc. as shown in Table 2.6.4. For passenger ships, in addition to the requirements given in the Table 2.6.4 the watertight doors and their controls are to be located in compliance with the following:

a) The door is to be located inboard of the damage zone B/5 on P&S as per SOLAS II-1 Reg.13.7.

b) The door controls including hydraulic piping and electric cables are to be kept as close as practicable to the bulkhead in which the doors are fitted in order to minimize the likelihood of them being involved in any damage to the ship. The positioning of doors and controls is to be such that if the ship sustains damage within damage zone B/5 as mentioned above, the operation of the doors clear of the damaged portion of the ship is not impaired.

2.6.5 Frequency of use whilst at sea

a) Normally closed
Kept closed at sea but may be used if authorised. To be closed again after use.

b) Permanently closed

The time of opening such doors in port and of closing them before the ship leaves port shall be entered in the log-book. Should such doors be accessible during the voyage, they shall be fitted with a device to prevent unauthorised opening.

c) Normally open
May be left open provided it is always ready to be immediately closed.

d) Used
In regular use, may be left open provided it is ready to be immediately closed.

Table 2.6.4 : Internal doors in watertight bulkheads in cargo ships and passenger ships

Position relative to equilibrium or intermediate waterplane	1. Frequency of use whilst at sea	2. Type	3. Remote control[6]	4. Indication locally and on bridge[6]	5. Audible alarm[6]	6. Notice	7. Comments	8. Regulation
I. Passenger Ships								
A. At or below	Norm. Closed	POS	Yes	Yes	Yes	No	Certain doors may be left open, see SOLAS II-1/22.4	SOLAS II-1/ 13; SOLAS II-1/22.1, 2, 3 and 4

	Norm. Closed	S, H	No	Yes	No	Yes	See notes 2+5	SOLAS II-1/ 13-1.3 SOLAS II-1/22-10

Notes:

1. Doors in watertight bulkheads subdividing cargo spaces.
2. If hinged, this door shall be of quick acting or single action type.
3. "ICLL66+A320" or "1988 Protocol to ICLL66", SOLAS, MARPOL, IGC and IBC - Codes require remotely operated watertight doors to be sliding doors.
4. The time of opening such doors in port and closing them before the ship leaves port shall be entered in the logbook.
5. The use of such doors shall be authorised by the officer of the watch.
6. Cables for control and power systems to power operated watertight doors and their status indication should comply with the requirements of Pt.4, Ch.8, Sec.1.17.

2.6.6 Types of doors in Table 2.6.4

Power operated, sliding or rolling	POS
Power operated, hinged	POH
Sliding or rolling	S
Hinged	H

2.6.7 Control

a) Local

All doors, except those which are to be permanently closed at sea, are to be capable of being opened and closed by hand, (and by power, where applicable) locally, from both sides of the doors, with the ship listed to either side. In the case of passenger ships, it is to be possible to close the door from a position above the bulkhead deck with an all round crank motion or some other movement providing the same degree of safety.

For passenger ships, the angle of list at which operation by hand is to be possible is 15 degrees or 20 degrees if the ship is allowed to heel up to 20 degrees during intermediate stages of flooding.

For cargo ships, the angle of list at which operation by hand is to be possible is 30 degrees.

b) Remote

Where indicated in Table 2.6.4, doors are to be capable of being remotely closed by power from the bridge. Where it is necessary to start the power unit for operation of the watertight door, means to start the power unit is also to be provided at remote control stations. The operation of such remote control is to be in accordance with Pt.4, Ch.8, Clauses 10.1.9 to 10.1.12.

2.6.8 Indication

Where shown in Table 2.6.4, position indicators are to be provided at all remote operating positions as well as locally, on both sides of the doors, to show whether the doors are open or closed and if applicable, with all dogs/cleats fully and properly engaged.

The door position indicating system is to be of self-monitoring type and means for testing of the indicating system is to be provided at the position where the indicators are fitted.

An indication (i.e. red light) should be placed locally showing that the door is in remote control mode ("doors closed mode"). Special care should be taken in order to avoid potential danger when passing through the door. Signboard/instructions should be placed in way of the door advising how to act when the door is in "doors closed" mode.

2.6.9 Alarms

Doors which are to be capable of being remotely closed are to be provided with an audible alarm, distinct from any other alarm in the area, which will sound whenever such a door is remotely closed. For passenger ships the alarm shall sound for at lest 5 s but not more than 10 s before the door begins to move and shall continue sounding until the door is completely closed. In the case of remote closure by hand operation, an alarm is required to sound only while the door is actually moving.

In passenger areas and areas of high ambient noise, the audible alarms are to be supplemented by visual signals at both sides of the doors.

2.6.10 Notices

As shown in Table 2.6.4, doors which are normally closed at sea but not provided with means of remote closure, are to have notices fixed to both sides of the doors stating, 'To be kept closed at sea'. Doors which are to be permanently closed at sea are to have notices fixed to both sides stating, 'Not to be opened at sea'.

2.6.11 Fire doors

Watertight doors may also serve as fire doors but need not be fire-tested when intended for use below the bulkhead deck. Where such doors are used at locations above the bulkhead deck they are to in addition to complying with the provisions applicable to fire doors at the same locations, also comply with means of escape provisions of Pt.6, Ch.4, Sec.2.

Where a watertight door is located adjacent to a fire door, both doors are to be capable of independent operation, remotely if required and from both sides of the each door.

2.6.12 Testing

a) Doors which become immersed by an equilibrium or intermediate waterplane are to be subjected to a hydrostatic pressure test. (See also Ch.18, Table 3.3.1).

b) For large doors intended for use in the watertight subdivision boundaries of cargo spaces, structural analysis may be accepted in lieu of pressure testing. Where such doors utilise gasket seals, a prototype pressure test to confirm that the compression of the gasket material is capable of accommodating any deflection, revealed by the structural analysis, is to be carried out.

c) Doors which are not immersed by an equilibrium or intermediate waterplane but become intermittently immersed at angles of heel in the required range of positive stability beyond the equilibrium position are to be hose tested.

2.6.13 Pressure testing

The head of water used for the pressure test shall correspond to at least the head measured from the lower edge of the door opening, at the location in which the door is to be fitted in the vessel, to the bulkhead deck or freeboard deck, as applicable, or to the most unfavourable damage waterplane, if that be greater. Testing may be carried out at the factory or other shore based testing facility prior to installation in the ship.

2.6.14 For doors on passenger ships which are normally open and used at sea or which become submerged by the equilibrium or intermediate waterplane, a prototype test shall be conducted, on each side of the door, to check the satisfactory closing of the door against a force equivalent to a water head of at least 1 [m] above the sill on the centre line of the door.

2.6.15 Hose testing

After installation in a ship if pressure test is not carried out, all watertight doors are to be subject to a hose test in accordance with Pt.3, Ch.18. Hose testing is to be carried out from each side of the door unless, for a specific application, exposure to floodwater is anticipated only from one side. Where a hose test is not practicable because of possible damage to machinery, electrical equipment, insulation or outfitting items, it may be replaced by means such as an ultrasonic leak test or an equivalent test.

2.7 Cofferdams

2.7.1 Cofferdams are to be provided between the following spaces to separate them from each other:

- tanks for fuel oil or lubricating oil
- tanks for edible oil
- tanks for fresh water and feed water.

2.7.2 Tanks for lubricating oil are also to be separated by cofferdams from those carrying fuel oil. However, these cofferdams need not be fitted provided that the common boundaries have full penetration welds and the head of lubricating oil is not less than that in the adjacent fuel oil tanks. In this case, a permanent notice is to be displayed near the lubricating oil tank that the oil level is not to be less than that in the adjacent fuel oil tank at any time.

2.8 Fore peak spaces

2.8.1 In ships of 400 GT and above, compartments forward of the collision bulkhead are not to be arranged for carriage of oil and other inflamable liquids.

Section 3

Structural Arrangement and Details

3.1 General

3.1.1 Oil fuel or oil carried as cargo in the deep tanks is to have a flash point of 60°C and above in closed cup test. Where tanks are intended for other liquid cargoes of a special nature the scantlings and arrangements will be considered in relation to the nature of the cargo.

3.1.2 If cargo is carried in a compartment adjacent to an oil fuel settling tank which may be heated, the compartment side of the bulkhead (or deck) is to be insulated, or equivalent arrangements provided.

3.1.3 The continuity of bulkhead longitudinals within a distance of 0.15D from the bottom or the strength deck is to be maintained in accordance with Ch.3, Sec.5.1.1.

3.1.4 Carlings, girders or floors are to be fitted below the corrugated bulkheads at their supports. These supporting members are to be aligned to the face plate strips of the corrugations.

3.1.5 The weld connections are to comply with the requirements of Ch.17.

3.2 Wash bulkheads

3.2.1 A centreline wash bulkhead is to be fitted in peak spaces used as tanks, where the breadth of the tank exceeds 0.5B and also in deep tanks used for fuel oil extending from side to side.

3.2.2 The area of perforations is generally to be between 5% to 10% of the total area of bulkhead. The plating is to be suitably stiffened in way of the openings.

3.3 Supporting bulkheads

3.3.1 Bulkheads or parts thereof supporting deck structure are also to be designed as pillars. The permissible axial loads and buckling strength are to be calculated in accordance with Ch.3, Sec.6. In calculating sectional properties the width of attached plating is not to be taken in excess of 40 times the plate thickness. Also see Ch.9, Sec.5.1.1.

Section 4

Design Loads

4.1 Watertight bulkhead loads

4.1.1 The design pressure 'p', for ordinary watertight bulkheads is given by:

$$p = 0.01\ h\ [N/mm^2]$$

where,

h = the vertical distance [m] from the center of loading to the freeboard deck.

Where it is shown by damage stability calculations that the deepest equilibrium damaged waterline in way of the load point is below the freeboard deck, a reduced value of 'h' may be considered.

For the definition of 'loadpoint' see Ch.4, Sec.3.

4.1.2 Watertight bulkheads enclosing hold spaces to carry water ballast are to be treated as tank bulkheads.

4.1.3 The design pressure for the end bulkheads of bulk cargo spaces are to be obtained as per Ch.4, Sec.3.4.3.

4.2 Tank bulkhead loads

4.2.1 The design pressure 'p' for tank bulkheads are normally to be taken as the greater of

$$p = 0.01\left(1 + \frac{0.5}{C_b} k_v\ a_o\right) h_s\ [N/mm^2]$$

$= 6.7\ h_p\ .\ 10^{-3}\ [N/mm^2]$

$= 0.01\ h_s + p_o\ [N/mm^2]$

where,

a_o = as given in Ch.4, Sec.1.

h_p = vertical distance [m] from the loadpoint to the top of the air pipe.

h_s = vertical distance [m] from the loadpoint to the top of the tank or hatchway.

$p_o = (0.02L + 0.6) \times 10^{-2}\ [N/mm^2]$ for L< 90 [m]

$= 0.024\ [N/mm^2]$ for $L \geq 90$ [m]

However, in mechanically propelled cargo ships of 500 GT and above and passenger ships, for tanks forming part of the watertight subdivision, p_0 is to be taken as not less than 0.024 [N/mm²].

For this purpose, tanks meeting any of the following conditions are to be considered as part of watertight subdivision:

a) Tanks considered watertight in damage stability calculations.

b) Double bottom tanks, peak tanks or tanks bounded by main transverse watertight bulkheads required as per 2.1.1.

Where automatic pressure valves are fitted, p_o is not to be taken as less than the valve release pressure.

4.2.2 For longitudinal bulkheads (and transverse bulkheads at sides) in way of wide tanks, the design pressure is normally given by the greater of 'p' according to 4.2.1 and

$$p = 6.7\ (h_s + \phi\ b) \times 10^{-3}\ [N/mm^2]$$

where,

b = athwartship distance [m] from the load point to the tank corner at tank top which is situated furthest from the load point. [See Fig.3.2.2 in Ch.8].

ϕ= roll angle as defined in Ch.4 Sec.2.2.1.

For transverse bulkheads (and longitudinal bulkheads at ends) in way of tanks of length > 0.15 L, the design pressure is normally given by greater of 'p' according to 4.2.1 and

$$p = 6.7\left(h_s + \theta\, l\right) x 10^{-3}\ [N/mm^2]$$

where,

l = larger longitudinal distance in 'm' from the load point to the tank corner at the top of the tank which is furthermost away from the load point.

θ = pitch angle as defined in Ch.4, Sec.2.1.1.

4.2.3 The pressure 'p' in tanks which may be filled between 20 percent and 90 percent of the tank heights is to be taken as the greater of that according to 4.2.1, 4.2.2 and the relevant values given as follows:

- for strength members located within 0.25 l_t from the end bulkheads 'p' is not to be taken as less than:

$$p = \rho[4 - 0.005L]\, l_t \times 10^{-3} \quad [N/mm^2]$$

where,

ρ = density of liquid in the tank [t/m³]

l_t = distance [m] between transverse tank bulkheads or effective transverse wash bulkheads at the height at which the strength member is located. Transverse web frames covering part of the tank cross-section (e.g. wing tank structures in tankers) may be regarded as wash bulkheads for this purpose.

- for strength members located within 0.25 b_t from the tank side bulkheads the pressure 'p' is not to be less than

$$p = \rho[3 - 0.01B]\, b_t \times 10^{-3} \quad [N/mm^2]$$

where,

b_t = distance [m] between tank side bulkheads or effective wash bulkheads at the height at which the strength member is located.

- for tanks with $l_t > 0.13L$ and/or $b_t > 0.56B$, p will be specially considered.

4.2.4 The pressure 'p' on girder web panels in cargo tanks or ballast tanks is not to be taken as less than 0.02 [N/mm²].

4.3 Wash bulkheads loads

4.3.1 The design pressure 'p' for wash bulkheads is not to be taken as less than

$$p = [4 - 0.005L]\, l_t \times 10^{-3} \quad [N/mm^2]$$

- for transverse bulkheads, and

$$p = [3 - 0.01B]\, b_t \times 10^{-3} \quad [N/mm^2]$$

- for longitudinal bulkheads.

where,

l_t = the greater of the distances between the adjacent transverse bulkheads.

b_t = the greater of the distances between the adjacent longitudinal bulkheads.

Section 5

Plating and Stiffeners

5.1 Bulkhead plating

5.1.1 The thickness 't' of the bulkhead plating is not to be less than the minimum thickness given in 5.1.2 nor less than

$$t = \frac{s\sqrt{p}}{2\sqrt{\sigma}} + t_c \ [mm]$$

where,

p = applicable design pressure as given in Sec.4.

σ = as per Table 5.1.1 for longitudinal bulkheads.

= 160/k for transverse tank bulkheads and collision bulkhead;

= 220/k for ordinary transverse watertight bulkheads.

= 190/k for transverse dry bulk cargo bulkheads

Table 5.1.1 : 'σ' values for longitudinal bulkhead plating

Region	Framing system	At neutral axis	At strength deck or at bottom	Between neutral axis and strength deck or bottom
0.4L amidships	Vertical	140/k	(175 - 120 f_s)/k max. 120/k	To be obtained by linear interpolation
	Longitudinal	160/k	(185 - 100 f_s)/k max. 120/k	To be obtained by linear interpolation
Within 0.1L from ends	160/k			
Elsewhere	To be obtained by linear interpolation between allowable values at regions specified above.			

5.1.2 The minimum thickness requirement of the bulkhead plating is given by

$$t = (5.0 + cL)\sqrt{k} + t_c \text{ [mm]}$$

where,

c = 0.02 for longitudinal bulkheads and bulkheads in cargo tank area and in peak tanks

= 0.01 for other bulkheads.

5.1.3 The plate thickness of corrugated bulkheads is not to be less than that required according to 5.1.1 and 5.1.2. The spacing 's' to be used in the calculation of the plating thickness is to be taken as the greater of 'b' or 'c' where 'b' and 'c' are indicated in Fig.5.1.3.

For built up corrugation bulkheads, where the thickness of the flange and web are different, the thickness of the wider plating is also not to be less than

$$t = \sqrt{\frac{s^2 . p}{2\sigma} - (t_a - t_c)^2} + t_c \quad \text{[mm]}$$

where,

t_a = thickness of adjacent plating [mm] not to be taken greater than t.

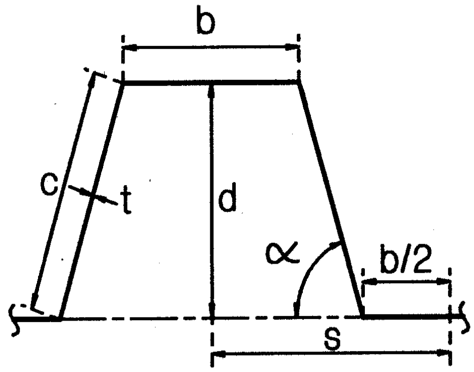

Fig. 5.1.3 : Corrugated bulkhead

5.1.4 The longitudinal bulkhead plating within 0.1D from bottom or strength deck is also to comply with the requirements of buckling strength given in Ch.3, Sec.6. For approximate thickness requirements for plane bulkheads see Ch.7, Sec.4.2.2 and Ch.9, Sec.4.1.3 respectively.

For corrugated bulkheads, the critical buckling stress σ_c is to be taken as

$$\sigma_c = \sigma_F \left[1 - \frac{\sigma_F}{c} \left(\frac{s}{1000\, t_f} \right)^2 \right]$$

where,

σ_F = minimum yield stress in [N/mm^2]

c = 2.42 (1 + t_w/t_f)

t_w = net web plate thickness [mm]

t_f = net flange thickness [mm]

s = width [mm] of the corrugation flange.

5.1.5 In way of stern tubes, doubling plate of same thickness as the corresponding strake is to be fitted, or the strake thickness is to be increased by at least 60 per cent.

5.2 Longitudinals

5.2.1 The section modulus of continuous longitudinal stiffeners and corrugations is not to be less than:

$$Z = \frac{spl^2}{m\sigma} x\, 10^3 + Z_c \ [cm^3]$$

where,

p = applicable design pressure given in Sec.4.

m = 12

σ = (215 - 135 f_s f_z)/k, max. 160/k [N/mm^2] for tank and dry bulk cargo bulkhead longitudinals within 0.4L amidships

= (225 - 135 f_s f_z)/k, max. 160/k [N/mm^2] for ordinary watertight bulkhead longitudinals within 0.4L amidships

= 160/k for longitudinals within 0.1L from ends.

For longitudinals between the regions specified above σ may be obtained by linear interpolation.

5.2.2 The thickness of the web and flange is not to be less than the minimum plating thickness requirements stipulated in 5.1.2.

5.2.3 The rule section modulus of a corrugated bulkhead element is to be obtained according to 5.2.1 taking 's' as shown in Fig.5.1.3.

5.2.4 The actual section modulus of a corrugated bulkhead element may be obtained in accordance with the following:

$$Z_{actual} = \frac{t.d\,(b + c/3)}{2000} \ [cm^3]$$

where, t,d,b and c are as shown in Fig.5.1.3 [mm].

5.3 Vertical and transverse stiffeners on tank bulkheads, collision bulkheads, dry bulk cargo bulkheads and wash bulkheads

5.3.1 The section modulus of bulkhead stiffeners is not to be less than:

$$Z = \frac{spl^2}{m\sigma} x\, 10^3 + Z_c \ [cm^3]$$

where,

p = applicable design pressure given in Sec.4.

m = 10 for transverse stiffeners and vertical stiffeners which may be considered fixed at both ends

= 7.5 for vertical stiffeners simply supported at one or both ends

= 10 for horizontal corrugation fixed at ends

=13 for fixed upper end of vertical corrugation

= 20 for non-fixed upper end of vertical corrugation

= m_s for vertical corrugation, lower end to stool

$= \frac{8m_s}{m_s - 4}$ for vertical corrugation at middle of span; [m] not more than 13

where,

$$m_s = 7.5\left[1 + \frac{4b_c\left(H_s + \frac{h_{db}}{2}\right)}{b_s\, l_{db}}\right]$$

b_c = breadth of stool [m] at the lower end of corrugation

b_s = breadth of stool at inner bottom

H_s = height of stool [m]

h_{db} = height of double bottom [m]

l_{db} = length of cargo hold double bottom between stools in [m], not to be taken larger than 6 Hs or 6 h_{db} where there is no stool

σ = 160/k for tank bulkhead and collision bulkhead

= 210/k for dry bulk cargo bulkheads.

5.3.2 The thickness of web and flange is to be as required in 5.1.2.

5.3.3 Actual section modulus of corrugations is to be obtained as per 5.2.4.

5.3.4 Brackets are normally to be fitted at the ends of non-continuous stiffeners. Where stiffeners are sniped at the ends, the thickness of the plating supported by the stiffeners is not to be less than:

t = 1.25 $\sqrt{[(l - 0.0005s)\, s.p.k]} + t_c$ [mm].

5.4 Vertical and transverse stiffeners on ordinary watertight bulkheads

5.4.1 The section modulus of bulkhead stiffeners is not to be less than

$$Z = \frac{spl^2}{m\sigma} \times 10^3$$

where,

p = applicable design pressure given in Sec.4.

m = 16 for stiffeners fixed at both ends

= 12 for stiffeners fixed at one end (lower end in case of vertical stiffeners) and simply supported at the other end.

= 8 for stiffeners simply supported at both ends.
σ = 220/k.

5.4.2 The thickness of web and flange is to be as required in 5.1.2. For sniped ends, the thickness of bulkhead plating is to be as per 5.3.4.

5.4.3 Actual section modulus of corrugations is to be obtained as per 5.2.4.

Section 6

Girders

6.1 General

6.1.1 Bulkhead stringers and deep transverses are to be arranged in line with other primary supporting structure to the adjoining deck, side shell and bottom so as to facilitate the formation of continuous ring structures. Otherwise equivalent scarphing arrangement is to be provided.

6.1.2 The section modulus requirement 'Z' of simple girders is not to be less than:

$$Z = \frac{b.p.S^2 x 10^6}{m\sigma} + Z_c \ [cm^3]$$

where,

m = 12 for continuous longitudinal girders with end attachments in accordance with Ch.3, Sec.5.

= 10 for other girders with end attachments in accordance with Ch.3, Sec.5.

σ = (190 - 135$f_S.f_z$), max 160/k [N/mm^2], for continuous longitudinal girders within 0.4L amidships.

= 160/k [N/mm^2] for continuous longitudinal girders within 0.1L from ends and for vertical or transverse girders on tank and collision bulkheads.

= 220/k for vertical and transverse girders in ordinary watertight bulkheads.

= 210/k for vertical and transverse girders in dry bulk cargo bulkheads.

For continuous longitudinal girders between the regions specified above, 'σ' may be obtained by linear interpolation.

6.1.3 The depth of the girders should not be less than 2.5 times the depth of the cutout (if any) for the passage of continuous stiffeners. The web area requirement (after deduction of the cutouts) at the girder ends is given by:

$$A_w = CkSbP + 0.01\, d_w\, t_c \ [cm^2]$$

where

C = 60 for tank and collision bulkheads

C = 45 for other watertight bulkheads

d_w = depth of web [mm].

However, for lower end of vertical girders value of C to be taken as 80 and 60 respectively.

The web area at middle of span to be not less than 0.5 A_w.

6.1.4 The girders are to be satisfactorily stiffened against buckling in accordance with the requirements given in Ch.3, Sec.6. Tripping brackets are to be fitted in accordance with the requirements given in Ch.3, Sec.4.

6.2 Complex girder system

In addition to satisfying the local requirements specified in 6.1, the scantlings of bulkhead girders, which are a part of a complex girder system in holds for heavy cargo or tanks may have to be based on direct stress analysis.

End of Chapter

Chapter 11

Superstructures, Deckhouses and Bulwarks

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The scantlings of the bulwarks and of the exposed bulkheads of the superstructures and deckhouse are to comply with the requirements of this chapter. The scantlings of the decks of the superstructures and deckhouses are to be in accordance with the requirements of Ch.9, and those of the sides of the superstructures are to be in accordance with the requirements of Ch.8.

1.2 Definitions

1.2.1 For definitions of the terms 'Superstructure' and 'Deckhouse' refer to Ch.1.

1.2.2 Superstructure deck is a deck forming the upper boundary of a superstructure.

Where the summer freeboard is increased such that the resulting draught is not more than that corresponding to the minimum summer freeboard for the same ship from an assumed freeboard deck located at a distance equal to or greater than the standard superstructure height below the actual freeboard deck;

The actual freeboard deck may be treated as the superstructure deck, while considering the requirements given in this chapter.

1.2.3 Where the freeboard is increased in accordance with 1.2.2 above, the first tier above the uppermost continuous deck may be treated as the second tier. The lowest tier is normally the tier that is directly situated on the deck to which the rule depth 'D' is measured.

1.2.4 Long deckhouse is a deckhouse having more than 0.2L of its length within 0.4L amidships.

1.3 Symbols

1.3.1 L and k as defined in Ch.1, Sec.2.

L_1 = length of the ship [m], but need not be taken greater than 300 [m].

C_b = block co-efficient as defined in Ch.1. C_b is not to be taken less than 0.6 nor greater than 0.8. When determining aft end bulkheads, situated for'd of amidships, C_b need not be taken as less than 0.8

x = distance, [m], between the after perpendicular and the load point under consideration. When determining the scantlings of the deckhouse sides, the deckhouse is to be subdivided into parts of approximately equal length, not exceeding 0.15L each, and 'x' is to be taken as the distance between AP and the centre of each part considered.

z = the vertical distance [m] from summer load waterline to the load point.

b' = breadth of deckhouse, [m] at the position considered.

B' = actual max. breadth of the ship, [m] on the exposed weather deck at the position considered.

s = spacing of stiffeners [mm].

l = span of stiffener [m].

Section 2

Design Loads

2.1 External pressure

2.1.1 The design pressure for the unprotected sides and ends of superstructures and deckhouses is given by :

$$p = a(bf-z)\, c\, 10^{-2}\ [\mathrm{N/mm^2}]$$

where,

$$a = 2.0 + \frac{L_1}{120}$$

- for unprotected fronts of the lowest tier.

$$= 1.0 + \frac{L_1}{120}$$

- for unprotected fronts of the 2nd tier.

$$= 0.5 + \frac{L_1}{150}$$

- for unprotected fronts of the third tier and for sides and protected fronts of all tiers.

$$= 0.7 - \frac{0.8x}{L} + \frac{L_1}{1000}$$

- for aft ends situated aft of amidships.

$$= 0.5 - \frac{0.4x}{L} + \frac{L_1}{1000}$$

- for aft ends situated forward of amidships.

$$b = 1.0 + \left[\frac{\frac{x}{L} - 0.45}{C_b + 0.2}\right]^2 \quad \text{for } x/L \leq 0.45$$

$$= 1.0 + 1.5\left[\frac{\frac{x}{L} - 0.45}{C_b + 0.2}\right]^2 \quad \text{for } x/L > 0.45$$

$$f = \frac{L}{10}.e^{(-L/300)} + \left[\frac{L}{150}\right]^2 - 1.0 \text{ for } L < 150\ [\mathrm{m}]$$

$$= \frac{L}{10}.e^{(-L/300)} \quad \text{for } 150[\mathrm{m}] \leq L < 300\ [\mathrm{m}]$$

= 11.03 for L $\geq$ 300 [m].

Values of 'f' may be linearly interpolated from Table 2.1.1

c = 1.0 for exposed parts of machinery casings

= 0.3 + 0.7 $\frac{b'}{B'}$ for other bulkheads

The value of (b'/B') is not to be taken less than 0.25.

2.1.2 The design pressure 'p' is not to be taken as less than:

p = 0.025 + 10^{-4} L [N/mm^2] - for lowest tier of unprotected fronts

p = 0.0125 + 0.5 x 10^{-4} L [N/mm^2] - elsewhere

In the above formulae 'L' is not to be taken as less than 50 [m], nor need be taken greater than 250 [m].

Table 2.1.1 : Values of 'f' [m]

L	f	L	f
20	.89	25	1.33
30	1.75	35	2.17
40	2.57	45	2.96
50	3.34	55	3.71
60	4.07	65	4.42
70	4.76	75	5.09
80	5.41	85	5.72
90	6.03	95	6.32
100	6.61	105	6.89
110	7.16	115	7.43
120	7.68	125	7.93
130	8.18	135	8.42
140	8.65	145	8.8
150	9.10	155	9.25
160	9.39	165	9.52
170	9.65	175	9.77
180	9.80	190	10.09
200	10.27	210	10.43

300	11.03		

Section 3

Scantlings

3.1 End bulkheads of superstructures and deckhouses and exposed sides in deckhouses

3.1.1 The thickness 't' of steel plating of the fronts, sides and aft ends of the deckhouses and the front and aft ends of the superstructures corresponding to the design pressure is given by

$t = 0.03\ s\sqrt{p}$ [mm]

3.1.2 The thickness however, is not to be less than :

$t = (5 + 0.01\ L_1)\ \sqrt{k}$ [mm] for the lowest tier;

$t = (4 + 0.01\ L_1)\ \sqrt{k}$ [mm] for upper tiers.

3.1.3 The section modulus Z of stiffeners on fronts, sides and end bulkheads of all erections other than sides of superstructures is not to be less than

$Z = 0.35\ s l^2 p$ [cm^3] in general

For longitudinals on sides of long deck house within 0.4L amidships and at strength deck level

$Z = 0.625\ s l^2\ p$ [cm^3].

The modulus may be linearly decreased to the general value at the first deck above the strength deck and at 0.1L from the perpendiculars.

l is not to be taken less than 2.0 m.

3.1.4 Stiffeners on fronts are to be connected to deck at both ends with a connection area 'a' not less than :

a = 0.07 s p l k [cm^2]

Webs of stiffeners on sides and after ends of the lowest tiers of all erections are to be welded to the deck at both ends.

3.2 Protected machinery casings

3.2.1 The thickness of plating is not to be less than:

t = 0.0085 s √k [mm]

however not less than 6.0 √k [mm] in way of cargo holds

= 0.0065 s √k [mm]

however not less than 5.0 √k [mm] in way of accommodations.

3.2.2 The section modulus 'Z' of stiffeners is not to be less than:

Z = 0.003 sl^2√k [cm^3]

where, l is not to be taken less than 2.5 [m].

3.2.3 Casings supporting one or more decks above are to be adequately strengthened.

Section 4

Structural Arrangement and Details

4.1 Structural continuity

4.1.1 Adequate transverse strength is to be provided to the deckhouses and superstructures by means of transverse bulkheads, girders and web frames.

4.1.2 The front and the after end bulkheads of the superstructures and deckhouses should be effectively supported below by a transverse bulkhead or by a combination of partial bulkheads, girders and pillars. Similarly, the exposed sides and internal bulkheads of various tiers of erections are to be located, as far as practicable, above bulkheads or above deep girders below, or equivalent.

4.1.3 Adequate web frames are to be provided in way of large openings, boat davits and other points of high loading.

4.1.4 All openings cut on the sides are to be substantially framed and have well rounded corners. Continuous coamings or girders are to be fitted below and above doors and similar openings. The size and number of openings on the sides are to be avoided or minimized at the ends of erections situated within 0.4L amidships.

4.1.5 At the ends of superstructures, which have no set-in from the ships' side, and at the ends of poop and bridge, the side plating is to extend beyond the ends of the superstructure, and is to be gradually reduced in height down to the sheer strake. The transition should be smooth and without any discontinuity. The extended plating is to be adequately stiffened, particularly at its upper edge.

4.1.6 Deck girders are to be fitted below the sides of long deckhouses and are to extend at least three frame spaces beyond the deckhouse ends. The depth of the girders is to be at least 100 [mm] greater than the depth of the beams and the girders are to be adequately stiffened at the lower edge.

4.1.7 The connection area between the corners of long deckhouses and deck plating should be increased locally. Deck beams under the corners of deck houses are not to be scalloped for a distance of 0.5 [m] on either side of the corners.

4.2 Navigation bridge visibility

4.2.1 Attention is drawn to Chapter V, Regulation 22 of SOLAS 1994 Amendments regarding Navigation Bridge Visibility requirements, applicable to ships of loadline length equal to or greater than 45 [m].

Section 5

Bulwarks and Guard Rails

5.1 General requirements

5.1.1 Bulwarks or guard rails are to be provided on the exposed parts of the freeboard and superstructure decks and also on the first tier of the deckhouse decks. The height of the bulwarks or guard rails measured above the sheathing, if any, is not to be less than 1.0 [m]. Consideration will be given to cases where this height would interfere with the normal operation of the ship.

5.2 Bulwark construction

5.2.1 Bulwarks are to be stiffened at the upper edge by a strong rail section and supported by stays from the deck. The spacing of stays forward of 0.07L from F.P. is to be not more than 1.2 [m] on Type 'A', Type 'B-60' and Type 'B-100' ships as defined in the ILLC, and not more than 1.8 [m]. on other types. Elsewhere, the bulwark stays are to be not more than 1.8 [m] apart. Where bulwarks are cut in way of a gangway or other openings, stays of increased strength are to be fitted at the ends of the openings.

Bulwark stays are to be supported by, or are to be in line with, suitable underdeck stiffening, which is to be connected by double continuous fillet welds in way of the bulwark stay connection.

Bulwarks are to be adequately strengthened in way of the eyeplates for cargo gear, and in way of the mooring pipes the plating is to be increased in thickness and also adequately stiffened.

5.2.2 Bulwarks are generally not to be welded to the top of the sheerstrake within 0.6L amidships.

5.2.3 Bulwarks should not be cut in way of the breaks of the superstructures, and are also to be arranged to ensure their freedom from main structural stresses. At the ends of the superstructures where the side plating is extended and tapered to align with the bulwark plating, the transition plating is to be suitably stiffened and supported. Where freeing ports or other openings are essential in this plate, they are to be suitably framed and kept well clear of the free edge.

5.3 Bulwark scantlings

5.3.1 The thickness of the bulwark plating is not to be less than that required for the superstructure side plating in the same location if the height of the bulwark is equal to or greater than 1.8 [m]. Where the height of the bulwark is 1.0 [m], the thickness need not exceed 6.0 [mm]. For intermediate bulwark heights the thickness may be obtained by interpolation.

5.3.2 The section modulus 'Z' at the bottom of the bulwark stay is not to be less than:

$Z = (33 + 0.44\ L)\ h^2\ s$ [cm^3]

where,

h = height of the bulwark [m].

s = spacing of bulwark stays [m].

In the calculation of section modulus 'Z', only the material connected to the deck is to be included. The contribution from bulwark plating and/or stay flange may be considered depending upon the construction details.

5.3.3 When the bulwark is subjected to loads from any deck cargo, the scantlings will be specially considered.

5.4 Freeing arrangements

5.4.1 Where bulwarks on the weather portion on freeboard or superstructure decks form wells, provision is to be made for rapidly freeing the decks of water. In general the minimum freeing area "A" on each side of the ship for each well on the freeboard deck is to be given by the following in cases where the sheer in way of the well is standard or greater than standard.

Where, length of the bulwark (l) in the well is less than or equal to 20 [m] -

$A = 0.7 + 0.035\ l$ [m^2];

and where l exceeds 20 [m] -

$A = 0.07\ l$ [m^2];

l not to be taken as greater than 0.7 L_L, where L_L is the loadline length of the vessel (See Ch.1)

If the bulwark is more than 1.2 [m] in average height, the required area is to be increased by 0.004 [m^2] per metre of length of the well for each 0.1 [m] difference in height. If the bulwark is less than 0.9 [m] in average height, the required area may be decreased in the same proportion.

The minimum area for each well on superstructure decks is to be one half of the area given above. Wells on raised quarter decks should be treated as being on freeboard deck.

5.4.2 In ships with no sheer the area of freeing ports as calculated above is to be increased by 50%. Where the sheer is less than standard, percentage of increase to be obtained by linear interpolation.

5.4.3 On a flush deck ship with a substantial deckhouse amidships, it is considered that the deckhouse provides sufficient break to form two wells and that each could be given the required freeing port area based upon the length of the 'well'. It would not then be allowed to base the area upon 0.7 L_L.

For a 'substantial' deckhouse, the breadth of the deckhouse should be at least 80% of the beam of the vessel and the passageways along the sides of the ship should not exceed 1.5 [m] in width.

Where a screen bulkhead is fitted completely across the vessel, at the forward end of a midship deck house, this would effectively divide the exposed deck into wells and no limitation on the breadth of the deckhouse is considered necessary in this case.

5.4.4 Two thirds of the freeing port area required is to be provided in the half of the well nearest the lowest point of the sheer curve. With zero or little sheer on the exposed freeboard deck or an exposed superstructure deck, it is considered that the freeing port area should be spread along the length of the well.

5.4.5 The effectiveness of the freeing port area in bulwarks required in 5.4.1 above depends on the free flow across the deck of a ship. Where there is no free flow due to the presence of a continuous trunk or hatchway coaming the freeing area in bulwarks is to be calculated as per Table 5.4.5. The area of freeing ports at intermediate breadths shall be obtained by linear interpolation.

Table 5.4.5

Breadth of hatchway or trunk in relation to the breadth of the ship	Area of freeing ports in relation to the total area of bulwark
40% or less	20%
75% or more	10%

5.4.6 The freeflow area on deck is the net area of gaps between hatchways, and between hatchways and superstructures and deckhouses upto the actual height of the bulwark.

The freeing port area in bulwarks should be assessed in relation to the net flow area as follows:

(i) If the freeflow area is not less than the freeing area calculated from 5.4.5 above as if the hatchway coamings were continuous, then the minimum freeing port area calculated from 5.4.1 & 5.4.2 should be deemed sufficient.

(ii) If the freeflow area is equal to or less than the freeing area calculated from 5.4.1 & 5.4.2, the minimum freeing area in the bulwarks should be determined from 5.4.5.

(iii) If the freeflow area is smaller than calculated from 5.4.5 but greater than calculated from 5.4.1 and 5.4.2, the minimum freeing port area should be determined from the following formula.

$$F = F_1 + F_2 - f_p \text{ [m}^2\text{]}$$

where,

F_1 = minimum freeing area [m^2] calculated from 5.4.1 and 5.4.2

F_2 = minimum freeing area [m^2] calculated from 5.4.5

f_p = the total net area of passages and gaps between hatch ends and superstructures or deckhouses up to the actual height of bulwark [m^2].

5.4.7 All such openings in the bulwark are to be protected by rails or bars spaced not more than 230 [mm] apart. If shutters are fitted to freeing ports ample clearance is to be provided to prevent jamming. Hinges are to have pins or bearings of non-corrodible materials. If shutters are fitted with securing devices, these appliances are to be of approved construction.

5.4.8 Type A ships and Type B ships with trunks are to have open rails fitted for at least half the length of the exposed parts of the freeboard deck or other effective freeing arrangements are to be provided. It is considered that a freeing port area in the lower part of the bulwarks, of 33% of the total area of the bulwark provides the 'other effective freeing arrangements' and may be considered equivalent to the requirement of 50% open rails.

However, for Type A ships which have superstructures connected by trunks open rails are to be fitted for the whole length of the exposed part of the freeboard deck.

For Type B ships with freeboards reduced by not more than 60% of the difference between the freeboards given in Tables B and A of the International Loadline Convention, 1966; there shall be freeing port area in the lower part of the bulwarks equal to at least 25% of the total area of the bulwarks.

The upper edge of the sheer strake is to be kept as low as possible.

5.5 Freeing ports in way of wells in combination with open superstructures

5.5.1 In the case of vessels having open superstructures on the freeboard or superstructure decks, which open to wells formed by bulwarks on the peripheries of the open decks, the minimum freeing port areas on each side of the ship for the open superstructure A_s and for the open well A_w are to be determined as follows:

a) For $l_t > 20$ [m]:

$A_w = (0.07\ l_w + A_c)\ .\ S_c\ .\ H_c\ [m^2]$

$A_s = 0.07\ .\ S_c\ .\ b_o\ \{1 - (l_w/l_t)^2\}\ .\ H_c\ [m^2]$

b) For $l_t \leq 20$ [m]

$A_w = (0.7 + 0.035\ l_w + A_c)\ .\ S_c\ .\ H_c\ [m^2]$

$A_s = (0.7 + 0.035\ l_t)\ .\ S_c\ .\ b_o/l_t\ \{1 - (l_w/l_t)^2\}\ .\ H_c\ [m^2]$

where,

$l_t = l_w + l_s$ where,

l_w = length of open deck enclosed by bulwarks [m] and

l_s = length of the common space within the open superstructure [m]

b_o = breadth of the openings in the end bulkhead of the enclosed superstructure.

A_c = area correction for bulwark height:

$A_c = 0.04\ l_w\ (h_b - 1.2)\ [m^2]$ for $h_b > 1.2$ [m]

$= 0.04\ l_w\ (h_b - 0.9)\ [m^2]$ for $h_b < 0.9$ [m]

$= 0.0\ [m^2]$ for $0.9 \leq h_b \leq 1.2$ [m]

h_b = height of bulwark [m]

S_c = sheer correction factor

= 1.5 for no sheer

= 0.0 for standard sheer;

For intermediate values of sheer S_c to be interpolated.

H_c = correction factor for distance of well deck above the freeboard deck;

$= 0.5\ h_s/h_w$; not greater than 1.0;

h_w = the height of the well deck above the freeboard deck [m]

h_s = standard superstructure height defined in Table 7.4.1 of Ch.12 [m].

5.6 Guard rails

5.6.1 The guard rails fitted as specified in Sec.5.1.1 should meet the following requirements:

a) Fixed, removable or hinged stanchions shall be fitted about 1.5 [m] apart.

b) At least every third stanchion shall be supported by a bracket or stay.

   In lieu of at least every third stanchion supported by stay, alternatively any of the following options may be provided: (See Fig.5.6.1):

   i) at least every third stanchion of increased breadth : $k\ .\ b_s = 2.9\ .\ b_s$

   ii) at least every second stanchion of increased breadth : $k\ .\ b_s = 2.4\ .\ b_s$

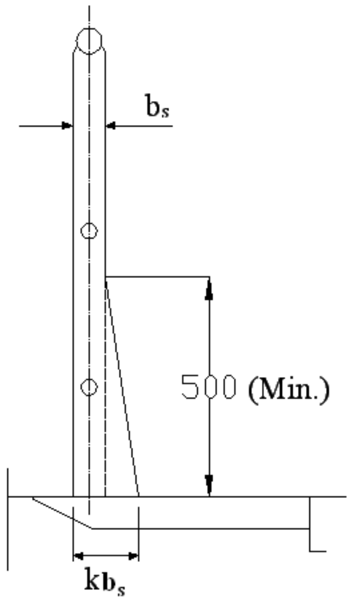

Fig.5.6.1 : Guardrail stanchion

iii) every stanchion of increased breadth : $k . b_s = 1.9 . b_s$

where,

b_s = breadth of normal stanchion according to the design standard.

Stanchions with increased breadth to be aligned with member below deck which is to be min. 100 x 12 flatbar welded to deck by double continuous fillet weld. The stanchions with increased breadth need not be aligned with under deck structure for deck plating exceeding 20 [mm].

c) Wire ropes may only be accepted in lieu of guardrails in special circumstances and then only in limited lengths.

d) Lengths of chain may be accepted in lieu of guard rails if they are fitted between two fixed stanchions and/or bulwarks.

e) The clear opening below the lowest course of the guard rails is not to exceed 230 [mm]. Where this course is not measured from the deck, but from the sheerstrake or a waterway bar, which is not in the same vertical plane as the rails, the length of opening is the diagonal distance between the lowest of the rails and the top of the sheerstrake or waterway bar. The other courses are not to be more than 380 [mm] apart. Where rounded gunwales are fitted the guard rail supports are to be placed on the flat of the deck, as close as possible to the beginning of the curvature of the gunwale.

f) Wires shall be made taut by means of turnbuckles.

g) Removable or hinged stanchions shall be capable of being locked in the upright position.

5.7 Protection of crew requirements for specific types

Note : Some Administrations may have more stringent requirements for protection of crew than those given below.

5.7.1 Protection of crew shall be provided by at least one of the means denoted in Table 5.7.1.

Acceptable arrangements referred to in the table are defined as follows:

a) A well lighted and ventilated underdeck passage (clear opening 0.8 [m] wide, 2 [m] high) as close as practicable to the freeboard deck, connecting and providing access to the locations in question.

b) On or near the centreline of a ship a permanent and efficiently constructed gangway fitted at the level of the superstructure deck, providing a continuous platform at least 0.6 [m] in width and a non-slip surface, with guard rails extending on each side throughout its length. Guard rails shall be at least 1 [m] high with courses as required in 5.6.e) above and supported by stanchions spaced not more than 1.5 [m]; a foot stop shall be provided.

</table>

c) A permanent walkway at least 0.6 [m] in width fitted at freeboard deck level consisting of two rows of guardrails with stanchions spaced not more than 3 [m]. The number of courses of rails and their spacing to be as required by 5.6.e above. On Type B ships hatchway coamings not less than 0.6 [m] in height may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.

d) A 10 [mm] minimum diameter wire rope lifeline supported by stanchions about 10 [m] apart, or A single handrail or wire rope attached to hatchcoamings, continued and adequately supported between hatchways.

e) A permanent and efficiently constructed gangway fitted at or above the level of the superstructure deck on or as near as practicable to the center line of the ship:

- located so as not to hinder easy access across the working areas of the deck;

- providing a continuous platform at least 1.0 [m] in width;

- constructed of fire resistant and non-slip material;

Note : FRP gratings used in lieu of steel gratings for safe access to tanker bows are to possess:

- low flame spread characteristics and are not to generate excessive quantities of smoke and toxic products, as per the FTP Code; and

- adequate structural fire integrity as per national / international standards.

- fitted with guard rails extending on each side throughout its length; guard rails should be at least 1.0 [m] high with courses as required by 5.6.e above and supported by stanchions spaced not more than 1.5 [m];

- provided with a foot stop on each side;

- having openings, with ladders where appropriate, to and from the deck. Openings should not be more than 40 [m] apart;

- having shelters of substantial construction set in way of the gangway at intervals not exceeding 45 [m] if the length of the exposed deck to be traversed exceeds 70 [m]. Every such shelter should be capable of accommodating at least one person and be so constructed as to afford weather protection on the forward, port and starboard sides.

f) A permanent and efficiently constructed walkway fitted at freeboard deck level on or as near as practicable to the center line of the ship having the same specifications as those for a permanent gangway listed in (e) except for foot-stops. On Type B ships (certified for the carriage of liquids in bulk), with a combined height of hatch coaming and fitted hatch cover of together not less than 1 [m] in height the hatchway coamings may be regarded as forming one side of the walkway, provided that between the hatchways two rows of guard rails are fitted.

Alternative transverse locations to 'c', 'd' and 'f' above: (indicated as (1) to (5) in Table 5.7.1).

(1) At or near center line of ship; or fitted on hatchways at or near center line of ship.

(2) Fitted one each side of the ship

(3) Fitted on one side, provision being made for fitting on either side

(4) Fitted on one side only.

(5) Fitted on each side of the hatchways as near to the center line as practicable.

The following requirements also to be met:

i. In all cases where wire ropes are fitted, adequate devices are to be provided to ensure their tautness

ii. Wire ropes may only be accepted in lieu of guard rails in special circumstances and then only in limited lengths.

iii. Lengths of chain may only be accepted in lieu of guard rails if fitted between two fixed stanchions.

iv. Where stanchions are fitted, every 3rd stanchion is to be supported by a bracket or stay.

v. Removable or hinged stanchions shall be capable of being locked in the upright position.

vi. A means of passage over obstructions, if any, such as pipes or other fittings of a permanent nature, should be provided.

vii. Generally, the width of the gangway or deck level walkway should not exceed 1.5 [m].

viii. For tankers less than 100 [m] in length, the minimum width of the gangway platform or deck level walkway fitted in accordance with arrangement (e) or (f), respectively, may be reduced to 0.6 [m].

Section 6

Means of Embarkation and Disembarkation

6.1 General

6.1.1 Ships constructed on or after 1 Jan 2010 are to be provided with means of embarkation and disembarkation such as gangways and accommodation ladders, for use in port and in port related operations in accordance with the requirements of this section. However, compliance with particular provisions may be waived by the Administration, if it is deemed to be unreasonable or impractical.

6.1.2 Where means of embarkation and disembarkation other than those specifically covered in the section are fitted, an equivalent level of safety is to be provided.

6.1.3 For all ships (i.e. constructed before, on or after 1 Jan 2010), means of embarkation and disembarkation are to be inspected and maintained in suitable condition for the intended purpose. Requirements for surveys of such means are given in Part 1, Chapter 2 of the rules.

6.2 Construction

6.2.1 Accommodation ladders and gangways for means of embarkation and disembarkation which are provided on board ships constructed on or after 1 Jan 2010 are to meet applicable international standards such as ISO 5488:1979, “Shipbuilding – accommodation ladders”, ISO 7061:1993, “Shipbuilding – aluminium shore gangways for seagoing vessels” and/or national standards and/or other requirements recognized by the Administration. Such accommodation ladders and gangways fitted on ships constructed before 1 Jan 2010, which are replaced after that date, should, in so far as is reasonable and practicable, comply with the requirements of this section.

6.2.2 The structure of the accommodation ladders and gangways and their fittings and attachments should be such as to allow regular inspection, maintenance of all parts and, if necessary, lubrication of their pivot pin. Special care should be taken to ensure that the welding work is carried out satisfactorily.

6.2.3 The construction and test of accommodation ladder winches are to be in accordance with applicable international standards such as ISO 7364:1983 “Shipbuilding and marine structures – deck machinery – accommodation ladder winches”.

6.3 Installation

6.3.1 Location

6.3.1.1 As far as practicable, the means of embarkation and disembarkation are to be sited clear of the working area and are not to be placed where cargo or other suspended loads may pass overhead.

6.3.2 Lighting

6.3.2.1 Adequate lighting is to be provided to illuminate the means of embarkation and disembarkation, the position on deck where persons embark or disembark and the controls of the arrangement.

6.3.3 Lifebuoy

6.3.3.1 A lifebuoy equipped with a self-igniting light and a buoyant lifeline is to be available for immediate use in the vicinity of the embarkation and disembarkation arrangement when in use.

6.3.4 Arrangement

6.3.4.1 Each accommodation ladder is to be of such a length to ensure that, at a maximum design operating angle of inclination, the lowest platform will be not more than 600 [mm] above the waterline in the “lightest seagoing condition”, as defined in the following:

“Lightest seagoing condition” is the loading condition with the ship on even keel, without cargo, with 10% stores and fuel remaining and in the case of a passenger ship with the full number of passengers and crew and their luggage.

6.3.4.2 The arrangement at the head of the accommodation ladder is to provide direct access between the ladder and the ship's deck by a platform securely guarded by handrails and adequate handholds. The ladder should be securely attached to the ship to prevent overturning.

6.3.4.3 For ships on which the height of the embarkation / disembarkation deck exceeds 20 [m] above the waterline specified in 6.3.4.1 and on other ships where compliance with the provisions of 6.3.4.1 is considered impractical, an alternative means of providing safe access to the ship or supplementary means of safe access to the bottom platform of the accommodation ladder may be accepted.

6.3.5 Marking

6.3.5.1 Each accommodation ladder or gangway is to be clearly marked at each end with a plate showing the restrictions on the safe operation and loading, including the maximum and minimum permitted design angles of inclination, design load, maximum load on bottom end plate, etc. Where the maximum operational load is less than the design load, it should also be shown on the marking plate.

6.3.6 Test

6.3.6.1 After installation, the winch and the accommodation ladder are to be operationally tested to confirm proper operation and condition of the winch and the ladder after the test.

6.3.6.2 The winch is to be tested as a part of the complete accommodation ladder unit through a minimum of two times hoisting and lowering of the accommodation ladder in accordance with the onboard test requirement specified in applicable international standards such as ISO 7364:1983.

6.3.6.3 Every new accommodation ladder is to be subjected to a static load test of the specified maximum working load upon installation.

6.3.7 Positioning

6.3.7.1 Gangways are not to be used at an angle of inclination greater than 30° from the horizontal and accommodation ladders are not to be used at an angle greater than 55° from the horizontal, unless designed and constructed for use at angles greater than these and marked as such, as required by 6.3.5.1.

6.3.7.2 Gangways are not to be secured to ship's guardrails unless they have been designed for that purpose. If positioned through an open section of bulwark or railings, any remaining gaps are to be adequately fenced.

6.3.7.3 Adequate lighting for means of embarkation and disembarkation and for the immediate approaches are to be ensured from the ship and/or the shore in hours of darkness.

6.3.8 Safety net

6.3.8.1 A safety net is to be mounted in way of the accommodation ladders and gangways where it is possible that a person may fall from them or between the ship and quayside.

6.3.9 Verification

6.3.9.1 Upon installation the entire arrangement of the means of embarkation and disembarkation will be verified for compliance with the requirements of this section.

6.4 Inspection and maintenance

6.4.1 The maintenance and inspection requirements for means of embarkation and disembarkation are to be addressed by the ship's safety management system.

6.4.2 The wires used to support the means of embarkation and disembarkation are to be renewed when necessary due to deterioration or at intervals of not more than 5 years, whichever is earlier.

6.4.3 Arrangements should also be made to examine the underside of gangways and accommodation ladders at regular intervals.

6.4.4 All inspections, maintenance work and repairs of accommodation ladders and gangways should be recorded in order to provide an accurate history for each appliance. The information to be recorded appropriately on board should include the date of the most recent inspection, the name of the person or body who carried out that inspection, the due date for the next inspection and the dates of renewal of wires used to support the embarkation and disembarkation arrangement.

End of Chapter

Chapter 12

Openings and Closing Appliances

Contents

Section

Section 1

General

1.1 Scope

1.1.1 This Chapter applies to all ship types in general. Additional requirements pertaining to special ship types are given in Pt.5.

1.1.2 The requirements conform, where applicable, to those of the International Convention on Load Lines, 1966 (ILLC, 1966) as amended by the 1988 protocol, as amended in 2003. Reference should also be made to the additional requirements of the National Authority of the country in which the ship is to be registered.

Requirements for hatch covers and coamings of bulk carriers, ore carriers and combination carriers are given in Pt.5, Ch.1.

1.2 Definitions

1.2.1 Where the freeboard is increased in accordance with Ch.11, Sec.1.2.2 the actual freeboard deck may be treated as the superstructure deck, while considering the requirements given in this chapter. The requirements of hatches and doors on the weather decks are given with respect to two basic positions as follows:

Position 1

- Upon exposed freeboard and raised quarter decks for their entire length and
- Upon exposed superstructure decks situated forward of the 0.25L from the F.P.

Position 2

- Upon exposed superstructure decks situated abaft the 0.25L from the F.P and located at least one standard height of superstructure above the freeboard deck, and.
- Upon exposed superstructure decks located forward of 0.25L from the F.P. and at least two standard heights of superstructure above the freeboard deck.

Note : The upper limit of the vertical extent of Position 2 need not be considered to exceed two standard superstructure heights at locations abaft the 0.25L from the F.P. and three standard superstructure heights forward of 0.25L from the F.P.

1.2.2 σ_y = the minimum upper yield strength of the material [N/mm^2].

1.3 Hatch cover and coaming load model

Structural assessment of hatch covers and hatch coamings is to be carried out using the design loads, defined in this section:

Definitions:

L = Rule length of ship [m] as defined in Ch1. Sec.2

L_L = Loadline length of ship [m] as defined in Ch1. Sec.2

x = Longitudinal co-ordinate of mid point of assessed structural member measured from aft end of length L or L_L, as applicable

D_{min} = the least moulded depth, [m] as defined in Ch.1, Sec.2

h_N = Standard superstructure height [m]

= $1.05 + 0.01\ L_L$, $1.8 \le h_N \le 2.3$

(Also see Table 7.5.1)

1.3.1 Vertical design weather load

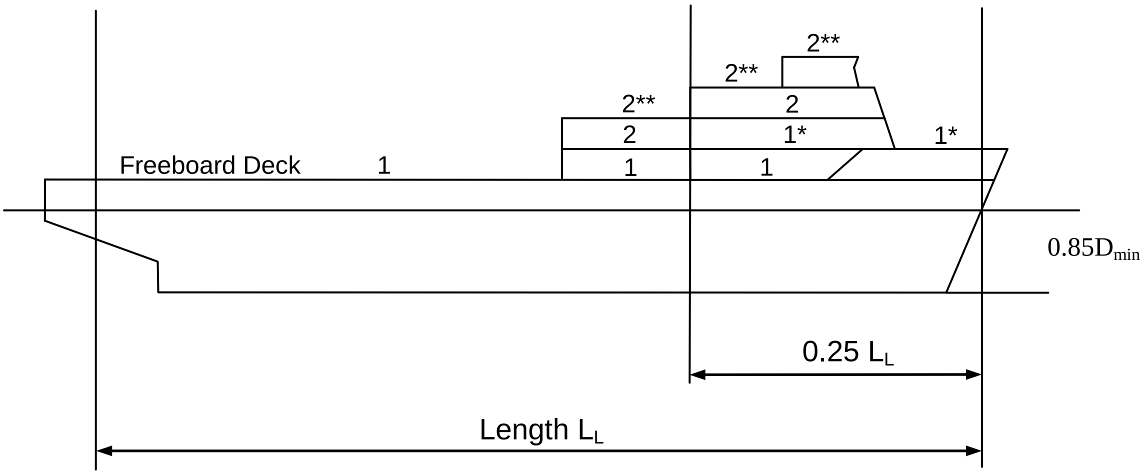
The pressure p_H, [N/mm²], on the hatch cover panels is given in Table 1.3.1. The vertical design weather load need not be combined with cargo loads given in 1.3.3 and 1.3.4.

In Fig.1.3.1.1 the positions 1 and 2 for the purpose of design weather loads are illustrated for an example ship.

Where an increased freeboard is assigned, the design load for hatch covers according to Table 1.3.1 on the actual freeboard deck may be as required for a superstructure deck, provided the summer freeboard is such that the resulting draught will not be greater than that corresponding to the minimum freeboard calculated from an assumed freeboard deck situated at a distance at least equal to the standard superstructure height h_N below the actual freeboard deck. (See Fig.1.3.1.2).

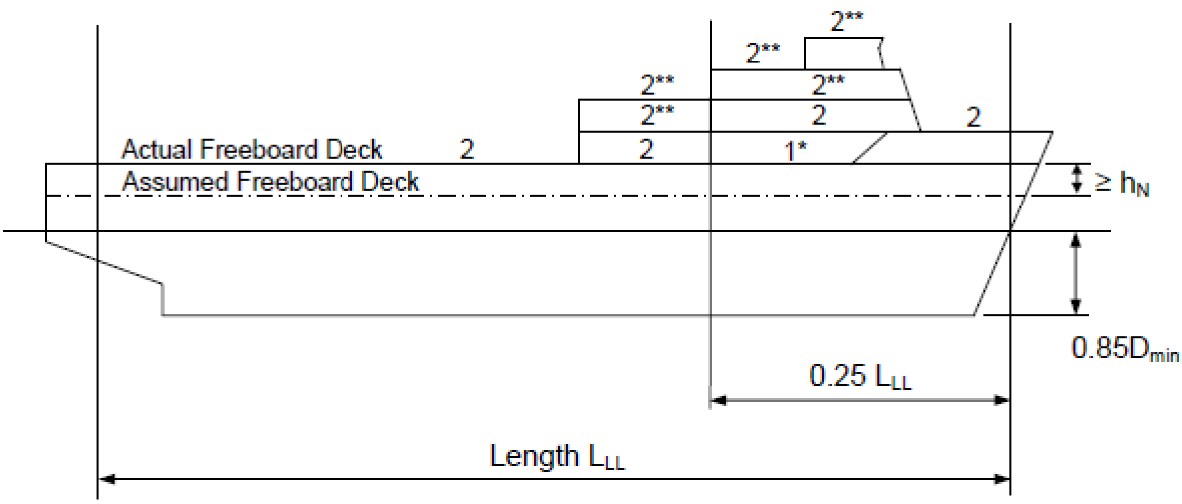
Table 1.3.1 : Design load p_H of weather deck hatches

Position	**Design load p_H [N/mm^2]**	
	$\frac{x}{L_L} \le 0.75$	$0.75 < \frac{x}{L_L} \le 1.0$
1	for 24 m ≤ L_L ≤ 100 m	
	$\frac{9.81x10^{-3}}{76} \cdot \left(1.5 \cdot L_L + 116\right)$	on freeboard deck $\frac{9.81x10^{-3}}{76} \cdot \left[\left(4.28\,x\,L_L + 28\right) \cdot \frac{x}{L_L} - 1.71\,x\,L_L + 95\right]$
		upon exposed superstructure decks located at least one superstructure standard height above the freeboard deck $\frac{9.81x10^{-3}}{76} \cdot \left(1.5\,x\,L_L + 116\right)$
	for L_{LL} > 100 m	
	$9.81 \cdot 3.5.10^{-3}$	on freeboard deck for type B ships according to ICLL $9.81x10^{-3}\left[\left(0.0296 \cdot L_1 + 3.04\right) \cdot \frac{x}{L_L} - 0.0222 \cdot L_1 + 1.22\right]$
		on freeboard deck for ships with less freeboard than type B according to ICLL $9.81x10^{-3}\left[\left(0.1452 \cdot L_1 + 8.52\right) \cdot \frac{x}{L_L} - 0.1089 \cdot L_1 + 9.89\right]$ L_1 = L_L but not more than 340 [m]
		upon exposed superstructure decks located at least one superstructure standard height above the freeboard deck $9.81\,x\,3.5.10^{-3}$
2	for 24 m ≤ L_L ≤ 100 m	
	$\frac{9.81\,x\,10^{-3}}{76} \cdot \left(1.1\,x\,L_L + 87.6\right)$	
	for L_L > 100 m	
	$9.81x2.6.10^{-3}$	
	upon exposed superstructure decks located at least one superstructure standard height above the lowest Position 2 deck $9.81x2.1$	



* reduced load upon exposed superstructure decks located at least one superstructure standard height above the freeboard deck
** reduced load upon exposed superstructure decks of vessels with L_L > 100 m located at least one superstructure standard height above the lowest Position 2 deck

Fig. 1.3.1.1 : Positions 1 and 2 for design weather loads



* reduced load upon exposed superstructure decks located at least one superstructure standard height above the freeboard deck
** reduced load upon exposed superstructure decks of vessels with L_{LL} > 100 m located at least one superstructure standard height above the lowest Position 2 deck

Fig. 1.3.1.2 : Positions 1 and 2 for design weather loads for an increased freeboard

1.3.2 Horizontal design weather load

The horizontal design weather load for determining the scantlings of outer edge girders (skirt plates) of weather deck hatch covers and of hatch coamings is:

$$p_A = a \cdot c \cdot (b \cdot c_L \cdot f - z).10^{-3} \ [\text{N/mm}^2]$$

f = $\frac{L}{25} + 4.1$ for L < 90 [m]

= $10.75 - \left(\frac{300 - L}{100}\right)^{1.5}$

for $90[\text{m}] \le \text{L} < 300[\text{m}]$

= 10.75

for $300[\text{m}] \le \text{L} < 350[\text{m}]$

= $10.75 - \left(\frac{L - 350}{150}\right)^{1.5}$ for $350[\text{m}] \le \text{L} \le 500[\text{m}]$

c_L = $\sqrt{\frac{L}{90}}$ for L < 90 [m]

= 1 for $\text{L} \ge 90[\text{m}]$

a = $20 + \frac{L_1}{12}$

for unprotected front coamings and hatch cover skirt plates

= $10 + \frac{L_1}{12}$

for unprotected front coamings and hatch cover skirt plates, where the distance from the actual freeboard deck to the summer load line exceeds the minimum non-corrected tabular freeboard according to ICLL by at least one standard superstructure height h_N

= $5 + \frac{L_1}{15}$

for side and protected front coamings and hatch cover skirt plates

= $7 + \frac{L_1}{100} - 8 \cdot \frac{x'}{L}$

for aft ends of coamings and aft hatch cover skirt plates abaft amidships

= $5 + \frac{L_1}{100} - 4 \cdot \frac{x'}{L}$

for aft ends of coamings and aft hatch cover skirt plates forward of amidships

L_1 = L, need not be taken greater than 300 [m]

b = $1.0 + \left(\frac{\frac{x'}{L} - 0.45}{C_B + 0.2}\right)^2$

for $\frac{x'}{L} < 0.45$

= $1.0 + 1.5 \cdot \left(\frac{\frac{x'}{L} - 0.45}{C_B + 0.2}\right)^2$

for $\frac{x'}{L} \ge 0.45$

$0.6 \le C_B \le 0.8$, when determining scantlings of aft ends of coamings and aft hatch cover skirt plates forward of amidships, C_B need not be taken less than 0,8.

x' = distance [m] between the transverse coaming or hatch cover skirt plate considered and aft end of the length L. When determining side coamings or side hatch cover skirt plates, the side is to be subdivided into parts of approximately equal length, not exceeding 0,15 L each, and x' is to be taken as the distance between aft end of the length L and the centre of each part considered.

z = vertical distance [m] from the summer load line to the midpoint of stiffener span, or to the middle of the plate field

c = $0.3 + 0.7 \cdot \frac{b'}{B'}$

b' = breadth of coaming [m] at the position considered

B' = actual maximum breadth of ship [m] on the exposed weather deck at the position considered.

b'/B' is not to be taken less than 0,25.

The design load p_A is not to be taken less than the minimum values given in Table 1.3.2.

Table 1.3.2 : Minimum design load p_{Amin}

L	p_{Amin} [N/mm²] for	
	unprotected fronts	elsewhere
≤ 50	$30 \cdot 10^{-3}$	$15 \cdot 10^{-3}$
> 50 < 250	$\left(25+\frac{L}{10}\right).10^{-3}$	$\left(12.5+\frac{L}{20}\right).10^{-3}$
≥ 250	$50 \cdot 10^{-3}$	$25 \cdot 10^{-3}$

Note: The horizontal weather design load need not be included in the direct strength calculation of the hatch cover, unless it is utilized for the design of substructures of horizontal support according to 4.4.3

1.3.3 Cargo loads

1.3.3.1 Distributed loads

The load on hatch covers due to distributed cargo loads p_L, [N/mm²], resulting from heave and pitch (i.e. ship in upright condition) is to be determined according to the following formula:

$$p_L = p_C(1+a_V) \text{ [N/mm²]}$$

where:

p_c = uniform cargo load [N/mm²]

a_V = vertical acceleration addition as follows:

$$a_V = F \cdot m$$

$$F = 0.11 \cdot \frac{v_0}{\sqrt{L}}$$

m = $m_0 - 5(m_0 - 1)\frac{x}{L}$ for $0 \leq \frac{x}{L} \leq 0.2$

= 1.0 for $0.2 < \frac{x}{L} \leq 0.7$

= $1 + \frac{m_0 + 1}{0.3}\left[\frac{x}{L} - 0.7\right]$ for $0.7 < \frac{x}{L} \leq 1.0$

m_0 = 1.5 + F

v_o = maximum speed at summer load line draught, v_o is not to be taken less than $\sqrt{L}$ [knots]

1.3.3.2 Point loads

The load *P*, [kN] due to a concentrated force P_s [kN] except for container load, resulting from heave and pitch (i.e. ship in upright condition) is to be determined as follows:

$$P = P_S(1+a_V) \text{ [kN]}$$

1.3.4 Container loads

1.3.4.1 The loads defined in 1.3.4.2 and 1.3.4.4 are to be applied where containers are stowed on the hatch cover.

1.3.4.2 The load *P* [kN], applied at each corner of a container stack, and resulting from heave and pitch (i.e. ship in upright condition) is to be determined as follows:

$$P = 9.81\,\frac{M}{4}(1 + a_V)$$

where:

a_V = acceleration addition according to 1.3.3.1

M = maximum designed mass of container stack [t]

1.3.4.3 The loads, [kN], applied at each corner of a container stack, and resulting from heave, pitch, and the ship's rolling motion (i.e. ship in heel condition) are to be determined as follows , (see also Fig.1.3.4):.

$$A_z = 9.81\frac{M}{2}\cdot(1+a_V)\cdot\left(0.45 - 0.42\frac{h_m}{b}\right) \text{[kN]}$$

$$B_z = 9.81\frac{M}{2}\cdot(1+a_V)\cdot\left(0.45 + 0.42\frac{h_m}{b}\right) \text{[kN]}$$

$$B_y = 2.4 \cdot M \text{ [kN]}$$

a_V = acceleration addition according to 1.3.3.1

M = maximum designed mass of container stack [t],

$= \sum W_i$

h_m = designed height of centre of gravity of stack above hatch cover top [m], may be calculated as weighted mean value of the stack, where the centre of gravity of each tier is assumed to be located at the centre of each container,

$=\sum(z_i W_i) / M$

z_i = distance from hatch cover top to the centre of i^{th} container [m]

W_i = weight of i^{th} container [t]

b = distance between midpoint of foot points [m]

A_Z, B_Z = support forces [kN] in z-direction at the forward and aft stack corners

B_y = support force [kN] in y-direction at the forward and aft stack corners

When strength of the hatch cover structure is assessed by grillage analysis according to 3.7, h_m and z_i need to be taken above the hatch cover supports. Force B_y does not need to be considered in this case.

Values of A_z and B_z applied for the assessment of hatch cover strength are to be shown in the drawings of the hatch covers.

Note;
It is recommended that container loads as calculated above are considered as limit for foot point loads of container stacks in the calculations of cargo securing (container lashing).

1.3.4.4 Load cases with partial loading

The load cases defined in 1.3.4.2 and 1.3.4.3 are also to be considered for partial non homogeneous loading which may occur in practice, e.g. where specified container stack places are empty. For each hatch cover, the heel directions, as shown in Table 1.3.4.4, are to be considered.
The load case *partial loading of container hatch covers* can be evaluated using a simplified approach, where the hatch cover is loaded without the outermost stacks, that are located completely on the hatch cover. If there are additional stacks that are supported partially by the hatch cover and partially by container stanchions then the loads from these stacks are also to be neglected, refer Table 1.3.4.4. Partial loading of container hatch covers. In addition, the case where only the stack places supported partially by the hatch cover and partially by container stanchions are left empty is to be assessed in order to consider the maximum loads in the vertical hatch cover supports. It may be necessary to also consider partial load cases where more or different container stack places are left empty.

1.3.4.5 Mixed stowage of 20 [ft] and 40 [ft] containers on hatch covers

1.3.4.5.1 In the case of mixed stowage (20 [ft] + 40 [ft] container combined stack), the foot point forces at the fore and aft end of the hatch cover are not to be higher than resulting from the design stack weight for 40 [ft] containers, and the foot point forces at the middle of the cover are not to be higher than resulting from the design stack weight for 20 [ft] containers.

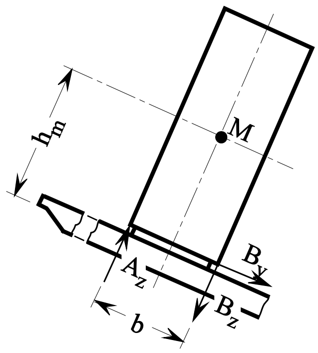


Fig. 1.3.4 : Forces due to container loads

Table 1.3.4.4 : Partial loading of container hatch covers

Heel direction	←	→
Hatch covers supported by the longitudinal hatch coaming with all container stacks located completely on the hatch cover		Hatch covers supported by the longitudinal hatch coaming with the outermost container stack supported partially by the hatch cover and partially by container stanchions		Hatch covers not supported by the longitudinal hatch coaming (center hatch covers)		
1.3.5 Loads due to elastic deformations of the ship's hull

Hatch covers, which in addition to the loads according to 1.3.1 to 1.3.4 are loaded in the ship's transverse direction by forces due to elastic deformations of the ship's hull, are to be designed such that the sum of stresses does not exceed the permissible values given in 3.3.1.

1.4 Corrosion addition for hatch covers and hatch coamings

The scantling requirements of the this chapter imply the following general corrosion additions t_c as per Table 1.4:

Table 1.4 : Corrosion additions t_c for hatch covers and hatch coamings

Application	Structure	t_c [mm]
Weather deck hatches of container ships, car carriers, paper carriers, passenger vessels	Hatch covers	1.0
	Hatch coamings	1.0
Weather deck hatches of all other ship types (Also see 1.1.2)	Hatch covers in general	2.0
	Weather exposed plating and bottom plating of double skin hatch covers	1.5
	Internal structure of double skin hatch covers and closed box girders	1.0
	Hatch coamings not part of the longitudinal hull structure	1.5
	Hatch coamings part of the longitudinal hull structure	1.0
	Coaming stays and stiffeners	1.5

1.5 Steel renewal

1.5.1 Steel renewal is required where the gauged thickness is less than t_{net} + 0.5 [mm] for:

- Single skin hatch covers
- The plating of double skin hatch covers, and
- Coaming structures for which corrosion additions t_c is provided in Table 1.4

1.5.2 Where the gauged thickness is within the range t_{net} + 0.5 [mm] and t_{net} + 1.0 [mm], coating (applied in accordance with the coating manufacturer's requirements) or annual gauging may be adopted as an alternative to steel renewal. Coating is to be maintained in GOOD condition.

1.5.3 For the internal structure of double skin hatch covers, thickness gauging is required when hatch cover top or bottom plating renewal is to be carried out or when this is deemed necessary, at the discretion of the individual class society's surveyor, on the basis of the plating corrosion or deformation condition. In these cases, steel renewal for the internal structures is required where the gauged thickness is less than t_{net}.

1.5.4 For corrosion addition t_S = 1.0 [mm] the thickness for steel renewal is t_{net} and the thickness for coating or annual gauging is when gauged thickness is between t_{net} and t_{net} + 0.5 [mm]. For coaming structures, the corrosion additions t_c of which are not provided in Tab. 1.4, steel renewal and coating or annual gauging are to be specially considered.

Section 2

Hatch Coamings

2.1 Coaming heights

2.1.1 The height of the coamings for hatchways closed by weathertight covers is to be not less than

- 600 [mm] in Position 1
- 450 [mm] in Position 2

Coaming heights are to be measured from the upper surface of the deck or top of the deck sheathing if fitted.

2.1.2 The height of coamings less than that required as per 2.1.1 may be accepted on special consideration provided the construction of the hatchcovers is such as to ensure that the safety of the ship is not impaired in any sea condition. Such reduced coaming heights will also have to be approved by the concerned National Authorities.

2.1.3 Height of coamings may be required to be increased on certain ships e.g., ships of Type 'B-100' or Type 'B-60' where it is found necessary to satisfy the requirements of floatability stipulated in the ILLC, 1966.

2.2 Hatch coaming construction

2.2.1 Hatchside coamings are to extend to the lower edge of the deck beams. Side coamings not forming a part of continuous girders, are to extend two frame spaces beyond the hatch ends below the deck.

2.2.2 Hatch end coamings when not in line with the deck transverses are to extend below the deck, at least three longitudinal frame spaces beyond the side coaming.

2.2.3 Continuous hatchway coamings or coamings forming an effective part of the deck girder system are to be made from steel of same tensile strength as that of the deck plating.

2.2.4 If the junction of hatch coamings forms a sharp corner, the side and end coamings are to be extended in the form of tapered brackets in longitudinal and transverse directions respectively. Alternatively tapered brackets may be omitted, provided that the hatch coamings at the corners of the hatchways are well rounded and are joined to the deck by full penetration welds. Suitable supporting brackets are to be provided if the deck overhang at the corner is excessive.

2.2.5 Extension brackets or rails arranged approximately in line with the cargo hatch side coamings and intended for the stowage of steel hatch covers are not to be welded to deckhouse, masthouse or to each other unless they form a part of the longitudinal strength members.

2.2.6 Hatch coamings and supporting structures are to be adequately stiffened to resist the loading from hatch covers, in longitudinal, transverse and vertical directions.

2.2.7 The stresses in the under deck structures induced by the load transmitted by the stays are not to be greater than the allowable stresses for coaming stays indicated in 2.5.2.

2.2.8 The coamings are to be satisfactorily stiffened against buckling.

2.2.9 Materials for hatch coaming are to satisfy the requirements of Part 2, Ch 2.

2.3 Hatch coaming strength criteria

2.3.1 Local net plate thickness of coamings

The net thickness of weather deck hatch coamings shall not be less than the larger of the following values:

$$t = 0.0142 \,.\, s\sqrt{\frac{p_A.10^3}{0.95.\sigma_F}} \text{ [mm]}$$

$$t_{min} = 6 + \frac{L_1}{100} \text{ [mm]}$$

s = stiffener spacing [mm]

L_1 = L, need not be taken greater than 300 [m]

σ_F = minimum yield stress [N/mm^2]

Longitudinal strength aspects are to be verified according to Ch.5.

2.4 Net scantling of secondary stiffeners of coamings

The stiffeners must be continuous at the coaming stays. For stiffeners with both ends constraint, the elastic net section modulus Z [cm^3] and net shear area A_s, [cm^2], calculated on the basis of net thickness, is not be less than:

$$Z = \frac{83}{\sigma_F}.s.l^2.p_A \quad [cm^3]$$

$$A_s = \frac{10.s.l.p_A}{\sigma_F} \quad [cm^2]$$

l = secondary stiffener span, [m], to be taken as the spacing of coaming stays

s = stiffener spacing [mm]

For sniped stiffeners of coaming at hatch corners section modulus and shear area at the fixed support have to be increased by 35%. The gross thickness of the coaming plate at the sniped stiffener end shall not be less than:

$$t = 19.6.\sqrt{\frac{p_A .10^{-3}.s.(1000l - 0.5s)}{\sigma_F}} \quad [mm]$$

Horizontal stiffeners on hatch coamings, which are part of the longitudinal hull structure, are to be designed according to Ch.10, Sec.5.2.

2.5 Coaming stays

Coaming stays are to be designed for the loads transmitted through them and permissible stresses according to 3.3.1

2.5.1 Coaming stay section modulus and web thickness

At the connection with deck, the net section modulus Z [cm^3] and the gross thickness t_w [mm], of the coaming stays designed as beams with flange (example 1 and 2 are shown in Figure 2.5.1) are to be taken not less than:

$$Z = \frac{526}{\sigma_F}.e.h_s^2.p_A.10^3 \quad [cm^3]$$

$$t_w = \frac{2}{\sigma_F}.\frac{e.h_s.p_A}{h_w} + t_c \quad [mm]$$

e = spacing of coaming stays [m]

h_s = height of coaming stay [m]

h_w=web height of coaming stay at its lower end [m]

t_c = corrosion addition [mm], according to 1.4

For other designs of coaming stays, such as those shown in Figure 2.5.1, example 3 and 4, the stresses are to be determined through a grillage analysis or FEM. The calculated stresses are to comply with the permissible stresses according to 3.1.1.

Coaming stays are to be supported by appropriate substructures. Face plates may only be included in the calculation if an appropriate substructure is provided and welding provides an adequate joint.

Webs are to be connected to the deck by fillet welds on both sides with a throat thickness of $a=0.44t_w$.

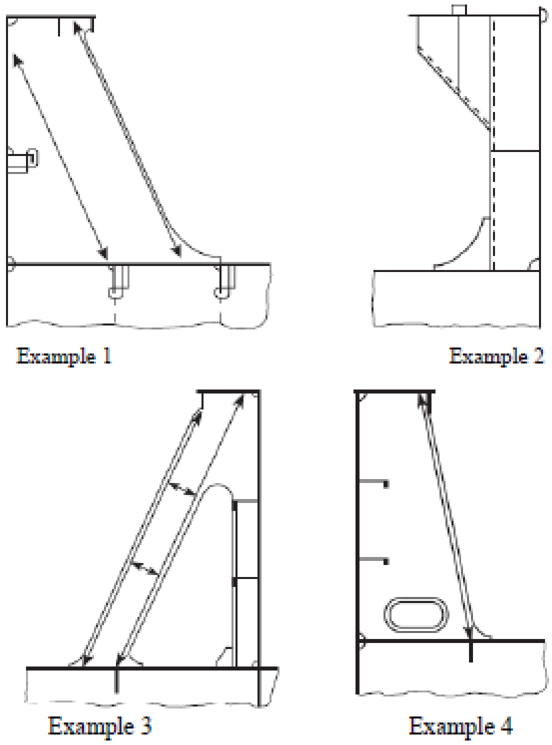

Fig.2.5.1 : Examples of coaming stays

2.5.2 Coaming stays under friction load

For coaming stays, which transfer friction forces at hatch cover supports, fatigue strength is to be considered. (Also see 4.4.2).

2.6 Further requirements for hatch coamings

2.6.1 Longitudinal strength

Hatch coamings which are part of the longitudinal hull structure are to be designed according to the requirements of Ch.5.

For structural members welded to coamings and for cutouts in the top of coamings sufficient fatigue strength is to be verified.

Longitudinal hatch coamings with a length exceeding 0.1L [m] are to be provided with tapered brackets or equivalent transitions and a corresponding substructure at both ends. At the end of the brackets they are to be connected to the deck by full penetration welds of minimum 300 [mm] in length.

2.6.2 Local details

Design of local details not covered in this section are to be suitable for the purpose of transferring the loads on the hatch covers to the hatch coamings and through them, to the deck structures below. Hatch coamings and supporting structures are to be adequately stiffened to accommodate the loading from hatch covers, in longitudinal, transverse and vertical directions.

Structures under deck are to be checked against the load transmitted by the stays.

Unless otherwise stated, weld connections and materials are to be dimensioned and selected in accordance with the requirements of Ch.17 and Ch.2 respectively.

2.6.3 Stays

On ships carrying cargo on deck such as timber, coal or coke, the stays are to be spaced not more than 1.5 [m] apart.

2.6.4 Extend of coaming plates

2.6.4.1 Coaming plates are to extend to the lower edge of the deck or hatch side girders are to be fitted that extend to the lower edge of the deck breams. Extended coaming plates and hatch side girders are to be flanged or fitted with face bars or half-round bars. Figure 2.6.4 gives an example.

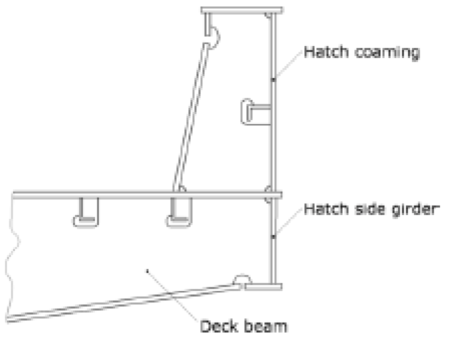

Fig.2.6.4 : Example of hatch side girder

2.6.5 Drainage arrangement at the coaming

If drain channels are provided inside the line of gasket by means of a gutter bar or vertical extension of the hatch side and end coaming, drain openings are to be provided at appropriate positions of the drain channels.

Drain openings in hatch coamings are to be arranged with sufficient distance to areas of stress concentration (e.g. hatch corners, transitions to crane posts).

Drain openings are to be arranged at the ends of drain channels and are to be provided with non-return valves to prevent ingress of water from outside. It is unacceptable to connect fire hoses to the drain openings for this purpose.

If a continuous outer steel contact between cover and ship structure is arranged, drainage from the space between the steel contact and the gasket is also to be provided for.

Section 3

Hatch Covers

3.1 General

3.1.1 The type of hatchcovers a) to e) as described below may be used as per Table 3.1.1 on the weathertight decks of various ship types mentioned in ILLC, 1966 as amended by the 1988 protocol, as amended in 2003.

Table 3.1.1 : Applicability of hatchcover type

Types of hatch covers	**Types of ships as per ILLC, 1966**				
	'A'	**'B-100'**	**'B-60'**	**'B'**	**'B+'**
a	No	Yes	Yes	Yes	Yes
b	No	No	No	Yes	Yes
c	No	No	No	No	Yes
d	Yes	Yes	Yes	Not applicable	
e	Yes	Yes	Yes	Yes	Yes

Hatch Cover Types :

'**a**' : Steel plated cargo hatch covers stiffened by webs or stiffeners and secured by clamping devices. Weathertightness is to be ensured by means of gaskets. Hatch covers used for holds containing liquid cargoes are also included in this category.

'b' : Steel plated pontoon type cargo hatch covers with internal webs and stiffeners extending over the full width of the hatchway. Weather-tightness is to be achieved by tarpaulins.

'c' : Wood or steel hatch covers used in conjunction with the portable beams. Weathertightness to be obtained by tarpaulins.

'**d**' : Access hatch covers for cargo oil tanks and adjacent spaces. The hatch covers are to be of steel and gasketed.

'**e**' : Access hatch covers other than 'd'. For Types 'A', 'B-100' and 'B-60' ships, the covers are to be of steel, and weathertightness is to be ensured by means of gaskets.

Note : Modern hatch cover designs of lift-away-covers are in many cases called pontoon covers. This definition does not fit to the definition above. Modern lift-away hatch cover designs should belong to one of the two categories single skin covers or double skin cover.

3.1.2 Tween deck hatch covers may be any of the types defined in 3.1.1, but need not be weathertight unless fitted to deep tank or water ballast holds or compartments, in which case the covers are to be of type (a) and oil tight or watertight as appropriate.

3.1.3 Materials for hatch covers are to satisfy the requirements of Part 3, Ch 2. Material Class

I is to be applied for top plate, bottom plate and primary supporting members.

3.1.4 The secondary stiffeners and primary supporting members of the hatch covers are to be continuous over the breadth and length of the hatch covers, as far as practical. When this is not practical, appropriate arrangements are to be adopted to ensure sufficient load carrying capacity. Sniped end connections are not to be used.

The spacing of the primary supporting members parallel to the direction of secondary stiffeners is not to exceed 1/3 of the span of the primary supporting members. When strength calculation is carried out by FE analysis using plane strain or shell elements, this requirement can be waived.

3.1.5 Load bearing connections between the hatch cover panels are to be fitted for the purpose of restricting the relative vertical displacements.

3.2 General strength criteria

3.2.1 The scantlings of the hatch cover plating, secondary stiffeners and primary supporting members are to be determined as per 3.4, 3.5 and 3.6 respectively using the design loads given in 1.3.

3.2.2 Hatchcovers of special construction and arrangement e.g. covers designed and constructed as a grillage, covers supported along more than two opposite edges and covers supporting other covers, may require submission of direct strength calculation taking into account the arrangement of stiffeners and the supporting members.

When a beam or a grillage analysis is used, the secondary stiffeners are not to be included in the attached flange area of the primary members.

3.3 Permissible stresses and deflections

3.3.1 Stresses

The equivalent stress σ_V in steel hatch cover structures related to the net thickness shall not exceed 0.8 σ_F, where σ_F is the minimum yield stress, [N/mm^2], of the material. For design loads according to 1.3.2 to 1.3.5, the equivalent stress σ_V related to the net thickness shall not exceed 0.9 σ_F when the stresses are assessed by means of FEM.

For steels with a minimum yield stress of more than 355 [N/mm^2], the value of σ_F to be applied will be specially considered.

For grillage analysis, the equivalent stress may be taken as follows:

$$\sigma_V = \sqrt{\sigma^2 + 3\tau^2} \quad \text{[N/mm}^2\text{]}$$

σ = normal stress [N/mm^2]

τ = shear stress [N/mm^2]

For FEM calculations, the equivalent stress may be taken as follows:

$$\sigma_V = \sqrt{\sigma_x{}^2 - \sigma_x \cdot \sigma_y + \sigma_y{}^2 + 3\tau^2} \quad \text{[N/mm}^2\text{]}$$

σ_X = normal stress, [N/mm^2], in x-direction

σ_Y = normal stress, [N/mm^2], in y-direction

τ = shear stress, [N/mm^2], in the x-y plane

Indices x and y are coordinates of a two-dimensional Cartesian system in the plane of the considered structural element.

In case of FEM calculations using shell or plane strain elements, the stresses are to be read from the centre of the individual element. It is to be observed that, in particular, at flanges of unsymmetrical girders, the evaluation of stress from element centre may lead to non-conservative results. Thus, a sufficiently fine mesh is to be applied in these cases or, the stress at the element edges is not to exceed the allowable stress. Where shell elements are used, the stresses are to be evaluated at the mid plane of the element.

Stress concentrations are to be assessed to the satisfaction of IRS.

3.3.2 Deflection

The vertical deflection of primary supporting members due to the vertical design weather load according to 1.3.1 is to be not more than $0.0056 \cdot l_g$ [m] where l_g [m] is the greatest span of primary supporting members.

Note: *Where hatch covers are arranged for carrying containers and mixed stowage is allowed, i.e., a 40'-container stowed on top of two 20'-containers, particular attention is to be paid to the deflections of hatch covers. Further the possible contact of deflected hatch covers with in hold cargo has to be observed.*

3.4 Local net plate thickness

The local net plate thickness t, [mm], of the hatch cover top plating is not to be less than:

$$t = F_p .15.8.s\sqrt{\frac{p.10^3}{0.95.\sigma_F}}$$

and to be not less than 1% of the spacing of the stiffener or 6 [mm] if that be greater.

F_p = factor for combined membrane and bending response

= 1.5 in general

= 1.9 . $\frac{\sigma}{\sigma_a}$, for $\frac{\sigma}{\sigma_a}$ ≥ 0.8 for the attached plate flange of primary supporting members

s = stiffener spacing [m]

p = pressure p_H and p_L, [N/mm^2], as defined in 1.3.

σ = maximum normal stress, [N/mm^2], of hatch cover top plating, determined according to Fig.3.2

$\sigma_a = 0.8 . \sigma_F$ [N/mm^2]

For flange plates under compression sufficient buckling strength according to 3.8 is to be demonstrated.

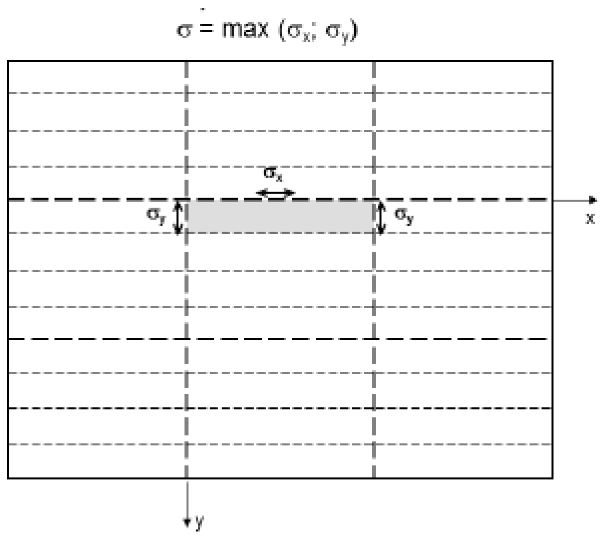

Fig. 3.2 : Determination of normal stress of the hatch cover plating

3.4.1 Local net plate thickness of hatch covers for wheel loading

The local net plate thickness of hatch covers for wheel loading is to be according to Ch.9, Sec.6.

3.4.2 Lower plating of double skin hatch covers and box girders

The thickness to fulfill the strength requirements is to be obtained from the calculation according to 3.7 under consideration of permissible stresses as per 3.3.1.When the lower plating is taken into account as a strength member of the hatch cover, the net thickness [mm], of lower plating is to be taken not less than 5 [mm]. When project cargo in intended to be carried on a hatch cover, the net thickness must not be less than:

t = 6.5 . s [mm]

where,

s = stiffener spacing [m]

Note:

Project cargo means especially large or bulky cargo lashed to the hatch cover. Examples are parts of cranes or wind power stations, turbines, etc. Cargoes that can be considered as uniformly distributed over that hatch cover, e.g., timber, pipes or steel coils need not to be considered as project cargo.

When the lower plating is not considered as a strength member of the hatch cover, the thickness of the lower plating will be specially considered.

3.5 Net scantling of secondary stiffeners

3.5.1 The net section modulus Z and net shear area A_S of uniformly loaded hatch cover stiffeners constrained at both ends must not be less than:

$Z = \frac{104psl^2\ 10^3}{\sigma_F}$ [cm^3], for design load according to 1.3.1

$Z = \frac{93psl^2 10^3}{\sigma_F}$ [cm^3], for design load according to 1.3.3.1

$A_s = \frac{10.8psl10^3}{\sigma_F}$ [cm^2], for design load according to 1.3.1

$A_s = \frac{9.6psl10^3}{\sigma_F}$ [cm^2], for design load according to 1.3.3.1

l = secondary stiffener span, [m], to be taken as the spacing, [m], of primary supporting members or the distance between a primary supporting member and the edge support, as applicable.

s = secondary stiffener spacing [m]

p = pressure p_H and p_L, [N/mm^2], as defined in 1.3.

For secondary stiffeners of lower plating of double skin hatch covers, requirements mentioned above are not applied due to the absence of lateral loads.
The net thickness [mm], of the stiffener (except u-beams/trapeze stiffeners) web is to be taken not less than 4 [mm].

3.5.2 The net section modulus of the secondary stiffeners is to be determined based on an attached plate width assumed equal to the stiffener spacing.

3.5.3 For flat bar secondary stiffeners and anti-buckling stiffeners, the ratio h/t_w is to be not greater than $15.k^{0.5}$, where:

h = height of the stiffener [mm]

t_w = net thickness of the stiffener [mm]
k = $235/\sigma_F$

3.5.4 Stiffeners parallel to primary supporting members and arranged within the effective breadth according to 3.7.1 must be continuous at crossing primary supporting member and may be considered for calculating the cross sectional properties of primary supporting members. It is to be verified that the combined stress of those stiffeners induced by the bending of primary supporting members and lateral pressures does not exceed the permissible stresses according to 3.3.1. The requirements of this paragraph are not applied to stiffeners of lower plating of double skin hatch covers if the lower plating is not considered as strength member.

3.5.6 For hatch cover stiffeners under compression sufficient safety against lateral and torsional buckling according 3.8.3 is to be verified.

3.5.7 For hatch covers subject to wheel loading or point loads stiffener scantlings are to be determined under consideration of the permissible stresses according to 3.3.1 or are to be determined according to Ch.9, Sec.6.

3.6 Net scantling of primary supporting members

3.6.1 Primary supporting members

Scantlings of primary supporting members are obtained from calculations according to 3.7 under consideration of permissible stresses as per 3.3.1.

For all components of primary supporting members sufficient safety against buckling must be verified according to 3.8. For biaxial compressed flange plates this is to be verified within the effective widths according to 3.8.3.2.

The net thickness of webs of primary supporting members is not to be less than:

$t = 6.5 \cdot s$ [mm]

$t_{\min} = 5$ [mm]

s = stiffener spacing [m].

3.6.2 Edge girders (Skirt plates)

Scantlings of edge girders are obtained from the calculations according to 3.7 under consideration of permissible stresses as per 3.3.1.

The net thickness of the outer edge girders exposed to wash of sea is not to be less than the largest of the following values:

$$t = 15.8 . s . \sqrt{\frac{p_A . 10^3}{0.95 . \sigma_F}} \text{ [mm]}$$

$t = 8.5 \cdot s$ [mm]

$t_{min} = 5$ [mm]

p_A = horizontal pressure [N/mm^2] as defined in 1.3.2

s = stiffener spacing [m]

The stiffness of edge girders is to be sufficient to maintain adequate sealing pressure between securing devices. The moment of inertia of edge girders is not to be less than:

$I = 6 \cdot q \cdot s_{SD}{}^4$ [cm^4]

q = packing line pressure [N/mm], minimum 5 [N/mm]

s_{SD} = spacing, [m], of securing devices

3.7 Strength calculations

Strength calculation for hatch covers may be carried out by either, grillage analysis or FEM. Double skin hatch covers or hatch covers with box girders are to be assessed using FEM, refer to 3.7.2.

3.7.1 Effective cross-sectional properties for calculation by grillage analysis

Cross-sectional properties are to be determined considering the effective breadth. Cross sectional areas of secondary stiffeners parallel to the primary supporting member under consideration within the effective breadth can be included, refer Fig. 3.8.3.2.1.

The effective breadth of plating e_m of primary supporting members is to be determined according to Table 3.7.1, considering the type of loading. Special calculations may be required for determining the effective breadth of one-sided or non-symmetrical flanges.

The effective cross sectional area of plates is not to be less than the cross sectional area of the face plate.

For flange plates under compression with secondary stiffeners perpendicular to the web of the primary supporting member, the effective width is to be determined according to 3.8.3.2.

Table 3.7.1 : Effective breadth e_m of plating of primary supporting members

l/e	0	1	2	3	4	5	6	7	≥ 8
e_{m1}/e	0	0.36	0.64	0.82	0.91	0.96	0.98	1.00	1.00
e_{m2}/e	0	0.20	0.37	0.52	0.65	0.75	0.84	0.89	0.90

e_{m1} is to be applied where primary supporting members are loaded by uniformly distributed loads or else by not less than 6 equally spaced single loads

e_{m2} is to be applied where primary supporting members are loaded by 3 or less single loads

Intermediate values may be obtained by direct interpolation.

l length of zero-points of bending moment curve:

$l = l_0$ for simply supported primary supporting members

$l = 0{,}6 \cdot l_0$ for primary supporting members with both ends constraint,

where l_0 is the unsupported length of the primary supporting member

e width of plating supported, measured from centre to centre of the adjacent unsupported fields

3.7.2 General requirements for FEM calculations

For strength calculations of hatch covers by means of finite elements, the cover geometry is to be idealized as realistically as possible. Element size is to be appropriate to account for effective breadth. In no case element width is to be larger than stiffener spacing. In way of force transfer points and cutouts the mesh has to be refined where applicable. The ratio of element length to width is not exceed 4.

The element height of webs of primary supporting member is not to exceed one-third of the web height. Stiffeners and supporting plates against pressure loads, are to be included in the idealization. Stiffeners may be modelled by using shell elements, plane stress elements or beam elements. Anti-buckling stiffeners may be disregarded for the stress calculation.

3.8 Buckling strength of hatch cover structures

For hatch cover structures sufficient buckling strength is to be demonstrated.

The buckling strength assessment of coaming parts is to be done according to Ch.3, Sec.6.

Definitions

a = length of the longer side of a single plate field [mm] (x-direction)

b = breadth of the shorter side of a single plate field [mm] (y-direction)

α = aspect ratio of single plate field

= a / b

n = number of single plate field breadths within the partial or total plate field

t = net plate thickness [mm]

σ_x = membrane stress, [N/mm²], in x-direction

σ_y = membrane stress, [N/mm²], in y-direction

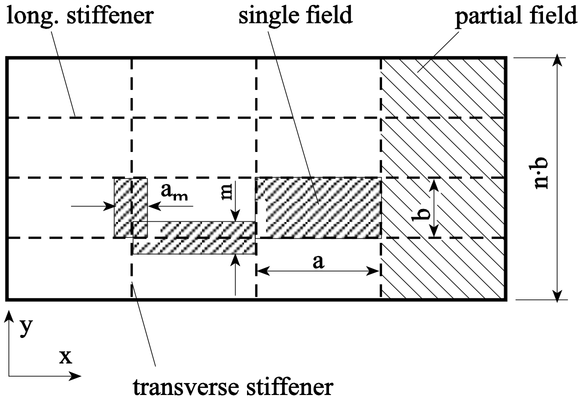
τ = shear stress, [N/mm²], in the x-y plane

E = modulus of elasticity [N/mm²], of the material

= $2.06 \cdot 10^5$ [N/mm^2] for steel

σ_F = minimum yield stress, [N/mm²], of the material

Compressive and shear stresses are to be taken positive, tensile stresses are to be taken negative.



longitudinal : stiffener in the direction of the length a
transverse : stiffener in the direction of the breath b

Fig. 3.8 : General arrangement of panel

Note:

If stresses in the x- and y-direction already contain the Poisson-effect (calculated using FEM), the following modified stress values may be used. Both stresses σ_x^* and σ_y^* are to be compressive stresses, in order to apply the stress reduction according to the following formulae:

$$\sigma_x = \left(\sigma_x^* - 0.3 \cdot \sigma_y^*\right) / 0.91$$

$$\sigma_y = \left(\sigma_y^* - 0.3 \cdot \sigma_x^*\right) / 0.91$$

σ_x^*, σ_y^* = *stresses containing the Poisson-effect*

Where compressive stress fulfils the condition $\sigma_y^* < 0.3\sigma_x^*$, then $\sigma_y = 0$ and $\sigma_x = \sigma_x^*$

Where compressive stress fulfils the condition $\sigma_x^* < 0.3\sigma_y^*$, then $\sigma_x = 0$ and $\sigma_y = \sigma_y^*$

F_1 = correction factor for boundary condition at the longitudinal stiffeners according to Table 3.8.

Table 3.8 : Correction factor F_1

Stiffeners sniped at both ends	1.00
Guidance values[1] where both ends are effectively connected to adjacent structures	1.05 for flat bars 1.10 for bulb sections 1.20 for angle and tee-sections 1.30 for u-type sections[2] and girders of high rigidity
An average value of F_1 is to be used for plate panels having different edge stiffeners	
[1] Exact values may be determined by direct calculations [2] Higher value may be taken if it is verified by a buckling strength check of the partial plate field using non-linear FEA and deemed appropriate by IRS, but not greater than 2.0	

σ_e = reference stress, [N/mm²], taken equal to

$$= 0.9 \cdot E\left(\frac{t}{b}\right)^2$$

Ψ = edge stress ratio taken equal to

= σ_2/σ_1 where

σ_1 = maximum compressive stress

σ_2 = minimum compressive stress or tensile stress

S = safety factor (based on net scantling approach), taken equal to

= 1.25 for hatch covers when subjected to the vertical design weather load according to 1.3.1

= 1.10 for hatch covers when subjected to loads according to 1.3.3 to 1.3.5

λ = reference degree of slenderness, taken equal to:

$$= \sqrt{\frac{\sigma_F}{K \cdot \sigma_e}}$$

K = buckling factor according to Table 3.8.2.

3.8.1 Proof of top and lower hatch cover plating

Proof is to be provided that the following condition is complied with for the single plate field of longer dimension ‘a’ and shorter dimension ‘b’.

$$\left(\frac{|\sigma_x|\cdot S}{\kappa_x\cdot\sigma_F}\right)^{e1}+\left(\frac{|\sigma_y|\cdot S}{\kappa_y\cdot\sigma_F}\right)^{e2}-B\left(\frac{\sigma_x\cdot\sigma_y\cdot S^2}{\sigma_F^2}\right)+\left(\frac{|\tau|\cdot S\cdot\sqrt{3}}{\kappa_\tau\cdot\sigma_F}\right)^{e3}\le 1.0$$

The first two terms and the last term of the above condition shall not exceed 1,0.

The reduction factors k_x, k_y and $k\tau$ are given in Table 3.8.2.

Where $\sigma_x \le 0$ (tensile stress), $k_x = 1.0$.

Where $\sigma y \le 0$ (tensile stress), $\kappa y = 1.0$.

The exponents e_1, e_2 and e_3 as well as the factor B are to be taken as given by Table 3.8.1.

Table 3.8.1 : Coefficients e_1, e_2, e_3 and factor B	
Exponents e_1 - e_3 and factor B	Plate panel
e_1	$1+\kappa_x^4$
e_2	$1+\kappa_y^4$
e_3	$1+\kappa_x\cdot\kappa_y\cdot\kappa_\tau^2$
B σ_x and σ_y positive (compressive stress)	$(\kappa_x\cdot\kappa_y)^5$
B σ_x or σ_y negative (tensive stress)	1

3.8.2 Webs and flanges of primary supporting members

For non-stiffened webs and flanges of primary supporting members sufficient buckling strength as for the hatch cover top and lower plating is to be demonstrated according to 3.8.1.

3.8.3 Proof of partial and total fields of hatch covers

3.8.3.1 Longitudinal and transverse secondary stiffeners

It is to be demonstrated that the continuous longitudinal and transverse stiffeners of partial and total plate fields comply with the conditions set out in 3.8.3.3 through 3.8.3.4.
For u-type stiffeners, the proof of torsional buckling strength according to 3.8.3.4 can be omitted. Single-side welding is not permitted to use for secondary stiffeners except for u-stiffeners.

3.8.3.2 Effective width of top and lower hatch cover plating

For demonstration of buckling strength according to 3.8.3.3 through 3.8.3.4 the effective width of plating may be determined by the following formulae:

$b_m = \kappa_x \cdot b$ for longitudinal stiffeners

$a_m = \kappa_y \cdot a$ for transverse stiffeners

see also Fig.3.8.

The effective width of plating is not to be taken greater than the value e_m obtained from 3.7.1.

The effective width e'_m of stiffened flange plates of primary supporting members may be determined as follows:

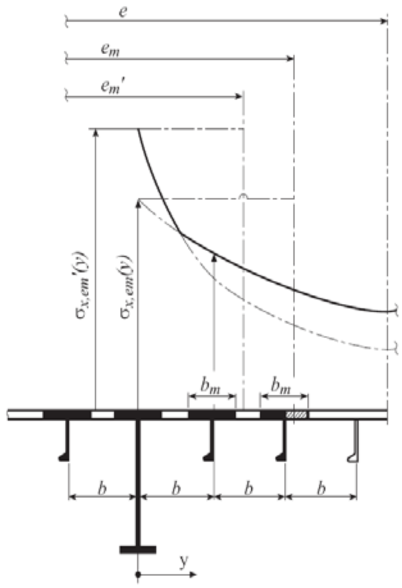

Fig. 3.8.3.2.1 : Stiffening parallel to web of primary supporting member

$b < e_m$

$e'_m = n \cdot b$

n = integer number of stiffener spacings b inside the effective breadth e_m according to 3.7.1

$= \text{int}\left(\frac{e_m}{b}\right)$

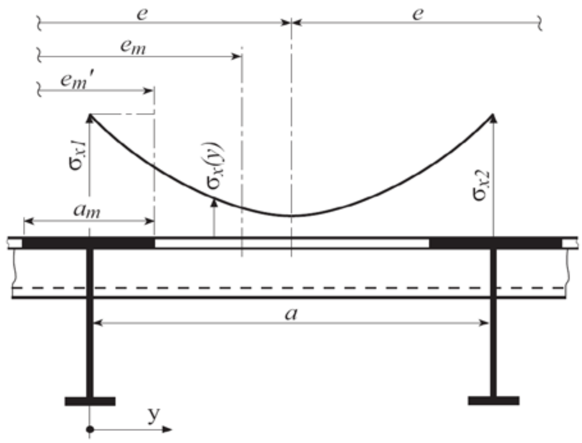

Fig. 3.8.3.2.2 : Stiffening perpendicular to web of primary supporting member

$a \geq e_m$

$e'_m = n \cdot a_m < e_m$

$n = 2{,}7 \cdot \frac{e_m}{a} \leq 1$

e = width of plating supported according to 3.7.1

For $b \geq e_m$ or $a < e_m$, respectively, b and a have to be exchanged.

a_m and b_m for flange plates are in general to be determined for $\psi = 1$.

Note:

Scantlings of plates and stiffeners are in general to be determined according to the maximum stresses $\sigma_x(y)$ at webs of primary supporting member and stiffeners, respectively. For stiffeners with spacing "b" under compression arranged parallel to primary supporting members no value less than "0.25" $\cdot \sigma_F$ shall be inserted for $\sigma_x(y{=}b)$.

The stress distribution between two primary supporting members can be obtained by the following formula:

$$\sigma_x(y) = \sigma_{x1} \cdot \left\{1 - \frac{y}{e}\left[3 + c_1 - 4 \cdot c_2 - 2\,\frac{y}{e}\left(1 + c_1 - 2\,c_2\right)\right]\right\}$$

$c_1 = \frac{\sigma_{x2}}{\sigma_{x1}} \qquad 0 \leq c_1 \leq 1$

$c_2 = \frac{1.5}{e} \cdot \left(e''_{m1} + e''_{m2}\right) - 0.5$

e''_{m1} = *proportionate effective breadth e_{m1} or proportionate effective width e'_{m1}*

		of primary supporting member 1 within the distance "e", as appropriate
e''_{m2}	=	*proportionate effective breadth* e_{m2} *or proportionate effective width* e'_{m2} *of primary supporting member 2 within the distance "e", as appropriate*
σ_{x1}, σ_{x2}	=	*normal stresses in flange plates of adjacent primary supporting member 1 and 2 with spacing e, based on cross-sectional properties considering the effective breadth or effective width, as appropriate*
y	=	*distance of considered location from primary supporting member 1*

Shear stress distribution in the flange plates may be assumed to vary linearly.

3.8.3.3 Lateral buckling of secondary stiffeners

$$\frac{\sigma_a + \sigma_b}{\sigma_F} S \leq 1$$

σ_a = uniformly distributed compressive stress, [N/mm^2] in the direction of the stiffener axis.

σ_a = σ_x for longitudinal stiffeners

σ_a = σ_y for transverse stiffeners

σ_b = bending stress, [N/mm^2], in the stiffener

$$= \frac{M_0 + M_1}{Z_{st} \cdot 10^3}$$

M_0 = bending moment, [Nmm], due to the deformation "w" of stiffener, taken equal to:

$$M_0 = F_{Ki} \frac{p_z \cdot w}{c_f - p_z} \quad \text{with } \left(c_f - p_z\right) > 0$$

M_1 = bending moment, [Nmm], due to the lateral load "p" equal to:

$$\mathrm{M}_1 = \frac{\mathrm{p}.10^3.\mathrm{b}.\mathrm{a}^2}{24\,\mathrm{x}10^3} \quad \text{for longitudinal stiffeners}$$

$$\mathrm{M}_1 = \frac{\mathrm{p}.10^3\,\mathrm{a(n/b)}^2}{\mathrm{c_s}.8\,\mathrm{x}10^3} \quad \text{for transverse stiffeners}$$

n is to be taken equal to 1 for ordinary transverse stiffeners.

p = lateral load [N/mm²]

F_{Ki} = ideal buckling force [N] of the stiffener

$$F_{Kix} = \frac{\pi^2}{a^2} \cdot E \cdot I_x \cdot 10^4$$ for longitudinal stiffeners

$$F_{Kiy} = \frac{\pi^2}{(n \cdot b)^2} \cdot E \cdot I_y \cdot 10^4$$ for transverse stiffeners

I_x, I_y = net moments of inertia, [cm^4], of the longitudinal or transverse stiffener including effective width of attached plating according to 3.8.3.2. I_x and I_y are to comply with the following criteria:

$$I_x \geq \frac{b \cdot t^3}{12 \cdot 10^4}$$

$$I_y \geq \frac{a \cdot t^3}{12 \cdot 10^4}$$

p_z = nominal lateral load, [N/mm^2], of the stiffener due to σ_x, σ_y and τ

(i) for longitudinal stiffeners

$$p_{zx} = \frac{t}{b}\left(\sigma_{xl}\left(\frac{\pi \cdot b}{a}\right)^2 + 2 \cdot c_y \cdot \sigma_y + \sqrt{2}\tau_1\right)$$

(ii) for transverse stiffeners

$$p_{zy} = \frac{t}{a}\left(2 \cdot c_x \cdot \sigma_{xl} + \sigma_y\left(\frac{\pi \cdot a}{n \cdot b}\right)^2\left(1 + \frac{A_y}{a \cdot t}\right) + \sqrt{2}\tau_1\right)$$

$$\sigma_{xl} = \sigma_x\left(1 + \frac{A_x}{b \cdot t}\right)$$

c_x, c_y = factor taking into account the stresses perpendicular to the stiffener's axis and distributed variable along the stiffener's length

$$= 0.5.(1 + \Psi)\ \text{for}\ 0 \leq \Psi \leq 1$$

$$= \frac{0.5}{1-\Psi} \quad \text{for}\,\Psi < 0$$

A_x, A_y = net sectional area, [mm²] of the longitudinal or transverse stiffener, respectively, without attached plating

$$\tau_1 = \left[\tau - t\sqrt{\sigma_F \cdot E\left(\frac{m_1}{a^2} + \frac{m_2}{b^2}\right)}\right] \geq 0$$

for longitudinal stiffeners:

$\frac{a}{b} \geq 2.0$: $m_1 = 1.47$ $m_2 = 0.49$

$\frac{a}{b} < 2.0$: $m_1 = 1.96$ $m_2 = 0.37$

for transverse stiffeners:

$\frac{a}{n.b} \geq 0.5$: $m_1 = 0.37$ $m_2 = \frac{1.96}{n^2}$

$\frac{a}{n.b} \geq 0.5$: $m_1 = 0.49$ $m_2 = \frac{1.47}{n^2}$

$$w = w_0 + w_1$$

w_o = assumed imperfection [mm]

$$w_{0x} \leq \min\left(\frac{a}{250}, \frac{b}{250}, 10\right)$$

- for longitudinal stiffeners

$$w_{0y} \leq \min\left(\frac{a}{250}, \frac{n \cdot b}{250}, 10\right)$$

- for transverse stiffeners

Note:

For stiffeners sniped at both ends w_O must not be taken less than the distance from the midpoint of plating to the neutral axis of the profile including effective width of plating.

w_1 = Deformation of stiffener, [mm], at midpoint of stiffener span due to lateral load "*p*".

In case of uniformly distributed load the following values for "w_1" may be used:

$$w_1 = \frac{p.b.a^4.10^3}{384.10^7.E.I_x}$$ for longitudinal stifeners

$$w_1 = \frac{5.\,a.p.(n\,.b)^4.10^3}{384.10^7.E.I_y.c_x^2}$$ for transverse stiffeners

c_f = elastic support provided by the stiffener, [N/mm²]

i) For longitudinal stiffeners:

$$c_{fx} = F_{Kix} \cdot \frac{\pi^2}{a^2} \cdot (1 + c_{px})$$

$$c_{px} = \frac{1}{\left\{1 + \frac{0.91.\left(\frac{12.10^4.I_x}{t^3.b} - 1\right)}{c_{xa}}\right\}}$$

$$c_{xa} = \left[\frac{a}{2b} + \frac{2b}{a}\right]^2 \quad \text{for} \quad a \geq 2b$$

$$c_{xa} = \left[1 + \left(\frac{a}{2b}\right)^2\right]^2 \quad \text{for} \quad a < 2b$$

ii) For transverse stiffeners:

$$c_{fy} = c_S \cdot F_{Kiy} \cdot \frac{\pi^2}{(n \cdot b)^2} \cdot (1 + c_{py})$$

$$c_{py} = \frac{1}{\left\{1 + \frac{0.91.\left(\frac{12.10^4.I_y}{t^3.a} - 1\right)}{c_{ya}}\right\}}$$

$$c_{ya} = \left[\frac{n \cdot b}{2a} + \frac{2a}{n \cdot b}\right]^2 \quad \text{for}$$

$n \cdot b \geq 2a$

$$c_{ya} = \left[1 + \left(\frac{n \cdot b}{2a}\right)^2\right]^2 \quad \text{for} \quad n \cdot b < 2a$$

c_S = factor accounting for the boundary conditions of the transverse stiffener
= 1.0 for simply supported stiffeners
= 2.0 for partially constrained stiffeners

Z_{St} = net section modulus of stiffener (longitudinal or transverse) [cm³] including effective width of plating according to 3.8.3.2.

If no lateral load "p" is acting the bending stress "σ_b" is to be calculated at the midpoint of the stiffener span for that fibre which results in the largest stress value. If a lateral load "p" is acting, the stress calculation is to be carried out for both fibres of the stiffener's cross sectional area (if necessary for the biaxial stress field at the plating side).

3.8.3.4 Torsional buckling of secondary stiffeners

3.8.3.4.1 Longitudinal secondary stiffeners

The longitudinal ordinary stiffeners are to comply with the following criteria:

$$\frac{\sigma_x \cdot S}{\kappa_T \cdot \sigma_F} \le 1.0$$

K_T = coefficient taken equal to:

$\kappa_T = 1.0$ for $\lambda_T \le 0.2$

$$\kappa_T = \frac{1}{\Phi + \sqrt{\Phi^2 - \lambda_T^2}} \quad \text{for } \lambda_T > 0.2$$

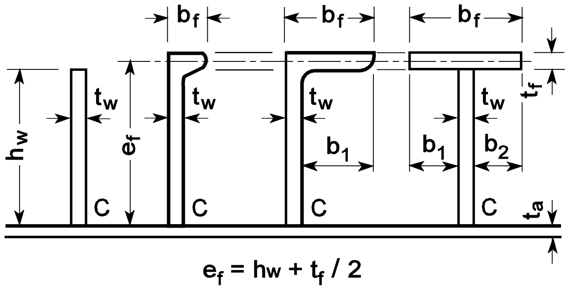
$$\Phi = 0.5\left(1 + 0.21(\lambda_T - 0.2) + \lambda_T^2\right)$$

λ_T = reference degree of slenderness taken equal to:

$$\lambda_T = \sqrt{\frac{\sigma_F}{\sigma_{KiT}}}$$

$$\sigma_{KiT} = \frac{E}{I_P}\left(\frac{\pi^2 \cdot I_\omega \cdot 10^2}{a^2}\varepsilon + 0.385 \cdot I_T\right),$$
[N/mm²]

For I_P, I_T, I_ω see Fig. 3.8.3.4.1 and Table 3.8.3.4.1.



e_f = hw + t_f / 2

Fig. 3.8.3.4.1 : Dimensions of stiffener

I_P = net polar moment of inertia of the stiffener, [cm⁴], related to the point C

I_T = net St. Venant's moment of inertia of the stiffener, [cm⁴]

I_ω = net sectorial moment of inertia of the stiffener, [cm⁶], related to the point C

ε = degree of fixation taken equal to:

$$\varepsilon = 1 + 10^{-3}\sqrt{\frac{a^4}{\frac{3}{4}\pi^4 \cdot I_\omega\left(\frac{b}{t^3} + \frac{4h_w}{3t_w^3}\right)}}$$

h_w = web height, [mm]

t_w = net web thickness, [mm]

b_f = flange breadth, [mm]

t_f = net flange thickness, [mm]

A_w = net web area equal to: $A_w = h_w \cdot t_w$

A_f = net flange area equal to: $A_f = b_f \cdot t_f$

$e_f = h_w + \frac{t_f}{2}$, [mm]

Table 3.8.3.4.1 : Moments of inertia

Section	I_P	I_T	I_ω
Flat bar	$\dfrac{h_w^3 \cdot t_w}{3 \cdot 10^4}$	$\dfrac{h_w \cdot t_w^3}{3 \cdot 10^4}\left(1 - 0.63\dfrac{t_w}{h_w}\right)$	$\dfrac{h_w^3 \cdot t_w^3}{36 \cdot 10^6}$
Sections with bulb or flange	$\left(\dfrac{A_w \cdot h_w^2}{3} + A_f \cdot e_f^2\right)10^{-4}$	$\dfrac{h_w \cdot t_w^3}{3 \cdot 10^4}\left(1 - 0.63\dfrac{t_w}{h_w}\right)$ + $\dfrac{b_f \cdot t_f^3}{3 \cdot 10^4}\left(1 - 0.63\dfrac{t_f}{b_f}\right)$	for bulb and angle sections: $\dfrac{A_f \cdot e_f^2 \cdot b_f^2}{12 \cdot 10^6}\left(\dfrac{A_f + 2.6A_W}{A_f + A_W}\right)$ for tee-sections: $\dfrac{b_f^3 \cdot t_f \cdot e_f^2}{12 \cdot 10^6}$

3.8.3.4.2 Transverse secondary stiffeners

For transverse secondary stiffeners loaded by compressive stresses and which are not supported by longitudinal stiffeners, sufficient torsional buckling strength is to be demonstrated analogously in accordance with 3.8.3.4.1.

3.9 Hatch covers with variable cross-section

Hatch covers with Z and I gradually reducing towards the ends of the span are to be designed so that the maximum bending stresses and deflections are not increased.

3.9.1 When the section shape is reduced towards the ends (See Fig. 3.9) the requirements of the section modulus Z and the moment of inertia I of the section in the middle uniform part are to be increased by the factors C_1 and C_2 respectively

where C_1 and C_2 are given by

$$C_1 = 1 + \frac{3.2\alpha - \beta - 0.8}{7\beta + 0.4}$$

$$C_2 = 1 + 8\alpha^3 \frac{1 - \delta}{0.2 + 3\sqrt{\delta}}$$

where,

$\alpha = l_1 / l_0$

$\beta = Z_1/Z_o$

$\delta = I_1/I_o$

I_o, Z_0 and I_1, Z_1 are the moment of inertia and section modulus at middle of span and at the ends respectively as shown in Fig.3.9.

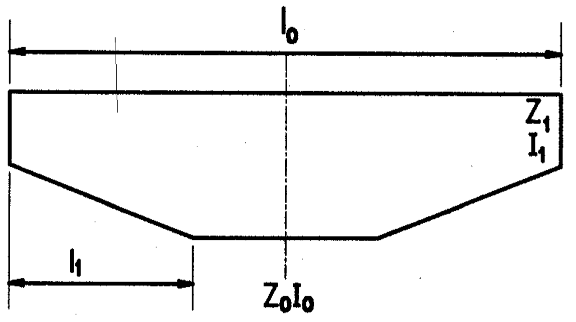


Fig.3.9 : Hatchcovers with variable cross-section

3.9.2 The net web area of the primary supporting members at any point is not to be less than:

$$A = 10\frac{\left(0.5 - \dfrac{x}{l}\right)}{\tau_a}.l\text{sp } [\text{cm}^2]$$

where,

τ_a = allowable shear stress

= 0.46 σ_F [N/mm^2]

x is the distance [m] from the end of the span to the section considered. The value of x is not to be taken more than 0.25*l*.

3.10 Wooden hatch covers

3.10.1 Wooden hatch covers are to have a finished thickness of not less than 60[mm] in association with an unsupported span of 1.5 [m] and of not less than 82 [mm] with 2 [m] unsupported span. The thickness for the intermediate span may be obtained by linear interpolation. Where the tween deck height exceeds 2.6 [m], the thickness of the wood hatch cover is to be increased at the rate of 16.5 per cent per metre of excess tween deck height.

3.10.2 The ends of all wooden hatch covers are to be protected by encircling with galvanized steel bands, about 65 [mm] wide and 3 [mm] thick, efficiently secured.

3.11 Portable hatch beams

3.11.1 The section modulus and the moment of inertia of the portable hatch beams stiffened at their upper and lower edges by continuous flat bars are to satisfy the requirements of 3.4 for pontoon hatch covers.

3.11.2 The ends of the web plates are to be doubled, or inserts fitted for at least 180 [mm] along the length of the web.

3.11.3 The beams which carry the ends of wood or steel hatch covers, a 50 [mm] vertical flat is to be arranged on the upper face plate. The width of bearing surface for hatch covers is to be not less than 65 [mm].

3.11.4 Carriers or sockets, or other suitable arrangements are to be provided as means of the efficient fitting and securing of portable hatch beams. The arrangements are to be of suitable construction and the width of the bearing surface is not to be less than 75 [mm].

3.11.5 Sliding hatch beams are to be provided with an efficient device for locking them in their correct fore and aft positions when the hatchway is closed.

3.12 Direct calculations

3.12.1 Hatchcovers of special construction and arrangement e.g. covers designed and constructed as a grillage, covers supported along more than two opposite edges and covers supporting other covers, may require submission of direct strength calculation taking into account the arrangement of stiffeners and the supporting members.

Section 4

Hatch Cover Securing Arrangement

4.1 General

4.1.1 The gaskets and the securing arrangements are to be designed for the expected relative movement between cover and coaming or special devices are to be fitted to restrict such movement.

4.1.2 Securing arrangements together with suitable gasketting material are to ensure weathertightness of the covers to the satisfaction of the surveyors. The arrangements are to be such as to ensure that the weathertightness can be maintained in any sea condition.

4.1.3 The gasket material is to be of satisfactory air, seawater and if necessary oil resistant quality. It is to be effectively secured along the edges of the cover in a manner as to ensure that the forces from the hatch covers or cargo stowed on top of the hatchcovers are transferred to the coaming or to the deck by direct contact. The sealing is to be achieved by relatively soft packing. The hatch coaming or steel parts on the adjacent covers in contact with the packing are to be well rounded where necessary.

4.1.4 Dispensation of weather tight gaskets

For hatch covers of cargo holds solely for the transport of containers, upon request by the owners and subject to compliance with the following conditions the fitting of weather tight gaskets according to 4.1.2 and 4.1.3 may be dispensed with:

- The hatchway coamings is not to be less than 600 [mm] in height;

- The exposed deck on which the hatch covers are located is situated above a depth H(x) . H(x) is to be shown to comply with the following criteria:

  $H(x) \geq T_{fb} + f_b + h$ [m]

  T_{fb} = draught [m] corresponding to the assigned summer load line

  f_b = minimum required freeboard [m], determined in accordance with ICLL Reg.28 as modified by further regulations as applicable.

  $$h = 4.6\,\mathrm{m\,for}\,\frac{x}{L_L} \leq 0.75$$

  $$= 6.9\,\mathrm{m\,for}\,\frac{x}{L_L} \geq 0.75$$

- Labyrinths, gutter bars or equivalents are to be fitted proximate to the edges of each panel in way of the coamings. The clear profile of these opening is to be kept as small as possible.

- Where a hatch is covered by several hatch cover panels the clear openings of the gap in between the panels is not to be wider than 50 [mm].

- The labyrinths and gaps between hatch cover panels is to be considered as unprotected openings with respect to the requirements of intact and damage stability calculations.

- With regard to drainage of cargo holds and the necessary fire-fighting system reference is made to the sections P*iping Systems, Valves and Pumps and Fire Protection and Fire Extinguishing Equipment* of Pt.4, Ch.3, Pt.6 and Pt. 5, Ch.5, Sec. 2.2 of the Rules.

- Bilge alarms is be provided in each hold fitted with non-weathertight covers.

- Furthermore, Chapter 3 of IMO MSC/Circ. 1087 is to be referred to concerning the stowage and segregation of containers containing dangerous goods.

4.1.5 Securing devices are to be of reliable construction and securely attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

4.1.6 A metallic contact is to be kept between the hatchcover and the hull to effect electrical earthing.

4.1.7 Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

4.1.8 In case where hydraulic arrangement is provided for securing the cleats, the system is to remain mechanically locked in closed position in the event of a failure of the hydraulic system.

4.1.9 Materials used in the manufacturer of stoppers or securing devices including welding electrodes are to be in accordance with relevant requirements given in Part 2.

4.2 Portable steel covers - tarpaulins and battening devices

4.2.1 At least two layers of tarpaulins in good condition are to be provided for each hatchway in position 1 and 2. The tarpaulins are to be free from jute, and are to be waterproof and of ample strength. The minimum mass of the material before treatment is to be 0.65 [kg/m^2] if the material is to be tarred, 0.60 [kg/m^2] if it is to be chemically dressed and 0.55 [kg/m^2] if to be dressed with black oil. A certificate to this effect is to be supplied by the makers of the tarpaulins. Special consideration will be given to the synthetic materials for the tarpaulins.

4.2.2 Cleats are to be of an approved pattern, at least 65 [mm] wide, with edges so rounded as to minimize damage to the wedges, and are to be spaced not more than 600 [mm] from centre to centre; the first and last cleats along each side or end being not more than 150 [mm] from the hatch corners. Cleats are to be so set as to fit the taper of the wedges.

4.2.3 Battens and wedges are to be efficient and in good condition. Wedges are to be of tough wood, generally not more than 200 [mm] in length and 50 [mm] in width. They should have a taper of not more than 1 in 6 and should not be less than 13 [mm] thick at the point.

4.2.4 For all hatchways in positions 1 and 2, steel bars or other equivalent means are to be provided in order to efficiently and independently secure each section of hatch covers after the tarpaulins are battened down. Hatch covers of more than 1.5 [m] in length are to be secured by at least two such securing devices. Where hatchway covers extend over intermediate supports, steel bars or their equivalent are to be fitted at each end of each section of the covers. At all other hatchways in exposed position on weather decks, ring bolts or other fittings suitable for lashings are to be provided.

Acceptable equivalent means to steel bars are to consist of devices and materials which will provide strength and stiffness equivalent to that of steel. Steel wire ropes cannot be regarded as satisfactory equivalent means. Care is to be taken that tarpaulins are adequately protected from the possibility of damage arising from the usage of securing devices which do not provide a flat bearing surface.

4.3 Securing devices

4.3.1 General

Securing devices between cover and coaming and at cross-joints are to be installed to provide weathertightness. Sufficient packing line pressure is to be maintained.

Securing devices must be appropriate to bridge displacements between cover and coaming due to hull deformations.

Securing devices are to be of reliable construction and effectively attached to the hatchway coamings, decks or covers. Individual securing devices on each cover are to have approximately the same stiffness characteristics.

Sufficient number of securing devices is to be provided at each side of the hatch cover considering the requirements of 3.6.2. This applies also to hatch covers consisting of several parts.

The materials of stoppers, securing devices and their weldings are to be to the satisfaction of IRS. Specifications of the materials are to be shown in the drawings of the hatch covers.

4.3.2 Rod cleats

Where rod cleats are fitted, resilient washers or cushions are to be incorporated.

4.3.3 Hydraulic cleats

Where hydraulic cleating is adopted, a positive means is to be provided so that it remains mechanically locked in the closed position in the event of failure of the hydraulic system.

4.3.4 Cross-sectional area of the securing devices

The gross cross-sectional area [cm^2] of the securing devices is not to be less than:

$$A = 0.28 \cdot q \cdot s_{SD} \cdot k_l$$

q = packing line pressure [N/mm], minimum 5 [N/mm]

s_{SD} = spacing between securing devices [m], not to be taken less than 2 [m]

$k_l = \left(\frac{235}{\sigma_F}\right)^e$, σ_F is the minimum yield strength of the material [N/mm^2], but is not to be taken greater than 0,7 σ_m where σ_m is the tensile strength of the material [N/mm^2].

e = 0.75 for $\sigma_F > 235$ [N/mm^2]
= 1.00 for $\sigma_F \leq 235$ [N/mm^2]

Rods or bolts are to have a gross diameter not less than 19 mm for hatchways exceeding 5 [m²] in area.

Securing devices of special design in which significant bending or shear stresses occur may be designed as anti-lifting devices according to 4.3.5. As load, the packing line pressure q multiplied by the spacing between securing devices s_{SD} is to be applied.

4.3.5 Anti lifting devices

The securing devices of hatch covers, on which cargo is to be lashed, are to be designed for the lifting forces resulting from loads according to 1.3.4, refer Fig.4.3.5. Unsymmetrical loadings, which may occur in practice, are to be considered. Under these loadings the equivalent stress in the securing devices is not to exceed:

$$\sigma_V = \frac{150}{k_l} \text{ [N/mm²]}$$

Note:
The partial load case given in Table 1.3.4.4 may not cover all unsymmetrical loadings, critical for hatch cover lifting.

Omission of anti-lifting devices will be specially considered.

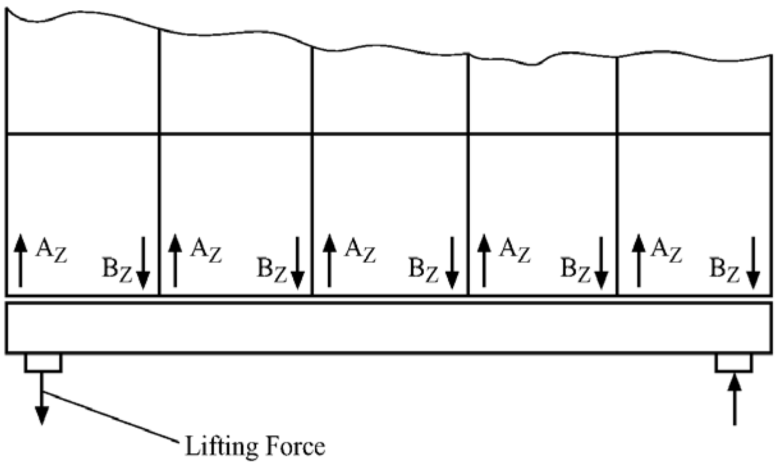

Fig. 4.3.5 : Lifting forces at a hatch cover

4.4 Hatch cover supports, stoppers and supporting structures

4.4.1 Horizontal mass forces

For the design of the hatch cover supports the horizontal mass forces $F_h = m \cdot a$ are to be calculated with the following accelerations:

$a_X = 0.2 \cdot g$ in longitudinal direction

$a_Y = 0.5 \cdot g$ in transverse direction

m = Sum of mass of cargo lashed on the hatch cover and mass of hatch cover

The accelerations in longitudinal direction and in transverse direction do not need to be considered as acting simultaneously.

4.4.2 Hatch cover supports

For the transmission of the support forces resulting from the load cases specified in 1.3 and of the horizontal mass forces specified in 4.4.1, supports are to be provided which are to be designed such that the nominal surface pressures in general do not exceed the following values:

$p_{n\max} = d \cdot p_n$ [N/mm^2]

d = 3.75 – 0.015 L

$d_{\max}$ = 3.0

$d_{\min}$ = 1.0 in general

= 2.0 for partial loading conditions, see 1.3.4.1

P_n = permissible nominal surface pressure [N/mm^2] as per Table 4.4.2.

For metallic supporting surfaces not subjected to relative displacements, the nominal surface pressure applies:

$p_{n\max} = 3 \cdot p_n$ [N/mm²]

Note:

When the maker of vertical hatch cover support material can provide proof that the material is sufficient for the increased surface pressure, not only statically but under dynamic conditions including relative motion for adequate number of cycles, permissible nominal surface pressure may be relaxed at the discretion of IRS. However, realistic long term distribution of spectra for vertical loads and relative horizontal motion should be assumed and agreed with IRS.

Drawings of the supports are to be submitted. In the drawings of supports the permitted maximum pressure given by the material manufacturer must be specified.

Where large relative displacements of the supporting surfaces are to be expected, the use of material having low wear and frictional properties is recommended.

Table 4.4.2 : Permissible nominal surface pressure p_n		
Support material	p_n [N/mm²] when loaded by	
	Vertical force	Horizontal force (on stoppers)
Hull structural steel	25	40
Hardened steel	35	50
Plastic materials on steel	50	–

The substructures of the supports must be of such a design, that a uniform pressure distribution is achieved.

Irrespective of the arrangement of stoppers, the supports must be able to transmit the following force P_h in the longitudinal and transverse direction:

$$P_h = \mu \cdot \frac{P_V}{\sqrt{d}}$$

P_V = vertical supporting force

μ = frictional coefficient
= 0.5 in general

For non-metallic, low-friction support materials on steel, the friction coefficient may be reduced but not to be less than 0.35 and to the satisfaction of IRS.

Supports as well as the adjacent structures and substructures are to be designed such that the permissible stresses according to 3.3.1 are not exceeded.

For substructures and adjacent structures of supports subjected to horizontal forces P_h, a fatigue strength analysis is to be carried out.

4.4.3 Hatch cover stoppers

Hatch covers shall be sufficiently secured against horizontal shifting. Stoppers are to be provided for hatch covers on which cargo is carried.

The greater of the loads resulting from 1.3.2 and 4.4.1 is to be applied for the dimensioning of the stoppers and their substructures.
The permissible stress in stoppers and their substructures, in the cover, and of the coamings is to be determined according to 3.3.1. In addition, the provisions in 4.4.2 are to be observed.

Section 5

Side Shell Doors and Stern Doors

5.1 General

5.1.1 These rules give requirements for the arrangement, strength and securing of side shell doors, abaft the collision bulkhead, and stern doors leading into enclosed spaces.

5.1.2 Stern doors for passenger vessels are to be situated above the freeboard deck. Stern doors for Ro-Ro cargo ships and side shell doors may be either below or above the freeboard deck.

5.1.3 Side shell doors and stern doors are to be so fitted as to ensure tightness and structural integrity commensurate with their location and the surrounding structure.

The sill of any side shell door is, in general, not to be below a line drawn parallel to the freeboard deck at side, with its lowest point 230 [mm] above the uppermost loadline.

5.1.4 Where the sill of any side shell door is below the line specified in 5.1.3 satisfactory additional features are to be fitted to maintain the watertight integrity. Fitting of a second door of equivalent strength and watertightness is one acceptable arrangement. Leakage detection device should be provided in the compartment between the two doors. Further, drainage of this compartment to the bilges controlled by an easily accessible screw down valve, should be arranged.

5.1.5 Doors should preferably open outwards.

5.1.6 Definitions

Securing device : a device used to keep the door closed by preventing it from rotating about its hinges or about pivotted attachments to the ship.

Supporting devices : a device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure.

Locking device : a device that locks a securing device in the closed position.

5.2 Design loads

5.2.1 The design forces, [N] considered for the scantlings of primary members, securing and supporting devices of side shell doors and stern doors are to be not less than:

i) Design forces for securing or supporting devices of doors opening inwards:

- external force : $F_e = AP_e\ 10^6 + F_p$
- internal force : $F_i = F_o + 10\ W$

ii) Design forces for securing or supporting devices of doors opening outwards:

- external force : $F_e = AP_e\ 10^6$
- internal force : $F_i = F_o + 10\ W + F_p$

iii) Design forces for primary members:

- external force : $F_e = AP_e\ 10^6$
- internal force : $F_i = F_o + 10\ W$

whichever is the greater,

where,

A = area [m^2] of the door opening

W = mass of the door [kg]

F_p = total packing force [N]. Packing line pressure is normally not to be taken less than 5 [N/mm]

F_o = the greater of F_c and 5000 A [N]

F_c = accidental force, [N] due to loose cargo etc., to be uniformly distributed over the area A and not to be taken less than 300000 [N]. For small doors such as bunker doors and pilot doors, the value of F_c may be appropriately reduced. However, the value of F_c may be taken as zero, provided an additional structure such as an inner ramp is fitted, which is capable of protecting the door from accidental forces due to loose cargoes.

P_e = external design pressure [N/mm^2] determined at the centre of gravity of the door opening and not taken less than the following:

a) $P_e = R_s\ k_s\ (C_w - 0.8\ h_o)\ .\ 10^{-3}$ [N/mm^2]

where,

R_s, k_s, C_w are as given in 3.2.1.

h_o = vertical distance [m] from the summer load waterline to the load point under consideration.

b) $P_e = 0.01\ (T_1 - Z_G) + 0.025$ [N/mm^2] for $Z_G < T_1$, and

0.025 [N/mm^2] for $Z_G > T_1$

where,

Z_G = height of the centre of area of the door [m] above the baseline, and

T_1 = draught [m] at the highest subdivision loadline.

Moreover, for stern doors of ships fitted with bow doors, P_e is not to be taken less than:

$P_e = 0.6\ \lambda\ C_H\ (0.8 + 0.6L^{0.5})^2\ .\ 10^{-3}$ [N/mm^2]

where,

λ = coefficient depending on the area where the ship is intended to be operated:

λ = 1 for sea going ships,

λ = 0.8 for ships operated in coastal waters,

λ = 0.5 for ships operated in sheltered waters.

C_H = 0.0125 L for L < 80 [m]
= 1 for $L \geq 80$ [m]

L = ship's length [m] but need not be taken greater than 200 [m].

5.3 Strength criteria

5.3.1 Scantlings of the primary members, securing and supporting devices of side shell doors and stern doors are to be determined considering simply supported end connections and the design loads defined in 5.2. The following permissible stresses are not to be exceeded:

shear stress : $\tau = \frac{80}{\mathrm{k}}$ [N/mm^2]

bending stress : $\sigma = \frac{120}{\mathrm{k}}$ [N/mm^2]

equivalent stress :

$$\sigma_c = \sqrt{\sigma^2 + 3\tau^2} = \frac{150}{\mathrm{k}} \text{ [N/mm}^2\text{]}$$

where k, the material factor, is not to be taken less than 0.72 unless a direct strength analysis with regard to relevant modes of failures is carried out.

5.3.2 The buckling strength of primary members is to be verified as being adequate.

5.3.3 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 0.8, where is the yield stress of the bearing material. For other bearing materials, the permissible bearing pressure is to be determined according to the manufacturer's specification.

5.3.4 The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces. The maximum tension in way of threads of bolts not carrying support forces is not to exceed 125/k [N/mm^2].

5.4 Scantlings

5.4.1 The strength of side shell doors and stern doors is to be commensurate with that of the surrounding structure.

5.4.2 Side shell doors and stern doors are to be adequately stiffened and means are to be provided to prevent any lateral or vertical movement of the doors when closed. Adequate strength is to be provided in the connections of the lifting/manoeuvring arms and hinges to the door structure and to the ship's structure.

5.4.3 Where doors also serve as vehicle ramps, the design of the hinges should take into account the ship's angle of trim and heel which may result in uneven loading on the hinges.

5.4.4 Shell door openings are to have well-rounded corners and adequate compensation is to be arranged with web frames at sides and stringers or equivalent above and below.

5.4.5 The thickness of the door plating is not to be less than the required thickness for the side shell plating, using the door stiffener spacing, and not less than the minimum required thickness of shell plating as per Ch.8, Sec.4.1.

Where doors serve as vehicle ramps, the plating thickness is to be not less than required for vehicle decks.

5.4.6 The section modulus of secondary horizontal or vertical stiffeners is not to be less than that required for side framing as per Ch.8, Sec.4.3.2 and 4.3.5.

Where doors serve as vehicle ramps, the stiffener scantlings are not to be less than required for vehicle decks.

5.4.7 The secondary stiffeners are to be supported by primary members constituting the main stiffening of the door.

5.4.8 The primary members and the hull structure in way are to have sufficient stiffness to ensure structural integrity of the boundary of the door.

5.4.9 Scantlings of the primary members are to be based on direct strength calculations in association with the design forces given in 5.2 and permissible stresses given in 5.3.1.

5.5 Securing and supporting of doors

5.5.1 Side shell doors and stern doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the doors is to be suitable for the same design loads and design stresses as the securing and supporting devices.

Where packing is required, the packing material is to be of a comparatively soft type and the supporting forces are to be carried by the steel structure only. Other types of packing may be specially considered.

Maximum design clearance between securing and supporting devices is not generally to exceed 3 [mm].

A means is to be provided for mechanically fixing the door in the open position.

5.5.2 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered to calculate the reaction forces acting on the devices. Small and/or flexible devices such as cleats intended to provide local compression of the packing material are not generally to be included in the calculations in 5.5.4. The number of securing and supporting devices are generally to be the minimum practical whilst taking into account the requirement for redundant provision given in 5.5.5 and the available space for adequate support in the hull structure.

5.5.3 Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in 5.3.1.

5.5.4 The distribution of the reaction forces acting on the securing devices and supporting devices may require direct calculations taking into account the flexibility of the hull structure and the actual position of the supports.

5.5.5 The arrangement of securing devices and supporting devices in way of these securing devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding by more than 20 per cent the permissible stresses as given in 5.3.1.

5.5.6 All load transmitting elements in the design load path, from the door through securing and supporting devices into the ship's structure, including pins, support brackets, back-up brackets and welded connections, are to be to the same strength standard as required for the securing and supporting devices.

5.6 Securing and locking arrangement

5.6.1 Securing devices are to be simple to operate and easily accessible.

Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or are to be of the gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

5.6.2 Doors which are located partly or totally below the freeboard deck with a clear opening area greater than 6 [m^2] are to be provided with an arrangement for remote control, from a position above the freeboard deck of:

- the closing and opening of the doors,
- associated securing and locking devices.

For doors which are required to be equipped with a remote control arrangement, indication of the open/closed position of the door and the securing and locking device is to be provided at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorized persons. A notice plate, giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

Alternative means of securing are to be provided for emergency use in case of failure of the power systems.

5.6.3 Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position. This means that in the event of loss of the hydraulic fluid, the securing devices remain locked.

The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits, when in closed position.

5.6.4 The requirements in 5.6.5 to 5.6.8 apply to doors in the boundary of special category spaces or ro-ro spaces, as defined in Pt.6, Ch.1, Sec.3, through which such spaces may be flooded.

For cargo ships, where no part of the door is below the uppermost waterline and the area of the door opening is not greater than 6 [m^2], the requirements of this section need not be applied.

5.6.5 Separate indicator lights and audible alarms are to be provided on the navigation bridge and on each operating panel to indicate that the doors are closed and that their securing and locking devices are properly positioned.

The indication panel is to be provided with a lamp test function. It shall not be possible to turn off the indicator light.

5.6.6 The indicator system is to be designed on the fail safe principle and is to indicate by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating the doors and is to be provided with a backup power supply from the emergency source of power or other secure power supply such as a UPS.

The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

The requirements for fail safe design principle are to be similar to those for bow doors as indicated in 6.7.4.

5.6.7 The indication panel on the navigation bridge is to be equipped with a mode selection function "harbour/sea voyage", so arranged that audible alarm is given if the vessel leaves harbour with side shell or stern doors not closed or with any of the securing devices not in the correct position.

5.6.8 For passenger ships, a water leakage detection system with audible alarm and CCTV surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of any leakage through the doors.

For cargo ships, a water leakage detection system with audible alarm is to be arranged to provide an indication to the navigation bridge.

5.6.9 For ro-ro passenger ships, on international voyages, the special category spaces and ro-ro spaces are to be continuously patrolled or monitored by effective means, such as CCTV surveillance, so that any movement of vehicles in adverse weather conditions and unauthorized access by passengers thereto, can be detected whilst the ship is underway.

5.7 Operating and maintenance manual

5.7.1 An Operating and Maintenance Manual for the side shell and stern doors is to be provided onboard and contain necessary information indicated in 6.8.1, as applicable.

This Manual has to be submitted for approval.

5.7.2 Documented operating procedures for closing and securing side shell and stern doors are to be kept on board and posted at the appropriate places.

Section 6

Bow Doors and Inner Doors

6.1 General

6.1.1 These requirements cover the arrangement, strength and securing of bow doors and inner doors leading to a complete or long forward enclosed superstructure.

6.1.2 Two types of bow doors have been considered:

- Visor doors opened by rotating upwards and outwards about a horizontal axis through two or more hinges located near the top of the door and connected to the primary structure of the door by longitudinally arranged lifting arms;

- Side-opening doors opened either by rotating outwards about a vertical axis through two or more hinges located near the outboard edges or by horizontal translation by means of linking arms arranged with pivoted attachments to the door and the ship. It is anticipated that side-opening bow doors are arranged in pairs.

Other types of bow door will be specially considered in association with the applicable requirements of this section.

6.1.3 Bow doors are to be situated above the freeboard deck. A watertight recess in the freeboard deck located forward of the collision bulkhead and above the deepest waterline fitted for arrangement of ramps or other related mechanical devices may be regarded as a part of the freeboard deck for the purpose of this requirement.

6.1.4 An inner door is to be fitted. The inner door is to be part of the collision bulkhead. The inner door need not be fitted directly above the bulkhead below, provided it is located within the limits specified for the position of the collision bulkhead. A vehicle ramp may be arranged for this purpose, provided its position is within the limits. (See Ch.10, Sec.2.2.5). If this is not possible, a separate inner weathertight door is to be installed, as far as practicable within the limits specified for the position of the collision bulkhead.

6.1.5 Bow doors are to be so fitted as to ensure tightness consistent with operational conditions and to give effective protection to inner doors. Inner doors forming part of the collision bulkhead are to be weathertight over the full height of the cargo space and arranged with fixed sealing supports on the aft side of the doors.

6.1.6 Bow doors and inner doors are to be arranged so as to preclude the possibility of the bow door causing structural damage to the inner door or to the collision bulkhead in the case of damage to or detachment of the bow door. If this is not possible, a separate inner weathertight door is to be installed, as indicated in Sec.6.1.4.

6.1.7 The requirements for inner doors are based on the assumption that vehicles are effectively lashed and secured against movement in stowed position.

6.1.8 Definitions

Securing devices : a device used to keep the door closed by preventing it from rotating about its hinges

Supporting device : a device used to transmit external or internal loads from the door to a securing device and from the securing device to the ship's structure, or a device other than a securing device, such as a hinge, stopper or other fixed device, that transmits loads from the door to the ship's structure

Locking device : a device that locks a securing device in the closed position.

6.2 Design loads

6.2.1 The external sea pressure to be considered for the scantlings of primary members, securing and supporting devices of bow doors is to be taken as the greater of

a) $P_e = R_s\ k_s\ (C_w - 0.8/h_o) \times 10^{-3}$ [N/mm^2]

where,

R_s, k_s, C_w as given in 3.2.1.

h_o = vertical distance [m] from the summer load waterline to the load point under consideration.

b) $P_e = 2.75\ \lambda\ C_H\ (0.22 + 0.15 \tan\alpha) \times$

$(0.4V \sin\beta + 0.6\ L^{0.5})^2 \times 10^{-3}$ [N/mm^2]

where,

V = maximum service speed, in knots

L = ship's length, [m], but need not be taken greater than 200 [m]

λ = coefficient depending on the area where the ship is intended to be operated:

λ = 1 for seagoing ships,

λ = 0.8 for ships operated in coastal waters,

λ = 0.55 for ships operated in sheltered waters.

C_H = 0.0125 L for L < 80 [m]
=1 for $L \geq 80$ [m]

α = flare angle [deg] at the point to be considered, defined as the angle between a vertical line and the tangent to the side shell plating, measured in a vertical plane normal to the horizontal tangent to the shell plating;

β = entry angle [deg] at the point to be considered, defined as the angle between a longitudinal line parallel to the centreline and the tangent to the shell plating in a horizontal plane. (See also Fig.6.2.1 for α and β).

6.2.2 The design external forces, considered for the scantlings of securing and supporting devices of bow doors are not to be less than:

$F_x = P_e A_x\ 10^3$ [kN]

$F_y = P_e A_y\ 10^3$ [kN]

$F_z = P_e A_z\ 10^3$ [kN]

where,

A_x = area, [m^2], of the transverse-vertical projection (i.e. in y-z plane) of the door between the levels of the bottom of the door and the top of the door including the bulwark, where it is part of the door. Where the flare angle of the bulwark is at least 15° less than the flare angle of the adjacent shell plating, the bulwark portion of the door may be excluded from the projected area.

A_y = area, [m^2], of the longitudinal-vertical projection (i.e. in (x-z plane) of the door between the levels of the bottom of the door and the top of the door, including the bulwark, where it is part of the door. Where the flare angle of the bulwark is at least 15° less than the flare angle of the adjacent shell plating, the bulwark portion of the door may be excluded from the projected area.

l = length, [m], of the door at a height h/2 above the bottom of the door;

w = breadth, [m], of the door at a height h/2 above the bottom of the door;

P_e = external pressure, as given in 6.2.1 with flare angle and entry angle β measured at a location on the shell h/2 above the bottom of the door and l/2 aft of the intersection of the door with the stem.

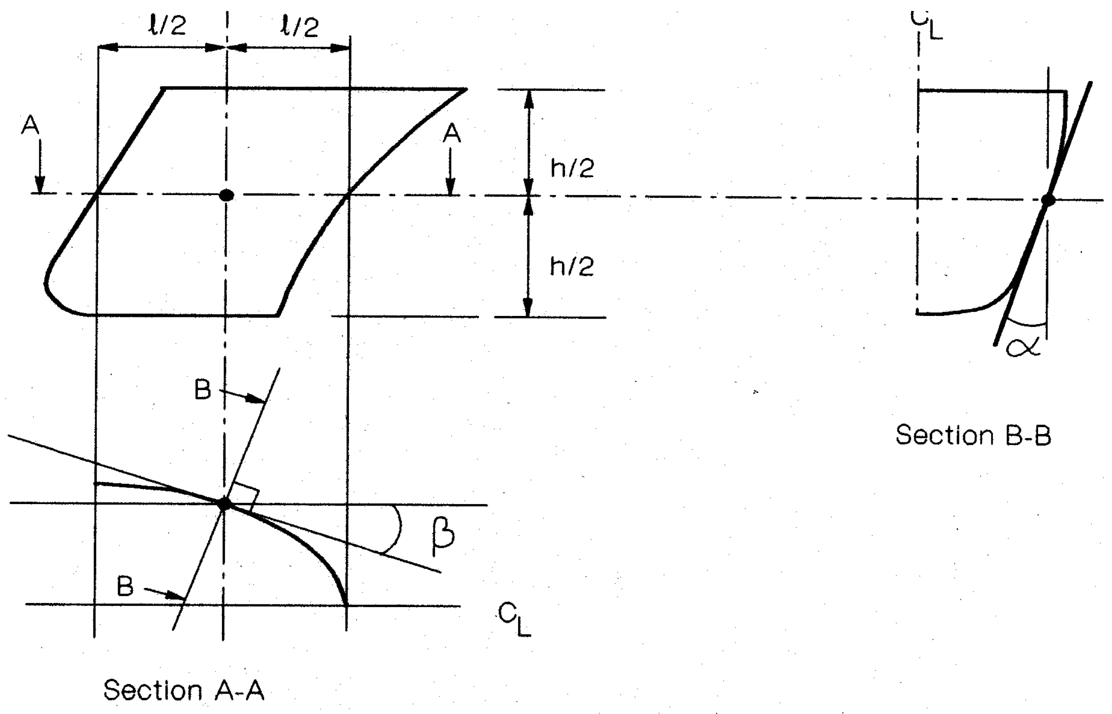

Fig.6.2.1 : Definition of α and β

A_z = area, [m^2], of the horizontal projection (i.e. in x-y plane) of the door between the bottom of the door and the top of the door, including the bulwark, where it is part of the door. Where the flare angle of the bulwark is at least 15° less than the flare angle of the adjacent shell plating, the bulwark portion of the door may be excluded from the projected area.

If the bulwark is flared inwards such that the horizontal projected area to the top of the bulwark is less than that to the upper deck, then the horizontal projected area to the upper deck is to be considered for the determination of A_z.

h = height, [m], of the door between the levels of the bottom of the door and the upper deck or between the bottom of the door and the top of the door, whichever is the lesser;

For bow doors, including bulwark, of unusual form or proportions, e.g. ships with a rounded nose and large stem angles, the areas and angles used for determination of the design values of external forces may require to be specially considered.

6.2.3 For visor doors the closing moment M_y under external loads, is to be taken as:

$$M_y = F_x\, a + 10 \,.\, c.\, W - F_z\, b \quad [\text{kN-m}]$$

where,

W = mass of the visor door, [t];

a = vertical distance, [m], from visor pivot to the centroid of the transverse vertical projected area of the visor door, as shown in Fig.6.2.3;

b = horizontal distance, [m], from visor pivot to the centroid of the horizontal projected area of the visor door, as shown in Fig.6.2.3;

c = horizontal distance, [m], from visor pivot to the centre of gravity of visor mass, as shown in Fig.6.2.3.

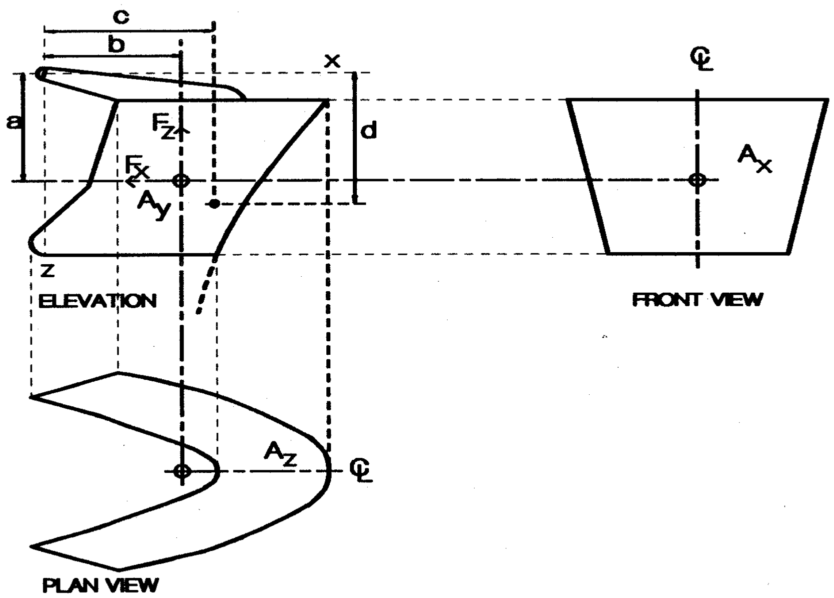

Fig.6.2.3 : Bow door of visor type

6.2.4 The design of lifting arms of a visor door and its supports is to take into account the static and dynamic forces applied during the lifting and lowering operations, and a minimum wind pressure of 0.0015 [N/mm^2].

6.2.5 The design external pressure, considered for the scantlings of primary members, securing and supporting devices and surrounding structure of inner doors is to be taken as the greater of the following:

a) $P_e = 0.45\ L \times 10^{-3}$ [N/mm^2]

b) $P_h = 0.01h$ [N/mm^2]

where,

h = the distance, [m], from the load point to the top of the cargo space.

L = ship's length [m], but need not be taken greater than 200 [m].

6.2.6 The design internal pressure P_b, considered for the scantlings of securing devices of inner doors is not to be less than:

$P_b = 0.025$ [N/mm^2]

6.3 Strength criteria

6.3.1 Scantlings of the primary members, securing and supporting devices of bow doors and inner doors are to be determined to withstand the design loads defined in 6.2, using the following permissible stresses:

bending stress:

$$\sigma = \frac{120}{\mathrm{k}}\ [\mathrm{N/mm^2}]$$

shear stress:

$$\tau = \frac{80}{\mathrm{k}}\ [\mathrm{N/mm^2}]$$

equivalent stress:

$$\sigma_c = \sqrt{\sigma^2 + 3\tau^2} = \frac{150}{\mathrm{k}}\ [\mathrm{N/mm^2}]$$

where, k, the material factor, is not to be taken less than 0.72, unless a direct fatigue analysis is carried out.

6.3.2 The buckling strength of primary members is to be in accordance with Ch.3, Sec.6.

6.3.3 For steel to steel bearings in securing and supporting devices, the nominal bearing pressure calculated by dividing the design force by the projected bearing area is not to exceed 0.8 times the yield stress of the bearing material. For other bearing materials, the bearing pressure is not to exceed the manufacturer's recommended value.

6.3.4 The arrangement of securing and supporting devices is to be such that threaded bolts do not carry support forces.

In bolts not carrying support forces, the maximum tensile stress in way of the bolt threads is not to exceed.

$$\tau = \frac{125}{\mathrm{k}}\ [\mathrm{N/mm^2}]$$

6.4 Scantlings of bow doors

6.4.1 General

The strength of bow doors is to be commensurate with that of the surrounding structure.

Bow doors are to be adequately stiffened and means are to be provided to prevent lateral or vertical movement of the doors when closed. For visor doors adequate strength for the opening and closing operations is to be provided in the connections of the lifting arms to the door structure and to the ship structure.

6.4.2 Plating and secondary stiffeners

The thickness of the bow door plating is not to be less than that required for the side shell plating as in Ch.8, Sec.4.1, using the bow door spacing and also not less than the minimum required thickness of fore end shell plating.

The section modulus of horizontal or vertical stiffeners is not to be less than that required for the end framing given in Ch.8, Sec.4.5 increased by 50 percent for simply supported ends.

The net sectional area of stiffener webs is not to be less than:

$$A = 0.05\ P_e s.l.\ \ [\mathrm{cm^2}]$$

6.4.3 Primary structure

The bow door secondary stiffeners are to be supported by primary members constituting the main stiffening of the door.

The primary members of the bow door and the hull structure in way, are to have sufficient stiffness to ensure integrity of the boundary support of the door.

Scantlings of the primary members are to be based on the external pressure given in 6.2.1 and permissible stresses given in 6.3. Supporting calculations for resultant stresses are to be submitted. Simple beam theory may be applied to determine the bending stresses. Members are to be considered to have simply supported end connections.

6.5 Scantlings of inner doors

6.5.1 General

Scantlings of the primary members of inner doors are to be based on the external pressure given in 6.2.5 and permissible stresses given in 6.3. Supporting calculations for resultant stresses are to be submitted.

Where inner doors also serve as vehicle ramps, the scantlings are not to be less than those required for vehicle decks as given in Ch.8, Sec.6.

Calculations to determine the distribution of forces acting on the securing and supporting devices are to take into account the flexibility of the structure and the actual position and stiffness of the supports and are to be submitted for approval.

6.6 Securing and supporting of bow doors

6.6.1 Bow doors are to be fitted with adequate means of securing and supporting so as to be commensurate with the strength and stiffness of the surrounding structure. The hull supporting structure in way of the bow doors is to be strengthened for the loads and stresses arising from the securing and supporting devices. Where packing is required, the packing material is to be of a comparatively soft type, and the supporting forces are to be carried by the steel structure only. Other types of packing may be considered. Maximum design clearance between securing and supporting devices is not generally to exceed 3 [mm].

Means are to be provided for mechanically fixing the door in the open position.

6.6.2 Only the active supporting and securing devices having an effective stiffness in the relevant direction are to be included and considered while calculating the reaction forces acting on the devices. Small and/or flexible devices such as cleats intended to provide load compression of the packing material are not generally to be included in the calculations in 6.6.7. The number of securing and supporting devices are generally to be the minimum practical whilst taking into account the requirements for redundancy given in 6.6.7 and 6.6.8 and the space available for adequate support in the hull structure.

6.6.3 For visor doors opening outwards, the pivot arrangement is generally to be such that the visor is self closing under external loads, that is $M_y > 0$. Moreover, the closing moment M_y as given in 6.2.3 is to be not less than:

$M_{yo} = 10\ c\ W + 0.1\ (a^2 + b^2)^{0.5}\ (F_x^2 + F_z^2)^{0.5}$ [kN-m]

6.6.4 Securing and supporting devices are to be adequately designed so that they can withstand the reaction forces within the permissible stresses given in 6.3.1.

6.6.5 For visor doors, the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body, are to be determined for the following combinations of external loads acting simultaneously together with the self weight of the door;

i) case 1 : F_x and F_z
ii) case 2 : $0.7F_y$ acting on each side separately together with $0.7F_x$ and $0.7F_z$

where F_x, F_y and F_z are determined as indicated in 6.2.2 and applied at the centroid of projected areas.

6.6.6 For side-opening doors, the reaction forces applied on the effective securing and supporting devices assuming the door as a rigid body, are to be determined for the following combination of external loads acting simultaneously together with the self weight of the door:

i) case 1 : F_x, F_y and F_z acting on both doors
ii) case 2 : $0.7F_x$ and $0.7F_z$ acting on both doors and $0.7F_y$ acting on each door separately,

where F_x, F_y and F_z are determined as indicated in 6.2.2 and applied at the centroid of projected areas.

6.6.7 The support forces as determined according to 6.2.2, 6.6.5 i) and 6.6.6 i) shall generally give rise to a zero moment about the transverse axis through the centroid of the area A_x. For visor doors, longitudinal reaction forces of pin and/or wedge supports at the door base contributing to this moment are not to be in the forward direction.

The arrangement of securing and supporting devices is to be designed with redundancy so that in the event of failure of any single securing or supporting device the remaining devices are capable to withstand the reaction forces without exceeding the permissible stresses given in 6.3.1, by more than 20 per cent .

6.6.8 For visor doors, two securing devices are to be provided at the lower part of the door, each capable of providing the full reaction force required to prevent opening of the door within the permissible stresses given in 6.3.1. The opening moment M_o, in kN-m, to be balanced by this reaction force, is not to be taken less than:

$M_o = 10\ W\ d + 5A_x\ a$

where,

d = vertical distance, [m], from the hinge axis to the centre of gravity of the door,
a = as defined in 6.2.3.

For visor doors, the securing and supporting devices excluding the hinges should be capable of resisting the vertical design force (F_z - 10W), in kN, within the permissible stresses given in 6.3.1.

6.6.9 For side-opening doors, thrust bearing has to be provided in way of girder ends at the closing of the two leaves to prevent one leaf to shift towards the other one under effect of unsymmetrical pressure (See Fig.6.6.9). Each part of the thrust bearing has to be kept secured on the other part by means of securing devices. Any other arrangement serving the same purpose may be proposed.

6.6.10 All load transmitting elements in the design load path, from door through securing and supporting devices into the ship structure, including pins, supporting brackets, back-up brackets and welded connections, are to be to the same strength standard as required for the securing end supporting devices.

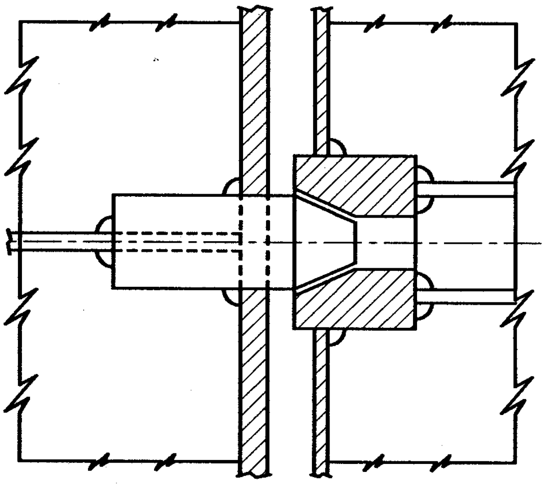

Fig.6.6.9 : Thrust bearing

6.7 Securing and locking arrangement

6.7.1 Securing devices are to be simple to operate and easily accessible.

Securing devices are to be equipped with mechanical locking arrangement (self locking or separate arrangement), or to be of the gravity type. The opening and closing systems as well as securing and locking devices are to be interlocked in such a way that they can only operate in the proper sequence.

6.7.2 Bow doors and inner doors giving access to vehicle decks are to be provided with an arrangement for remote control of the following from a position above the freeboard deck:

- the closing and opening of the doors, and
- associated securing and locking devices for every door.

Indication of the open/closed position of every door and every securing and locking device is to be available at the remote control stations. The operating panels for operation of doors are to be inaccessible to unauthorized persons. A notice plate, giving instructions to the effect that all securing devices are to be closed and locked before leaving harbour, is to be placed at each operating panel and is to be supplemented by warning indicator lights.

Alternative means of securing are to be provided for emergency use in case of failure of the power systems.

6.7.3 Where hydraulic securing devices are applied, the system is to be mechanically lockable in closed position (i.e. in the event of loss of the hydraulic fluid, the securing devices are to remain locked).

The hydraulic system for securing and locking devices is to be isolated from other hydraulic circuits, when in closed position.

6.7.4 Separate indicator lights and audible alarms are to be provided on the navigation bridge and on the operating panel to show that the bow door and inner door are closed and that their securing and locking devices are properly positioned.

The indication panel is to be provided with a lamp test function. It shall not be possible to turn off the indicator light.

The indicator system is to be designed on the fail safe principle and is to show by visual alarms if the door is not fully closed and not fully locked and by audible alarms if securing devices become open or locking devices become unsecured. The power supply for the indicator system is to be independent of the power supply for operating the doors and provided with a back-up power supply from the emergency source of power or other secure power supply such as a UPS. The sensors of the indicator system are to be protected from water, ice formation and mechanical damages.

The indication panel on the navigation bridge is to be equipped with a mode selection function "harbour/sea voyage", so arranged that audible alarm is given on the navigating bridge if vessel leaves harbour with the bow door or inner door not closed and with any of the securing devices not in the correct position.

The indicator system is considered designed on the fail – safe principle when the following are satisfied:

1) The indication panel is provided with:

- a power failure alarm
- an earth failure alarm
- a lamp test
- separate indication for door closed, door locked, door not closed and door not locked.

2) Limit switches electrically closed when the door is closed (when more than one limit switch is provided they may be connected in series).

3) Limit switches electrically closed when securing arrangements are in place (when more

than one limit switch is provided they may be connected in series).

4) Two electrical circuits (may be provided in one multicore cable), one for the indication of door closed/not closed and the other for door locked / not locked.

5) In case of dislocation of limit switches, indication to show : not closed / not locked / securing arrangement not in place – as appropriate.

6.7.5 A water leakage detection system with audible alarm and CCTV surveillance is to be arranged to provide an indication to the navigation bridge and to the engine control room of leakage through the inner door.

Between the bow door and the inner door a CCTV surveillance system is to be fitted with a monitor on the navigation bridge and in the engine control room. The system is to monitor the position of doors and a sufficient number of their securing devices. Special consideration is to be given for lighting and contrasting colour of objects under surveillance.

6.7.6 A drainage system is to be arranged in the area between bow door and ramp, or where no ramp is fitted, between the bow door and inner door. The system is to be equipped with an audible alarm function to the navigation bridge for water level in these areas exceeding 0.5 [m] above the car deck level.

6.7.7 For ro-ro passenger ships on international voyages, the special category spaces and ro-ro spaces are to be continuously patrolled or monitored by effective means, such as CCTV surveillance, so that any movement of vehicles in adverse weather conditions or unauthorized access by passengers thereto, can be detected whilst the ship is underway.

6.8 Operating and maintenance manual

6.8.1 An Operating and Maintenance Manual for the bow door and inner door has to be provided on board and contain necessary information on:

- main particulars and design drawings
  special safety precautions;
  details of vessel;
  equipment and design loading (for ramps);
  key plan of equipment (doors and ramps);
  manufacturer's recommended testing for equipment;
  description of equipment:

    bow doors
    inner bow doors
    bow ramp/doors
    side doors
    stern doors
    central power pack
    bridge panel
    engine control room panel.

- service conditions: limiting heel and trim of ship for loading/unloading;
  limiting heel and trim for door operations;
  doors/ramps operating instructions;
  doors/ramps emergency operating instructions.

- Maintenance schedule and extent of maintenance;
  trouble shooting and acceptable clearances;
  manufacturer's maintenance procedures.

- register of inspections, including inspection of locking, securing and supporting devices, repairs and renewals.

This manual is to be submitted for approval.

6.8.2 Documented operating procedures for closing and securing the bow door and inner door are to be kept on board and posted at appropriate place.

Section 7

Miscellaneous Openings

7.1 Small openings on freeboard and superstructure decks

7.1.1 The number and size of hatchways and access openings are to be kept to the minimum, consistent with the satisfactory operation of the ship.

7.1.2 The height of coamings are to be in accordance with 2.1.1. Lower heights may be considered in relation to operational requirements and the nature of the spaces to which access is given. Such reduced coaming heights will also have to be approved by the concerned National Authorities.

7.1.3 The minimum coaming thickness is to be as given in 2.3.1 but need not exceed the rule minimum thickness of deck plating inside the line of openings for that position. The stiffening of coaming is to be appropriate to its length and height.

7.1.4 Hatchcovers are to be of steel and hinged in general. Weathertightness is to be maintained in all sea conditions. Where toggles are fitted, their diameter is to be not less than 16 [mm]. It is recommended that the spacing of toggles does not exceed 600 [mm] and the distance between hatch corner and adjacent toggle is not more than 300 [mm].

Hinges are not to be used as securing devices.

7.1.5 The thickness of the covers is to be not less than the minimum thickness of the deck, inside the line of opening at that location or (0.01 s) where 's' is the spacing of the stiffeners in [mm].

The hatch covers are to be adequately stiffened.

7.1.6 Escape hatches are to be capable of being operated from either side.

7.1.7 For hatch covers constructed of materials other than steel, the scantlings are to provide equivalent strength.

7.1.8 In addition to the requirements, in 7.1.1 to 7.1.6, small hatches on the exposed foredeck of vessels with L $\geq$ 80 [m] are to meet the requirements of 7.2.

7.2 Additional requirements for small hatches on the exposed fore deck

7.2.1 General

The requirements in 7.2.2 to 7.2.4 apply to small hatches on the exposed deck over the forward 0.25L on ships of L $\geq$ 80 [m], where the height of exposed deck above the summer load waterline in way of the hatch is less than 0.1L or 22 [m], whichever is less.

Small hatches in this context are hatches designed for access to spaces below the deck and capable of being closed weathertight and having an area of opening generally not exceeding 2.5 [m^2].

7.2.2 Strength

The plate thickness, stiffener arrangement and scantlings of the hatch covers are to be in accordance with Table 7.2.2 and Fig. 7.2.2. Stiffeners, where fitted, are to be aligned with the metal-to-metal contact points, required in 7.2.3 (see Fig.7.2.2). The primary stiffeners (shown by thick lines) are to be continuous. All stiffeners are to be welded to the inner edge stiffener indicated in Fig.7.2.3.

The upper edge of the hatchway coamings is to be suitably reinforced by a horizontal section, normally not more than 190 [mm] from the upper edge of the coamings.

For small hatch covers of circular or similar shape, the cover plate thickness and reinforcement would be specially considered.

7.2.3 Primary securing devices

7.2.3.1 Small hatches located on exposed fore deck are to be fitted with primary securing devices such that their hatch covers can be secured in place and weathertight by means of a mechanism employing any one of the following methods:

i) Butterfly nuts tightening onto forks (clamps),
ii) Quick acting cleats, or
iii) Central locking device.

Dogs (twist tightening handles) with wedges are not acceptable.

However, securing devices of hatches designed for emergency escape are to be of a quick-acting type (e.g. where one-action wheel handle is provided as central locking devices for latching / unlatching of hatch cover), operable from both sides of the hatch cover.

Butterfly nuts and quick acting cleats are not to be used for hatches.

7.2.3.2 The hatch cover is to be fitted with a gasket of elastic material. This is to be designed to allow a metal to metal contact at a designed compression and to prevent over compression of the gasket by green sea forces that may cause the securing devices to be loosened or dislodged. The metal-to-metal contacts are to be arranged close to each securing device in accordance with Fig.7.2.2 and of sufficient capacity to withstand the bearing force.

7.2.3.3 For a primary securing method using butterfly nuts, the forks (clamps) are to be of robust design. They are to be designed to minimize the risk of butterfly nuts being dislodged while in use; by means of curving the forks upward, a raised surface on the free end, or a similar method. The plate thickness of unstiffened steel forks is not to be less than 16 [mm]. An example arrangement is shown in Fig.7.2.3. The primary securing method is to be designed and manufactured such that the designed compression pressure is achieved by one person without the need of any tools.

7.2.3.4 For small hatch covers located on the exposed deck forward of the fore-most cargo hatch, the hinges are to be fitted such that the predominant direction of green sea will cause the cover to close, which means that the hinges are normally to be located on the fore edge.

On small hatches located between the main hatches, for example between Nos.1 and 2, the hinges are to be placed on the fore edge or outboard edge, whichever is practicable for protection from green water in beam sea and bow quartering conditions.

Table 7.2.2 : Scantlings for small steel hatch covers on the fore deck

Nominal size [mm x mm]	Cover plate thickness [mm]	Primary stiffeners	Secondary stiffeners
		Flat bar [mm x mm]; number	
630 x 630	8	-	-
630 x 830	8	100 x 8 ; 1	-
830 x 630	8	100 x 8 ; 1	-
830 x 830	8	100 x 10 ; 1	-
1030 x 1030	8	120 x 12 ; 1	80 x 8 ; 2
1330 x 1330	8	150 x 12 ; 2	100 x10 ; 2

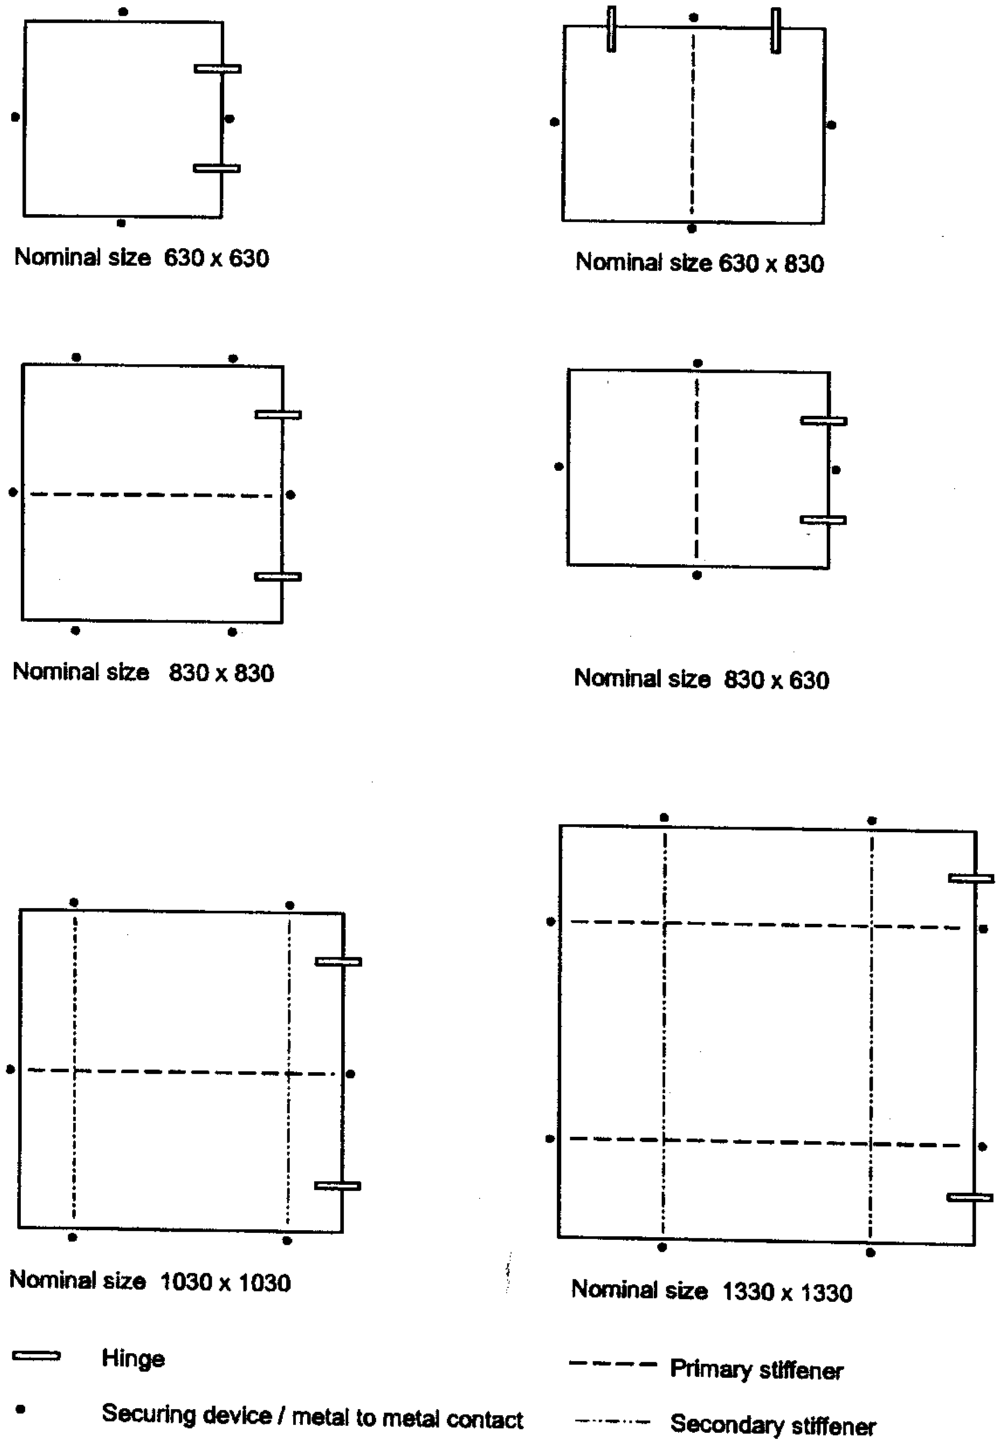

Fig.7.2.2 : Arrangement of stiffeners

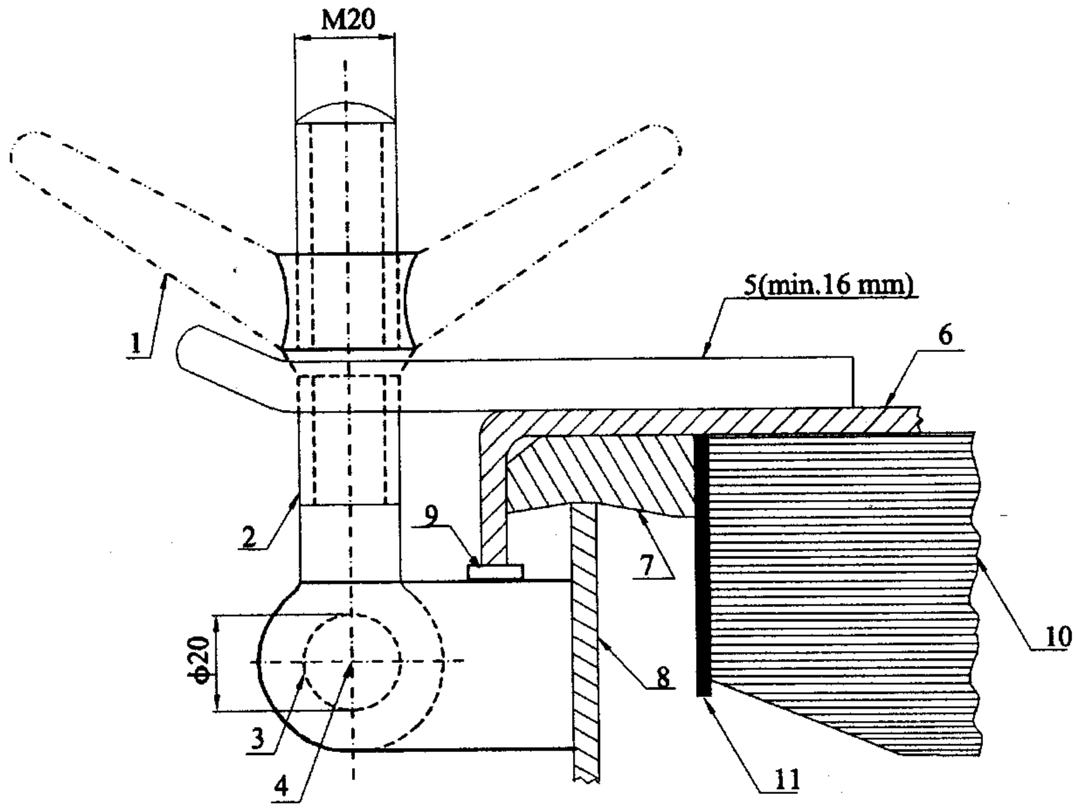

1: butterfly nut
2: bolt
3: pin
4: center of pin
5: fork (clamp) plate
6: hatch cover
7: gasket
8: hatch coaming
9: bearing pad welded on the bracket of a toggle bolt for metal to metal contact
10: stiffener
11: inner edge stiffener

(Note: Dimensions in millimeters)

Fig.7.2.3 : Example of a primary securing method

7.2.4 Secondary securing device

Small hatches on the fore deck except those designed for emergency escapes are to be fitted with an independent secondary securing device e.g. by means of a sliding bolt, a hasp or a backing bar of slack fit, which is capable of keeping the hatch cover in place, even in the event that the primary securing device became loosened or dislodged. It is to be fitted on the side opposite to the hatch cover hinges.

7.3 Manholes and flush hatches

7.3.1 Manholes and flush scuttles on the decks fitted in Positions 1 and 2 or within superstructures other than enclosed superstructures, are to be closed by substantial covers capable of closing them weathertight. Unless secured by closely spaced bolts, the covers are to be permanently attached.

7.4 Hatchways within enclosed super-structure and tween decks

7.4.1 The requirements of 7.1 are to be complied with as and where applicable.

7.5 Companionways, doors and accesses on weather decks

7.5.1 Openings in freeboard decks, other than hatchways, machinery space openings, manholes and flush scuttles, are to be protected by an enclosed superstructure or by a deckhouse or companionway of equivalent strength and weathertightness to an enclosed superstructure, effectively secured to deck.

Any such openings:

a) in an exposed superstructure deck,
b) on top of a deckhouse on the freeboard deck and giving access to space below freeboard deck,
c) in an exposed position on the deck above a superstructure deck and giving access to space within that superstructure,

shall be protected by an efficient deckhouse or companionway as above. However in the case of c) it is considered that openings in the top of a deckhouse:

i) on a raised quarter deck or

ii) on a superstructure of less than standard height but having a height equal to or greater than standard quarter deck height

are to be provided with an acceptable means of closing but need not be protected by an efficient deckhouse or companionway provided the height of the deckhouse is at least the standard height of a superstructure.

The standard height of superstructures mentioned above are to be taken from Table 7.5.1.

Table 7.5.1

Freeboard Length L_L [m]	Standard height [m]	
	Raised quarter deck	Other super-structure
≤ 30	0.9	1.8
75	1.2	1.8
≥ 125	1.80	2.3
At intermediate length of the ship, standard height to be obtained by linear interpolation		

7.5.2 Steel doors or doors of other equivalent material are to be fitted to the following access openings in:

a) bulkheads at ends of enclosed superstructures.

b) deckhouses or companionways protecting openings leading to spaces below the freeboard deck, or to enclosed superstructures.

c) deckhouse on another deckhouse protecting an opening leading to a space below the freeboard deck.

The doors are to be permanently and strongly attached to the bulkhead and framed, stiffened and fitted so that the whole structure is of equivalent strength to the unpierced bulkhead and weathertight when closed. Any fixed lights in the doors are to be provided with hinged steel deadlights fitted internally. The doors are to be gasketed and secured weathertight by means of clamping devices or equivalent arrangements, permanently attached to the bulkhead or to the door. Doors are generally to open outward and are to be capable of being operated and secured from both sides.

7.5.3 Portable sills to be avoided. However in order to facilitate the loading/ unloading of heavy spare parts or similar items portable sills may be fitted on the following conditions:

a) They must be installed before the ship leaves port.

b) Sills are to be gasketed and fastened by closely spaced bolts.

c) Wherever the sills are replaced after removal, the weathertightness of the sills and the related doors must be verified by hose testing. The dates of removal, replacing and hose testing shall be recorded in the ship's, log book.

7.5.4 In locations other than those mentioned in Sec.7.5.2, doors may be of 50 [mm] thick hardwood or equivalent material and strength subject to any requirement of fire protection.

7.5.5 The height of doorway sills above the deck sheathing, if fitted, is to be at least

a) 600 [mm] in Position 1

b) 380 [mm] in Position 2.

7.5.6 Where access is provided to the deckhouse, bridge or a poop deck from the deck above as an alternative to the access from the freeboard deck, the height of sill into the deckhouse, bridge or poop may be 380 [mm].

7.5.7 The height of sills to doorways in a forecastle if protecting a companionway is to be 600 [mm], regardless of whether access is provided from above. If not protecting a companionway the sill height may be 380 [mm].

7.5.8 The height of door sills may be required to be increased on ships of Type 'A', Type 'B-100' or Type 'B-60' where this is shown to be necessary by the floatability calculations required by the ILLC 1966. The engine casing in such ships, when not protected by an outer structure will require two weathertight doors in series, with the sill height of the outer and inner door being not less than 600 [mm] and 230 [mm] respectively.

7.5.9 When the closing appliances of openings in superstructures and deckhouses do not comply with the requirements of 7.5.2, the openings on the interior deck are to be treated as if exposed to the weather deck.

7.6 Openings on engine and boiler casing

7.6.1 Machinery space openings in Position 1 or 2 are to have efficient closing appliances. The openings and coamings for fiddley, funnel and machinery space ventilators in the casing in those positions are to be provided with strong covers of steel or other equivalent material permanently attached in their proper positions and capable of being secured weathertight.

7.6.2 Doorways in the engine and boiler casings are to be arranged to provide the maximum protection of the space below.

7.6.3 Skylights are to be of substantial construction and secured firmly to the deck. For skylights in position 1 or 2 the coaming height is not to be less than that of the hatch coaming. Efficient means are to be provided for closing and securing the hinged scuttles, if any. The thickness of glasses in fixed or opening skylights is to be appropriate to their position and size as required for side scuttles. Glasses in any position are to be protected against mechanical damage, and where fitted in Positions 1 and 2 are to be fitted with deadlights or storm covers permanently attached.

7.6.4 Side scuttles in the engine casings are to be provided with fireproof glass.

7.7 Windows and side scuttles

7.7.1 Side scuttles and windows together with their glasses, deadlights and storm covers, if fitted, shall be of approved design and substantial construction in accordance with, or equivalent to, recognized national or international standards. Non-metallic frames are not acceptable.

'Deadlights', in accordance with recognised standards, are fitted to the inside of windows and side scuttles while 'storm covers', of comparable specifications to deadlights, are fitted to the outside of windows, where accessible, and may be hinged or portable.

7.7.2 Side scuttles are defined as being round or oval in shape and where the area of openings does not exceed 0.16 M^2.

Windows are defined as being rectangular in shape generally having a radius at each corner (depending on the window size in accordance with recognised national or international standards) and also those associated with round or oval shapes where the area of openings exceeds 0.16 M^2.

7.7.3 Side scuttles to the following spaces shall be fitted with efficient hinged inside deadlights:

a) spaces below the freeboard deck
b) spaces within the first tier of enclosed superstructures
c) first tier deckhouses on the freeboard deck protecting openings leading below
d) first tier deckhouses on the freeboard deck considered buoyant in stability calculations.

The deadlights shall be capable of being effectively closed and secured watertight if fitted below the freeboard deck and weathertight if fitted above.

7.7.4 Side scuttles shall not be fitted in such a position that their sills are below a line drawn parallel to the freeboard deck at side and having its lowest point 0.025B or 500 [mm], whichever is the greater distance, above the summer load line (or timber summer load line, if assigned).

7.7.5 Side scuttles shall be of the non-opening type in ships subject to damage stability regulations, if the calculations indicate that they would become immersed by any intermediate stage of flooding or the final equilibrium waterplane in any required damage case.

7.7.6 Windows shall not be fitted below the freeboard deck, in the first tier end bulkheads or sides of enclosed superstructures and in first tier deckhouses considered buoyant in the stability calculations or protecting openings leading below.

7.7.7 Side scuttles and windows at the side shell in the second tier, protecting direct access below or considered buoyant in the stability calculations, shall be provided with efficient hinged inside deadlights capable of being effectively closed and secured weathertight.

Side scuttles and windows set inboard from the side shell in the second tier, protecting direct access below to spaces listed in 7.6.3, shall be provided with either efficient hinged inside deadlights or, where they are accessible, permanently attached external storm covers of approved design and of substantial construction and capable of being effectively closed and secured weathertight.

7.7.8 Cabin bulkheads and doors in the second tier separating side scuttles and windows from a direct access leading below may be accepted in place of deadlights or storm covers fitted to the side scuttles and windows.

Deckhouses situated on a raised quarter deck or on the deck of a superstructure of less than standard height may be regarded as being in the second tier as far as the provision of deadlights is concerned, provided the height of the raised quarter deck or superstructure is equal to, or greater than, the standard quarter deck height.

7.7.9 Side scuttles and windows facing open or enclosed lifeboat and liferaft embarkation areas and below such areas in such a position that their failure during a fire would impede the launching of or embarkation into lifeboats or liferafts are to have adequate fire integrity.

End of Chapter

Chapter 13

Ventilators, Air Pipes and Discharges

Contents

Section 1

General

1.1 Scope

1.1.1 This Chapter applies to all ships and provides requirements for ventilators, air and sounding pipes and overboard discharges.

1.1.2 The requirements conform, where relevant, to those of the International Convention on Load Lines, 1966. Reference should also be made to any additional requirements of the National Authority of the country in which the ship is to be registered.

1.2 Definitions

1.2.1 The requirements of ventilators and air pipes are given with respect to two basic positions – Position 1 and Position 2 as defined in Ch.12, Sec.1.2.

1.3 Protection

1.3.1 In all cargo spaces and other areas where mechanical damage is likely, all air and sounding pipes, ventilators, scuppers and discharges, including their valves, controls and indicators, are to be well protected. This protection is to be of steel or other equivalent material.

1.4 Strength of attachments of fore deck fittings

1.4.1 The airpipes, ventilators and their closing devices fitted on ships of $L \geq 80$ [m] on exposed decks in the forward 0.25L are to satisfy the requirements given in 1.4.2 and 1.4.3 if the height of the exposed deck in way of the item is less than 0.1L or 22 [m] above the summer load waterline, whichever is the lesser:

However, these requirements need not be applied to cargo tank venting systems and inert gas systems of oil tankers, chemical carriers and liquefied gas carriers.

1.4.2 Design load

The green sea pressure ‘p’ acting on air pipes, ventilators and their closing appliances is to be taken as:

$$p = 0.5\, \rho\, V^2\, C_d\, C_s\, C_p \quad [kN/m^2]$$

where,

ρ = density of sea water = 1.025 t/m^3

V = velocity of water [m/sec] over the fore deck

= 13.5 for $d \leq 0.5d_1$

$= 13.5\sqrt{2(1-(d/d_1))}$

for $0.5d_1 < d < d_1$

d = distance [m] from summer load waterline to exposed deck

d_1 = 0.1L or 22[m] whichever is the lesser

C_d = shape coefficient

= 0.5 for pipes

= 1.3 for air pipe or ventilator heads in general

= 0.8 for an air pipe or ventilator head of cylindrical form with its axis in the vertical direction.

C_s = slamming coefficient = 3.2

C_p = protection coefficient:

= 0.7 for pipes and ventilator heads located immediately behind a breakwater or forecastle

= 1.0 elsewhere and immediately behind a bulwark.

Forces acting in the horizontal direction on the pipe and its closing device are to be calculated using pressure 'p' and the largest projected area of each component.

1.4.3 Strength criteria

a) Bending moments and stresses in air pipes and ventilator pipes are to be calculated at critical positions, such as at penetration pieces, weld or flange connections, and toes of supporting brackets. Bending stresses considering the net section (after deduction of 2.0 [mm] from the pipes thickness), irrespective of the corrosion protection provided are not to exceed 0.8 σ_y, where σ_y is the specified minimum upper yield stress or 0.2% proof stress of the steel at room temperature.

b) For standard ventilators of 900 [mm] height closed by heads of not more than the tabulated projected area, the applicable pipe thicknesses and bracket heights are specified in Table 1.4.3a). For standard air pipes of height 760 [mm] closed by heads of not more than the tabulated projected area, the applicable pipe thicknesses and bracket heights are specified in Table 1.4.3.b). For other configurations of air pipes and ventilators, loads according to clause 1.4.2 are to be applied and means of support determined in order to comply with the requirements of clause 1.4.3 a).

c) Where brackets are specified for supporting the air pipe or ventilator three or more radial brackets are to be fitted. These brackets are to have gross thickness of at least 8 [mm], minimum length 100 [mm] and height according to Table 1.4.3a) or Table 1.4.3b) as applicable but need not extend over the joint flange for the head. Bracket toes at the deck are to be suitably supported.

d) All component parts and connections of the air pipe or ventilator are to be capable of withstanding the green sea pressure 'p' given in 1.4.2.

e) Rotating type mushroom ventilator heads are unsuitable for application in the location defined in 1.4.1. Screw down type mushroom ventilators may be used in such locations.

Table 1.4.3a) : 900 mm [(a)] ventilator pipe thickness and bracket standards

Standard ventilator details			Required Height[(b)] of brackets mm]
Nominal pipe diameter [mm]	**Minimum fitted gross thickness [mm]**	**Maximum projected area of head [cm^2]**	
80A	6.3	-	460
100A	7.0	-	380
150A	8.5	-	300
200A	8.5	550	-
250A	8.5	880	-
300A	8.5	1200	-
350A	8.5	2000	-
400A	8.5	2700	-
450A	8.5	3300	-
500A	8.5	4000	-

Notes :

a) For other ventilator heights, the relevant requirements of 1.4.2 and 1.4.3 are to be applied.
b) Brackets need not extend over the joint flange for the head.

Table 1.4.3b) : 760 mm [(a)] air pipe thickness and bracket standard

Standard air pipe details			Required Height[(b)] of brackets [mm]
Nominal pipe diameter [mm]	**Minimum fitted gross thickness [mm]**	**Maximum projected area of head [cm^2]**	
65A	6.0	-	480
80A	6.3	-	460
100A	7.0	-	380
125A	7.8	-	300
150A	8.5	-	300
175A	8.5	-	300
200A	8.5	1900	300[(c)]
250A	8.5	2500	300[(c)]
300A	8.5	3200	300[(c)]
350A	8.5	3800	300[(c)]
400A	8.5	4500	300[(c)]

Notes :

a) For other air pipe heights, the relevant requirements of 1.4.2 and 1.4.3 are to be applied.

b) Brackets need not extend over the joint flange for the head.

c) Brackets need not be provided if the as fitted gross thickness of air pipes is not less than 10.5 [mm].

Section 2

Ventilators

2.1 General

2.1.1 Special care is to be taken in the design and positioning of ventilator openings and coamings, particularly in the region of the forward end of superstructures and other points of high stress. The deck plating in way of the coamings is to be efficiently stiffened.

2.1.2 Ventilators from deep tanks and tunnels passing through 'tween decks are to have scantlings suitable for withstanding the pressures to which they may be subjected, and are to be made watertight.

2.1.3 For the requirements of fire precautions on cargo and passenger ships, see Pt.6, Ch.2, Sec.2.

2.2 Coamings

2.2.1 The height of ventilator coamings exposed to the weather is to be not less than :

- 900 [mm] in position 1
- 760 [mm] in position 2

these heights being measured above deck sheathing where fitted. Particularly in exposed positions, the height of coamings may be required to be increased.

2.2.2 The height of ventilator coamings may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability criterion required by the International Convention on Load Lines, 1966.

2.2.3 The thickness of ventilator coamings is not to be less than 6.0 [mm] for ventilators upto 80 [mm] external diameter and 8.5 [mm] for ventilators of external diameters 165 [mm] and above; the thickness for intermediate diameters may be obtained by interpolation.

2.2.4 Where the height of the ventilator exceeds that required by 2.2.1 the thickness given in 2.2.3 may be gradually reduced, above the required minimum height, to a minimum of 6.0 [mm]. The ventilator is to be adequately stayed.

2.3 Closing appliances

2.3.1 All ventilator openings are to be provided with efficient weathertight closing appliances except where:-

(a) the height of the coaming is greater than 4.5 [m] in position 1, or

(b) the height of the coaming is greater than 2.3 [m] in position 2

in which case closing appliances need not be provided unless unusual features of design make it necessary.

The weathertight closing appliance for all ventilators in positions 1 and 2 are to be of steel or other equivalent materials. Wood plugs and canvas covers are not acceptable in these positions.

2.3.2 In general, ventilators which are necessary to continuously supply the machinery space and on demand, immediately supply the emergency generator room, should have coamings with sufficient heights specified in 2.3.1, without having to fit weathertight closing appliances.

However, where due to vessel size and arrangement this is not practicable, lesser heights for machinery space and emergency generator room ventilator coamings may be considered with provision of weathertight closing appliances in combination with other suitable arrangements to ensure an uninterrupted, adequate supply of ventilation to these spaces.

2.3.3 In ships where the load line length, L_L, is not more than 100 [m], the closing appliances are to be permanently attached to the ventilator coaming. Whereas in other ships, they may be conveniently stowed near the ventilator to which they are to be fitted.

2.3.4 Where, in ferries, ventilators are proposed to be led overboard in an enclosed 'tween deck' the closing arrangements are to be submitted for approval. If such ventilators are led overboard more than 4.5 [m] above the main vehicle deck, closing appliances may be omitted, provided that satisfactory baffles and drainage arrangements are provided, as in the case of air intakes or exhaust openings for machinery spaces, which may be arranged in the sides of the ship.

2.3.5 On offshore supply ships, to ensure satisfactory operation in all weather conditions, machinery space ventilation inlets and outlets are to be located in such positions that closing appliances will not be necessary.

Section 3

Air and Sounding Pipes

3.1 General

3.1.1 Air and sounding pipes are to comply with the requirements of Pt.4, Ch.2.

3.1.2 Striking plates of suitable thickness, or their equivalent, are to be fitted under all sounding pipes.

3.1.3 On offshore supply ships air pipes are to be situated clear of the cargo containment areas.

3.2 Height of air pipes

3.2.1 The height of air pipes from the upper surface of decks exposed to the weather, to the point where water may have access below is not normally to be less than :

- 760 [mm] on freeboard deck
- 450 [mm] on superstructure decks

these heights being measured above deck sheathing, where fitted. Air pipes with height exceeding 900 [mm] are to be additionally supported.

3.2.2 Lower heights may be approved in cases where these are essential for the working of the ship, provided that the design and arrangements are otherwise satisfactory. In such cases, efficient, permanently attached closing appliances of an approved automatic type will generally be required.

3.2.3 The height of air pipes may be required to be increased on ships of Type 'A', Type 'B-100' and Type 'B-60' where this is shown to be necessary by the floatability calculations required by the International Convention on Load Lines, 1966.

3.2.4 Air pipes are generally to be led to an exposed deck, but alternative arrangements will be considered in the case of ferries where such an arrangement is not practicable.

3.2.5 The thickness of the portion of the air pipe exposed to weather is not to be less than 6.0 [mm] upto 80 [mm] external diameter and 8.5 [mm] for 165 [mm] and above; the thickness for intermediate external diameters may be obtained by interpolation.

3.3 Closing appliances

3.3.1 All openings of air and sounding pipes are to be provided with permanently attached, satisfactory means of closing to prevent the free entry of water.

3.3.2 Air pipe closing devices are to be of an approved type and so designed that they withstand both ambient and working conditions and be suitable for use at inclinations upto and including 40^{o}.

3.3.3 Closing devices are to be of automatic type. Pressure-vacuum valves (P-V valves) may however, be accepted on tankers.

3.3.4 Air pipe closing devices are to be so constructed as to allow inspection of the closure and the inside of the casing as well as changing of the seals.

3.3.5 Efficient ball or float seating arrangements are to be provided for the closures. Bars, cage or other devices are to be provided to prevent the ball or float from contacting the inner chamber in its normal state and made in such a way that the ball or float is not damaged when subjected to water impact due to a tank being overfilled.

3.3.6 The clear area through an air pipe closing device is to be at least equal to the area of the inlet. Air pipe closing devices are to be self draining.

3.3.7 In the case of air pipe closing devices of the float type, suitable guides are to be provided to ensure unobstructed operation. The maximum allowable tolerances for wall thickness of ball floats is not to exceed 10% of the nominal thickness.

3.3.8 Casings of air pipe closing devices are to be of approved metallic materials adequately protected against corrosion. The inner and the outer chambers of an automatic air pipe head is to be of a minimum thickness of 6 [mm].

3.3.9 For galvanized steel air pipe heads, the zinc coating is to be applied by the hot method and the coating thickness is to be 70 to 100 microns.

For areas of the head susceptible to erosion (e.g. those parts directly subjected to ballast water impact when the tank is being pressed up, for example the inner chamber area above the air pipe, plus an overlap of 10° or more on either side) an additional harder coating such as aluminium bearing epoxy coating or equivalent, is to be applied over the zinc coating.

3.3.10 Closures and seats made of non-metallic materials are to be compatible with the media intended to be carried in the tank at temperatures between $-25^{o}C$ and $85^{o}C$ and sea water.

Section 4

Scuppers and Sanitary Discharges

4.1 General

4.1.1 Scuppers sufficient in number and size to provide effective drainage are to be fitted in all decks.

4.1.2 Scuppers draining weather decks and spaces within superstructures or deckhouses not fitted with efficient weathertight doors are to be led overboard.

4.1.3 Scuppers and discharges which drain spaces below the freeboard deck, or spaces within intact superstructures or deckhouses on the freeboard deck fitted with efficient weathertight doors, may be led to the bilges in the case of scuppers, or to suitable sanitary tanks in the case of sanitary discharges. Alternatively, they may be led overboard provided that the spaces drained are above the load waterline, and the pipes are fitted with efficient and accessible means of preventing water from passing inboard.

4.1.4 The drainage arrangements of enclosed 'tween deck spaces in ships with small freeboards are to be specially considered.

4.1.5 In the enclosed 'tween deck space on the main vehicle deck of a ferry, which is provided with a drencher fire extinguishing system, scuppers of not less than 150 [mm] diameter are to be provided port and starboard, spaced about 9,0 [m] apart. The capacity of the scuppers may be required to be increased, dependent on the discharge rate of the drencher system. The mouth of the scupper is to be protected by bars.

4.1.6 If a 'tween deck space on the main vehicle deck of a ferry is not totally enclosed, scuppers or freeing ports are to be provided consistent with the requirements of Ch.11.

4.1.7 The following will apply to drainage of enclosed cargo spaces on the bulkhead deck of passenger ships or on the freeboard deck of cargo ships:

i) Where the freeboard to the bulkhead deck or the freeboard deck, respectively, is such that the deck edge is immersed when the ship heels more than 5 [deg.] the drainage shall be by means of a sufficient number of scuppers of suitable size discharging directly overboard.

ii) Where the freeboard is such that the edge of the bulkhead deck or the edge of the freeboard deck, respectively, is immersed when the ship heels 5 [deg.] or less, the drainage shall be led to a suitable space of adequate capacity, having a high water level alarm and provided with suitable arrangements for discharge overboard.

4.1.8 For drainage arrangements of closed vehicle and ro-ro spaces and special category spaces, refer to Pt.6, Ch.7, Cl.3.6.1.4 and Cl.3.6.1.5.

4.1.9 Scuppers and discharge pipes should not normally pass through fuel oil or cargo oil tanks. Where scuppers and discharge pipes pass, unavoidably, through fuel oil or cargo oil tanks, and are led through the shell within the tanks, the thickness of the piping should be at least the same thickness as Rule shell plating in way, derived from the appropriate Chapters, but need not exceed 19 [mm].

Piping within tanks is to be tested in accordance with Pt.4, Ch.2 and Ch.3.

4.1.10 All piping is to be adequately supported.

4.2 Closing appliances

4.2.1 In general, each separate overboard discharge is to be fitted with a screw-down non-return valve capable of being operated from a position always accessible and above the freeboard deck. An indicator is to be fitted at the control position showing whether the valve is open or closed. (Fig.4.2.1).

It is considered that an acceptable equivalent to an automatic non-return valve with a positive means of closing from a position above the freeboard deck would be one automatic non-return valve and one sluice valve controlled from above the freeboard deck.

Where sanitary discharges and scuppers lead overboard through the shell in way of machinery spaces, the fitting to shell of a locally operated closing valve, together with non-return valve inboard, is considered to provide protection equivalent to above.

4.2.2 Where, in an enclosed 'tween deck space on the main vehicle deck of a ferry, a drencher fire extinguishing system is provided, such controls are to be operable from spaces above the main vehicle deck and to be protected from mechanical damage.

4.2.3 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds $0{,}01L_L$ the discharge may be fitted with two automatic non-return valves without positive means of closing, instead of the screw-down non-return valve, provided that the inboard valve is always accessible for examination under service conditions i.e. the inboard valve should be above the level of the tropical load waterline. If this is not practicable, then, provided a locally controlled sluice valve is interposed between the two automatic non-return valves, the inboard valve need not be fitted above the LWL.

4.2.4 Where the vertical distance from the summer load waterline to the inboard end of the discharge pipe exceeds $0{,}02L_L$, a single automatic non-return valve without positive means of closing may be fitted. See Fig.4.2.1.

4.2.5 Scuppers and discharge pipes originating at any level which penetrate the shell either more than 450 [mm] below the freeboard deck or less than 600 [mm] above the summer load waterline, are to be fitted with an automatic non-return valve at the shell. This valve, unless required by 4.1.3, may be omitted provided that the pipe is of heavy gauge thickness. However, the thickness need not exceed 12.5 [mm], unless greater thickness is required by 4.1.8.

4.2.6 If, in association with 4.1.8, a valve is required by 4.1.3, this valve should preferably be fitted as close as possible to the point of entry of the pipe into the tank. If fitted below the freeboard deck, the valve is to be capable of being controlled from an easily accessible position above the freeboard deck. Local control is also to be arranged, unless the valve is inaccessible. An indicator is to be fitted at the control position showing whether the valve is open or closed.

4.2.7 In a ship to which timber freeboards are assigned, the summer load waterline is to be regarded as that corresponding to the timber summer freeboard.

4.2.8 It is considered that requirements for non-return valves are applicable only to those discharges which remain open during the normal operation of a vessel. For discharges which must necessarily be closed at sea, such as gravity drains from topside ballast tanks, a single screw down valve operated from the deck is sufficient.

The inboard end of a gravity discharge which leads overboard from an enclosed superstructure or space is to be located above the waterline formed by a 5 degree heel, to port or starboard, at a draft corresponding to be assigned summer freeboard.

4.2.9 For garbage chutes an acceptable equivalent to the non-return valve with a positive means of closing from a position above the freeboard deck would be two gate valves controlled from the working deck of the chute. The lowest gate valve should, in addition, be controlled from a position above the freeboard deck. An interlock system is to be arranged between the two valves. The distance between the two gate valves is to be adequate to allow the smooth operation of the interlock system.

4.2.10 It is recommended that the inboard end of the garbage chute be located above the waterline formed by an 8.5 deg heel, to port or starboard, at a draft corresponding to the assigned summer freeboard, but not less than 1000[mm] above the summer waterline.

4.2.11 Where the inboard end of the garbage chute exceeds $0.01L_L$ above the summer waterline, valve control from the freeboard deck is not required, provided the inboard gate valve is always accessible under service conditions.

4.2.12 Alternatively, the upper gate valve may be replaced by a hinged weathertight cover at the inboard end of the chute together with a discharge flap which replaces the lower gate valve.
The cover and the flap are to be arranged with an interlock so that the discharge flap cannot be operated until the cover is closed.

The chute is to be constructed of material of substantial thickness (See Part 4, Chapter 3, Section 3.5) upto and including the cover.

4.2.13 The gate valve controls and/or hinged cover are to be clearly marked: “Keep closed when not in use”.

4.3 Materials for valves, fittings and pipes

4.3.1 All shell fittings and valves required by 4.2 are to be of steel, bronze or other approved ductile material; ordinary cast iron or similar material is not acceptable. Materials are to satisfy the requirements of Pt.2.

4.3.2 All these items, if made of steel or other approved material with low corrosion resistance, are to be suitably protected against wastage.

4.3.3 The lengths of pipe attached to the shell fittings, elbow pieces or valves are to be of galvanized steel or other equivalent approved material.

4.3.4 Where plastic pipes are used for sanitary discharges and scuppers, they are also subject to the requirement of Fig.4.2.1, and the valve at the shell is to be operated from outside the space in which the valve is located.

Where such plastic pipes are located below the summer waterline, the valve is to be operated from a position above freeboard deck.

The portion of discharge line from the shell to the first valve as well as shell fittings and valves shall be of steel; bronze or other approved ductile material.

The approval of plastic piping in any location will be subject to the consideration of strength and fire hazards involved with special reference to penetrations through bulkheads, decks or other significant compartment boundaries. Attention must be paid to valid fire technical regulations.

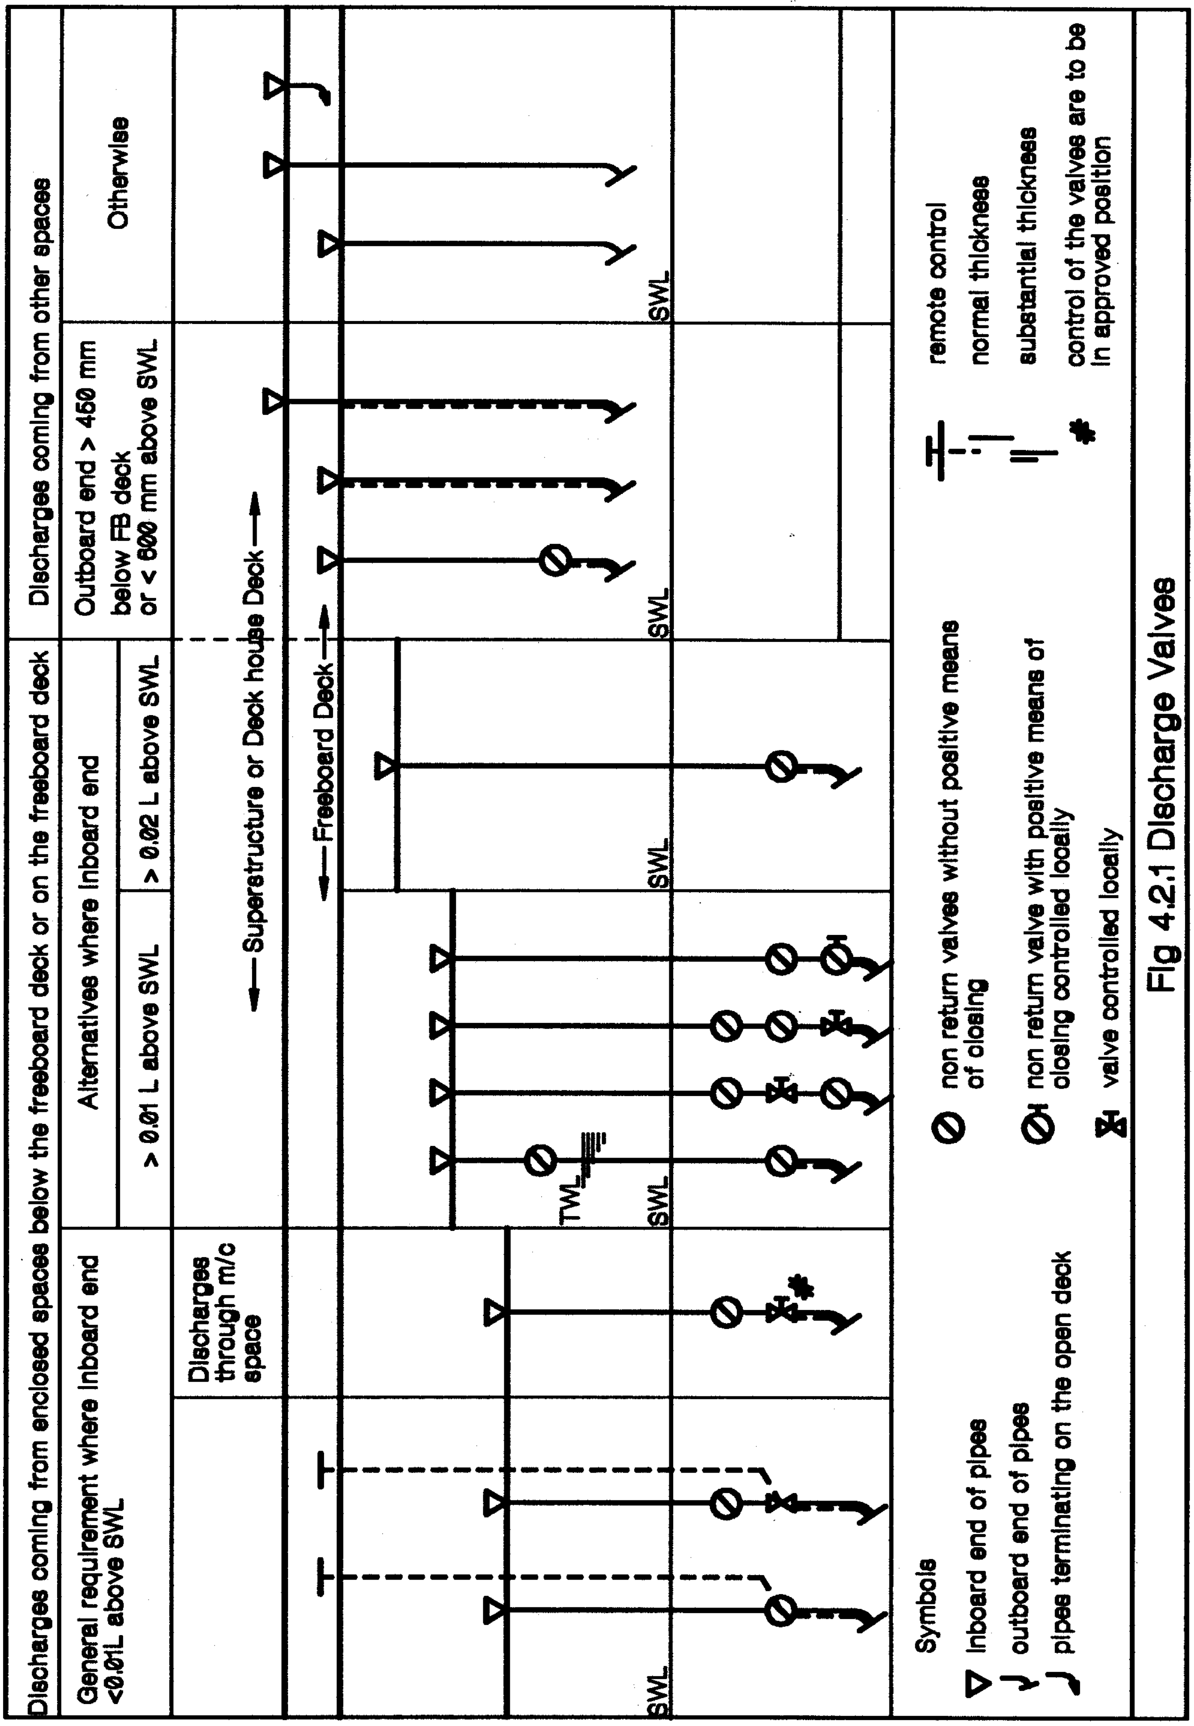

Fig 4.2.1 Discharge Valves

End of Chapter

Chapter 14

Rudders

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The requirements of this Chapter apply to arrangement and scantlings of normal streamlined or plate rudders and their supporting structure. Rudders fitted with special features e.g. special profiles, fins, flaps, steering propellers etc. to increase the lift force will be specially considered.

1.1.2 IRS may accept alternatives to requirements given in this Chapter, provided they are deemed to be equivalent.

1.1.3 Direct analyses adopted to justify an alternative design are to take into consideration all relevant modes of failure, on a case by case basis. These failure modes may include, amongst others: yielding, fatigue, buckling and fracture. Possible damages caused by cavitation are also to be considered.

1.1.4 Lab tests, or full scale tests may be requested to validate the alternative design approach, if deemed necessary by IRS,

1.1.5 Additional requirements for various Ice Class notations are given in Pt.5, Ch.21.

1.2 Material

1.2.1 All materials used in the construction of the rudder are to be tested and approved in accordance with Pt.2.

1.2.2 Material grades for plates and sections for the rudder blade are to be selected as per Pt.3, Ch.2.

1.2.3 For rudder stocks, pintles, keys and bolts, the minimum yield stress is not to be less than 200 [N/mm^2]. For materials having yield stress differing from 235 [N/mm^2], material factor 'k' as determined below, is to be applied.

$$k = \left(\frac{235}{\sigma_y}\right)^e$$

with e = 0.75 for $\sigma_y > 235$ [N/mm^2]

= 1.0 for $\sigma_y \leq 235$ [N/mm^2]

σ_y = yield stress of the material used, but not to be taken greater than 0.7 σ_u or 450 [N/mm^2] whichever is smaller; where σ_u is the tensile strength [N/mm^2] of the material.

Where high strength steels are used for rudder stock, evaluation of stock deformations may be required, as large deformations can cause excessive edge pressures in way of bearings.

1.2.4 Bearing materials for bushings are to be stainless steel, bronze, white metal, synthetic material or lignum vitae. If stainless steel is proposed to be used for liners or bushes for the rudder stocks and pintles, the chemical composition is to be submitted for approval.

Hardness of the material of the bushing is to be at least 65 Brinell lower than that of the liner or the rudder stock or pintle.

Synthetic bush materials are to be of approved type. Arrangement is to be provided for adequate supply of sea-water to these bearings.

1.3 Testing

1.3.1 Bodies of the rudders are to be tested in accordance with the requirements given in Ch.18.

Section 2

Arrangement and Details

2.1 General

2.1.1 Various types of rudder arrangement are shown in Fig.2.1.1, other combinations of couplings and bearings may however be proposed.

2.1.2 Effective means are to be provided for supporting the weight of the rudder. Where the support is provided by a carrier bearing attached to the rudder head, the structure in way of the bearing is to be adequately strengthened. The plating under all rudder head bearings or rudder carriers is to be increased in thickness.

2.1.3 All rudder bearings are to be accessible for measuring wear without lifting or unshipping the rudder.

2.1.4 Satisfactory arrangement is to be provided to prevent water from entering the steering gear compartment and lubricant from being washed away from the rudder carrier. A seal or stuffing box is to be fitted above the deepest load water line for this purpose, however two separate seals or stuffing boxes are to be provided when the rudder carrier is below the deepest load water line.

2.1.5 Suitable arrangement is to be provided to prevent the rudder from lifting and accidental unshipping.

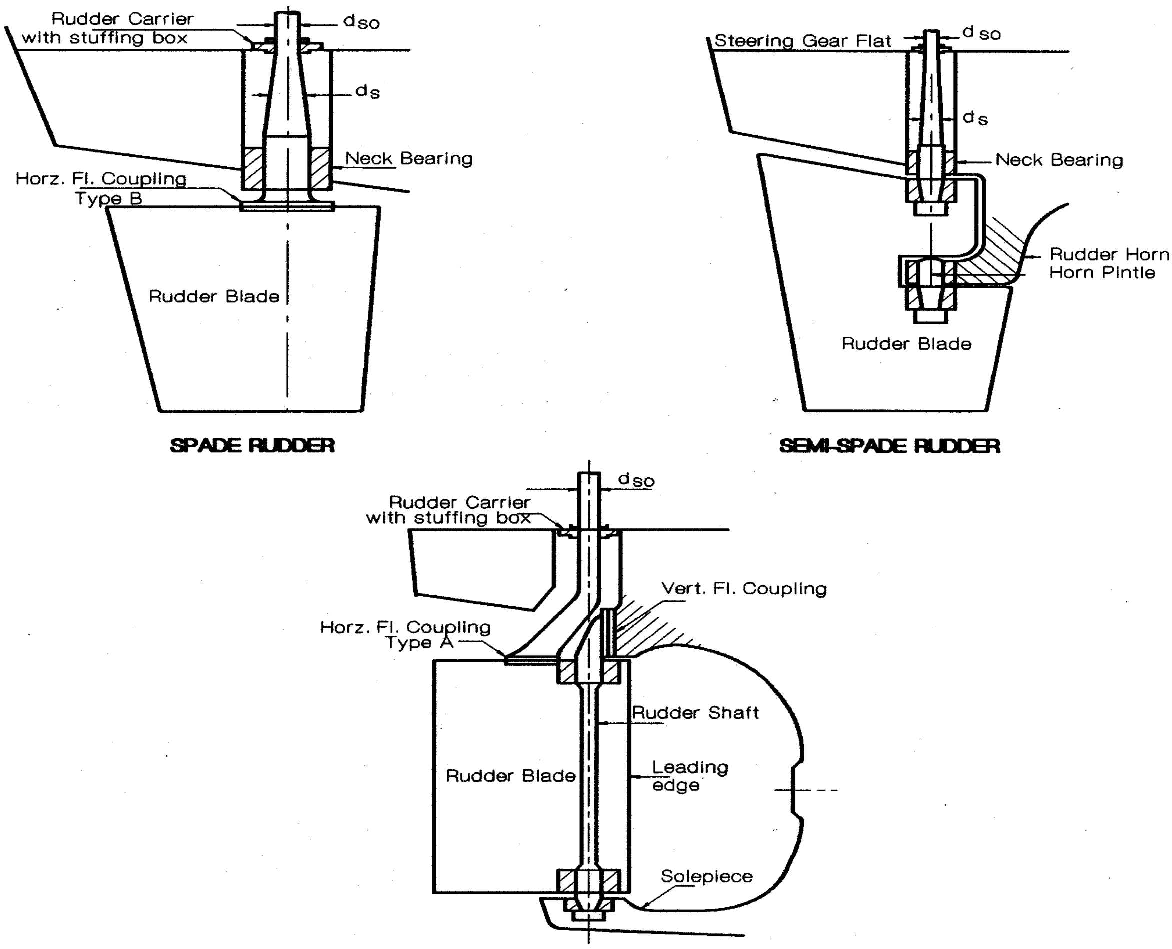

Fig.2.1.1 : Types of rudders

Section 3

Design Loads

3.1 Rudder force

3.1.1 The rudder force upon which rudder scantlings are to be based is to be determined from the following formula:

$F_r = 132 \,.\, K_1 \,.\, K_2 \,.\, K_3 \,.\, A \,.\, V^2$ [N]

where,

F_r = rudder force [N]

A = area of rudder blade [m^2]

V = maximum service speed (knots) with the ship on summer load waterline. When the speed is less than 10 knots, V is to be replaced by the expression.

$V_{min} = (V + 20)/3$

For astern condition, the maximum astern speed is to be used, but in no case less than:

$V_{astern} = 0.5V$

Where the service speed is obtained at lower power than the maximum continuous rating of the propelling machinery, the speed V to be used in the calculation is to be increased in proportion of $(\text{Power})^{1/3}$.

K_1 = factor based on the aspect ratio, λ of the rudder area;

$K_1 = (\lambda + 2)/3$; with λ not to be taken greater than 2.

$\lambda = b^2/A_t$; where b is the mean height of the rudder area [m] and At, the sum of rudder blade area and area of rudder post or rudder horn, if any, within the height b [m^2]

Mean breadth C [m] and mean height b [m] of rudder are calculated according to the co-ordinate system in Fig.3.1.1.

K_2 = Factor depending on type of the rudder and the rudder profile as per Table 3.1.1.

K_3 = 0.80 for rudders outside the propeller jet

= 1.15 for rudders behind a fixed propeller nozzle

= 1.0 otherwise.

As per Fig, 3.1.1,

$C = \frac{x_2+x_3-x_1}{2}$; Mean Breadth of Rudder

$b = \frac{z_3+z_4-z_2}{2}$; Mean Height of Rudder

Table 3.1.1

Profile Type	K_2	
	Ahead condition	**Astern condition**
NACA-00 series Göttingen 	1.10	0.80
Flat side 	1.10	0.90
Hollow 	1.35	0.90
Fish tail 	1.40	0.80
Single plate 	1.00	1.00
Mixed profiles (e.g. HSVA)	1.21	0.90

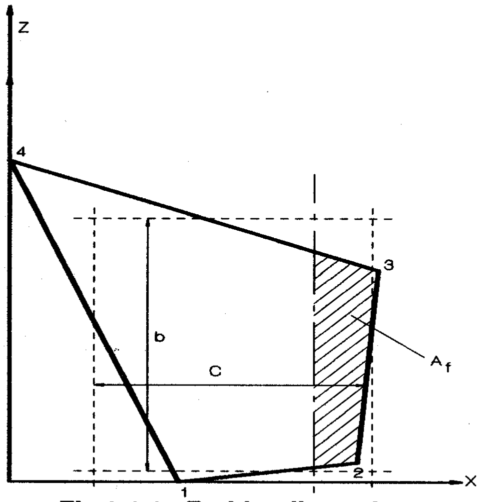

Fig.3.1.1 : Rudder dimensions

3.2 Rudder torque

3.2.1 The rudder torque on regular shaped rudders in both the ahead and astern conditions of travel is to be calculated as follows:

$$Q_r = F_r \cdot r \text{ [N-m]};$$

where,

$r = x_c - f$ [m]; but not to be taken less than 0.1C.

x_c = the distance of the point of application of the design force F_r from the leading edge

= 0.33 C in ahead condition

= 0.66 C in astern condition.

C = Mean breadth of rudder area [m] See Fig.3.1.1.

$f = C \cdot A_f/A$ where A_f is the portion of the rudder blade area situated ahead of the centre line of the rudder stock.

3.2.2 In case of rudder blades with stepped contours / semi-spade rudders, the total rudder torque is to be obtained as follows:

$$Q_r = \Sigma Q_{ri} \quad \text{for } i = 1,2,3,.....$$

where,

$Q_{ri} = F_{ri} \cdot r_i$; individual torque component from each part A_i of the total rudder area. See Fig.3.2.2.

$F_{ri} = F_r \cdot A_i/A$

$r_i = x_{ci} - f_i$; but not to be taken less than 0.1 C_i.

where,

$f_i = C_i \cdot A_{if}/A_i$

x_{ci}, f_i, A_{if} and C_i are to be taken as x_c, f, A_f and C as in 3.2.1 for each discrete part except that for those rudder parts immediately aft of rudder horn x_{ci} is to be taken as $0.25C_i$ and $0.55C_i$ in ahead and astern conditions respectively.

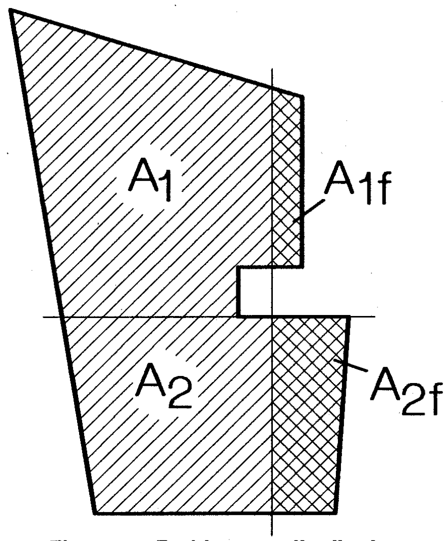

Fig.3.2.2 : Rudder area distribution

3.3 Rudder Strength Calculations

3.3.1 The rudder force and resulting rudder torque as given in 3.1 and 3.2 causes bending moments and shear forces in the rudder body, bending moments and torques in the rudder stock, supporting forces in pintle bearings and rudder stock bearings and bending moments, shear forces and torques in rudder horns and heel pieces. The rudder body is to be stiffened by horizontal and vertical webs enabling it to act as a bending girder.

3.3.2 The bending moment (BM) and shear force (SF) distributions along the entire height of the rudder blade and rudder stock as well as the bearing reactions may be obtained by direct calculation. The rudder is to be assumed as simply supported at the centres of the upper bearing and the neck bearing. In case of rudders supported by the sole piece or rudder horn the flexibility of the sole piece or rudder horn, and rudder and rudder stock is to be taken into consideration. Guidelines for calculation of bending moment and shear force distribution for various types of rudders are given in Section 8.

Section 4

Rudder Blades

4.1 Construction details

4.1.1 Care is to be taken to avoid notch effects and to maintain continuity of strength around cut-outs and openings in the side plating. The plating thickness is to be increased suitably and corners are to be well rounded and ground smooth.

4.1.2 Side plating and vertical webs transmitting the torque are to be welded to the coupling flange by full penetration welds. Welds between plates and heavy pieces (solid parts in forged or cast steel or very thick plating) are also to be made as full penetration welds. In way of highly stressed areas e.g. cut-out of semi-spade rudder and upper part of spade rudder, cast or welding on ribs is to be arranged. Two sided full penetration welding is normally to be arranged. Where back welding is impossible welding is to be performed against ceramic backing bars or equivalent. Steel backing bars may be used and are to be continuously welded on one side to the heavy piece.

4.1.3 Webs are to be connected to the side plating in accordance with Ch.17. Where fillet welding is not practicable side plating is to be connected by means of slot welding to flat bars welded to the webs. Slot welding is to be limited as far as possible. Slot welding is not to be used in areas with large in-plane stresses transversely to the slots or in way of cut-out areas of semi-spade rudders. Normally slots of length 75 [mm], breadth at least twice the side plating thickness and spaced 200 [mm] centre to centre will be accepted. The ends of the slots are to be well rounded. The slots are to be fillet welded around the edges and filled with a suitable compound, e.g. epoxy putty. Slots are not to be filled with weld.

4.1.4 Continuous slot welds may be used in lieu of slot welds. When continuous slot welding is used, the root gap is to be between 6-10 [mm] and the bevel angle is to be atleast 15º.

4.1.5 In way of the rudder horn recess of semi-spade rudders, the radii in the rudder plating are not to be less than 5 times the plate thickness, but in no case less than 100 [mm]. Welding in side plate is to be avoided in or at the end of the radii. Edges of side plate and weld adjacent to radii are to be ground smooth.

4.1.6 Requirements for welding and design details of rudder trunks are indicated in 7.3.

4.1.7 Requirements for welding and design details when the rudder stock is connected to the rudder by horizontal flange coupling are indicated in 6.1.6.

4.1.8 Requirements for welding and design details of rudder horns are indicated in 7.2.3.

4.1.9 Arrangement is to be provided to drain the rudders completely. Drain plugs are to be provided with efficient packing.

4.1.10 Internal surfaces of rudders are to be efficiently coated for corrosion resistance after completion of fabrication and testing. Where it is intended to fill the rudder with plastic foam, details of the foam material are to be submitted.

4.2 Double plated rudders

4.2.1 Thickness 't' of the rudder side, top and bottom plating is not to be less than:

$$t = 5.5.s.f_a.\sqrt{k.\left(T + \frac{F_r}{A}.10^{-4}\right)}.10^{-3} + 2.5 \text{ [mm]}$$

where,

$$f_a = \sqrt{1.1 - 0.5(s/1000/l)^2};\ \max.1.00$$

s = the smaller of the distances between the horizontal or the vertical web plates/ smallest unsupported width of plating [mm].

l = the larger of the distances between the horizontal or the vertical web plates/ greatest unsupported width of plating [m].

T = Summer load line draught [m]

k = Material factor for the rudder plating.

The thickness 't' is however not to be less than the minimum side shell thickness as per Pt.3, Ch.8.

For nose plates the thickness is to be increased to 1.25 t.

4.2.2 The thickness of the vertical and horizontal webs is not to be less than 70 per cent of the requirement given in 4.2.1 with a minimum of 8 [mm].

4.2.3 Overall strength of the rudder blade based on bending moments (BM) and shear forces (SF) obtained as per Sec.3 is to satisfy the following criteria:

a) bending stress $\sigma = \frac{\mathrm{BM}}{\mathrm{Z}_l} \leq 110/\mathrm{k}\ [\mathrm{N/mm^2}]$

b) shear stress $\tau = \frac{\mathrm{SF}}{\mathrm{A_w}} \leq 50/\mathrm{k}\ [\mathrm{N/mm^2}]$

c) equivalent stresses

$$\sigma_{\mathrm{a}} = \sqrt{\sigma^2 + 3\tau^2} \leq 120/\mathrm{k}\ [\mathrm{N/mm^2}]$$

where,

Z_l = Section modulus of the blade cross section against lateral bending obtained considering side plating and web plates within the effective width of the rudder profile. The effective width is to be generally taken as 40 per cent of the net width of the rudder profile; and

A_w = Total Sectional area of the vertical webs.

k = Material factor for the rudder plating

d) In way of cut-outs or openings in the side plating for access to cone coupling or pintle nut:

Bending stress, $\sigma \leq 75$ [N/mm^2]

Torsional stress, $\tau_t \leq 50$ [N/mm^2]

$$\sqrt{\sigma^2 + 3\tau^2} \leq 100/\mathrm{k}\ [\mathrm{N/mm^2}]$$

where,

τ_t is torsional stress based on torque arising from the partial rudder force acting on the area below the section in consideration.

Note : The stresses in d) apply equally to high tensile and ordinary steels.

e) In way of the coupling the stresses are to be limited as in d); however for calculation of the stresses only the items within the width of the coupling are to be considered.

4.3 Single plated rudders

4.3.1 Mainpiece diameter

The mainpiece diameter is calculated according to 5.1.1 and 5.1.4 respectively. The diameter of the main piece at top end is not to be less than that of the lower rudder stock, and it may be gradually reduced towards lower end provided stresses are limited as per 4.2.3. For spade rudders the lower third may taper down to 0.75 times stock diameter.

4.3.2 Blade thickness

The blade thickness is not to be less than:

$$t_b = 1.5\, s\, V\sqrt{k} + 2.5 \qquad [\mathrm{mm}]$$

where:

s = spacing of stiffening arms, [m], not to exceed 1 m;

V = speed in knots, see 3.1.1.

k = material factor for the rudder plating.

4.3.3 Arms

The thickness of the arms is not to be less than the blade thickness

$t_a = t_b$ [mm]

The section modulus is not to be less than:

$Z_a = 0.5\, s\, C_1^2\, V^2\, k$ [cm^3];

C_1 = horizontal distance from the aft edge of the rudder to the centreline of the rudder stock, [m]

k = material factor

4.3.4 Rudder blade is to be stiffened by horizontal arms spaced not more than 1000 [mm] apart. The arms are to be efficiently attached to the main piece.

4.4 Connection of rudder blade structure with solid parts

4.4.1 Solid parts in forged or cast steel, which house the rudder stock or the pintle, are normally to be provided with protrusions.

These protrusions are not required when the web plate thickness is less than:

- 10 [mm] for web plates welded to the solid part on which the lower pintle of a semi-spade rudder is housed and for vertical web plates welded to the solid part of the rudder stock coupling of spade rudders.

- 20 [mm] for other web plates.

4.4.2 The solid parts are in general to be connected to the rudder structure by means of two horizontal web plates and two vertical web plates.

4.4.3 Minimum section modulus of the connection with the rudder stock housing.

The section modulus of the cross-section of the structure of the rudder blade, in [cm^3], formed by vertical web plates and rudder plating, which is connected with the solid part where the rudder stock is housed is to be not less than:

$$Z_s = c_s\, d_c^3 \left(\frac{H_E - H_X}{H_E}\right)\frac{k}{k_s}\; 10^{-4} \quad [\text{cm}^3]$$

where:

c_s = coefficient, to be taken equal to:

= 1.0 if there is no opening in the rudder plating or if such openings are closed by a full penetration welded plate

= 1.5 if there is an opening in the considered cross-section of the rudder

d_c = rudder stock diameter, [mm]

H_E = vertical distance between the lower edge of the rudder blade and the upper edge of the solid part, [m]

H_X = vertical distance between the considered cross-section and the upper edge of the solid part, [m]

k = material factor for the rudder blade plating.

k_s = material factor for the rudder stock.

The actual section modulus of the cross-section of the structure of the rudder blade is to be calculated with respect to the symmetrical axis of the rudder.

The breadth of the rudder plating, [m], to be considered for the calculation of section modulus is to be not greater than:

$$b = s_V + 2\,H_x / 3 \quad [\text{m}]$$

where:

s_V = spacing between the two vertical webs, [m] (see Fig.4.4.3)

Where openings for access to the rudder stock nut are not closed by a full penetration welded plate, they are to be deducted.

4.4.4 The thickness of the horizontal web plates connected to the solid parts, in [mm], as well as that of the rudder blade plating between these webs, is to be not less than the greater of the following values:

t_H = 1.2 t [mm]

t_H = $0.045\, d_s^2 / s_H$ [mm]

where:

t = defined in 4.2.1

d_S = diameter,[mm], to be taken equal to:

= d_c, as per 5.1.4, for the solid part housing the rudder stock

= d_p, as per 5.2.1, for the solid part housing the pintle

s_H = spacing between the two horizontal web plates, [mm]

The increased thickness of the horizontal webs is to extend fore and aft of the solid part at least to the next vertical web.

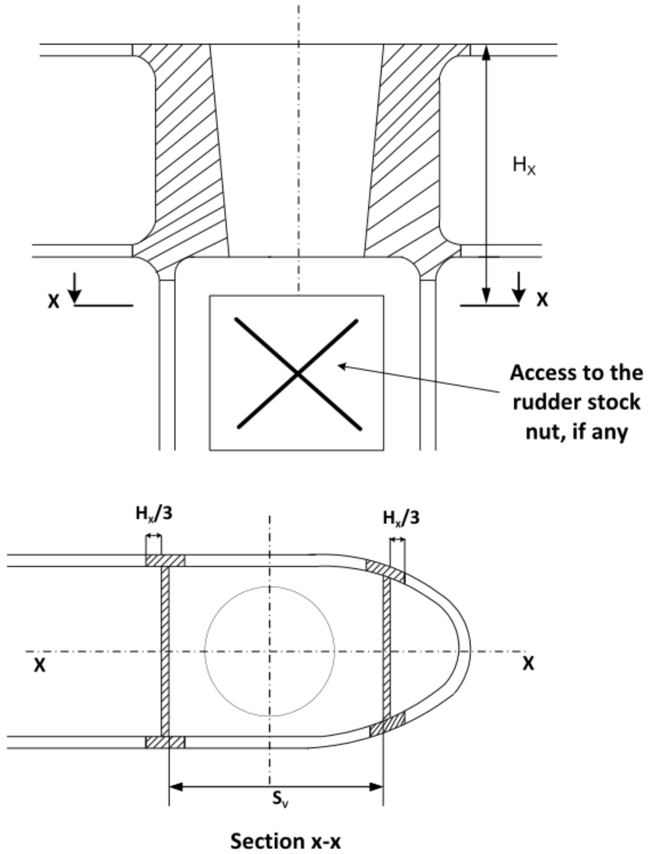

Fig.4.4.3 : Cross-section of the connection between rudder blade structure and rudder stock housing

4.4.5 The thickness of the vertical web plates welded to the solid part where the rudder stock is housed as well as the thickness of the rudder side plating under this solid part is to be not less than the values obtained, in [mm], from Table 4.4.5. The increased thickness is to extend below the solid piece at least to the next horizontal web.

Table 4.4.5 : Thickness of side plating and vertical web plates

Type of rudder	Thickness of vertical web plates, [mm]		Thickness of rudder plating, [mm]	
	Rudder blade without opening	Rudder blade with opening	Rudder blade without opening	Area with opening
Rudder supported by sole piece	1.2 t	1.6 t	1.2 t	1.4 t
Semi-spade and spade rudders	1.4 t	2.0 t	1.3 t	1.6 t
t = thickness of the rudder plating, [mm] as defined in 4.2				

Section 5

Rudder Stock and Pintles

5.1 Rudder stock

5.1.1 The rudder stock diameter required for the transmission of the rudder torque is to be dimensioned such that the torsional stress is not exceeding the following value:

$$\tau_T = 68 / k \text{ [N/mm}^2\text{]}$$

The rudder stock diameter for the transmission of the rudder torque is therefore not to be less than:

$$d_t = 4.2\sqrt[3]{Q_r k} \text{ [mm]}$$

Q_r = Total rudder torque [Nm] as calculated in 3.2.

k = Material factor of the rudder stock as given in 1.2.3

5.1.2 If the rudder stock is subjected to combined torque and bending, the Equivalent stress σ_e in the rudder stock is not to exceed 118/k [N/mm^2] i.e.

k = Material factor of the rudder stock as given in 1.2.3

$$\sigma_e = \sqrt{\sigma^2 + 3\tau_t^{\ 2}} \le 118/\mathrm{k} \text{ [N/mm}^2\text{]}$$

where,

σ is the bending stress in [N/mm^2],

$\sigma = 10.2 \text{ x } 10^3 \text{ M } / \mathrm{d}_c^3$

τ_t is the torsional shear stress in [N/mm^2].

$\tau_t = 5.1 \text{ x } 10^3 \text{ Q}_r / \mathrm{d}_c^3$

This requirement is regardless of the liners; and both ahead and astern conditions are to be considered.

5.1.3 The diameter of the rudder stock at and above rudder carrier is given by

$$\mathrm{d}_t = 4.2\sqrt[3]{(\mathrm{Q}_r.\mathrm{k})} \text{ [mm]}$$

5.1.4 The diameter of rudder stock at any other cross section is given by

$$\mathrm{d}_s = d_t . \sqrt[6]{\left[1 + \frac{4}{3}.\frac{\mathrm{BM}^2}{\mathrm{Q}_r^2}\right]} \text{[mm]}$$

where BM is the bending moment at the cross section under consideration obtained as per 3.3.

5.1.5 The diameter of the rudder stock at neck bearing is to be maintained to a point as far as practicable above the top of the neck bearing and may subsequently be tapered to that required at the rudder carrier. The length of the taper is to be at least three times the reduction in diameter. Particular care is to be taken to avoid the formation of a notch at the upper end of the taper.

5.1.6 Sudden changes of section or sharp corners in way of the rudder coupling, jumping collars and shoulders for rudder carriers are to be avoided. Jumping collars are not to be welded to the rudder stock. Keyways in the rudder stock are to have rounded ends and the corners at the base of the keyway are to be adequately radiused.

5.1.7 Significant reductions in rudder stock diameter due to the application of steels with yield stresses exceeding 235 [N/mm^2] are to be granted only after evaluation of rudder stock deformations. Large deformations of the rudder stock are to be avoided in order to avoid excessive pressures in way of bearings.

5.2 Pintles

5.2.1 Scantlings

The diameter d_p of the pintles, is not to be less than

$$d_p = 0.35\sqrt{(B\,k_p)}$$

where,

B = relevant bearing force, [N]

k_p = material factor for pintle as given in 1.2.3

5.2.2 Couplings

Pintles are to have a conical attachment to the gudgeons with a taper on diameter not greater than:

1:8 - 1:12 for keyed and other manually assembled pintles applying locking by slugging nut,

1:12 - 1:20 on diameter for pintles mounted with oil injection and hydraulic nut.

5.2.3 Push-up pressure for pintle bearings

The required push-up pressure for pintle bearings, in [N/mm²], is to be determined by the following formula:

$$p_{req} = 0.4\,\frac{B_1 d_0}{d_m^2\, l}$$

where:

B_1 = Supporting force in the pintle bearing, [N]

d_0, d_m, l = Pintle dimensions, see Fig. 6.3.1

5.2.4 The minimum dimensions of threads and nuts are to be determined according to Cl. 6.3.2. The push-up length is to be calculated similarly as in Cl. 6.4.3, using required push-up pressure and properties for the pintle bearing. An effective sealing against sea water is to be provided at both ends of the cone.

5.2.5 Pintle housing

The length of pintle housing in the gudgeon is not to be less than the pintle diameter d_p. The thickness of the pintle housing is not to be less than 0.25 d_p.

5.2.6 Where liners are fitted to pintles, they are to be shrunk on or otherwise efficiently secured. If liners are to be shrunk on, the shrinkage allowance is to be indicated on the plans. Where liners are formed by stainless steel weld deposit, the pintles are to be of weldable quality steel, and details of the procedure are to be submitted. Bushing is to be effectively secured against movement.

5.3 Bearings of rudder stock, rudder shaft and pintle

5.3.1 Liners and Bushes

5.3.1.1 Rudder stock bearing

Liners and bushes are to be fitted in way of bearings. The minimum thickness of liners and bushes is to be equal to:

- t_{min} = 8 [mm] for metallic materials and synthetic material
- t_{min} = 22 [mm] for lignum material

5.3.1.2 Pintle bearing

The thickness of any liner or bush, [mm], is neither to be less than:

$$t = 0.01\sqrt{B}$$

where:

B = relevant bearing force, [N]

nor less than the minimum thickness defined in 5.3.1.1

5.3.2 Minimum Bearing Surface

5.3.2.1 An adequate lubrication is to be provided. The bearing surface A_b (defined as the projected area: length x outer diameter of liner) is not to be less than:

$$A_b = {}^{P}\!/_{q_a}$$

where:

P = reaction force [N] in bearing as determined in 3.3;

q_a = allowable surface pressure according to the Table 5.3.2.

5.3.3 Bearing clearances are normally to be as given in Table 5.3.3.

Attention is to be paid to the manufacturer's recommendations particularly where bush material requires pre-soaking.

5.3.4 The maximum surface pressure p, for the various combinations is not to exceed the values given in Table 5.3.4. Higher values than given in table may be taken on verification by tests.For the purpose of this calculation, the bearing length is not to be taken greater than 1.2 times the rudder stock or pintle diameter measured outside of liners, if fitted. The bearing length L_p of the pintle is to be such that

$$D_p \leq L_p \leq 1.2\, D_p$$

where,

D_p = Actual pintle diameter measured on the outside of the liners.

Table 5.3.3 : Bearing clearances

- For metal bearing material	Not less than 0.001 d_p + 1.0 [mm]
- For synthetic bearing material	To be specially determined considering the swelling and thermal expansion properties of the material, but not less than 1.5 [mm]#.

A smaller clearance may be accepted if supported by the manufacturer’s recommendation and documented evidence of satisfactory service history with reduced clearance.

Table 5.3.4 : Maximum surface pressure q_a

Bearing material	**q_a [N/mm^2]**
Lignum vitae	2.5
White metal, oil lubricated	4.5
Synthetic material with hardness between 60 and 70 shore D(1)	5.5(2)
Steel,(3) bronze and hot pressed bronze- graphite materials	7.0

Note:

(1) Indentation hardness test at 23°C and with 50% moisture, according to a recognised standard. Synthetic bearing materials to be of approved type.

(2)Surface pressures exceeding 5.5 [N/mm^2] may be accepted in accordance with the bearing manufacturer’s specification and tests, but in no case more than 10 [N/mm^2]

(3) Stainless and wear resistant steel in an approved combination with stock liner.

Section 6

Rudder Couplings

6.1 Horizontal flange couplings

6.1.1 The diameter of the coupling bolts is not to be less than:

$$d_b = 0.62\left[\frac{d_s^3 . k_b}{n.e_m.k_s}\right]^{1/2} \text{ [mm]}$$

where,

d_s = Stock diameter [mm] in way of the coupling flange; equal to the greater of the diameters d_t or d_c according to 5.1.3 and 5.1.4

k_s = material factor for the rudder stock material;

k_b = material factor for the bolt material;

n = total number of bolts;

e_m = mean distance of the bolt axes from the centre of the bolt system [mm].

6.1.2 Coupling bolts are to be fitted bolts and a minimum of six (6) bolts are to be provided. Their nuts are to be effectively locked.

6.1.3 Mean distance e_m from the centre of the bolts to the centre of the bolt system is not to be less than 0.9 d_s [mm]. In addition, where the coupling is subjected to bending stress the mean athwartship distance from the centre of bolts to the longitudinal centreline of the coupling is not to be less than 0.6 d_s [mm].

6.1.4 The thickness of coupling flanges is not to be less than that obtained by the following formula:

$$t_f = d_b \sqrt{\left(\frac{k_f}{k_b}\right)} \text{ [mm]}$$

t_f is to be also not less than 0.9 d_b;

d_b = bolt diameter [mm] calculated for a number of bolts not exceeding 8.

k_f = material factor for the flange;

k_b = material factor for the bolt material.

6.1.5 The width of material outside the bolt holes is not to be less than 0.67 d_b [mm].

6.1.6 The welded joint between the rudder stock and the flange is to be made in accordance with Fig.6.1.6 or equivalent.

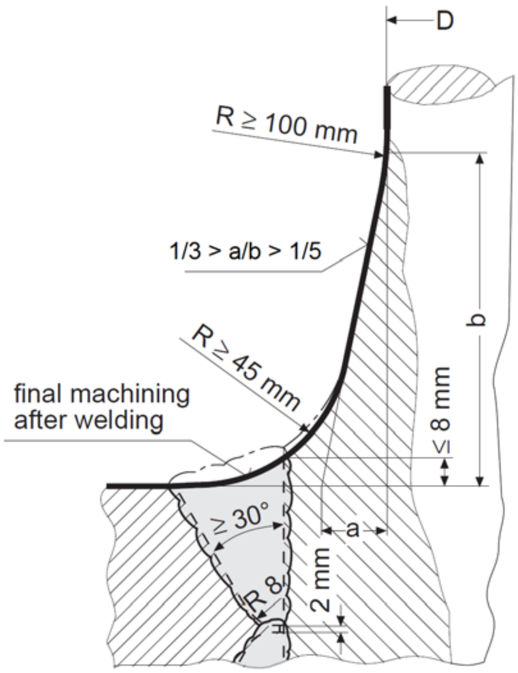

Fig. 6.1.6 : Welded joint between rudder stock and coupling flange

6.2 Vertical flange couplings

6.2.1 The diameter of the coupling bolts is not to be less than:

$$d_b = 0.81\left[\frac{d_s^2 \, . k_b}{n \, . k_s}\right]^{1/2} \quad [mm]$$

where,

d_s = Stock diameter [mm] in way of the coupling flange

n = total number of bolts , but not less than 8.

k_b = material factor for bolts.

k_s = material factor for rudder stock .

6.2.2 The first moment of area of the bolts about the centre of the coupling to be not less than:

$$m = 0.00043 \, d_s^3 \; [cm^3]$$

6.2.3 The thickness of the coupling flanges is to be at least equal to the bolt diameter; and the width of the flange material between the perimeter of the bolt holes and the perimeter of the flange is to be greater than or equal to 0.67 d_b.

6.2.4 Coupling bolts are to be fitted bolts and their nuts are to be locked effectively.

6.3 Cone couplings with key/ Cone couplings without hydraulic arrangement for mounting and dismounting

6.3.1 Cone couplings without hydraulic arrangements for mounting and dismantling the coupling should have a taper 'c' on diameter generally ranging between 1:8 to 1:12.

$$c = \frac{d_o - d_u}{l} \text{ according to Fig.6.3.1.}$$

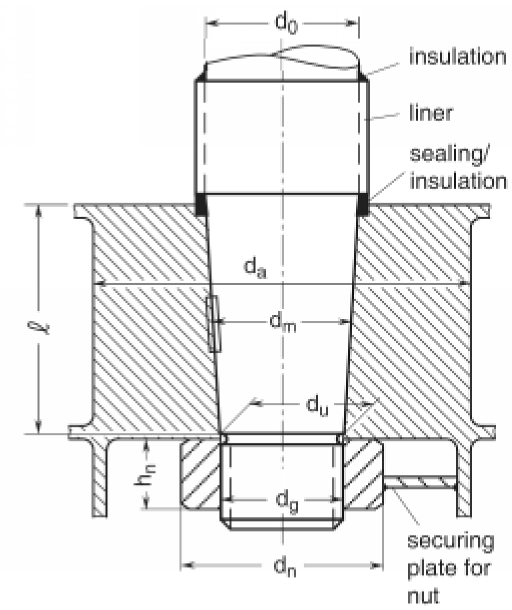

Fig.6.3.1 : Cone coupling with key

The coupling length *l* is in general not to be less than 1.5 times the rudder stock diameter d_o at the top of rudder.

The cone shape is to be very exact and the slugging nut is to be efficiently secured.

6.3.2 The dimensions of the slugging nut [mm], are not to be less than (See Fig 6.3.1) :

External thread of nut, $d_g \geq 0.65 \, d_o$;

Outer diameter of nut, $d_n \geq 1.2 \, d_u$ or $1.5 \, d_g$, whichever is the greater;

Height of nut, $h_n \geq 0.6\ d_g$

6.3.3 A key is to be fitted in the tapered connection, as close to the nut as possible and ample fillets are to be provided at corners of the keyway.

The shear area of the key is not to be less than :

$$a_s = \frac{17.55\ Q_F}{d_k\ \sigma_{F1}}$$

where,

Q_F = design yield moment of rudder stock, in [Nm]

$$Q_F = 0.02664\ \frac{d_t^3}{k}$$

Where the actual diameter d_{ta} is greater than the calculated diameter d_t, the diameter d_{ta} is to be used. However, d_{ta} applied to the above formula need not be taken greater than 1.145 d_t.

d_t = stock diameter, [mm], according to 5.1.3.

k = material factor for stock as given in 1.2.3

d_k = mean diameter of the conical part of the rudder stock, [mm], at the key

σ_{F1} = minimum yield stress of the key material, [N/mm^2]

The effective surface area, [cm^2], of the key (without rounded edges) between key and rudder stock or cone coupling is not to be less than:

$$a_k = \frac{5\ Q_F}{d_k \sigma_{F2}}$$

where:

σ_{F2} = minimum yield stress of the key, stock or coupling material, [N/mm^2], whichever is less.

6.3.4 Push up

It is to be proved that 50% of the design yield moment is solely transmitted by friction in the cone couplings. This can be done by calculating the required push-up pressure and push-up length according to 6.4.2 and 6.4.3 for a torsional moment $Q'_F = 0.5\ Q_F$.

6.3.5 Notwithstanding the requirements in 6.3.3 and 6.3.4, where a key is fitted to the coupling between stock and rudder and it is considered that the entire rudder torque is transmitted by the key at the couplings, the scantlings of the key as well as the push-up force and push-up length are to be specially considered.

6.4 Cone couplings with hydraulic arrangement for mounting and dismounting (with oil injection and hydraulic nut)

6.4.1 Where the stock diameter exceeds 200 [mm], the press fit is recommended to be achieved by a hydraulic pressure connection. In such cases, the cone diameter is to be, c, generally ranging between 1:12 to 1:20.

In case of hydraulic pressure connections the nut is to be effectively secured against the rudder stock or the pintle.

For the safe transmission of the torsional moment by the coupling between rudder stock and rudder body the push-up pressure and the push-up length are to be determined according to 6.4.2 and 6.4.3 respectively.

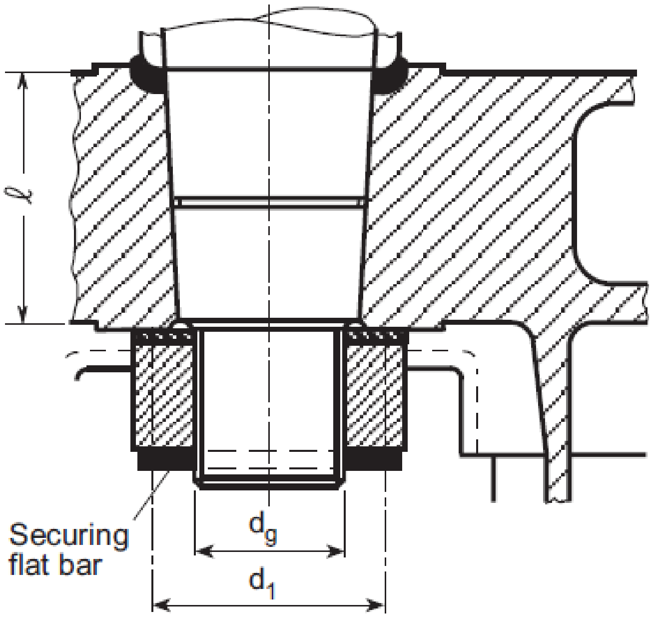

Fig.6.4.1 : Cone coupling without key

6.4.2 Push-up pressure

The push-up pressure is not to be less than the greater of the two following values:

$$p_{req1} = \frac{2Q_F}{d_m^2 \ell \pi \mu_0} 10^3 \qquad \text{[N/mm²]}$$

$$p_{req2} = \frac{6M_b}{\ell^2 d_m} 10^3 \qquad \text{[N/mm²]}$$

where:

Q_F = design yield moment of rudder stock, as defined in 6.3.3, [Nm]

d_m = mean cone diameter [mm], see Figure 6.3.1

ℓ = cone length [mm]

μ_0 = frictional coefficient, equal to 0.15

M_b = bending moment in the cone coupling (e.g. in case of spade rudders), [Nm]

It has to be proved by the designer that the push-up pressure does not exceed the permissible surface pressure in the cone. The permissible surface pressure, [N/mm²], is to be determined by the following formula:

$$p_{perm} = \frac{0.8R_{eH}\left(1-\alpha^2\right)}{\sqrt{3+\alpha^4}} \qquad \text{[N/mm²]}$$

where:

R_{eH} = minimum yield stress of the material of the gudgeon [N/mm^2]

α = d_m /d_a

d_m = diameter, [mm], see Fig. 6.3.1

d_a = outer diameter of the gudgeon to be not less than 1.5 d_m, [mm], see Fig.6.3.1

6.4.3 Push-up length

The push-up length $\Delta\ell$, [mm], $\Delta\ell$ is to comply with the following formula:

$$\Delta\ell_1 \le \Delta\ell \le \Delta\ell_2$$

where:

$$\Delta\ell_1 = \frac{p_{req} d_m}{E\left(\frac{1-\alpha^2}{2}\right)c} + \frac{0.8R_{tm}}{c} \qquad \text{[mm]}$$

$$\Delta\ell_2 = \frac{1.6R_{eH} d_m}{Ec\sqrt{3+\alpha^4}} + \frac{0.8R_{tm}}{c} \qquad \text{[mm]}$$

R_{tm} = mean roughness, [mm] taken equal to 0.01

c = taper on diameter according to 6.4.1

Notwithstanding the above, the push up length is not to be less than 2 [mm].

Note: In case of hydraulic pressure connections the required push-up force P_e, [N], for the cone may be determined by the following formula:

$$P_e = p_{req} d_m \pi \ell \left(\frac{c}{2} + 0.02 \right)$$

The value 0.02 is a reference for the friction coefficient using oil pressure. It varies and depends on the mechanical treatment and roughness of the details to be fixed. Where due to the fitting procedure a partial push-up effect caused by the rudder weight is given, this may be taken into account when fixing the required push-up length, subject to approval by IRS.

Section 7

Sole Pieces and Rudder Horns

7.1 Sole piece

The section modulus around the vertical (z)-axis is not to be less than:

Z_z = M_b k / 80 [cm^3]

The section modulus around the transverse (y)-axis is not to be less than:

Z_y = 0.5 Z_z

The sectional area is not to be less than:

A_s = B_1 k / 48 [mm^2]

k = material factor as given in 1.2.3

7.1.1 Equivalent stress

At no section within the length ℓ_{50} is the equivalent stress to exceed 115 / k [N/mm^2]. The equivalent stress is to be determined by the following formula (See Fig.8.4.2):

$$\sigma_e = \sqrt{\sigma_b^2 + 3\tau^2} \quad [\text{N/mm}^2];$$

where:

σ_b = M_b / Z_z(x) [N/mm^2];

τ = B_1 / A_s [N/mm^2];

M_b = bending moment at the section considered [Nm];

M_b = B_1 x [Nm];

M_{bmax} = B_1 ℓ_{50} [Nm];

B_1 = supporting force in the pintle bearing [N] (normally B_1 = C_R / 2).

k = material factor as given in 1.2.3

7.2 Rudder horn

When the connection between the rudder horn and the hull structure is designed as a curved transition into the hull plating, special consideration is to be given to the effectiveness of the rudder horn plate in bending and to the stresses in the transverse web plates.

The bending moments and shear forces are to be determined by a direct calculation or in line with the guidelines given in Section 8 for semi spade rudder with one elastic support and semi spade rudder with 2-conjugate elastic support respectively.

The section modulus around the horizontal x-axis is not to be less than:

Z_x = M_b k / 67 [cm^3].

M_b = bending moment at the section considered, [Nm];

The shear stress is not to be larger than:

τ = 48 / k [N/mm^2].

k = material factor as given in 1.2.3

7.2.1 Equivalent stress

At no section within the height of the rudder horn is the equivalent stress to exceed 120 / k N/mm^2. The equivalent stress is to be calculated by the following formula:

$$\sigma_e = \sqrt{\sigma_b^2 + 3\left(\tau^2 + \tau_T^2\right)} \text{ [N/mm}^2\text{];}$$

σ_b = M_b / Z_x [N/mm^2];

τ = B_1 / A_h [N/mm^2];

B_1 = supporting force in the pintle bearing [N];

A_h = effective shear area of rudder horn in y-direction [mm^2];

τ_T = $M_T 10^3 / 2 A_T t_h$ [N/mm^2];

M_T = torsional moment [Nm];

A_T = area in the horizontal section enclosed by the rudder horn [mm^2];

t_h = plate thickness of rudder horn [mm];

k = material factor as given in 1.2.3

7.2.2 Rudder horn plating

The thickness of the rudder horn side plating is not to be less than:

$$t = 2.4\sqrt{Lk} \quad \text{[mm]}$$

where:

L = Rule length as defined in Chapter 1, Cl. 2.1.3;

k = material factor as given in 1.2.3.

7.2.3 Welding and connection to hull structure

.1 The rudder horn plating is to be effectively connected to the aft ship structure, e.g. by connecting the plating to side shell and transverse/ longitudinal girders, in order to achieve a proper transmission of forces, see Figure 7.2.3.

.2 Brackets or stringer are to be fitted internally in horn, in line with outside shell plate, as shown in Figure 7.2.3.

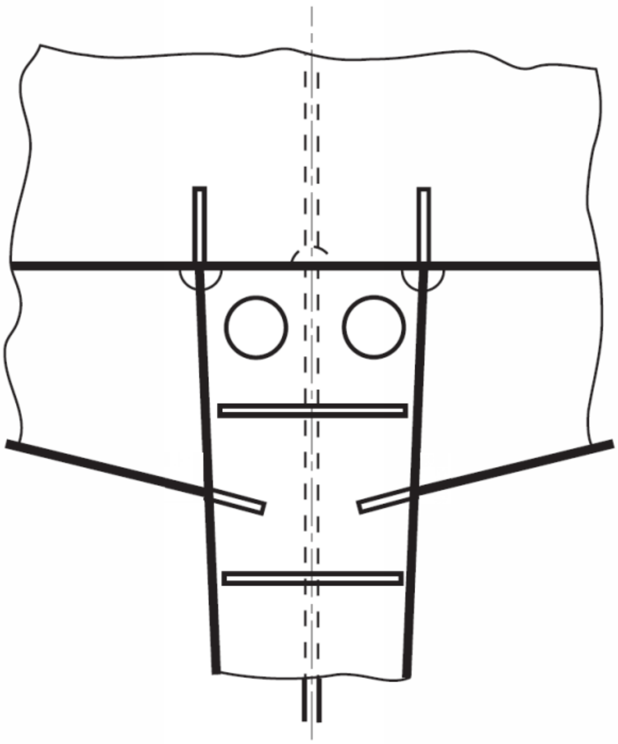

Fig.7.2.3 : Connection of Rudder Horn to aft Ship Structure

.3 Transverse webs of the rudder horn are to be led into the hull up to the next deck in a sufficient number.

.4 Strengthened plate floors are to be fitted in line with the transverse webs in order to achieve a sufficient connection with the hull.

.5 The centre line bulkhead (wash-bulkhead) in the after peak is to be connected to the rudder horn.

.6 Scallops are to be avoided in way of the connection between transverse webs and shell plating.

.7 The weld at the connection between the rudder horn plating and the side shell is to be full penetration. The welding radius is to be as large as practicable and may be obtained by grinding.

7.3 Rudder trunk

7.3.1 Materials, welding and connection to hull

This requirement applies to both trunk configurations (extending or not below stern frame).

The steel used for the rudder trunk is to be of weldable quality, with a carbon content not exceeding 0.23% on ladle analysis and a carbon equivalent C_{EQ} not exceeding 0.41.

Plating materials for rudder trunks are in general not to be of lower grades than corresponding to Class II as defined in Part 2 of the Rules.

The weld at the connection between the rudder trunk and the shell or the bottom of the skeg is to be full penetration.

The fillet shoulder radius r, [mm] (see Figure 7.2.4) is to be as large as practicable and to comply with the following formulae:

r = 60 [mm] when $\sigma \geq 40/k$ [N/mm^2]

r = $0.1d_c$, without being less than 30 [mm] when $\sigma < 40/k$ [N/mm^2]

where:

d_c = rudder stock diameter axis defined in 5.1.

σ = bending stress in the rudder trunk, [N/mm²].

k = material factor as given in 1.2.3

The radius may be obtained by grinding. If disk grinding is carried out, score marks are to be avoided in the direction of the weld. The radius is to be checked with a template for accuracy. Four profiles at least are to be checked. A report is to be submitted to the attending Surveyor.

Rudder trunks comprising of materials other than steel would be specially considered.

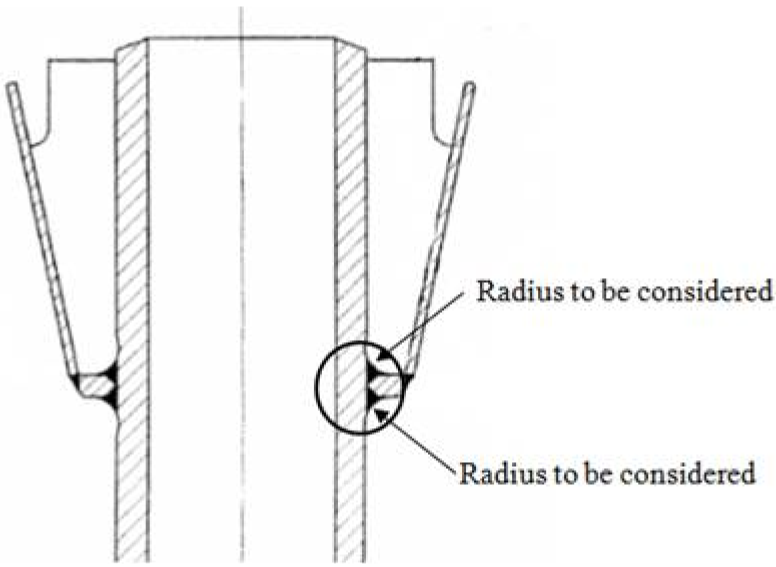

Fig.7.2.4 : Fillet Shoulder Radius

7.3.2 Scantlings

Where the rudder stock is arranged in a trunk in such a way that the trunk is stressed by forces due to rudder action, the scantlings of the trunk are to be such that:

- the equivalent stress due to bending and shear does not exceed 0.35 σ_F,
- the bending stress on welded rudder trunk is to be in compliance with the following formula: $\sigma \leq 80/k$ [N/mm²]

with:

σ = bending stress in the rudder trunk, as defined in 7.3.1.

k = material factor for the rudder trunk as given in 1.2.3, not to be taken less than 0.7

σ_F = yield stress [N/mm^2] of the material used.

For calculation of bending stress, the span to be considered is the distance between the mid-height of the lower rudder stock bearing and the point where the trunk is clamped into the shell or the bottom of the skeg.

Section 8

Guidelines for Evaluation of Bending Moment and Shear Force Distribution

8.1 The evaluation of bending moments, shear forces and support forces for the system rudder – rudder stock may be carried out for some basic rudder types as outlined in the succeeding paragraphs:

8.2 Spade rudder

8.2.1 Data for the analysis

ℓ_{10} - ℓ_{30} = Lengths of the individual girders of the system, [m]

$I_{10} – I_{30}$ = Moments of inertia of these girders, [cm^4]

Load of rudder body:

$P_R = C_R / (\ell_{10}\ 10^3)$ [kN/m]

8.2.2 The moments and forces may be determined by the following formulae:

$M_b = C_R (\ell_{20} + (\ell_{10} (2\ c_1 + c_2) / 3\ (c_1 + c_2)))$ [Nm]

$B_3 = M_b / \ell_{30}$ [N]

$B_2 = C_R + B_3$ [N]

8.3 Spade rudder with trunk

8.3.1 Data for the analysis

ℓ_{10} - ℓ_{30} = Lengths of the individual girders of the system, [m]

$I_{10} – I_{30}$ = Moments of inertia of these girders, [cm^4]

Load of rudder body:

$P_R = C_R / ((\ell_{10} + \ell_{20})10^3)$ [kN/m]

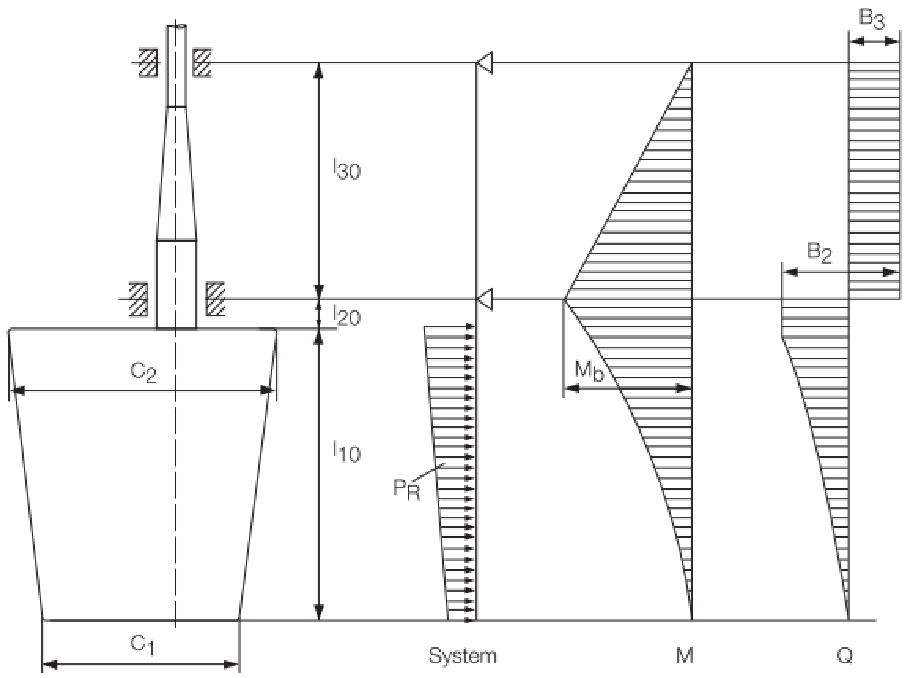

Fig.8.2.2 : Strength Calculations – Spade Rudder

8.3.2 For spade rudders with rudders trunks the moments, [Nm], and forces, [N], may be determined by the following formulae:

M_R is the greatest of the following values:

$$M_R = C_{R2}\,(\ell_{10} - CG_{2Z})$$

$$M_R = C_{R1}\,(CG_{1Z} - \ell_{10})$$

where:

C_{R1} : Rudder force over the rudder blade area A_1

C_{R2} : Rudder force over the rudder blade area A_2

CG_{1Z} : Vertical position of the centre of gravity of the rudder blade area A_1

CG_{2Z} : Vertical position of the centre of gravity of the rudder blade area A_2

$$M_B = C_{R2}\,(\ell_{10} - CG_{2Z})$$

$$B_3 = (M_B + M_{CR1}) / (\ell_{20} + \ell_{30})$$

$$B_2 = C_R + B_3$$

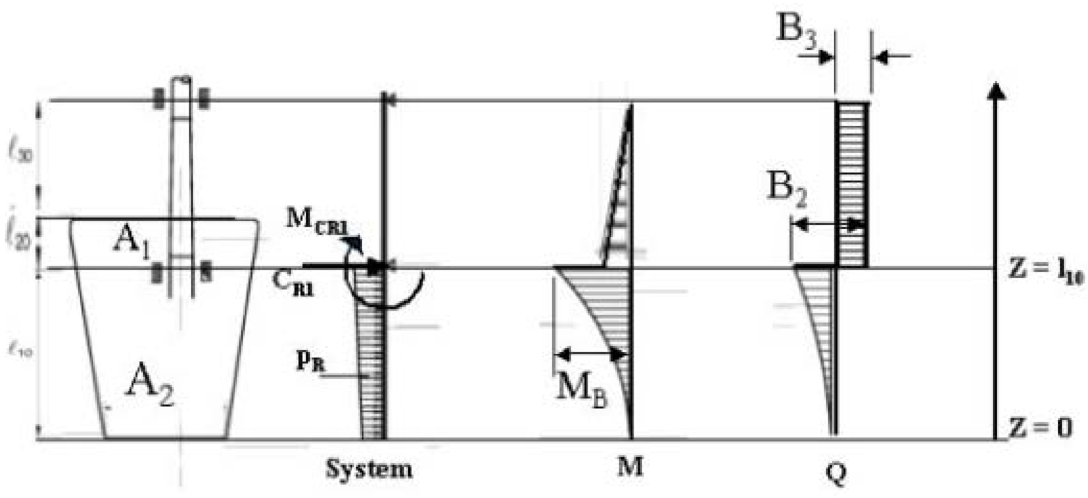

Fig.8.3.2 : Strength Calculations – Spade Rudder with Trunk

8.4 Rudder supported by sole piece

8.4.1 Data for the Analysis

ℓ_{10} - ℓ_{50} = Lengths of the individual girders of the system, [m]

I_{10} – I_{50} = Moments of inertia of these girders, [cm^4]

For rudders supported by a sole piece the length ℓ_{20} is the distance between lower edge of rudder body and centre of sole piece and I_{20} the moment of inertia of the pintle in the sole piece.

I_{50} = moment of inertia of sole piece around the z-axis, [cm^4];

ℓ_{50} = effective length of sole piece, [m];

Load of rudder body:

P_R = C_R / (ℓ_{10} 10^3) [kN/m]

Z = spring constant of support in the sole piece

Z = 6.18 x I_{50} / ℓ_{50}^3 [kN/m]

8.4.2 The moments and shear forces are indicated in Figure 8.4.2.

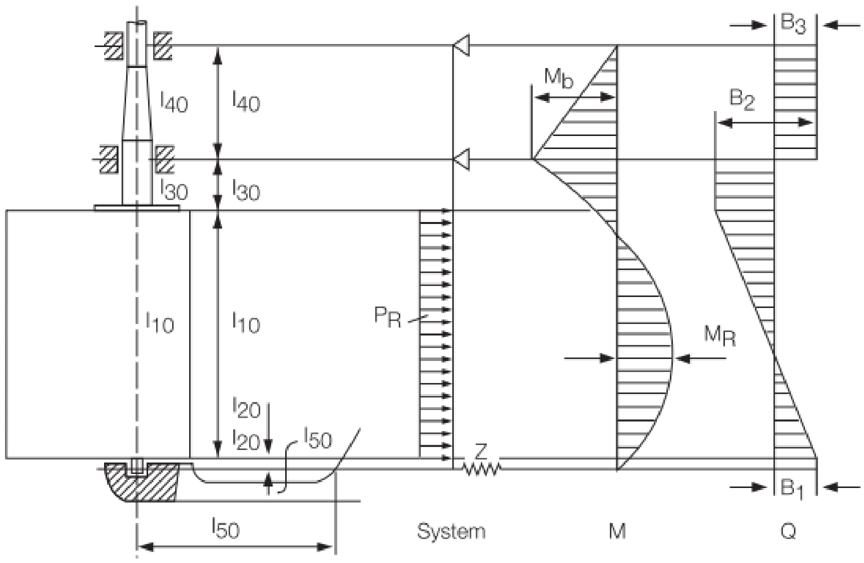

Fig.8.4.2 : Strength Calculations – Rudder supported by Sole Piece

8.5 Semi-spade rudder with one elastic support

8.5.1 Data for the analysis

ℓ_{10} - ℓ_{50} = Lengths of the individual girders of the system, [m];

I_{10} – I_{50} = Moments of inertia of these girders, [cm^4];

Z = spring constant of support in the rudder horn;

Z = 1 / (f_b + f_t) [kN/m] for the support in the rudder horn (Figure 8.5.2);

f_b = unit displacement of rudder horn in [m] due to a unit force of 1 kN acting in the centre of support;

f_b = 1.3 d^3 / (6.18 I_n) [m/kN] (guidance value);

I_n = moment of inertia of rudder horn around the x-axis, [cm^4] (see also Figure 8.5.2);

f_t = unit displacement due to torsion;

$f_t = d\, e^2 \sum {}^{u_i}/_{t_i} / [3.14 \times 10^8 F_T^2]$ [m/KN];

F_T = mean sectional area of rudder horn, [m^2];

u_i = breadth, [mm] of the individual plates forming the mean horn sectional area;

t_i = thickness within the individual breadth u_i, [mm];

d = Height of the rudder horn, [m], defined in Figure 8.5.2. This value is measured downwards from the upper rudder horn end, at the point of curvature transition, to the mid-line of the lower rudder horn pintle;

e = distance as defined in Figure 8.5.3

Load of rudder body:

P_{R10} = C_{R2} / (ℓ_{10} x 10^3) [kN/m];

P_{R20} = C_{R1} / (ℓ_{20} x 10^3) [kN/m];

for C_R, C_{R1}, C_{R2}, method indicated in 3.2.2 for estimation may be followed.

8.5.2 Moments and shear forces are indicated in Figure 8.5.2

8.5.3 Rudder horn

The loads on the rudder horn are as follows:

M_b = bending moment = B_1 z [Nm],

M_{bmax} = B_1 d [Nm]

q = shear force = B_1 [N]

M_T(z) = torsional moment = B_1 e (z) [Nm]

An estimate for B_1 is:

B_1 = C_R b / (ℓ_{20} + ℓ_{30}) [N]

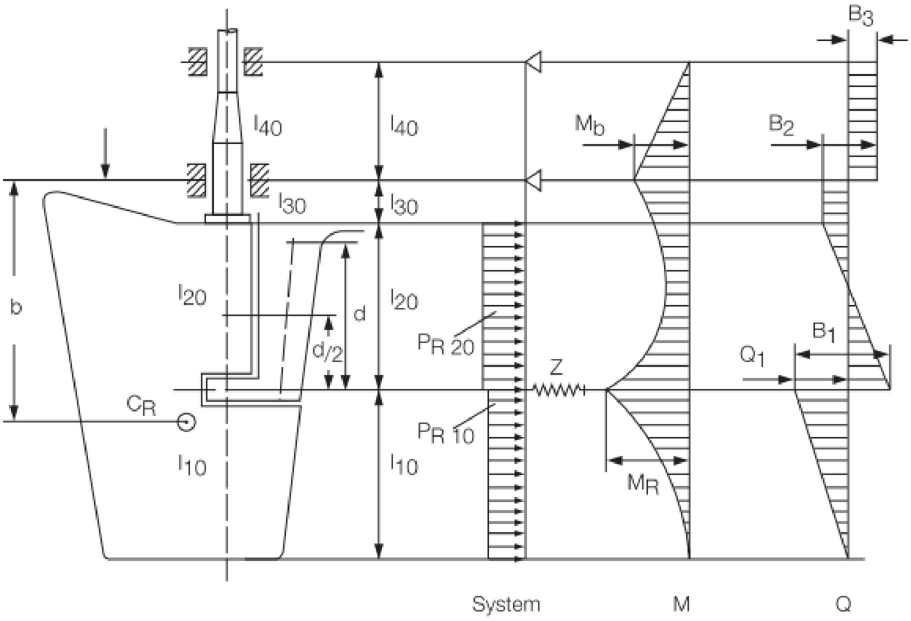

Fig.8.5.2 : Strength Calculations – Semi Spade Rudder with one Elastic Support

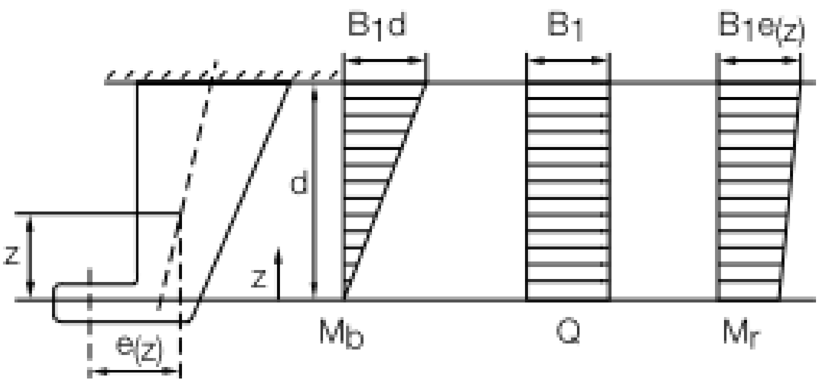

Fig 8.5.3

8.6 Semi-spade rudder with 2-conjugate elastic support

8.6.1 Data for the Analysis

K_{11}, K_{22}, K_{12} : Rudder horn compliance constants calculated for rudder horn with 2-conjugate elastic supports (Figure 8.6.2).The 2-conjugate elastic supports are defined in terms of horizontal displacements, y_i, by the following equations:

at the lower rudder horn bearing:

y_1 = $- K_{12} B_2 - K_{22} B_1$

at the upper rudder horn bearing:

y_2 = $- K_{11} B_2 - K_{12} B_1$

where:

y_1, y_2 : Horizontal displacements,[m], at the lower and upper rudder horn bearings, respectively.

B_1, B_2 : Horizontal support forces,[kN], at the lower and upper rudder horn bearings, respectively.

K_{11}, K_{22}, K_{12} : Obtained, [m/kN], from the following formulae:

$$K_{11} = 1.3\frac{\lambda^3}{3EJ_{1h}} + \frac{e^2\lambda}{GJ_{th}}$$

$$K_{22} = 1.3\left[\frac{\lambda^3}{3EJ_{1h}} + \frac{\lambda^2(d \quad \lambda)}{2EJ_{1h}}\right] + \frac{e^2\lambda}{GJ_{th}}$$

$$K_{12} = 1.3\left[\frac{\lambda^3}{3EJ_{1h}} + \frac{\lambda^2(d \quad \lambda)}{EJ_{1h}} + \frac{\lambda(d \quad \lambda)^2}{EJ_{1h}} + \frac{(d \quad \lambda)^3}{3EJ_{2h}}\right] + \frac{e^2 d}{GJ_{th}}$$

d : Height of the rudder horn, [m], defined in Figure 8.6.2. This value is measured downwards from the upper rudder horn end, at the point of curvature transition, to the mid-line of the lower rudder horn pintle.

λ : Length, [m], as defined in Figure 8.6.2. This length is measured downwards from the upper rudder horn end, at the point of curvature transition, to the mid-line of the upper rudder horn bearing. For λ = 0, the above formulae converge to those of spring constant Z for a rudder horn with 1-elastic support, and assuming a hollow cross section for this part.

e : Rudder-horn torsion lever, [m], as defined in Figure 8.6.2 (value taken at z = d/2).

J_{1h} : Moment of inertia of rudder horn about the x axis,[m^4], for the region above the upper rudder horn bearing. Note that J_{1h} is an average value over the length λ (see Figure 8.6.2).

J_{2h} : Moment of inertia of rudder horn about the x axis,[m^4], for the region between the upper and lower rudder horn bearings. Note that J_{2h} is an average value over the length d - λ (see Figure 8.6.2).

J_{th} : Torsional stiffness factor of the rudder horn, [m^4].

For any thin wall closed section:

$$J_{th} = \frac{4F_T^{\ 2}}{\sum_i \frac{u_i}{t_i}}$$

F_T : Mean of areas enclosed by outer and inner boundaries of the thin walled section of rudder horn, [m^2].

u_i : Length,[mm], of the individual plates forming the mean horn sectional area.

t_i : Thickness,[mm], of the individual plates mentioned above.

The J_{th} value is taken as an average value, valid over the rudder horn height.

Load of rudder body:

P_{R10} = $C_{R2} / (\ell_{10} \times 10^3)$ [kN/m];

$P_{R20} = C_{R1} / (\ell_{20} \times 10^3)$ [kN/m];

for C_R, C_{R1}, C_{R2}, see S10.2.2

8.6.2 The moments and shear forces are indicated in Fig.8.6.2.

8.6.3 Rudder horn bending moment

The bending moment acting on the generic section of the rudder horn is to be obtained, [Nm], from the following formulae:

- between the lower and upper supports provided by the rudder horn:

$M_H = F_{A1}\, z$

- above the rudder horn upper-support:

$M_H = F_{A1}\, z + F_{A2}\, (z - d_{lu})$

where:

F_{A1} : Support force at the rudder horn lower-support, [N], to be obtained according to Figure 8.6.2, and taken equal to B_1.

F_{A2} : Support force at the rudder horn upper-support, [N], to be obtained according to Figure 8.6.2, and taken equal to B_2.

z : Distance, [m], defined in Figure 8.6.3, to be taken less than the distance d, in [m], defined in the same figure.

d_{lu} : Distance, [m], between the rudder-horn lower and upper bearings (according to Figure 8.6.2, $d_{lu} = d - \lambda$).

8.6.4 Rudder horn shear force

The shear force Q_H, [N], acting on the generic section of the rudder horn is to be obtained, from the following formulae:

- between the lower and upper rudder horn bearings:

$Q_H = F_{A1}$

- above the rudder horn upper-bearing:
$Q_H = F_{A1} + F_{A2}$

where:

F_{A1}, F_{A2} : Support forces, in [N].

8.6.5 The torque, [Nm], acting on the generic section of the rudder horn is to be obtained from the following formulae:

- between the lower and upper rudder horn bearings:

$M_T = F_{A1}\, e_{(z)}$

- above the rudder horn upper-bearing:

$M_T = F_{A1}\, e_{(z)} + F_{A2}\, e_{(z)}$

where:

F_{A1}, F_{A2} : Support forces, in [N]

$e_{(z)}$: Torsion lever, [m], defined in Fig.8.6.3.

8.6.6 Rudder horn shear stress calculation

For a generic section of the rudder horn, located between its lower and upper bearings, the following stresses are to be calculated:

T_S: Shear stress, [N/mm^2], to be obtained from the following formula:

$$\tau_S = \frac{F_{A1}}{A_H}$$

T_T : Torsional stress, [N/mm^2], to be obtained for hollow rudder horn from the following formula:

$$\tau_T = \frac{M_T 10^3}{2F_T t_H}$$

For solid rudder horn, T_T is to be specially considered.

For a generic section of the rudder horn, located in the region above its upper bearing, the following stresses are to be calculated:

T_S: Shear stress, [N/mm^2], to be obtained from the following formula:

$$\tau_S = \frac{F_{A1} + F_{A2}}{A_H}$$

T_T : Torsional stress, [N/mm^2], to be obtained for hollow rudder horn from the following formula:

$$\tau_T = \frac{M_T 10^3}{2 F_T t_H}$$

For solid rudder horn, T_T is to be specially considered, where:

F_{A1}, F_{A2} : Support forces, [N];

A_H : Effective shear sectional area of the rudder horn, [mm^2], in y-direction;

M_T : Torque, [Nm];

F_T : Mean of areas enclosed by outer and inner boundaries of the thin walled section of rudder horn, [m^2];

t_H : Plate thickness of rudder horn,[mm]. For a given cross section of the rudder horn, the maximum value of T_T is obtained at the minimum value of t_H.

8.6.7 Rudder horn bending stress calculation

For the generic section of the rudder horn within the length *d*, the following stresses are to be calculated:

σ_B : Bending stress, [N/mm^2], to be obtained from the following formula:

$$\sigma_B = \frac{M_H}{W_X}$$

where:

M_H : Bending moment, [Nm] at the section considered.

W_X : Section modulus, [cm^3], around the X-axis (see Fig.8.6.3).

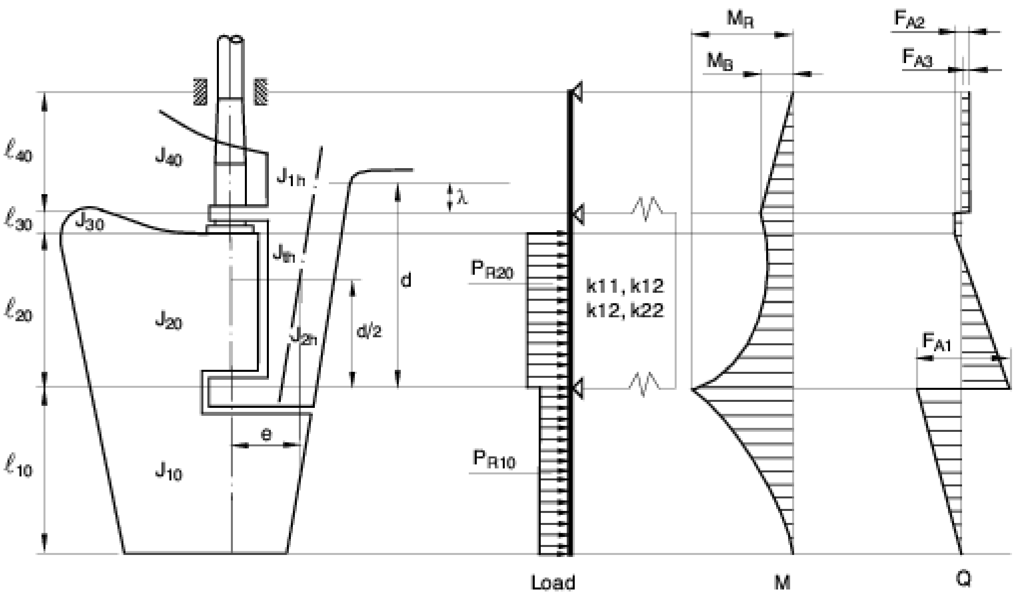

Fig.8.6.2 : Strength Calculations – Semi Spade Rudder with 2-conjugate Elastic Support

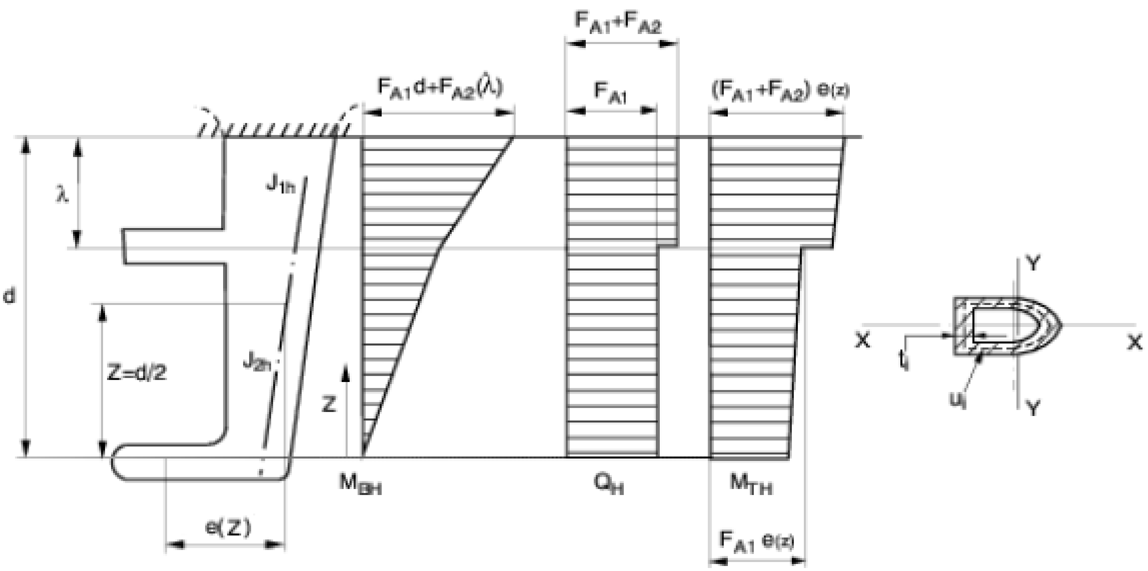

Fig.8.6.3

End of Chapter

Chapter 15

Anchoring and Mooring Equipment

Contents

Section

Section 1

General

1.1 Introduction

1.1.1 To entitle a vessel to the letter 'L' in her character of classification, anchoring and mooring equipment is to be provided in accordance with the requirements of this Chapter.

1.1.2 Except in case of supply vessels engaged in towing operations and tugs, towlines are not subject of classification and the details given in the equipment table are for guidance purpose only. Requirements for towlines for supply vessels engaged in towing operations and tugs are given in 3.2.4. However, for tugs intended to be classed for operations in harbours only, requirement of towline may be waived with written concurrence from the owner.

1.1.3 Attention is drawn to any relevant requirements of the National Authorities of the country in which the ship is to be registered.

1.2 Design of the anchoring equipment

1.2.1 The anchoring equipment required herewith is intended for temporary mooring of a vessel within a harbour or sheltered area when the vessel is awaiting berth, tide, etc.

1.2.2 The equipment is therefore not designed to hold a ship off fully exposed coasts in rough weather or to stop a ship which is moving or drifting. In this condition the loads on the anchoring equipment increase to such a degree that its components may be damaged or lost owing to the high energy forces generated, particularly in large ships.

1.2.3 The anchoring equipment presently required herewith is designed to hold a ship in good holding ground in conditions such as to avoid dragging of the anchor. In poor holding ground the holding power of the anchors will be significantly reduced.

1.2.4 The Equipment Numeral (EN) formula for anchoring equipment required here under is based on an assumed current speed of 2.5 m/sec. wind speed of 25 m/sec and a scope of chain cable between 6 and 10, the scope being the ratio between length of chain paid out and water depth.

1.2.5 It is assumed that under normal circumstances a ship will use only one bow anchor and chain cable at a time.

1.3 Documentation

1.3.1 The arrangements of anchoring and mooring and Equipment Number calculations are to be submitted for approval.

For vessels of 500 GT and above, towing arrangement plan is to be submitted for approval.

1.3.2 Following details of the proposed equipment are to be submitted for approval:-

1) Number, weight, type and design of anchors.

2) Length, diameter, grade and type of chain cables.

3) Type and breaking load of steel and fibre ropes.

1.4 Symbols

1.4.1 L,B,T,C_b and k as defined in Ch.1, Sec.2.

Section 2

Structural Arrangement for Anchoring Equipment

2.1 General

2.1.1 The anchors are normally to be housed in hawse pipes and anchor pockets of adequate size, scantlings and suitable form to prevent movement of anchor and chain due to wave action.

The arrangements are to provide an easy lead of chain cable from windlass to the anchors. Upon release of the brake, the anchors are to immediately start falling by their own weight. Substantial chafing lips are to be provided at shell and deck. These are to have sufficiently large, radiused faces to minimise the probability of cable links being subjected to large bending stresses. Alternatively, roller fairleads of suitable design may be fitted.

Alternative arrangements for housing of anchors will be specially considered.

2.1.2 The shell plating and framing in way of the hawse pipes are to be reinforced as necessary.

2.1.3 On ships provided with a bulbous bow, and where it is not possible to obtain ample clearance between shell plating and anchors during anchor handling, adequate local reinforcements on bulbous bow are to be provided.

2.1.4 The chain locker is to have adequate capacity and depth to provide an easy direct lead for the cable into the chain pipes, when the cable is fully stowed. The chain pipes are to be of suitable size and provided with chafing lips. The port and starboard cables are to have separate spaces.

The chain lockers boundaries and chain pipes are to be watertight upto the weather deck. Bulkheads which form common boundary of chain lockers need not be watertight. Where a means of access to spurling pipes or cable lockers is located below the weather deck, the access cover and its securing arrangements are to be in accordance with recognized standards or equivalent for watertight manhole covers.

Provisions are to be made to minimize the ingress of water to the chain locker in bad weather. The chain pipes are to be provided with permanently attached closing appliances such as steel plates with cutouts for chain links or canvas hoods with lashing arrangements. For requirements regarding drainage of chain lockers, See Pt.4.

Provisions are to be made for securing the inboard ends of the chains to the structure. The strength of this attachment should be between 15 per cent to 30 per cent of the breaking strength of the chain cable. It is recommended that suitable arrangements be provided so that in an emergency the inboard end of the chain (bitter end) can be readily made to slip from an accessible position outside the chain locker.

2.1.5 The windlass and chain stoppers are to be efficiently bedded and secured to deck. The thickness of deck plating is to be increased in way of the windlass and chain stoppers and adequate stiffening underneath is to be provided.

Section 3

Equipment Specification

3.1 Equipment number

3.1.1 The equipment number, EN, on which the requirements of equipment are based is to be calculated as follows :-

$$EN = K.ENc$$

where,

$ENc = \Delta^{2/3} + 2BH + 0.1A$

Δ = moulded displacement, [t], to the summer load water line

H = effective height, [m], from the summer load waterline to the top of the uppermost deckhouse, to be measured as follows:

$H = a + \Sigma h_i$

a = distance [m] from summer load waterline amidships to the upper deck at side

h_i = height [m] on the centreline of each tier of houses having a breadth greater than B/4. For lowest tier, h_i is to be measured at centre line from upper deck, or from a notional deck line where there is a local discontinuity in the upper deck.

A = area [m^2] in profile view of the hull, superstructures and houses above the summer load waterline, which is within the Rule length of the vessel. Houses of breadth less than B/4 are to be disregarded.

In the calculation of H and A, sheer and trim are to be ignored.

Parts of windscreens or bulwarks which are more than 1.5[m] in height are to be regarded as parts of houses when determining H and A. The height of the hatch coamings and that of any deck cargo, such as containers, may be disregarded.

'K' is a factor depending upon the type of vessel and service notation as given below:

For fishing vessels,

K = 1.00

For other vessels,

K = 1.00 for vessels of Unrestricted Service.
K = 0.85 for vessels of Coastal Service
K = 0.775 for vessels of Restricted Water Service.
K = 0.50 for vessels of Sheltered Water Service.

3.1.2 For a barge rigidly connected to a push tug the equipment number is to be calculated for the combination regarded as one unit.

3.1.3 For tugs, while determining the equipment number EN, the term '2BH' in Sec.3.1.1 may be substituted by $2(aB + \Sigma h_i b_i)$ where b_i is the breadth, [m], of the widest superstructure or deckhouse of each tier having a breadth greater than B/4.

3.2 Equipment

3.2.1 For fishing vessels the equipment is to be in accordance with the requirements given in Table 3.2.1 using EN as calculated in 3.1.

3.2.2 For other vessels the equipment is to be in accordance with the requirements given in Table 3.2.2 using EN as calculated in 3.1.

3.2.3 The two bower anchors in Table 3.2.1 and Table 3.2.2 are to be connected to their cables and positioned onboard ready for use. The total length of chain is to be divided in approximately equal parts between the two bower anchors.

3.2.4 For tugs the particulars of towlines are to be based upon the maximum bollard pull and the intended duty of the vessel. However, in no case the breaking strength of the towline is to be less than twice the maximum bollard pull.

3.2.5 For offshore supply vessels the length and the diameter of chain cable is to be based on an equipment letter two steps higher than that corresponding to the EN of the vessel. Towline is to be as per 1.1.2

3.2.6 For unmanned barges and pontoons of length "L" less than 30 [m] no anchor need be provided.

Where length "L" is greater than or equal to 30 [m] only one anchor of the tabular weight need be provided. The attached chain cable is to be of the tabular diameter and 2 L [m] in length.

Two mooring lines of tabular breaking strength are to be provided where the length 'L' is less than 65 [m], otherwise three mooring lines are to be provided. The length of each mooring line is not be less than the greater of 2L [m] or 80 [m].

For unmanned barges and pontoons where the letter 'L' is not intended to be included in the character of classification only mooring lines of adequate length and strength need be provided.

3.2.7 For vessels of length less than 30 [m] the anchor chains may be replaced by wire ropes of equal strength. For vessels of length between 30 [m] and 40 [m] one chain cable may be replaced by wire rope of equal strength provided normal chain cable is maintained for the second line. For fishing vessels, wire ropes of trawl winches complying with the above may be used as anchor cables.

When wire ropes are substituted for anchor chains the following should be complied with :-

i) The length of ropes should be at least 1.5 times the corresponding tabular length of chain.

ii) A short length of chain shall be fitted between the anchor and the wire rope. The length of the cable need be the smaller of 12.5 [m] and the distance between the anchor in stowed position and the winch.

Table 3.2.1 : Equipment for fishing vessels

EN	Equipment letter	Stockless Bower Anchors		Stud-Link Chain Cables			Mooring Lines (Recommendation)		
					Diameter and chain grade		Steel or natural fibre ropes		
		Number	Mass per anchor [kg]	Total length [m]	CC1 [mm]	CC2 [mm]	Number	Length [m]	Breaking strength [kN]
30 & ≤ 40	A_of1	2	80	165	11		2	50	29
> 40 & ≤ 50	A_of2	2	100	192.5	11		2	60	29

> 14600 & ≤ 16000	O*	2	46000	770			162			21	200	735

1) For individual mooring lines with required breaking force above 490 [kN] according to the table, the required strength may be reduced by the corresponding increase of the number of mooring lines and vice versa, provided that the total of all mooring lines on board is not less than the Rule value. However, the number of mooring lines is not to be less than 6, and no line is to have a breaking force less than 490 [kN].

Section 4

Anchors

4.1 General

4.1.1 Anchors are to be of an approved design.

4.1.2 The mass of each bower anchor as required in Sec.3 is for anchors of equal mass. The masses of individual anchors may vary by ±7 per cent of the tabular masses, provided that the total mass of the anchors is not less than would have been required for anchors of equal mass.

4.1.3 The mass of the head, including pins and fittings, of an ordinary stockless anchor is not to be less than 60 per cent of the total mass of the anchor.

4.1.4 The mass 'ex stock' of stocked bower or stream anchors is not to be less than 80 per cent of the tabular mass of ordinary stockless bower anchors. The mass of the stock is to be 25 per cent of the total mass of the anchor including the shackle etc. but excluding the stock.

4.1.5 When anchors of a design approved for the designation 'High Holding Power' or 'Super High Holding Power' are used as bower anchors, the mass of each such anchor may be 75 percent or 50 percent respectively of the tabular mass of ordinary stockless bower anchors.

4.1.6 Anchor shackles are to be of a design and material suitable to the service for which the anchor is intended.

4.2 High Holding Power (HHP) anchors

4.2.1 Designs of H.H.P. anchors are to be approved for the designation.

H.H.P. anchors are to be designed for effective hold of the sea bed irrespective of the angle or position at which they first settle on the sea bed after dropping from a normal type of hawse pipe. In case of doubt a demonstration of these abilities may be required. The designs are to be tested on sea bed to show that they have a holding down power per unit of mass at least twice that of approved ordinary stockless anchor.

4.2.2 If approval is sought for a range of anchor sizes, at least two sizes are to be tested. The mass of the larger anchor to be tested is not to be less than one-tenth of that of the largest anchor of which approval is sought. The smaller of the two anchors to be tested is to have a mass not less than one-tenth of that of the larger.

Each test is to comprise of a comparison between the H.H.P. anchor and at least one approved ordinary stockless anchor of nearly equal mass.

Anchors are to be tested in association with the size of chain cable appropriate to this mass.

4.2.3 The tests are to be conducted on at least three different types of bottom, which should normally be soft mud or silt, sand or gravel, and hard clay or similarly compacted material. Three tests are to be taken for each anchor and each type of bottom.

The tests should normally be carried out from a tug, and the pull measured by dynamometer or derived from recently verified curves of tug rev/min against bollard pull.

A scope of ten is recommended for the anchor cable.

4.3 Super High Holding Power (SHHP) anchors

4.3.1 A super high holding power anchor is an anchor with a holding power of at least four times that of an ordinary stockless anchor of the same mass. The use of SHHP anchors is to be limited to vessels with service restrictions given in Pt.1, Ch.1, Sec. 2.7.3. These anchors are not to require prior adjustment or special placement on the sea bed.

The SHHP anchor mass should generally not exceed 1500 [kg].

4.3.2 For approval and/or acceptance as a SHHP anchor satisfactory full scale tests are to be made confirming that the anchor has a holding power of at least four times that of an ordinary stockless anchor or at least two times that of a previously approved HHP anchor, of the same mass. The tests are also to verify that the anchor withstands the test without permanent deformation.

4.3.3 The full scale tests are to be carried out at sea as specified in 4.2.3 for HHP anchors, on three types of bottom. The tests are to be applied to anchors of mass which are as far as possible representative of the full range of sizes proposed.

For a definite group within the range, the two anchors selected for testing (ordinary stockless and SHHP anchors) should be approximately the same mass and should be tested in association with the size of chain required for the anchor mass and anchor type. Where an ordinary stockless anchor is not available, a previously approved HHP anchor may be used in its place.

Tests in comparison with a previously approved SHHP anchor may be also accepted as a basis for approval.

If approval is sought for a range of anchor sizes then at least three anchor sizes are to be tested, indicative of the bottom middle and top of the mass range.

4.3.4 The holding power test load is not to exceed the proof load of the anchor.

4.4 Manufacture and testing

4.4.1 Anchors and anchor shackles are to be manufactured and tested in accordance with the requirements of Pt.2, Ch.10.

Section 5

Anchor Chain Cables

5.1 General

5.1.1 Anchor chain cables and steel wire ropes (where proposed in lieu of chain cables) are to be as required by Sec.3.

5.1.2 Grade CC3 chain cable is to be used only when diameter is 20.5 [mm] or more.

5.1.3 Grade CC1 chain cable having material tensile strength of less than 400 [N/mm^2] is not to be used in association with high holding power or super high holding power anchors.

5.1.4 When the vessel may anchor where the current exceeds 2.5 m/s, a length of heavier chain cable locally between the anchor and the rest of the chain to enhance anchor bedding is recommended.

5.2 Manufacture and testing

5.2.1 Chain cables, steel wire ropes and shackles are to be manufactured and tested in accordance with the requirements of Pt.2, Ch.10.

Section 6

Towlines, Mooring Lines and associated Shipboard Fittings

6.1 General

6.1.1 Towlines and mooring lines may be of steel wire, natural fibre or synthetic fibre and are to be made by an approved manufacturer.

6.1.2 The number, length and breaking strength of towlines and mooring lines are to be as required by Sec.3. Also see 1.1.2.

6.1.3 The lengths of individual mooring lines may be reduced by up to 7 per cent of the tabular length, provided that the total length of mooring lines is not less than would have resulted had all lines been of equal tabular length.

6.1.4 The diameter of a fibre rope is not to be less than 20 [mm].

6.2 Manufacture and testing

6.2.1 Steel wire ropes are to be manufactured and tested in accordance with the requirements of Pt.2, Ch.10.

6.2.2 Fibre ropes will be specially considered in each case.

6.3 Towing and Mooring arrangements

6.3.1 Means are to be provided to enable towing lines and mooring lines to be adequately secured on board a ship. Bollards and bitts, fairleads, chocks, cleats, etc. are to be so designed and installed as to protect ropes against excessive wear.

These shipboard fittings associated with the towing and/or mooring, operations at bow, sides and stern are to comply with the requirements given in 6.4 and 6.5. For ships below 500 GT, special consideration may be given if considered necessary for practical/operational reasons.

6.3.2 Oil tankers, chemical tankers and liquefied gas carriers are also to comply with the requirements of emergency towing arrangements given in Pt.5, Ch.2, 3 and 4 as applicable.

6.3.3 Mooring winches should be fitted with drum brakes, the strength of which is sufficient to prevent unreeling of the mooring line when the rope tension is equal to 80 per cent of the breaking strength of the rope as fitted on the first layer on the winch drum.

6.4 Design loads

6.4.1 Where required, the minimum design loads to be considered for shipboard fittings and supporting hull structures are to be as follows:

a) For normal towing operations (e.g. harbour / manoeuvring), 1.25 times the intended maximum towing load (e.g.

static bollard pull) as indicated on the towing and mooring arrangement plan.

b) For other towing operations (e.g. escort), the nominal breaking strength of the tow-line as required in Table 3.2.2 corresponding to the equipment number of the vessel as per 3.1.1. While calculating equipment number for this purpose, the side projected areas including maximum stacks of deck cargoes are to be taken into account in the estimation of area 'A'.

c) For mooring operations, 1.25 times the breaking strength of the mooring line as required in Table 3.2.2 corresponding to the equipment number of the vessel as per 3.1.1. However, side projected area including maximum stacks of deck cargoes is to be taken into account for assessment of lateral wind forces, arrangement of tug boats and selection of mooring lines.

6.4.2 The design load is to be applied through the tow line / mooring line according to the arrangement shown on the towing and mooring arrangements plan

6.4.3 When a specific SWL (Safe Working Load) is applied for a shipboard fitting by which the design load will be greater than the above minimum values, the strength of the fitting is to be designed using this specific design load.

6.4.4 The method of application of the design load to the fittings and supporting hull structures is to be taken into account such that the total load need not be more than twice the design load, i.e. no more than one turn of one line (see Fig.6.4.4).

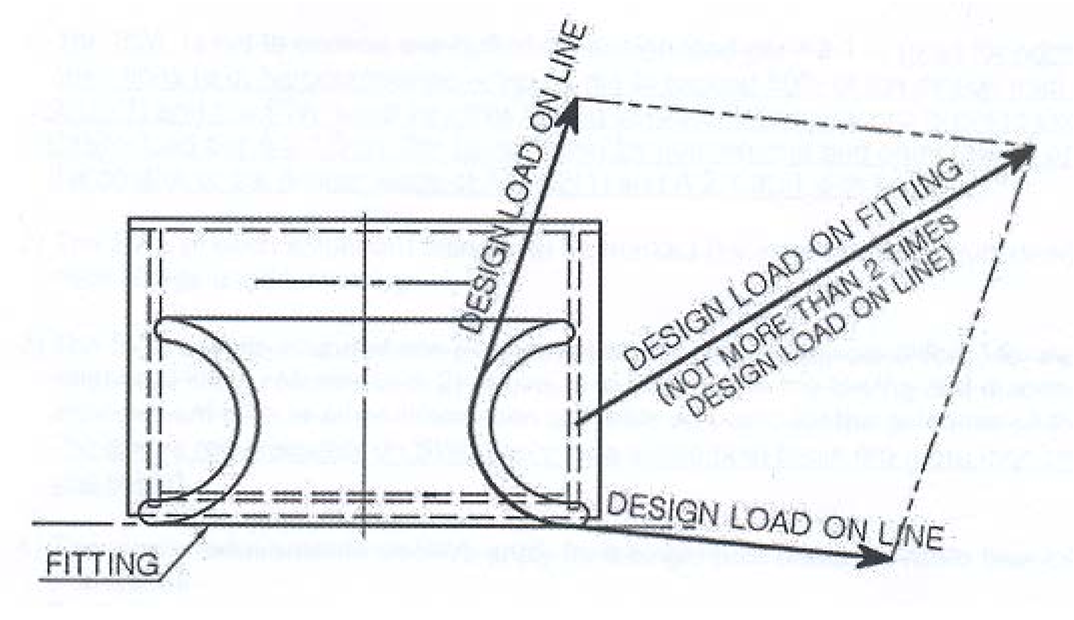

Fig.6.4.4

6.5 Shipboard fittings

6.5.1 The shipboard fittings associated with towing and/or mooring, including their welded or bolted connections to the supporting structure, are to be in accordance with a recognized standard, e.g. ISO 13795 Ships and Marine Technology – Ship's mooring and towing fittings – welded steel bollards for sea-going vessels. Alternatively, the strength of the fittings and its attachment is to be proved adequate for the design load specified in 6.4:

6.5.2 Shipboard fittings are to be suitably located on longitudinals, beams and/or girders so as to facilitate efficient distribution of the towing and/or mooring loads.

6.5.3 The net scantlings of the underdeck supporting structure are to be adequate to meet the design loads specified in 6.4.1, considering the possible locations for transfer of the load and any horizontal or vertical variation in direction of the applied load. The acting point of the force on the shipboard fittings is to be taken at the attachment point of the towing/mooring line or at a change in its direction.

Allowable stresses given below are not to be exceeded:

Normal stress = σ_y

Shear stress, $\tau = 0.6\ \sigma_y$

Where σ_y = specified minimum upper yield stress [N/mm^2];

Normal stress is the sum of the bending stress and axial stress with the corresponding shearing stress acting perpendicular to the normal stress.

Stress concentration factors are not to be taken into account in the above allowable stresses.

The required gross thickness is obtained by adding a corrosion addition of 2.0 [mm] to the net scantling except for oil tankers and bulk carriers covered by the common structural rules, where the corrosion additions specified in those rules would be applicable.

6.5.4 The safeworking load SWL for normal towing operations (e.g. harbour / manoeuvring) is not to exceed 80% of the design load as per 6.4.1a) and that for other towing operations (e.g. escort) is not to exceed the design load as per 6.4.1b).

For mooring operations, the SWL is not to exceed 80% of the design load as per 6.4.1c).

The above requirements on SWL apply for a single post basis (no more than one turn of cable).

The safe working load SWL of each shipboard fitting is to be marked (by weld bead or equivalent).

6.5.5 Towing and mooring arrangement plan

The SWL for the intended use for each shipboard fitting is to be noted in the towing and mooring arrangement plan available on board for the guidance of the Master.

Information provided on the plan is to include in respect of each shipboard fitting:

a) location on the ship;
b) fitting type;
c) SWL;
d) Purpose (mooring / harbour towing / escort towing); and
e) Manner of applying towing or mooring line load including limiting fleet angles.

Where the arrangements and details of deck fittings and their supporting hull structures are designed based on a variation of mooring arrangement (number of mooring lines and their individual strength) that is permitted as per Note 1 of Table 3.2.2, the following information is to be clearly indicated on the plan:

a) the arrangement of mooring lines showing number of lines (N), together with

b) the breaking strength of each mooring line (BS).

6.6 Emergency towing procedure

6.6.1 A ship specific emergency towing procedure is to be provided according to SOLAS Ch.II-1/Reg.3-4 on ships as indicated in the following:

a) all passenger ships, not later than 01 January 2010

b) cargo ships constructed on or after 01 January 2010

c) Cargo ships constructed before 01 January 2010, not later than 01 January 2012.

In the case of oil tankers, chemical carriers and liquefied gas carriers, the requirement for emergency towing arrangements given in Pt.5, Ch.2, Sec.2.8, Pt.5, Ch.3, IR2.8 and Pt.5, Ch.4, IR3.9 respectively are also to be complied with.

6.6.2 The emergency towing procedure is to be based on existing arrangements and equipment available on board the ship

6.6.3 The emergency towing procedure is to include:

a) drawings of fore and aft deck showing possible emergency towing arrangements;

b) inventory of equipment on board that can be used for emergency towing;

c) means and methods of communication; and

d) sample procedures to facilitate the preparation for and conducting of emergency towing operations.

(Refer to the IMO guidelines for owners / operators on preparing emergency towing procedures (MSC.1/Circ.1255)).

Section 7

Windlass and Chain Stoppers

7.1 General

7.1.1 Windlass of sufficient power and suitable for the size of chain cable is to be fitted. Where wire ropes are proposed and approved in lieu of chain cables, suitable winches capable of controlling wire rope at all times are to be fitted.

7.1.2 Windlass is to have one cable lifter for each anchor required to be kept ready for use. The cable lifter is normally to be connected to the driving shaft by release coupling and provided with brake.

7.1.3 For each chain cable, a chain stopper is normally to be arranged between the windlass and hawse pipe. The chain cables are to reach the hawse pipe through the cable lifter only.

7.1.4 Electrically driven windlasses are to have a torque limiting device. Electric motors are to comply with the requirements of Pt.4, Ch.8.

7.1.5 The windlass is to be capable of exerting, for a period of 30 minutes, a continuous duty pull corresponding to the grade of chain cable, as follows :-

36.8 d_c^2 [N]	for grade CC1
41.7 d_c^2 [N],	for grade CC2
46.6 d_c^2 [N]	for grade CC3

Where d_c is the chain diameter [mm]. The mean hoisting speed is not to be less than 9 [m]/min. Also See Sec. 7.2.1.

The windlass is to be also capable of exerting, for a period of not less than 2 minutes, a pull of not less than 1.5 times the continuous duty pull. The speed in this period can be lower.

The above criteria do not require both anchors to be raised or lowered simultaneously on windlass fitted with two cable lifters.

7.1.6 The capacity of the windlass brake is to be sufficient for safe stopping of anchor and chain cable when paying out.

The windlass with brakes engaged and release coupling disengaged is to be able to withstand static pull of 45 per cent of the tabular breaking strength of the chain without any permanent deformation of the stressed parts and without brake slip.

If a chain stopper is not fitted, the windlass is to be able to withstand a static pull of 80 per cent of the tabular breaking strength of the chain without any permanent deformation of the stressed parts and without brake slip.

The chain stoppers and their attachments are to withstand a pull of 80 per cent of the tabular breaking strength of the chain without any permanent deformation of the stressed parts. The chain stoppers are to be so designed that additional bending of the individual link does not occur and the links are evenly supported.

7.1.7 Attention is to be paid to stress concentrations in keyways and other stress raisers and also to dynamic effects due to sudden starting or stopping of the prime mover or anchor chain.

7.2 Strength of windlass securing arrangements to resist the green sea loads

7.2.1 In case of ships of length > 80 [m] the windlasses and mooring winches integral with the windlasses fitted on exposed decks in the forward 0.25L are to be adequately secured against the green sea loads given in 7.2.2, if the height of the exposed decks in way of the windlasses is less than 0.1L or 22 [m] above summer LWL. The strength criteria given in 7.2.3 is to be complied with.

7.2.2 Design loads

The following green sea pressures are to be considered:

- Pressure 'p_x' equal to 200 [kN/m^2], normal to the shaft axis as shown in Fig.7.2.2 and acting over the projected area in this direction.

- Pressure 'p_y' equal to 150 [kN/m^2], parallel to the shaft axis as shown in Fig.7.2.2 acting both inboard and outboard separately, over the multiple of 'f' times the projected area in this direction.

where 'f' is defined as:

f = 1+B/H, but need not be taken greater than 2.5

where,

B = width of windlass measured parallel to the shaft axis.

H = overall height of windlass.

7.2.3 For calculation of forces in the bolts securing the windlass to the deck, the bolts may be considered to be divided into 'N' bolt groups each containing one or more bolts. (See Fig.7.2.2).

The axial force R_i in bolt group (or bolt) i, positive in tensile, may be calculated from:

$R_{xi} = P_x\, hx_i\, A_i / I_x$
$R_yi = P_y\, hy_i\, A_i / I_y$

and $R_i = R_{xi} + R_{yi} – R_{si}$

where,

P_x = force [kN] acting normal to the shaft axis

P_y = force [kN] acting parallel to the shaft axis, either inboard or outboard whichever gives the greater force in bolt group 'i'

h = shaft height above the windlass mounting [cm]

x_i, y_i = x and y coordinates of bolt group 'i' from the centroid of all N bolt groups, positive in the direction opposite to that of the applied force [cm]

A_i = cross sectional area of all bolts in group 'i' [cm^2]

$I_x = \Sigma A_i x_i^2$ for N bolt groups
$I_y = \Sigma A_i y_i^2$ for N bolts groups

R_{si} = static reaction at bolt group 'i', due to weight of windlass.

Shear forces F_{xi}, F_{yi} applied to the bolt group 'i', and the resultant combined force F_i may be calculated from:

$F_{xi} = (P_x - \alpha gM) / N$
$F_{yi} = (P_y - \alpha gM) / N$

and

$$F_i = (F_{xi}^2 + F_{yi}^2)^{0.5}$$

where,

α = coefficient of friction = 0.5
M = mass of windlass (tonnes)
g = gravity acceleration = 9.81 m/sec^2
N = number of bolt groups.

Axial tensile and compressive forces and lateral forces are also to be considered in the design of the supporting structure.

7.2.4 Strength criteria

Tensile axial stresses in the individual bolts in each bolt group 'i' are to calculated. The horizontal forces F_{xi} and F_{yi} are normally to be reacted by shear chocks. Where "fitted" bolts are designed to support these shear forces in one or both directions, the von Mises equivalent stresses in the individual bolts are to be calculated and compared to the stress under proof load. Where pourable resins are incorporated in the holding down arrangements, due account is to be taken in the calculations.

The safety factor against bolt proof strength is to be not less than 2.0.

7.3 Testing

7.3.1 After installation on board, anchoring tests are to be carried out to demonstrate satisfactory working.

The mean speed of the chain cable measured during trials, when hoisting the anchor and cable from a depth of 82.5 [m] to a depth of 27.5 [m] is not to be less than 9 [m/min]. Where the depth of water in trial areas is inadequate, consideration will be given to acceptance of equivalent simulated conditions.

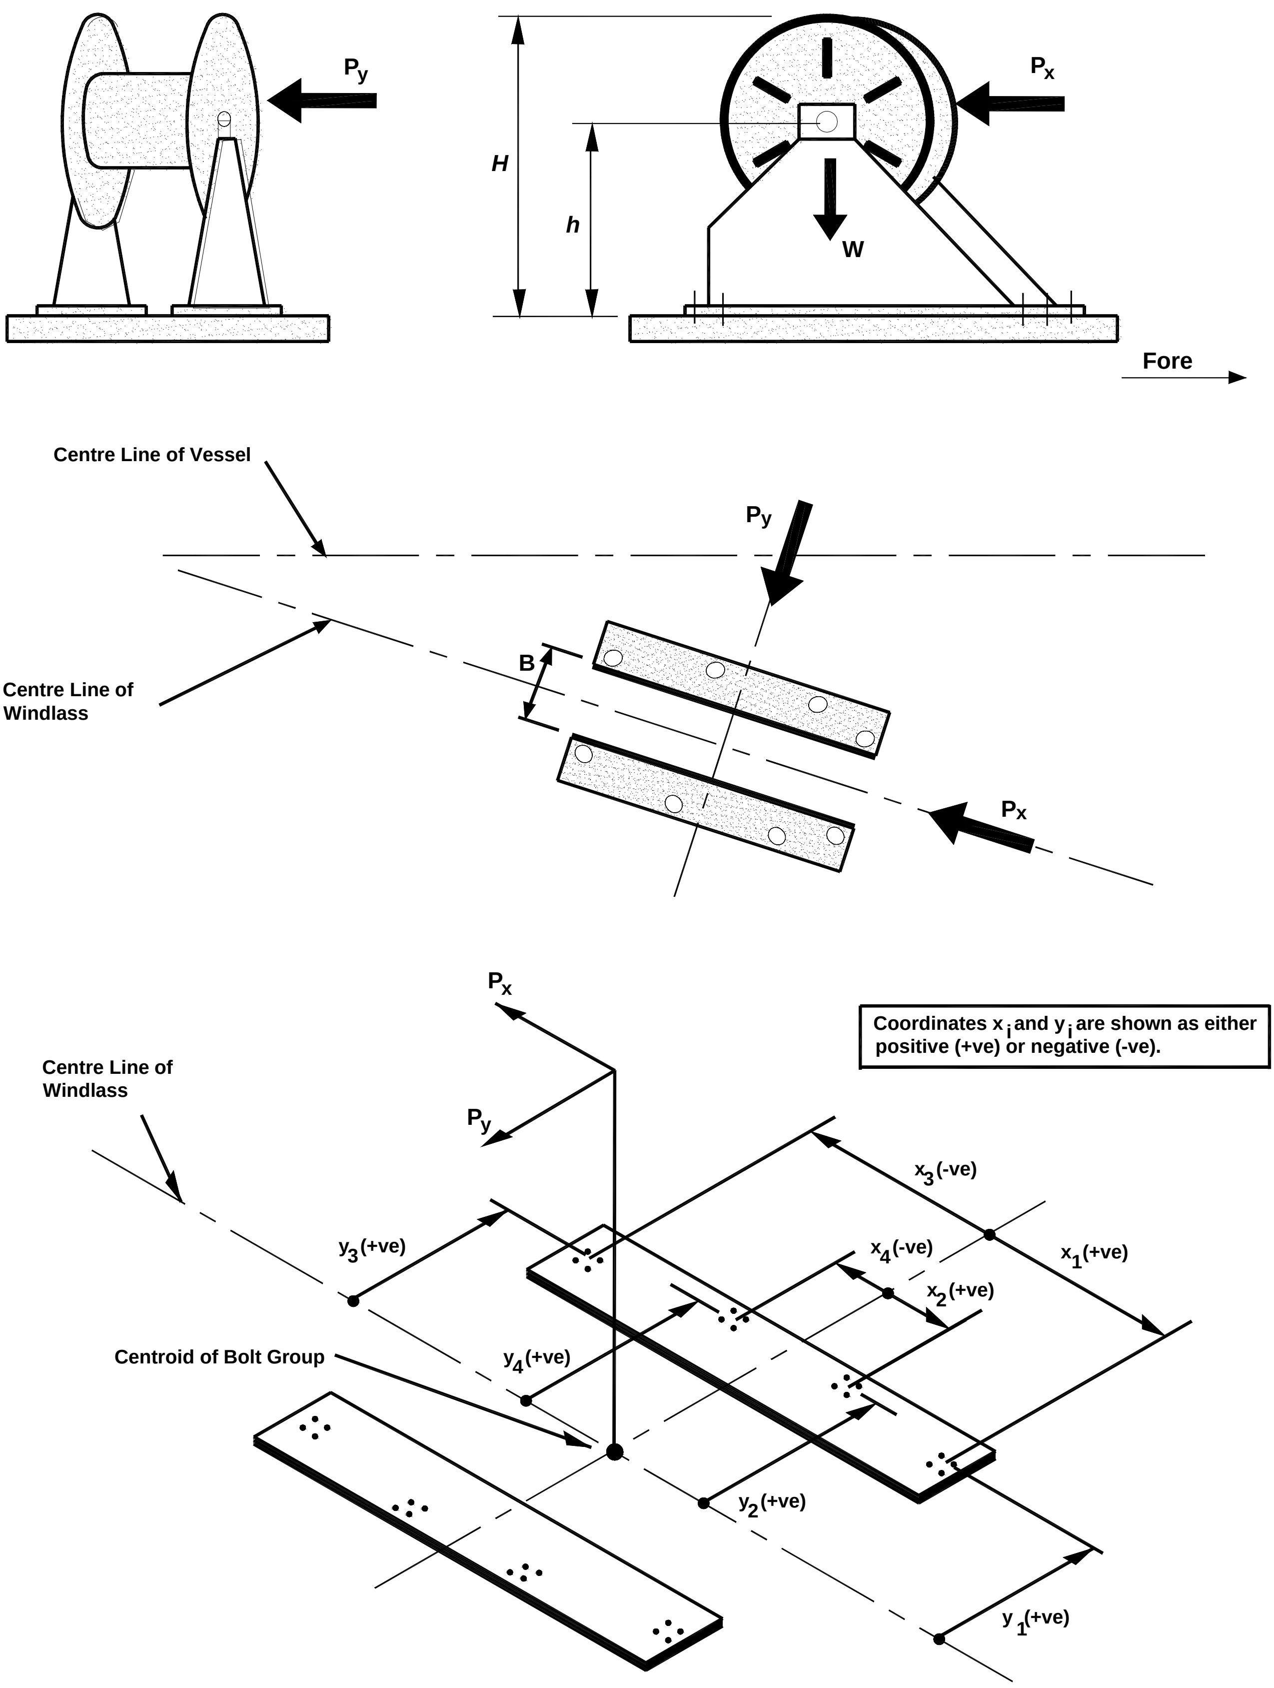

Fig.7.2.2 : Direction of forces and weight

End of Chapter

Chapter 16

Masts and Rigging

Contents

Section

Section 1

General

1.1 Application

1.1.1 Masts, derrick posts, crane pedestals etc. and their supporting hull structure are to be in accordance with the requirements of this Chapter. The derricks and the cargo handling gear, are not subject to approval unless required by additional class notations.

1.2 Documentation

1.2.1 The following plans and information are to be submitted:

i) Arrangement plan showing location of mast or derrick post, standing rigging and cargo handling gear alongwith the information about the operation of the derrick booms, their safe working load and working positions.

ii) Plan showing proposed scantlings of mast, derrick post and standing rigging.

iii) Plan showing supporting structures and strengthening of hull in way of mast, post and standing rigging fastenings,

iv) Specification of the steel wire ropes intended to be used for standing rigging, indicating rope construction, scantlings and minimum breaking strength.

1.2.2 Calculations considering the derrick booms at the operating position which results in maximum stresses on the mast, are to be submitted. For masts supporting derricks, angles of heel and trim of the ship in this condition of less than 5° and 2° respectively, may be ignored. Where these angles are exceeded, and in all cases where the mast supports derrick cranes or derricks of special design, the actual angles are to be taken into account in calculating the stresses in the mast. In case of stayed masts, the calculations are to take into account the elongation of the stays under tension.

1.2.3 For masts such as portal, bipod, lattice etc. and those under significant forces other than resulting from cargo gear; detailed stress calculations are to be submitted, taking into account:

i) All horizontal, vertical and torsional forces,
ii) Deflection of the structure,
iii) Variations in the moment of inertia of the parts of the structure,
iv) The effects of outriggers and similar structures,
v) Elasticity and sag in stays, where fitted.

1.3 Materials

1.3.1 Steel for masts, derrick posts, crane pedestals and associated items are to be tested and approved in accordance with the requirements of Pt.2, Ch.3. Material grades of steel are to be as follows:

Thickness [mm]	t ≤ 20	20 ≤ t < 25	25 ≤ t < 40	t > 40
Grade	A/AH	B/AH	D/DH	E/EH

1.3.2 Wire ropes used for stays are to be in accordance with the requirements of Pt.2, Ch.10.

Section 2

Masts

2.1 Scantlings

2.1.1 The outer diameter 'd' of the masts without derricks at the level of upper supporting deck is not to be less than:

d = 37 *l* [mm] for unstayed masts

= 33 *l* [mm] for stayed masts

where,

l = length of the mast [m] measured above upper supporting deck to hounds.

The diameter is to be maintained upto the level of the gooseneck fitting where this is entirely supported by the mast. In case of masts without derricks, the diameter may be reduced to 0.75 d at top.

2.1.2 For masts without derricks, the thickness 't' of the mast plating is not to be less than

t = 0.01d + 2.5 [mm] or 5 [mm] whichever is greater.

2.1.3 The scantlings of masts with derricks are to be based on calculations mentioned in 1.2.2 and 1.2.3. The total stress σ_t at any location, is not to exceed the allowable stress values given below:-

Allowable stresses in masts		
SWL	**Stayed mast**	**Unstayed mast**
SWL ≤ 10t	0.50 σ_y	0.55 σ_y
SWL ≥ 60t	0.625 σ_y	0.675 σ_y
10 < SWL < 60	By linear interpolation	

where,

$$\sigma_t = \sqrt{\left[(\sigma_b + \sigma_c)^2 + 3\tau^2\right]}\ [\mathrm{N/mm^2}]$$

σ_b = bending stress at that location.

σ_c = direct compressive stress at that location due to the vertical components of force. In general, the weight of the mast and cross trees may be ignored in this calculation.

τ = The shear stress due to torque in the mast. The effect of torque need only be considered where cross trees are fitted.

σ_y = Upper yield stress of the material [N/mm^2].

For the above Table, SWL corresponding to the largest derrick operating on the mast is to be taken.

The thickness of the mast plating is to be adequate to prevent buckling and in no case is to be less than 7.5 [mm].

2.2 Construction details

2.2.1 Masts are to be adequately supported by atleast two decks and are to be efficiently scarphed into the main hull structure. The hull structure is to be suitably reinforced. A deckhouse may be considered as a support provided adequate strength is ensured by additional stiffening and increased plate thickness.

2.2.2 In general, mast scantlings are not to be reduced inside the deckhouse and are to be maintained upto the level of the gooseneck fitting where it is entirely supported by the mast.

2.2.3 Cross trees, outriggers, brackets on bridge fronts and similar structures are to be of such design that the stresses on them resulting from the cargo gear and any other significant forces do not exceed the values given in 2.1.3 for unstayed masts. The design is also to be such as to minimize the moments acting on the mast. Attachment to the mast is to be such as to avoid distortion of the mast under the load.

2.2.4 Special attention is to be paid to structural continuity, and abrupt changes of section are to be avoided. Manholes, lightening holes and other cut outs are to be avoided in way of concentrated loads and areas of high shear. Openings, where unavoidable, are to be well rounded, suitably framed and stiffened.

2.2.5 Care should be taken in the design of masts and fittings to reduce the likelihood of water collecting in inaccessible parts of the structure. Adequate means of drainage should be provided to remove any water which might otherwise accumulate.

2.2.6 Masts are to be strengthened either by addition of doubling plates or equivalent strengthening, or by an increase of the thickness of the plating at the following locations:

i) In way of the fastening of the derrick heels,

ii) In way of the fastening of the derrick spans,

iii) In way of the fastening of all metal fittings.

Suitable arrangements are to be made to avoid notch effects.

2.2.7 Welding and weld details are to comply with Ch.17.

2.2.8 Where a mast supports a derrick with a SWL > 25 [t], all welded joints of the masts below a level 3.0 [m] above the uppermost supporting deck or that of the derrick head, whichever is higher, are to be examined by non-destructive crack or flaw detection method.

2.2.9 Where higher tensile steel is used, preheating or other heat treatments may be required at the Surveyors discretion. Such treatments will normally be required for all ring seams on masts supporting derricks of SWL > 60 [t]. Non-destructive examination may be required in areas of high stresses.

2.2.10 Lightning conductors are to be fitted to masts having wood, aluminium or plastic top masts or where a break in electrical conductivity occurs in other arrangements.

Section 3

Rigging

3.1 General

3.1.1 The positioning of the rigging (shrouds, stays etc.) is to be so designed as to ensure proper working of the cargo gear and that they do not foul with the running rigging or derrick booms under the expected service conditions.

3.1.2 Wire rope stays are to be in one length and are to be set up with an initial tension of 30 [N/mm^2].

3.2 Stay construction

3.2.1 The scantlings of the stay are to be such as to provide the necessary tensile force and elongation for the stayed mast. The breaking load of the stay is to be not less than 3.5 times the maximum calculated force on that stay.

3.2.2 The connection of the stay to a deck, bulwark, house or mast is to be such as to allow rotation at the point of attachment and is to be designed so that the stay cannot become disconnected while the derrick system is in use.

End of Chapter

Chapter 17

Welding

Contents

Section

Section 1

General

1.1 Scope

1.1.1 Welding in steel hull construction of all types of ships is to comply with the requirements of this Chapter.

Welding in aluminium structures will be specially considered.

1.2 Documentation

1.2.1 Connection details of the welded structural members, including type and size of welds are to be clearly indicated on the plans submitted for approval. An explanation of all symbols or abbreviations used in detailing the weld connections should be included on the plans.

Details of proposed welding procedure is to be submitted indicating preheating temperature and any post-welding heat treatment, if employed. Extent to which automatic welding, including deep penetration welding, is to be employed should also be indicated.

Section 2

Welding

2.1 Welders and supervision

2.1.1 Welders are to be proficient in the type of work on which they are to be engaged. The records of their tests and qualifications are to be kept by the builders and made available to the Surveyors. A sufficient number of skilled supervisors are to be employed to ensure effective control at all stages of assembly and welding operations.

2.2 Welding electrodes

2.2.1 Electrodes and welding consumables approved by IRS in accordance with the requirements of Pt.2, Ch.11 and suitable for the type of joint and grade of steel, are to be used.

2.2.2 For the connection of two different grades of steel of the same tensile strength properties, electrodes suitable for the lower grade will be generally acceptable except at structural discontinuities or other points of stress concentration.

2.2.3 For the connection of steel of different tensile strengths, the electrodes are to be suitable for the tensile strength of the component, on the basis of which the weld fillet size has been determined in Sec.3.

2.3 Preparation for welding

2.3.1 The parts to be welded are to be fitted in accordance with the approved joint detail. The edge preparation is to be accurate and uniform.

Means are to be provided for maintaining the parts to be welded, in correct position during the welding operations. Excessive force is not to be employed in aligning the parts before welding and the means employed in maintaining the alignment are to be so arranged as to allow for expansion and contraction during the welding operation. All methods employed in correcting improper alignment are to be to the satisfaction of the Surveyor.

2.3.2 All surfaces to be welded are to be clean, dry and free from rust, scale and grease. The surface and boundaries of each run of deposit are to be thoroughly cleaned and freed from slag before the next run is applied. Before a manual sealing run is applied to the back of a weld, the original root material is to be gouged out to sound metal.

2.3.3 Tack welding is to be kept to a minimum, and where used, should be equal in quality to that of the finished welds. Any defective tack weld is to be cut out before completing the finished welds. Care is to be taken in removing the tack welds to ensure that the structure is not damaged in doing so.

2.4 Welding procedure

2.4.1 Only approved welding procedures are to be used, See 2.5.

2.4.2 Structural arrangements are to be such as to allow adequate access for satisfactory completion of all welding operations. Welded joints are to be so arranged so as to facilitate downhand welding wherever possible.

2.4.3 The sequence of welding is to be so planned that any restraint during welding operations is reduced to a minimum. The ends of the frames and stiffeners should be left unattached to the plating at the subassembly stage until connecting welds are made, in the intersecting systems of plating, framing and stiffeners, at the erection stage.

Where a butt meets a seam, the welding of the seam should be interrupted well clear of the junction and not be continued until the butt is completed. Welding of the butt should continue past the open seam and the weld be chipped out for the seam to be welded straight through.

2.4.4 Adequate precautions are to be taken to ensure that the welding site is protected from the deleterious effects of high moisture, severe wind and extreme cold.

2.5 Approval of procedures

2.5.1 Unless previously approved, welding procedures are to be established by the yard and forwarded to IRS for approval. The welding procedure specifications are to include detailed description of the base material, primer, plate thickness range, joint/groove design, welding consumable, welding position, welding techniques, welding parameters, preheating/ interpass temperature and post heat treatment if any.

The welding for procedure qualification and subsequent testing, are to be witnessed by the IRS Surveyor.

2.6 Inspection of welds

2.6.1 Effective arrangements are to be provided for the inspection of finished welds to ensure that all welding has been satisfactorily completed.

2.6.2 All finished welds are to be visually inspected and are to be sound, uniform and substantially free from slag inclusions, porosity, undercutting or other defects. Welds and adjacent base metal are to be free from injurious arc strikes.

2.6.3 For the examination of important structural welds, visual inspection is to be supplemented by radiography or other acceptable non-destructive crack or flaw detection methods. The extent of such examination is to be to the Surveyors' satisfaction, but particular attention is to be given to the following locations:

a) Junction and crossings of seams and butts in strength deck, sheer strake, side and bottom shell within 0.4L amidships.

b) Butts of keel plating and rounded sheerstrake within 0.4L amidships.

c) Insert plates in way of hatch openings on the strength deck.

d) Butts of longitudinal framing and longitudinal bulkhead stiffeners within 0.4L amidships.

2.6.4 Defective sections of welds as found by visual or non- destructive examination or leakages under hydrostatic tests, are to be gouged out as necessary and carefully rewelded.

Section 3

Welded Connections

3.1 Butt welds

3.1.1 Plates of equal thickness may be manually butt welded as per Fig.3.1.1. For automatic welding procedures and special welding techniques, the welding procedure will be specially considered.

3.1.2 For joints of plates with difference in thickness of more than 4 [mm], the thicker plate is to be tapered. The taper is not to exceed 1:3. Edge preparation after the tapering is to be as indicated in 3.1.1 above.

3.1.3 All manual butt welds are normally to be welded from both sides. Where a back ceiling run is not practicable or in certain cases when the stress level in the members is very low, welding on one side may be permitted provided the welding process is found satisfactory.

3.1.4 Where stiffening members, attached by continuous fillet welds, cross the finished butt or seam welds, these welds are to be made flush in way of the faying surface. Similarly for butt welds in webs of stiffening members, the butt weld is to be first completed and made flush with the stiffening member before the stiffener is connected to the plating by fillet weld. The ends of the flush portion are to run out smoothly without notches or any sudden change of section. Where such conditions can not be complied with, a scallop is to be arranged in the web of the stiffening member. Scallops are to be of such size and in such a position, that a satisfactory weld can be made.

3.2 'T' connections

3.2.1 The throat thickness (See Fig.3.2.1) of the fillet welds is given by:

throat thickness = t_p . weld factor . d/s

where,

t_p = thickness [mm], of the thinner of the two parts being connected.

d = distance [mm], between the successive weld fillets.

s = length [mm], of the correctly proportioned weld fillets, clear of end craters is not to be less than 75 [mm].

The weld factors for various connections are generally to be as given in Table 3.2.1.

Where an approved automatic deep penetration procedure is used, the weld factors may be reduced by 15 per cent.

3.2.2 The throat thickness is not to be less than 3.0 [mm] for t_p upto 8.0 [mm] and 0.21 t_p or 3.25 [mm], whichever is greater, for t_p over 8 [mm]. The throat thickness is also generally not to be greater than 0.44 t_p for double continuous welds and the greater of 0.44 t_p or 4.5 [mm] for intermittent welds.

3.2.3 The leg length is not to be less than √2 times the specified throat thickness.

3.2.4 Where the connection is highly stressed, deep penetration or full penetration welding may be required. Where full penetration welding is required, the abutting plate may require to be beveled. (See Fig.3.2.4).

3.2.5 Continuous welding is to be adopted in the following locations and may be used elsewhere if desired.

a) Boundaries of weathertight decks and erections, including hatch coamings, companionways and other openings.

b) Boundaries of tanks and watertight compartments.

c) All structures in the afterpeak and the afterpeak bulkhead stiffeners.

d) All welding inside tanks intended for chemicals or edible liquid cargoes.

e) All lap welds in tanks.

f) Floors and girders to bottom shell in the 0.25L forward.

g) Primary and secondary members to plating in way of end connection and end brackets to plating in the case of lap connection.

h) Where the thickness of the abutting member (i.e. stiffener web) is greater than 15 [mm] and also exceeds the thickness of the table member (e.g. plating).

i) Where loading is mainly of dynamic nature (e.g. bottom and side plating forward subjected to slamming and bow impact).

j) Other connections as given in Table - 3.2.1.

3.2.6 Where intermittent welding is used, the welding is to be made continuous around the ends of brackets, lugs, scallops and at other orthogonal connections with other members. Where intermittent welding is permitted as per Table 3.2.1, only scalloped welding is to be used in tanks for water ballast, cargo oil or freshwater.

Chain or staggered intermittent welding may be used in dry spaces or tanks arranged for fuel oil only.

3.2.7 Where structural members pass through the boundary of a tank, and leakage into the adjacent space could be hazardous or undesirable, full penetration welding is to be adopted for the members for at least 150 [mm] on each side of the boundary. Alternatively, a small scallop of suitable shape may be cut in the member close to the boundary outside the compartment, and carefully welded all round.

3.3 Lap connections

3.3.1 Overlaps are not to be used to connect plates which may be subjected to high strength or compressive loading. However, where they are adopted, the width of overlap is to be adequate to ensure a good weld, the surfaces are to be in close contact and the joints should be closed all round by continuous fillet weld.

3.4 Slot weld

3.4.1 For the connection of plating to internal webs, where access for welding is not practicable, the closing plating is to be attached by continuous full penetration or slot welds to flat bars fitted to the webs. Slots are to be well rounded at ends, to have a minimum length of 75 [mm] and in general, a minimum width of twice the plating thickness. The distance between the slots is not to exceed 150 [mm]. Complete filling of the slots is normally not permitted.

3.5 End connection

3.5.1 In way of the end connections of girders double continuous welding is to be used all around. The weld area is not to be less than the cross-sectional area of the member, and the throat thickness not less than that given by Table 3.2.1 for girder ends.

3.5.2 Where stiffeners have bracketed end connections, bracket arms are to be welded all around and the throat thickness is not to be less than 0.35 times the thickness of bracket.

3.5.3 Where stiffeners are continuous at girder, they are to be connected to the webs, either directly and/or by means of lugs. The weld area is to be such that the shear stress does not exceed 80/k [N/mm^2]. Where the shear forces are high, a double sided connection to the web and/or a web stiffener welded on top of the continuous stiffener may be required.

Fabricated anchors		F.P.			
Masts, derrick posts, crane pedestals, deck machinery and mooring equipment seating - to deck etc.		To be considered in each individual case			

Intermittent welding means chain intermittent, staggered intermittent or scalloped welding with rounded ends.
For permitted use see 3.2.6.

F.P. means Full Penetrant weld

Note 1 For tank boundaries see 3.2.5. Where intermittent fillet welding of internals is proposed, see 3.2.6.

Note 2 Preferably to be deep penetration or full penetration weld depending on the thickness of the engine girders.

Note 3 Generally full penetration, but alternative proposals may be considered depending on t_p.

Note 4 For end connections see Chapter 11, 3.1.4.

Note 5 See Chapter 14, Section 4.1.

Chapter 18

Hull Inspection, Workmanship and Testing

Contents

Section 1

Hull Inspection

1.1 Approval of works

1.1.1 The builders, intending to class vessels to be built at their yard with IRS, are to demonstrate their capability to carry out the fabrication to acceptable quality standards before the commencement of the fabrication. Similar approval procedure shall apply to subcontractor's works also. Previous experience in the building and repair of relevant structures and equipment can be considered favourably in this regard.

1.2 Inspection facilities

1.2.1 Adequate facilities are to be provided to enable the Surveyor to carry out a satisfactory inspection of all components during each stage of prefabrication and construction.

Section 2

Workmanship

2.1 General

2.1.1 All workmanship is to be of good quality and in accordance with good shipbuilding practice. Any defect is to be rectified to the satisfaction of the Surveyor before being covered with paint, cement or other composition.

2.1.2 The assembly sequence and welding sequence are to be agreed prior to construction and are to be to the satisfaction of the Surveyor.

2.2 Plate edges and cut-outs

2.2.1 Openings, holes and other cut-outs in the main structural components are to be rounded off by adequately large radii. The free edges of cut-outs, hatch corners etc. are to be properly prepared and are to be free from notches. All edges should be faired.

2.3 Cold forming

2.3.1 Flanging and bending of plates while cold forming are not to have an average bending radius less than three times the plating thickness. The minimum radius is not to be less than twice the plating thickness.

2.3.2 During joggling of plates and profiles, the depth of joggle is not to be less than four times and the bending radius not less than twice the web thickness.

2.4 Hammering, bending and straightening

2.4.1 Steel being worked on when hot, is not to be overheated, and it is to be hammered and bent in the appropriate heat condition. Steel which is burnt, is not to be used.

2.4.2 Flame heating may be employed to straighten buckled plating when the buckling is not severe.

Section 3

Testing of Tanks and Tight Boundaries

3.1 General

3.1.1 These test procedures are to confirm the watertightness of tanks and watertight boundaries and the structural adequacy of tanks which consist of the watertight subdivisions of ships. These procedures may also be applied to verify the weathertightness of structures and shipboard outfitting. The tightness of all tanks and watertight boundaries of ships during new construction and those relevant to major conversions or major repairs (repairs affecting structural integrity) is to be confirmed by these test procedures prior to the delivery of the ship.

3.2 Application

3.2.1 All gravity tanks and other boundaries required to be watertight or weathertight are to be tested in accordance with this section and proven to be tight and structurally adequate as follows:

- Gravity tanks for their tightness and structural adequacy.
- Watertight boundaries other than tank boundaries for their watertightness, and
- Weathertight boundaries for their weathertightness.

Note : Gravity tank means a tank that is subject to vapour pressure not greater than 0.07 [MPa].

“Watertight” means having scantlings and arrangements capable of preventing the passage of water in any direction under the head of water likely to occur in intact and damaged conditions. In the damaged condition, the head of water to be considered in the worst situation at equilibrium, including intermediate stage of flooding.

“Weathertight” means that in any sea conditions, water will not penetrate into the ship. Weathertight Closing appliances for hatches, doorways and other access openings, ventilators, air-pipes etc are to be such as to prevent the passage of water into the ship in all sea conditions.

3.2.2 The testing of the cargo containment systems of liquefied gas carriers is to be in accordance with Pt.5, Ch.4, Sec.4.10 and Table 3.4.2.

3.2.3 The testing of structures not listed in Table 3.4.1 or 3.4.2 is to be specially considered.

3.3 Test Types and Definitions

3.3.1 The following two types of tests are specified in this requirement:

.1) Structural Test : A test to verify the structural adequacy of tank construction. This may be a hydrostatic test or, where the situation warrants, a hydropneumatic test.

.2) Leak Test : A test to verify the tightness of a boundary. Unless a specific test is indicated, this may be a hydrostatic / hydropneumatic test or an air test. A hose test may be considered an acceptable form of leak test for certain boundaries, as indicated by note 3 of Table 3.4.1.

3.3.2 The definition of each test type is as follows:

Hydrostatic Test: (Leak and Structural)	A test wherein a space is filled with a liquid to a specified head
Hydropneumatic Test: (Leak and Structural)	A test combining a hydrostatic test and an air test, wherein a space is partially filled with a liquid and pressurized with air.
Hose Test (Leak)	A test to verify the tightness of a joint by a jet of water with the joint visible from the opposite side.
Air Tests: (Leak)	A test to verify tightness by means of air pressure differential and leak indicating solution. It includes tank air test and joint air tests, such as compressed air fillet weld tests and vacuum box tests.
Compressed Air Fillet Weld Test: (Leak)	An air test of fillet welded tee joints wherein leak indicating solution is applied on fillet welds
Vacuum Box Test: (Leak)	A box over a joint with leak indicating solution applied on the welds. A vacuum is created inside the box to detect any leaks
Ultrasonic Test: (Leak)	A test to verify the tightness of the sealing of closing devices such as hatch covers by means of ultrasonic design techniques.
Penetration Test: (Leak)	A test to verify that no visual dye penetrant indications of potential continuous leakages exist in the boundaries of a compartment by means of low surface tension liquids (i.e. dye penetrant test).

3.4 Test procedures

3.4.1 General

Tests are to be carried out in the presence of a Surveyor at a stage sufficiently close to the completion of work with all hatches, doors, windows, etc., installed and all penetrations including pipe connections fitted and before any ceiling and cement work is applied over the joints. Specific test requirements are given in 3.4.4 and Table 3.4.1. For the timing of the application of coating and the provision of safe access to joints, see 3.4.5, 3.4.6 and Table 3.4.3.

3.4.2 Structural test procedures

3.4.2.1 Type and time of test

Where a structural test is specified in Table 3.4.1 or Table 3.4.2, a hydrostatic test in accordance with 3.4.4.1 will be acceptable. Where practical limitations, (strength of building berth, light density of liquid, etc.) prevent the performance of a hydrostatic test, a hydropneumatic test in accordance with 3.4.4.2 may be accepted instead

A hydrostatic test or hydropneumatic test for the confirmation of structural adequacy may be carried out while the vessel is afloat provided the results of a leak test are confirmed to be satisfactory before the vessel is afloat.

3.4.2.2 Testing Schedule for New Construction or Major Structural Conversion

(Note : Concurrence of the Flag Administration is to be obtained prior to allowing relaxation for structural tests for tanks of same structural configuration and for tanks in sister vessels).

3.4.2.2.1 The tank boundaries are to be tested from at least one side. The tanks for structural test are to be selected so that all representative structural members are tested for the expected tension and compression.

3.4.2.2.2 Structural tests are to be carried out for at least one tank of a group of tanks having structural similarity (i.e. same design conditions, alike structural configurations with only minor localized differences determined to be acceptable by the attending Surveyor) on each vessel provided all other tanks are tested for leaks by an air test. The acceptance of leak testing using an air test instead of a structural test does not apply to cargo space boundaries adjacent to other compartments in tankers and combination carriers or to the boundaries of tanks for segregated cargoes or pollutant cargoes in other types of ships.

3.4.2.2.3 Additional tanks may require structural testing if found necessary after the structural testing of the first tank.

3.4.2.2.4 When the structural adequacy of the tanks of a vessel were verified by the structural testing required in Table 3.4.1, subsequent vessels in the series (i.e. sister ships built from the same plans at the same shipyard) may be exempted from structural testing of tanks, provided that:

.1 Water-tightness of boundaries of all tanks is verified by leak tests and thorough inspections are carried out.

.2 Structural testing is carried out for at least one tank of each type among all tanks of each sister vessel.

.3 Additional tanks may require structural testing if found necessary after the structural testing of the first tank or if deemed necessary by the attending Surveyor.

For cargo space boundaries adjacent to other compartments in tankers and combination carriers or boundaries of tanks for segregated cargos or pollutant cargoes in other types of ships, the provision of 3.4.2.2.2 are to be applied in lieu of 3.4.2.2.4.2

3.4.2.2.5 Sister ships built (i.e keel laid) two years or more after the delivery of the last ship of the series, may be tested in accordance with 3.4.2.2.4 provided that:

1. General workmanship has been maintained (i.e. there has been no discontinuity of shipbuilding or significant changes in the construction methodology or technology at the yard, shipyard personnel are appropriately qualified and demonstrate an adequate level of workmanship as determined by IRS) and:

.2 An enhanced NDT programme is implemented for the tanks not subject to structural tests.

3.4.2.2.6 For the watertight boundaries of spaces other than tanks structural testing may be exempted, provided that the water-tightness of boundaries of exempted spaces is verified by leak tests and inspections. Structural testing may not be exempt and the requirements for structural testing of tanks in 3.4.2.2.1 to 3.4.2.2.5 are to be applied, for ballast holds, chain lockers and a representative cargo hold if intended for in-port ballasting.

3.4.3 Leak test procedures

3.4.3.1 For the leak tests specified in Table 3.4.1, tank air tests, compressed air fillet weld tests, vacuum box tests in accordance with 3.4.4.4 through 3.4.4.6, or their combination, will be acceptable. Hydrostatic or hydropneumatic tests may also be accepted as leak tests provided that 3.4.5, 3.4.6 and 3.4.7 are complied with. Hose tests will also be acceptable for such locations as specified in Table 3.4.1 with Note 3, in accordance with 3.4.4.3.

3.4.3.2 Air tests of joints may be carried out in the block stage provided that all work on the block that may affect the tightness of a joint is completed before the test. See also 3.4.5.1 for the application of final coatings and 3.4.6 for the safe access to joints and the summary in Table 3.4.3.

3.4.4 Test Methods

3.4.4.1 Hydrostatic Test

3.4.4.1.1 Unless another liquid is approved, hydrostatic test are to consist of filling the space with fresh water or sea water, whichever is appropriate for testing, to the level specified in Table 3.4.1 or Table 3.4.2.

3.4.4.1.2 In cases where a tank for higher density cargoes is to be tested with fresh water or sea water, the testing pressure height is to be specially considered.

3.4.4.1.3 All external surfaces of the tested space are to be examined for structural distortion, bulging and buckling, other related damage and leaks.

3.4.4.2 Hydropneumatic test

3.4.4.2.1 Hydropneumatic tests, where approved, are to be such that the test condition, in conjunction with the approved liquid level and supplemental air pressure, will simulate the actual loading as far as practicable. The requirements and recommendations for tank air tests in 3.4.4.4 will also apply to hydropneumatic tests.

3.4.4.2.2 All external surfaces of the tested space are to be examined for structural distortion, bulging and buckling, other related damage and leaks.

3.4.4.3 Hose test

3.4.4.3.1 Hose tests are to be carried out with the pressure in the hose nozzle maintained at least at 0.2 [MPa] i.e. (2 bar) during the test. The nozzle is to have a minimum inside diameter of 12 [mm] and be at a perpendicular distance from the joint not exceeding 1.5 [m]. The water jet is to impinge directly upon the weld.

3.4.4.3.2 Where a hose test is not practical because of possible damage to machinery, electrical equipment insulation or outfitting items, it may be replaced by a careful visual examination of welded connections, supported where necessary by means such as a dye penetrant test or ultrasonic leak test or the equivalent.

3.4.4.4 Tank air test

3.4.4.4.1 All boundary welds, erection joints and penetrations, including pipe connections, are to be examined in accordance with approved procedure and under a stabilized pressure differential above atmospheric pressure not less than 0.015 [MPa], with a leak indicating solution such as soapy water/detergent or a proprietary brand applied.

3.4.4.4.2 A U-tube with a height sufficient to hold a head of water corresponding to the required test pressure is to be arranged. The cross sectional area of the U-tube is not to be less than that of the pipe supplying air to the tank. Instead of using a U-tube, two calibrated pressure gauges may be acceptable to verify required test pressure.

3.4.4.4.3 A double inspection is to be made of tested welds. The first is to be immediately upon applying the leak indication solution; the second is to be after approximately four or five minutes in order to detect those smaller leaks which may take time to appear.

3.4.4.5 Compressed air fillet weld test

3.4.4.5.1 In this air test, compressed air is injected from one end of a fillet welded joint and the pressure verified at the other end of the joint by a pressure gauge. Pressure gauges are to be arranged so that an air pressure of at least 0.015 [MPa] can be verified at each end of all passages within the portion being tested.

Note : Where a leak test is required for fabrication involving partial penetration welds, a compressed air test is also to be applied in the same manner as to fillet weld where the root face is large, i.e., 6-8 [mm].

3.4.4.6 Vacuum box test

3.4.4.6.1 A box (vacuum testing box) with air connections, gauges and an inspection window is placed over the joint with a leak indicating solution applied to the weld cap vicinity. The air within the box is removed by an ejector to create a vacuum of 0.02 - 0.026 [MPa] inside the box.

3.4.4.7 Ultrasonic test

3.4.4.7.1 An ultrasonic echo transmitter is to be arranged inside of a compartment and a receiver is to be arranged on the outside. The watertight/weathertight boundaries of the compartment are scanned with the receiver in order to detect an ultrasonic leak indication. A location where sound is detectable by the receiver indicates a leakage in the sealing of the compartment.

3.4.4.8 Dye penetration test

3.4.4.8.1 A test of butt welds or other weld joints uses the application of a low surface tension liquid at one side of a compartment boundary or structural arrangement. If no liquid is detected on the opposite sides of the boundaries after the expiration of a defined period of time, this indicates tightness of the boundaries. In certain cases, a developer solution may be painted or sprayed on the other side of the weld to aid leak detection.

3.4.4.9 Other tests

3.4.4.9.1 Other methods of testing may be considered by IRS upon submission of full particulars prior to the commencement of testing.

3.4.5 Application of coating

3.4.5.1 Final coating

3.4.5.1.1 For butt joints welded by an automatic process, the final coating may be applied any time before the completion of a leak test of spaces bounded by the joints, provided that the welds have been carefully inspected visually to the satisfaction of the Surveyor.

3.4.5.1.2 However, the Surveyor reserves the right to require a leak test prior to the application of the final coating over automatic erection butt welds.

3.4.5.1.3 For all other joints, the final coating is to be applied after the completion of the leak test of the joint. See also Table 3.4.3.

3.4.5.2 Temporary coating

3.4.5.2.1 Any temporary coating which may conceal defects or leaks is to be applied at the time as specified for the final coating (See 3.4.5.1). This requirement does not apply to shop primer.

3.4.6 Safe access to joints

3.4.6.1 For leak tests, a safe access to all joints under examination is to be provided. See also Table 3.4.3.

3.4.7 Hydrostatic or hydropneumatic tightness test

3.4.7.1 In cases where the hydrostatic or hydropneumatic tests are applied instead of a specific leak test, examined boundaries must be dew-free, otherwise small leaks are not visible.

Table 3.4.1 : Test requirements for Tanks and Boundaries

Sr. No.	Tank or boundary to be tested	Test type	Test head or pressure	Remarks
1	Double bottom tanks[4]	Leak and structural[1]	The greater of - top of the overflow - to 2.4 [m] above top of tank[2], or - to bulkhead deck	
2	Double bottom voids[5]	Leak	See 3.4.4.4 through 3.4.4.6, as applicable	Including pump room double bottom and bunker tank protection double hull required by MARPOL Annex I
3	Double side tanks	Leak and structural[1]	The greater of - top of the overflow, - to 2.4 [m] above top of tank[2,8], or - to bulkhead deck	
4	Double side voids	Leak	See 3.4.4.4 through 3.4.4.6, as applicable	
5	Deep tanks other than those listed elsewhere in this table	Leak and structural[1]	The greater of - top of the overflow, - to 2.4 [m] above top of tank[2,8]	
6	Cargo oil tanks	Leak and structural[1]	The greater of - top of the overflow, - to 2.4 [m] above top of tank[2,8], or - top of tank[2] plus setting of any pressure relief valve	
7	Ballast hold of bulk carriers	Leak and structural[1]	- Top of cargo hatch coaming	
8	Peak tanks	Leak and structual[1]	The greater of - top of the overflow, or - to 2.4 [m] above top of tank[2,8]	After peak to be tested after installation of stern tube
9	a. Fore peak spaces with equipment	Leak	See 3.4.4.3 through 3.4.4.6, as applicable	
	b. Fore peak voids	Leak and structural[1, 11]	To bulkhead deck	
	c. Aft peak spaces with equipment	Leak	See 3.4.4.3 through 3.4.4.6, as applicable	
	d. Aft peak voids	Leak	See 3.4.4.4 through 3.4.4.6, as applicable	After peak to be tested after installation of stern tube
10	Cofferdams	Leak	See 3.4.4.4 through 3.4.4.6, as applicable	
11	a. Watertight bulkheads	Leak[10]	See 3.4.4.3 through 3.4.4.6, as applicable[7]	
	b. Superstructure end bulkheads	Leak	See 3.4.4.3 through 3.4.4.6, as applicable	

Table 3.4.1 : (Contd.)

Sr. No.	Tank or boundary to be tested	Test type	Test head or pressure	Remarks
12	Watertight doors below freeboard or bulkhead deck	Leak [6, 7]	See 3.4.4.3 through 3.4.4.6, as applicable	
13	Double plate rudder blades	Leak	See 3.4.4.4 through 3.4.4.6, as applicable	
14	Shaft tunnels clear of deep tanks	Leak[3]	See 3.4.4.3 through 3.4.4.6, as applicable	
15	Shell doors	Leak[3, 9]	See 3.4.4.3 through 3.4.4.6, as applicable	
16	Weathertight hatch covers and closing appliances	Leak[3,7]	See 3.4.4.3 through 3.4.4.6, as applicable	Hatch covers closed by tarpaulins and battens excluded
17	Dual purpose tanks / dry cargo hatch covers	Leak[3,7]	See 3.4.4.3 through 3.4.4.6, as applicable	In addition to structural test in item 6 or 7
18	Chain lockers	Leak and structural[1]	Top of chain pipe	
19	L.O. sump tanks and other similar tanks/spaces under main engines	Leak	- See 3.4.4.3 through 3.4.4.6 as applicable	
20	Ballast ducts	Leak and structural[1]	The greater of - Ballast pump maximum pressure, or - Setting of any pressure relief valve	
21	Fuel Oil Tanks	Leak and structural[1]	The greater of - Top of the overflow, - To 2.4 [m] above top of tank[2] or - To top of tank[2] plus setting of any pressure relief valves, or - To bulkhead deck	

Notes :

1. Refer to section 3.4.2.2
2. The top of a tank is the deck forming the top of the tank excluding any hatchways.
3. Hose Test may also be considered as a method of the test, see 3.3.2.
4. Including tanks arranged in accordance with the provisions of SOLAS regulation II-1/9.4.
5. Including duct keels and dry compartments arranged in accordance with the provisions of SOLAS regulation II-1/11.2 and II-1/9.4 respectively, and/or oil fuel tank protection and pump room bottom protection arranged in accordance with the provisions of MARPOL Annex I, Chapter 3, Part A regulation 12A and Chapter 4, Part A, regulation 22 respectively.
6. Where water tightness of a watertight door has not been confirmed by prototype test, testing by filling watertight spaces with water is to be carried out. See SOLAS regulation II-1/16.2 and MSC/Circ.1176.
7. An alternative to the hose testing, other testing methods listed in 3.4.4.7 through 3.4.4.9 may be applicable subject to adequacy of such testing methods being verified. See SOLAS regulation II-1/11.1. For watertight bulkheads (item 11 a) alternatives to the hose testing may only be used where a hose test is not practicable.
8. For vessels of $L < 90$ [m], the head of water above highest point of tank may be $(0.02L + 0.6)$ [m], but not less than 1.0 [m]. However, in mechanically propelled cargo ships of 500 GT and above and passenger ships, for tanks forming part of the watertight subdivision (See Pt.3, Ch.10, 4.2.1), head of water above the highest point of tank is to be 2.4 [m].
9. Watertight shell doors are to be prototype tested prior to installation on board.
10. A “Leak and Structural test” (see 3.4.2.2) is to be carried out for a representative cargo hold if intended for in-port ballasting. The filling level requirement for testing cargo holds intended for in-port ballasting is to be the maximum loading that will occur in-port as indicated in the loading manual.
11. Structural test may be waived where demonstrated to be impracticable to the satisfaction of the attending Surveyor.

Table 3.4.2 : Additional Test requirements for Special Service Ships / Tanks

Sr. No.	Type of Ship / Tank	Structures to be tested	Type of Test	Test Head of Pressure	Remarks
1	Liquefied gas carriers	Integral tanks	Leak and structural	Refer Pt 5, Ch 4, 4.10	
		Hull structure supporting membrane or semi-membrane tanks		Refer Pt 5, Ch 4, 4.10	
		Independent tanks type A		Refer Pt 5, Ch 4, 4.10	
		Independent tanks type B		Refer Pt 5, Ch 4, 4.10	
		Independent tanks type C		Refer Pt 5, Ch 4, 4.10	
2	Edible liquid tanks	Independent tanks	Leak and structural	The greater of - top of the overflow, or - to 0.9 [m] above top of tank[1]	
3	Chemical carriers	Integral or independent cargo tanks	Leak and structural	The greater of - to 2.4 [m] above top of tank[1], or - to top of tank[1] plus setting of any pressure relief valve	Where a cargo tank is designed for the carriage of cargoes with specific gravities larger than 1 , an appropriate additional head is to be considered

Note : 1. Top of tank is deck forming the top of the tank excluding any hatchways

Table 3.4.3 : Application of leak test, coating and provision of safe access for type of welded joints

Type of welded joints		Leak Test	Coating[1]		Safe Access[2]	
			Before leak test	After leak test but before structural test	Leak test	Structural test
Butt	Automatic	Not required	Allowed[3]	N/A	Not required	Not required
	Manual or semi-automatic[4]	Required	Not allowed	Allowed	Required	Not required
Fillet	Boundary including penetrations	Required	Not allowed	Allowed	Required	Not required

Notes :

1. Coating refers to internal (tank / hold coating), where applied and external (shell/deck) painting. It does not refer to shop primer.

2. Temporary means of access for verification of the leak test.

3. The condition applies provided that the welds have been carefully inspected visually to the satisfaction of the Surveyor

4. Flux Core Arc Welding (FCAW) semiautomatic butt welds need not be tested provided that careful visual inspection show continuous uniform weld profile shape, free from repairs, and the results of NDE testing show no significant defects.

Chapter 1

General Requirements for the Design and Construction of Machinery

Contents

Section 1

General

1.1 Scope

1.1.1 The Chapters of this Part cover the construction and installation of main propulsion and auxiliary machinery systems, together with their associated equipment, boilers, pressure vessels and pumping and piping arrangements fitted in vessels classed or intended to be classed with IRS.

1.2 Machinery to be constructed under survey

1.2.1 In ships intended to be built under Special Survey, all important units of equipment are to be surveyed at the manufacturer's works. The workmanship is to be to the Surveyor's satisfaction and the Surveyor is to be satisfied that the components are suitable for the intended purpose and duty. Examples of such units are :

- Main propulsion engines, including their associated gearing, flexible couplings, scavenge blowers and superchargers;

- Boilers supplying steam for propulsion or for services essential for the safety or the operation of the ship at sea, including superheaters, economisers, desuper-heaters, steam receivers. All other boilers having working pressures exceeding 0.34 [N/mm^2], and having heating surfaces greater than 4.65 [m^2];

- Auxiliary engines which are the source of power for services essential for safety or for the operation of the ship at sea;

- Steering machinery;

- Athwartship thrust units, their prime movers and control mechanisms;

- All pumps necessary for the operation of vessel, main propulsion and essential machinery, e.g. boiler feed, cooling water circulating, condensate extraction, oil fuel, lubricating oil, etc.;

- All heat exchangers necessary for the operation of main propulsion and essential machinery, e.g. air, water and lubricating oil coolers, oil fuel and water heaters, de-aerators and condensers, evaporators and distiller units;

- Air compressors, air receivers and other pressure vessels necessary for the operation of main propulsion and essential machinery. Any other unfired pressure vessels for which plans are required to be submitted for approval in accordance with the requirements of Ch.5;

- Alarm and control equipment as detailed in Ch.7;

- Electrical equipment and electrical propelling machinery as detailed in Ch.8.

- All pumps essential for safety of the ship, e.g. fire, bilge and ballast pumps; and

- Valves and other components detailed in Ch.2.

1.3 Extent of survey

1.3.1 The Surveyors are to examine and test the materials and workmanship from the commencement of work until the final test of the machinery under full power working conditions. Any defects, etc., are to be indicated as early as possible.

1.3.2 Where items of machinery are manufactured as individual or series produced units, IRS would be prepared to give consideration to the adoption of a survey procedure based upon quality assurance concepts as detailed in Sec.4.

1.4 Departures from the rules

1.4.1 Where it is proposed to depart from the requirements of the Rules, IRS will be prepared to give due consideration to the circumstances of any special case.

1.4.2 Any novelty in the construction of the machinery, boilers or pressure vessels is to be reported to IRS.

1.5 Plans and particulars

1.5.1 Before the work is commenced, plans in triplicate of all machinery items, as detailed in relevant Chapters of this Part giving the requirements for individual systems, are to be submitted for approval. The particulars of the machinery, including power ratings and design calculations, where applicable, necessary to verify the design, are also to be submitted. Any subsequent modifications are subject to approval before being put in to operation.

1.5.2 The strength requirements for rotating parts of the machinery, as specified in relevant Chapters of this Part, are based upon strength consideration only and their application does not relieve the manufacturer from the responsibility for the presence of dangerous vibrations in the installation at speeds within the operating range.

1.6 Availability of machinery for operation

1.6.1 Ship's machinery is to be so arranged that it can be brought in to operation from the "dead ship" condition using only the facilities available on board. "Dead ship" condition is understood to mean a condition under which the main propulsion plant, boilers and auxiliaries are not in operation and in restoring the propulsion, no stored energy for starting and operating the propulsion plant, the main source of electrical power and other essential auxiliaries is assumed to be available. In order to restore operation from the "dead ship" condition, an emergency generator complying with the requirements of Pt.4, Ch.8, Cl.2.8 may be used provided that the emergency power supply from it is available at all times. It is assumed that means are available to start the emergency generator at all times.

1.6.2 "Blackout" is a sudden loss of electric power in the main distribution system. All means of starting by stored energy are available.

1.7 Environmental conditions

1.7.1 All components and systems covered by the Rules are to be designed to operate under the following environmental conditions if not otherwise specified in the detailed requirements for the component or system:

- ambient air temperature in the machinery space between 0°C and 55°C;

- relative humidity of air in the machinery space up to 96 per cent;

- sea water temperature up to 32°C; and

- list, rolling, trim and pitch in accordance with Table 1.7.1.

1.7.2 Where the Rules have requirements for capacity or effect of machinery, these are to be based on a total barometric pressure of 1 bar, an engine room ambient temperature or suction air temperature of 45°C, a relative humidity of 60 per cent and a sea water temperature or where applicable the temperature of the charge air coolant at inlet of 32°C. The engine manufacturer is not expected to provide simulated ambient reference conditions at test bed.

1.7.3 In the case of ships to be classed for restricted service, the rating is to be suitable for the temperature conditions associated with the geographical limits of the restricted service.

1.7.4 Where electrical equipment is installed within environmentally controlled spaces the ambient temperature for which the equipment is suitable may be reduced from 45°C to a value not less than 35°C provided:

- The equipment is not for use for emergency services.

Table 1.7.1 : Machinery inclinations

Installations/Components	**Angle of inclination [1]**			
	Athwartships		**Fore and aft**	
	Static	**Dynamic**	**Static**	**Dynamic**
Main and auxiliary machinery	15°	22.5°	5°[4]	7.5°
Safety equipment e.g. emergency power installations, emergency fire pumps and their devices Switch gear, electric and electronic appliances[2] and remote control systems	22.5°[3]	22.5°[3]	10°	10°

Notes

1 Athwartships and fore and aft inclinations occur simultaneously.

2 Switches and controls are to remain in their last set position. Upto an angle of inclination of 45° no undesired switching operations or operational changes may occur.

3 In ships for the carriage of liquefied gases and of chemicals the emergency power supply must also remain operable with the ship flooded to a final athwartships inclination upto maximum of 30°.

4 For ships where Rule length (L) exceeds 100 [m], the fore and aft static angle of inclination can be taken as 500/L degrees.

5 Any deviations from these angles of inclination taking into consideration the size and service conditions of the ship will be specially considered.

- Temperature control is achieved by at least two cooling units so arranged that in the event of loss of one cooling unit, for any reason, the remaining unit(s) is capable of satisfactorily maintaining the design temperature.

- The equipment is able to be initially set to work safely within a 45°C ambient temperature until such a time that the lesser ambient temperature may be achieved. The cooling equipment is to be rated for a 45°C ambient temperature.

- Audible and visual alarms are provided, at a continually manned control station, to indicate any malfunction of the cooling units.

- It is to be ensured that electrical cables for their entire length are adequately rated for the maximum ambient temperature to which they are exposed along their length.

- The equipment used for cooling and maintaining the lesser ambient temperature is to be classified as a secondary essential service, as defined in Ch.8, sec.1.

1.8 Power ratings

1.8.1 In the following Chapters, where the dimensions of any particular component are determined from shaft power, P in kW, and revolutions per minute, R, the values to be used are to be derived from the following:

- For main propulsion machinery, the maximum shaft power and corresponding revolutions per minute giving the maximum torque for which the machinery is to be classed; and

- For auxiliary machinery, the maximum continuous shaft power and corresponding revolutions per minute which will be used in service.

1.9 Units

1.9.1 Units and formulae included in the Rules are shown in SI units.

1.9.2 Where the metric version of shaft power, i.e. (shp), appears in the Rules, 1 shp is equivalent to 75 [kgf] [m/sec] or 0.735 [kW].

1.9.3 Pressure gauges may be calibrated in bar

where,

1 bar = 0.1 [N/mm^2] = 1.02 [kgf/cm^2].

1.10 Astern power

1.10.1 In order to maintain sufficient maneuverability and secure control of the ship in all normal conditions, the main propulsion machinery is to be capable of reversing the direction of thrust so as to bring the ship to rest from the maximum service speed. The main propulsion machinery is to be capable of maintaining in free route astern at least 70% of the ahead revolutions.

1.10.2 Where steam turbines are used for main propulsion, they are to be capable of maintaining in free route astern at least 70% of the ahead revolutions for a period of at least 15 minutes. The astern trial is to be limited to 30 minutes or in accordance with manufacturer's recommendation to avoid overheating of the turbine due to the effects of "windage" and friction.

1.10.3 For main propulsion systems with reversing gears, controllable pitch propeller or electric propeller drive, running astern is not to lead to overload of the propulsion machinery.

1.10.4 The ahead revolutions as mentioned above are understood as those corresponding to the maximum continuous ahead power for which the vessel is classed.

1.10.5 The reversing characteristics of the propulsion plant are to be demonstrated and recorded during trials.

1.11 Fuel

1.11.1 The flash point (closed cup test) of oil fuel for use in ships classed for unrestricted service, in general, is not to be less than 60°C.

1.11.2 For emergency generator engines, fuel having a flash point (closed cup test) of not less than 43°C may be used.

1.11.3 Fuels with flash points lower than 60°C, but not less than 43°C unless specially approved, may be used in ships intended for service restricted to geographical limits where it can be ensured that the temperature of the machinery and boiler spaces will always be 10°C below the flash point of fuel. In such cases, safety precautions and the arrangements for storage and pumping will be specially considered. (Also refer Pt.6, Ch.2, 1.2.1).

1.11.4 The use of fuels having a lower flash point than specified in 1.11.1 to 1.11.3 as applicable may be permitted provided that such fuel is not stored in any machinery space and arrangements for the complete installation are specially approved.

1.11.5 For engines operating on "boil-off" vapours from the cargo, the arrangements will be specially considered.

1.12 Materials

1.12.1 The materials used in the construction are to be manufactured and tested in accordance with the requirements of Pt.2 of the Rules. Materials for which provision is not made therein may be accepted, provided that they comply with an approved specification and such tests as may be considered necessary.

1.12.2 Installation of material which contain asbestos is prohibited.

1.13 Alternative design and arrangements

1.13.1 The Rules generally cover the requirements of SOLAS Ch.II-1, Parts C, D and E. Design and arrangements alternative to these requirements may be accepted based on SOLAS Reg. II-1/55 and MSC.1/Circ. 1212.

Section 2

Machinery Room Arrangements

2.1 General

2.1.1 The machinery is to be so designed, installed and protected that risks of fire, explosions, accidental pollution, leakages and accidents thereof, and accidents to personnel working in machinery spaces will be minimised.

2.1.2 The design and arrangement of machinery foundations, shaft connections, piping and ducting is to take into account the effects of thermal expansion, vibrations, mis-alignment and hull interaction to ensure operation within safe limits.

Bolts and nuts exposed to dynamic forces and vibrations are to be properly secured.

2.2 Accessibility

2.2.1 Accessibility, for attendance and maintenance purposes, is to be provided for machinery plants.

2.3 Fire protection

2.3.1 All surfaces of machinery where the surface temperature may exceed 220°C, e.g., steam and exhaust gas lines, silencers, boilers, exhaust gas boilers, turbo blowers, etc. are to be effectively shielded to prevent ignition of combustible materials coming in to contact with them. Where insulation covering these surfaces is oil absorbing or may permit penetration of oil, the insulation is to be encased in steel or its equivalent.

2.3.2 The insulation is to be of a type and so supported that it will not crack or deteriorate when subjected to vibration.

2.3.3 Oil spillages coming into contact with hot surfaces, electrical installations or other sources of ignition.

a) Precautions (e.g. shielding) are to be taken to prevent oil that may escape under pressure from any pump, filter or heater or piping from coming into contact with sources of ignition.

b) Oil tanks, pipes, filters, heaters, etc. are not to be located immediately above or near units of high temperature including boilers, steam pipe lines, exhaust manifolds, silencers or other equipment required to be insulated and electrical equipment, as far as practicable. In particular, oil fuel filters under pressure for diesel engines are to be located such that in the event of leakage, oil cannot be sprayed on to the exhaust manifold.

c) Oil filters fitted in parallel for the purpose of enabling cleaning without disturbing oil supply to engines (e.g. duplex filters) are to be provided with arrangements that will minimise the possibility of a filter under pressure being opened by mistake. Filter/filter chambers are to be provided with suitable means for :

- venting when put in to operation; and

- depressurizing before being opened.

Valves or cocks with drain pipes led to a safe location are to be used for this purpose.

d) Hydraulic units with working pressure above 15 bar are preferably to be placed in separate spaces. If it is impracticable to locate such units in separate space, adequate shielding is to be provided.

2.3.4 Flammable or oil absorbing materials are not to be used in floors, gratings, etc. in boiler and engine rooms, shaft tunnels or in compartments where settling tanks are installed.

2.3.5 Segregation of oil fuel purifiers

a) Oil fuel purifiers for heated oil are to be in separate room enclosed by steel bulkheads extending from deck to deck and provided with self-closing steel doors.

b) The room is to be provided with :

- independent mechanical ventilation or a ventilation arrangement which can be isolated from the machinery space ventilation;

- fire detecting system; and

- fixed fire extinguishing installation.

The extinguishing installation is to be capable of being activated from outside the room. Closing of ventilation openings is to be effected from a position close to where the extinguishing system is activated. The extinguishing system is to be separate for the room, but may be part of the main fire extinguishing system for the machinery spaces.

c) If it is impracticable to locate the oil fuel purifiers in a separate space, IRS will give special consideration with regard to location, containment of possible leakages, shielding and ventilation. A local fixed fire extinguishing system is to be provided which is to be capable of being activated manually from the machinery control position or from other suitable location. If automatic release is provided, additional manual release is to be arranged.

2.4 Ventilation

2.4.1 All spaces, including engine and cargo pump spaces, where flammable or toxic gases or vapours may accumulate, are to be provided with adequate ventilation under all conditions.

2.4.2 Machinery spaces of Category A are be adequately ventilated so that a sufficient supply of air is maintained to the spaces for the safety and comfort of personnel and for operation of the machinery, when machinery or boilers are operating at full power in all weather conditions including heavy weather. Any other machinery space is to be adequately ventilated appropriate for the purpose of that machinery space.

IR2.4.2 The openings on deck through which the air is supplied to machinery space should be suitably protected (taking into account the requirements of Pt.3, Ch.13, Sec.2.2 and Sec.2.3).

The machinery spaces of Category A and other machinery spaces are as defined in Pt.6, Ch.1, Clauses 3.31 and 3.30 respectively.

2.5 Communications

2.5.1 At least two independent means of communication are to be provided between the bridge and engine room control station from which the engines are normally controlled.

One of these means is to visually indicate the order and response, both at the engine room control station and on the bridge.

2.5.2 At least one means of communication is to be provided between the bridge and any other control position(s) from which the propulsion machinery may be controlled.

2.5.3 Propulsion machinery orders from the navigation bridge are to be indicated in the main machinery control room and at the manoeuvring platform.

2.6 Machinery controls

2.6.1 Main and auxiliary machinery essential for the propulsion, control and safety of ship are to be provided with effective means for its operation and control. All control systems essential for the propulsion, control and safety of the ship are to be independent or designed such that failure of one system will not affect the performance of the other system.

2.6.2 Where remote control of propulsion machinery from the navigating bridge is provided, the control is to be performed by a single control device for each independent propeller, with automatic control of all associated services, including, where necessary, means of preventing overload of the propulsion machinery.

Section 3

Trials

3.1 General

3.1.1 Tests of components and trials of machinery, as detailed in the Chapters giving the requirements for individual systems are to be carried out to the satisfaction of the Surveyors.

3.2 Sea trials

3.2.1 For all types of installations, the sea trials are to be of sufficient duration, and carried out under normal maneuvering conditions, to prove the machinery under rated power. The trials are also to demonstrate that any vibration which may occur within the operating speed range is acceptable.

3.2.2 The trials are to include demonstrations of the following :

- The adequacy of the starting arrangements to provide the required number of starts of the main engines;

- The ability of the machinery to reverse the direction of thrust of the propeller/propulsion device in sufficient time, under normal maneuvering conditions, and so bring the ship to rest from maximum ahead rated speed; and

- In turbine installations, the ability to permit astern running at 70 per cent of the full power ahead revolutions without adverse effects. The astern trial need not be of more than 30 minutes duration.

3.2.3 Where controllable pitch propellers are fitted, the free route astern trial is to be carried out with the propeller blades set in full pitch astern position. Where emergency manual pitch setting facilities are provided, their operation is to be demonstrated to the satisfaction of the Surveyors.

3.2.4 In geared installations, prior to full power sea trials, the gear teeth are to be suitably coated to demonstrate the contact markings, and on conclusion of sea trials all gears are to be opened up sufficiently to permit the Surveyors to make an inspection of the teeth. The marking is to indicate freedom from hard bearing, particularly towards the end of the teeth, including both ends of each helix where applicable.

3.2.5 The stopping times, ship headings and distances recorded on trials, together with the results of trials to determine the ability of ships having multiple propellers or propulsion/steering arrangements to navigate and maneuver with one or more such devices inoperative, are to be available on board for the use of the master or designated personnel.

3.2.6 Where the ship is provided with supplementary means for maneuvering or stopping, the effectiveness of such means is to be demonstrated and recorded as referred to in 3.2.5.

3.2.7 All trials are to be to Surveyor's satisfaction.

Section 4

Certification of Machinery and Components Based on Alternative Certification Scheme

4.1 General

4.1.1 Machinery and components may be certified by Alternative Certification Scheme (ACS) for products including machinery and components as described in Part 1, Chapter 1, Section 4 of the Rules.

4.2 Certification of diesel engines

4.2.1 Certification of diesel engines based on Alternative Certification Scheme described in Part1, Chapter 1, Section 4 of the Rules can be considered only for diesel engines which have been type approved in accordance with IRS type approval scheme.

4.2.2 Certification of individual components of diesel engines is to be undertaken in accordance with the *Classification Note: "Approval of I.C Engines".*

End of Chapter

Chapter 2

Piping Design Requirements

Contents

Section

Section 1

General

1.1 Scope

1.1.1 The requirements of this Chapter apply to the design and construction of piping systems, including pipe fittings and valves forming parts of such systems for the following services:

Air, vapour, gas (excluding liquefied gas cargo and process piping), water, lubricating oil, fuel oil, hydraulic fluid systems for steering gear, toxic gas and liquids, cargo oil and tank cleaning piping and open ended lines such as drains, overflows, vents and boiler escape pipes.

1.1.2 The requirements of this Chapter do not cover the following:

Exhaust pipes from internal combustion engines and gas turbines, and pipes forming integral part of a boiler.

1.1.3 Hydraulic fluid systems other than those for steering gear will be specially considered.

1.1.4 For requirements pertaining to piping systems for liquefied gases (cargo and process) and cargo piping systems of ships carrying chemicals in bulk reference should be made to applicable Chapters of Pt.5 of the Rules.

1.2 Classes of pipes

1.2.1 For the purpose of testing, type of joints to be adopted, heat treatment and welding procedure, piping systems are divided into three classes, as given in Table 1.2.1.

1.3 Design pressure

1.3.1 The design pressure, P, is the maximum permissible working pressure and is to be not less than the highest set pressure of the safety valve or relief valve. For oil fuel pipes the design pressure is to be taken in accordance with Table 1.3.1. For gaseous fuel, the design pressure will be specially considered.

1.3.2 In water tube boiler installations, the design pressure for steam piping between the boiler and integral superheater outlet is to be taken as the design pressure of the boiler, i.e. not less than the highest set pressure of any safety valve on the boiler drum. For piping leading from the superheater outlet, the design pressure is to be taken as the highest set pressure of the superheater safety valves.

1.3.3 The design pressure of feed piping and other piping on the discharge from pumps is to be taken as the pump pressure at full rated speed against a shut valve. Where a safety valve or other protective device is fitted to restrict the pressure to a lower value than the shut valve load, the design pressure is to be the highest set pressure of the protective device.

Table 1.2.1 : Classes of piping systems [3,4]

Piping system	Class I	Class II	Class III
Toxic or corrosive media	Without special safeguards	Not to be used	Not to be used
a) Flammable media heated above flash point[2] b) Flammable media having flash point below 60°C[2] c) Liquefied gas	Without special safeguards	With special safeguards[1]	Not to be used
Steam	P > 16 or T > 300	16 ≥ P > 7 and 300 ≥ T > 170	P ≤ 7 and T ≤ 170
Thermal Oil	P > 16 or T > 300	16 ≥ P > 7 and 300 ≥ T > 150	P ≤ 7 and T ≤ 150
Fuel oil + Lubricating oil + Flammable hydraulic oil	P > 16 or T > 150	16 ≥ P > 7 and 150 ≥ T > 60	P ≤ 7 and T ≤ 60
Other media[5] including water, air, gases, non-flammable hydraulic oil	P > 40 or T > 300	40 ≥ P > 16 and 300 ≥ T > 200	P ≤ 16 and T ≤ 200

Notes:

1 Safeguards for reducing leakage possibility and limiting its consequences will be specially considered e.g. leading pipes in positions where leakage of internal fluids will not cause a potential hazard or damage to surrounding areas or by the usage of pipe ducts, shielding, screening etc.
2 Cargo oil pipes belong to Class III piping systems.
3 P = Design pressure in bar as defined in 1.3
4 T = Design temperature in °C as defined in 1.4.
5 For open ended pipes (drains, overflow, vents, exhaust gas lines, boiler escape lines, etc.) irrespective of the temperature, Class III pipes may be used.

Table 1.3.1 : Definition of the design pressure for fuel oil systems

Working temperature / Working Pressure (WP)	T ≤ 60°C	T > 60°C
WP ≤ **7 bar**	3 bar or max. working pressure, whichever is greater	3 bar or max. working pressure, whichever is greater
WP > 7 bar	Max. working pressure	14 bar or max. working pressure, whichever is greater

1.4 Design temperature

1.4.1 The design temperature is to be taken as the maximum temperature of the internal fluid, but in no case is it to be less than 50°C. For special cases the design temperature will be specially considered.

1.4.2 In the case of pipes for superheated steam, the temperature is to be taken as the designed operating steam temperature for the pipeline, provided that the temperature at the superheater outlet is closely controlled. Where temperature fluctuations exceeding 15°C above the designed temperature are to be expected in normal service, the steam temperature to be used for determining the allowable stress is to be increased by the amount of this excess.

1.5 Design symbols

1.5.1 The symbols used in this Chapter are defined as follows:

a = percentage negative manufacturing tolerance on thickness;

b = bending allowance [mm];

c = corrosion allowance [mm];

D = outside diameter of pipe [mm] (see 1.5.2);

d = inside diameter of pipe [mm] (see 1.5.3);

e = weld efficiency factor (see 1.5.4);

P = design pressure, in bar;

P_t = hydraulic test pressure, in bar;

R = radius of curvature of a pipe bend at the centreline of the pipe [mm];

T = design temperature, in °C;

t = the minimum thickness of a straight pipe [mm], including corrosion allowance and negative tolerance, where applicable;

t_b = the minimum thickness of a straight pipe to be used for a pipe bend [mm]; including bending allowance, corrosion allowance and negative tolerance, where applicable;

K = maximum permissible design stress [N/mm^2].

1.5.2 The outside diameter, D, is subject to manufacturing tolerance, but these are not to be used in the evaluation of formulae.

1.5.3 The inside diameter, d, is not to be confused with nominal size, which is an accepted designation associated with outside diameters of standard rolling sizes.

1.5.4 The weld efficiency factor, e, is to be taken as 1.0 for seamless and electric resistance and induction welded steel pipes delivered by manufacturers approved for making welded pipes which are considered to be equivalent to seamless pipes. Where other methods of pipe manufacture are proposed, the value of e will be specially considered.

1.6 Heat treatment

1.6.1 Method of heat treatment and means of temperature control and recording are to be to the satisfaction of Surveyors.

1.7 Minimum thickness of pipes and bends

1.7.1 The minimum thickness, t, of straight pipes is to be determined by the following formula when ratio of outside-diameter to inside-diameter does not exceed the value 1.7:-

$$t = \left(\frac{PD}{20Ke + P} + c\right)\frac{100}{100 - a}\ [mm]$$

where,

P, D, e and a are defined in 1.5.1.

The maximum permissible design stress, K, is to be taken as the lowest of the following values:-

$$K = \frac{E_t}{1.6} \text{ or } \frac{R_{20}}{2.7} \text{ or } \frac{S_R}{1.6} \text{ or } \sigma_{1/100,000}/1$$

where,

$\sigma_{1/100,000}/1$ = average stress [N/mm^2] to produce 1% creep in 100,000 hrs at the design temperature.

E_t = specified minimum lower yield or 0.2 per cent proof stress at the design temperature

R_{20} = specified minimum tensile strength at ambient temperature

S_R = average stress to produce rupture in 100,000 hours at the design temperature.

Value of K may be obtained from Sec.2, Table 2.1.1 and Table 2.1.2 for carbon and low alloy steel pipes and fittings or from Sec.3, Table 3.2.1 for copper and copper alloys pipes and fittings.

c is obtained from Sec.2, Table 2.2.1 for carbon and low alloy steel pipes and fittings or from Sec.3, Table 3.2.3 for copper and copper alloys pipes and fittings.

1.7.2 Where it is proposed to use, for high temperature service, alloy steels other than those detailed in Sec.2, particulars of the tube sizes, design conditions and appropriate national or proprietary material specifications are to be submitted for consideration.

1.7.3 The minimum thickness, t_b, of a straight steel pipe to be used for a pipe bend is to be determined by the following formula, except where it can be demonstrated that the use of a thickness less than t_b would not reduce the thickness below 't' at any point after bending:-

$$t_b = \left(\frac{PD}{20Ke + P} + b + c \right) \frac{100}{100 - a} \text{ [mm]}$$

where,

P, D, R, e, b and a are defined in 1.5.1;

K and c are defined in 1.7.1;

$$b = \frac{D}{2.5R} \left(\frac{PD}{20Ke + P} \right) \text{ [mm]}$$

In general, R, is to be not less than 3D.

1.7.4 Notwithstanding the requirements of 1.7.1 and 1.7.3, the minimum thickness of pipes is not to be less than that indicated in Sec.2 or 3, as applicable. For threaded pipes, where permitted, the minimum thickness is to be measured at the bottom of the thread.

1.8 Flanges

1.8.1 The dimensions of flanges and related bolts, gaskets are to be chosen in accordance with recognised national/international standards. For special applications, the dimensions of the flanges and related bolts, will be specially considered.

1.8.2 Gaskets are to be suitable for the medium being conveyed under design pressure and temperature conditions and their dimensions and configurations are to be in accordance with a recognized standard and for the intended service.

1.9 Materials

1.9.1 Materials for ferrous castings and forgings of Class I and Class II piping systems are to be produced at Works approved by IRS and are in general to be tested in accordance with the requirements of Pt.2 of the Rules.

1.9.2 The manufacturer's test certificate for materials of valves and fittings will be accepted in lieu of the IRS certificate provided the maximum conditions are less than given in Table 1.9.1.

1.9.3 Pipes and bodies of valves, intended to be fitted on ship's side and bottom or on collision bulkhead, are to comply with the requirements of Class II piping systems.

1.9.4 Materials for Class III piping systems may be manufactured and tested in accordance with the requirements of an acceptable national/ international standard.

1.9.5 Stainless steel grades 304, 304L, 316 and 316L are generally not considered suitable for use in seawater piping systems due to their limited corrosion resistance in contact with sea water.

Table 1.9.1 : Maximum conditions for valves and fittings for which manufacturer's test certificate is acceptable

Material	Working temp.°C	DN = Nominal Diameter [mm] P_w = Working Pressure in bar
Carbon and low alloy steel Spheroidal or nodular cast iron	< 300	DN < 50 or P_w x DN < 2500
Copper alloy	< 200	DN < 50 or P_w x DN < 1500

Section 2

Carbon and Low Alloy Steel Pipes and Fittings

2.1 Materials

2.1.1 Pipes having forge butt welded longitudinal seams are not to be used for oil fuel systems, for heating coils in oil tanks, or for pressures exceeding 4.0 bar.

2.1.2 Steel pipes, valves and fittings may be used within the temperature limits indicated in Table 2.1.1 and Table 2.1.2. Where rimming steel is used for pipes manufactured by electric resistance or induction welding processes, the design temperature is limited to 400°C.

2.2 Minimum thickness of steel pipes and bends

2.2.1 The minimum thickness of steel pipes and bends is to be higher of that calculated by Sec.1, Cl.1.7 and that indicated in Table 2.2.2, Table 2.2.3 or Table 2.2.4 as applicable.

2.2.2 The value of 'c' to be used in Sec.1, Cl.1.7 is to be in accordance with Table 2.2.1

Table 2.1.1 : Carbon and carbon-manganese steel pipes

Specified min. tensile strength [N/mm^2]	Maximum permissible stress [N/mm^2]												
	Maximum design temperature °C												
	50	100	150	200	250	300	350	400	410	420	430	440	450
320	107	105	99	92	78	62	57	55	55	54	54	54	49
360	120	117	110	103	91	76	69	68	68	68	64	56	49
410	136	131	124	117	106	93	86	84	79	71	64	56	49
460	151	146	139	132	122	111	101	99	98	85	73	62	53

2 1/4 Cr 1 Mo normalised and tempered (Note 2)	490	96	88	79	72	64	56	49	43	37	32
1/2 Cr 1/2 Mo 1/4 V	460	101	99	97	94	82	72	62	53	45	37

Notes:

1 Maximum permissible stress values applicable when the tempering temperature does not exceed 750°C.

2 Maximum permissible stress values applicable when the tempering temperature exceeds 750°C.

Table 2.2.1 : Values of 'c' for steel pipes

Piping service	**c [mm] (See Notes 1,2, 3)**
Superheated steam systems	0.3
Saturated steam systems	0.8
Steam coil systems in cargo tanks	2.0
Feed water for boilers in open circuit systems	1.5
Feed water for boilers in closed circuit systems	0.5
Blow down (for boilers) systems	1.5
Compressed air systems	1.0
Hydraulic/lubricating oil systems	0.3
Fuel oil systems	1.0
Cargo oil systems	2.0
Refrigerating plants	0.3
Fresh water systems	0.8
Sea water systems, in general	3.0

Table 2.2.1 (Contd.)

Notes:

1 For pipes passing through tanks an additional corrosion allowance is to be considered according to the figures given in Table and depending upon the external medium in order to account for the external corrosion.
2 The corrosion allowance may be reduced where pipes and any integral pipe joints are protected against corrosion by means of coating, lining etc., however, the reduction is not to be more than 50 percent in any case.
3 In the case of use of special alloy steel with sufficient corrosion resistance, the corrosion allowance may be reduced to zero.

Table 2.2.2 : Minimum wall thickness for steel pipes [11] [All dimension in mm]

Nominal size	External diameter D	Pipes in general [3, 4, 6, 8, 9, 10]	Venting overflow and sounding pipes for structural tanks [1-4, 6, 8]	Bilge ballast and general sea water pipes [1, 3-8]	Bilge, air, overflow and sounding pipes passing through ballast and fuel tanks, ballast lines through fuel tanks and fuel lines through ballast tanks [1-8]

	368	5.6	6.3	6.3	8.8
400	406.4	6.3	6.3	6.3	8.8
450	457.2	6.3	6.3	6.3	8.8

Notes:

1 IRS may accept reduction in thickness of pipes by an amount not exceeding 1 mm for pipes efficiently protected against corrosion.

2 For sounding pipes, except for those for cargo tanks with cargo having a flash point less than 60°C, the minimum wall thickness is to apply to the part outside the tank.

3 For threaded pipes, where permitted, the minimum wall thickness is to measured at the bottom of the thread.

4 The external diameters and thicknesses have been selected from ISO 4200 for welded and seamless steel pipes. For pipes covered by other standards, slightly less thicknesses may be accepted.

5 The minimum wall thickness for bilge lines and ballast lines through deep tanks will be specially considered. See Pt.5 for thickness of ballast lines passing through oil cargo tanks.

6 The minimum wall thickness for pipes larger than 450 [mm] nominal size is to be in accordance with a national or international standard and in any case not less than the minimum wall thickness indicated for 450 [mm] pipe size.

7 The minimum internal diameter for bilge, sounding, air and overflow pipes shall be 50 [mm], 32 [mm] and 50 [mm] respectively.

8 In general the minimum thickness given in this table is the nominal wall thickness and no allowance need be made for negative tolerance and reduction in thickness due to bending.

9 Minimum wall thickness of exhaust gas pipes will be specially considered.

10 Minimum wall thickness for cargo oil lines will be specially considered.

11 This table is not applicable to air pipes above weather deck, scuppers and discharges which are covered by loadline convention and also to pipes covered by Table 2.2.3.

Table 2.2.3 : Minimum wall thickness for steel pipes for CO_2 fire extinguishing		
External diameter D [mm]	From bottles to distribution station	From distribution station to nozzles
21.3 - 26.9	3.2	2.6
30 - 48.3	4	3.2
51 - 60.3	4.5	3.6
63.5 - 76.1	5	3.6
82.5 - 88.9	5.6	4
101.6	6.3	4
108 - 114.3	7.1	4.5
127	8	4.5
133 - 139.7	8	5
152.4 - 168.3	8.8	5.6

Table 2.2.3 (Contd.)

Notes:

1 Pipes are to be galvanised at least internally, except those fitted in the engine room where galvanising may be dispensed with.
2 For threaded pipes, where allowed, the minimum wall thickness is to be measured at the bottom of the thread.
3 The external diameters and thicknesses have been selected from ISO recommendations R 336 for smooth welded and seamless steel pipes. For pipes covered by other standards, slightly less thickness may be accepted.
4 For larger diameters, the minimum wall thickness will be specially considered.
5 In general, the minimum thickness is the nominal wall thickness and no allowance need be made for negative tolerance and reduction in wall thickness due to bending.

Table 2.2.4 : Minimum wall thickness for austenitic stainless steel pipes

External diameter D [mm]	Minimum wall thickness [mm]	External diameter D [mm]	Minimum wall thickness [mm]
10.2 to 17.2	1.0	219.1	2.6
21.3 to 48.3	1.6	273.0	2.9
60.3 to 88.9	2.0	323.9 to 406.4	3.6
114.3 to 168.3	2.3	Over 406.4	4.0
Note : Diameters and thicknesses according to national or international standard may be accepted.			

2.3 Types of connection

2.3.1 Pipe lengths may be joined by

- screwed-on or welded on bolted flanges
- Butt welds between pipes or between pipes and valve chests or other fittings
- Socket weld joints
- Threaded sleeve joints
- Mechanical joints.

and are to be to a recognized standard or of a design proven to be suitable for the intended purpose.

2.4 Flange connections

2.4.1 Flange attachments are to be in accordance with recognized national or international standards applicable to piping system keeping in view the boundary fluids, design pressure and temperature conditions, external or cyclic loading and location.

2.4.2 Flanges may be cut from plates or may be forged or cast. The material is to be suitable for the design temperature. Flanges may be attached to the branches by screwing and expanding or by welding. Alternative methods of flange attachment may be accepted provided details are submitted for consideration.

2.4.3 Examples of accepted flanged connections and their uses are given in Fig.2.4.1 and Table 2.4.1 respectively.

2.4.4 Where flanges are secured by screwing, as indicated in Fig.2.4.1, the pipe and flange are to be screwed with a vanishing thread and the diameter of the screwed position of pipe over the thread is not to be appreciably less than the outside diameters of the unscrewed pipe. After the flange has been screwed hard home, the pipe is to be expanded into the flange.

The vanishing thread on a pipe is to be not less than three pitches in length, and the diameter at the root of the thread is to increase uniformly from the standard root diameter to the diameter at the top of the thread. This may be produced by suitably grinding the dies, and the flange should be tapered out to the same formation.

Table 2.4.1 : Type of flange connections

Class of piping	t°C	Steam	Lub. and fuel oil	Other media
		Typical flange application	Typical flange application	Typical flange application
I [1)]	> 400	A	A - B	A
	≤ 400	A - B[2]		A - B
II	> 250	A - B - C	A - B - C	A - B - C
	≤ 250	A - B - C - D - E		A - B - C - D - E
III		A - B - C - D - E	A - B -C - E	A - B - C - D - E

1 For Class I only one condition is sufficient.

2 Type B for outer diameter < 150 [mm] only.

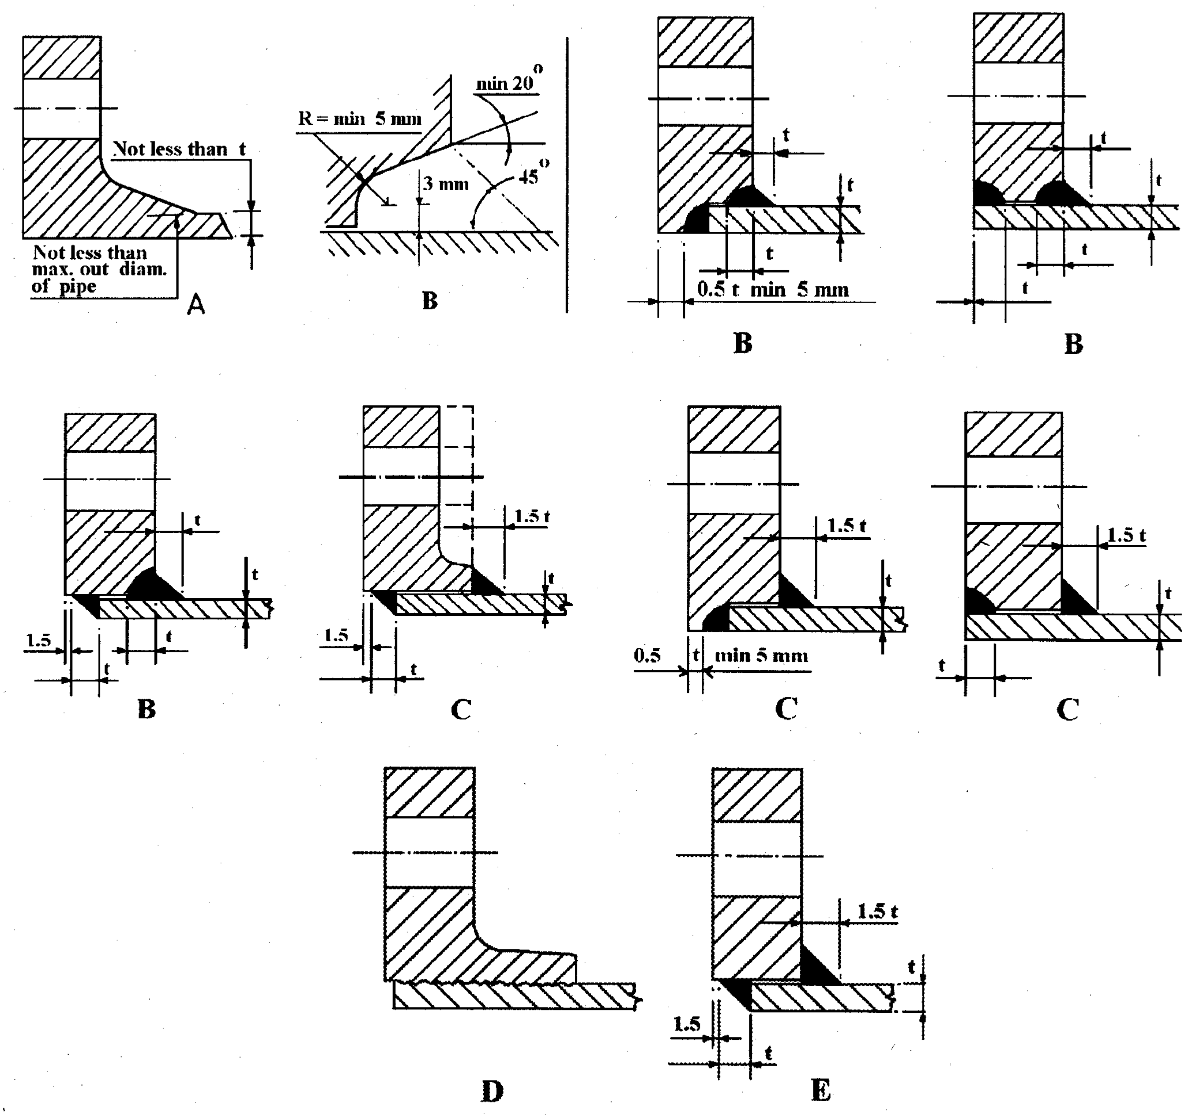

Fig. 2.4.1 : Types of flange connections

2.5 Threaded sleeve joints

2.5.1 Threaded sleeve joints requiring pressure-tight joints, having parallel or tapered threads in accordance with national or other established standards, may be used with carbon steel pipes within the limits given in Table 2.5.1 and for services other than pipe systems conveying combustible or toxic fluids or services where fatigue, severe erosion or crevice corrosion is expected to occur.

Threaded joints in CO_2 systems shall be allowed only inside protected spaces and in CO_2 cylinder rooms.

Threaded joints for direct connections of pipe lengths with tapered threads are to be allowed for

a) Class I piping having outside diameter not more than 33.7 [mm].

b) Class II and Class III piping having outside diameter not more than 60.3 [mm].

Threaded joints with parallel threads are to be allowed for Class III piping having outside diameter not more than 60.3 [mm].

In particular cases, sizes in excess of those mentioned above may be accepted by IRS if in compliance with a recognized national and/or international standard.

Table 2.5.1 : Limiting design conditions for threaded sleeve joints

Nominal bore [mm]	Maximum pressure in bar	Maximum temp.°C
≤ 25	12	260
> 25 ≤ 40	10	260
> 40 ≤ 80	8.5	260
> 80 ≤ 100	7	260

2.6 Welding, non-destructive examination and post-weld heat treatment of welded pipes

2.6.1 Requirements regarding welding procedures, non-destructive examination of welds and post-weld heat treatment are given in Ch.10.

2.7 Mechanical joints

2.7.1 Mechanical joints means devices intended for direct connection of pipe lengths other than by flanges, threaded joints or welding as described in 2.4, 2.5 and 2.6.

2.7.2 The requirements given here are applicable to pipe unions, compression couplings, slip-on joints as shown in Fig.2.7. Similar joints complying with these requirements may be acceptable.

2.7.3 Mechanical joints including pipe unions, compression couplings, slip-on joints and similar joints are to be of approved type for the pressure ratings, service conditions and the intended application. The construction and type are to conform to the examples shown in Fig.2.7 and are to be in accordance with Table 2.7.1 and Table 2.7.2 for their classification and application. (For approval refer "Type Approval of Mechanical Joints used in Piping").

2.7.4 Where the application of mechanical joints results in reduction in pipe wall thickness due to the use of bite type rings or other structural elements, this is to be taken into account in determining the minimum wall thickness of the pipe to withstand the design pressure.

The materials used in construction of mechanical joints is to be compatible with the piping material and internal and external media. In general the mechanical joints are to be of fire resistant type as required by Table 2.7.1.

2.7.5 The pressure pulsation, piping vibration, temperature variation and any other similar adverse effects occurring during operation on board is not to result in failure of joint integrity or its tightness.

2.7.6 Mechanical joints, which in the event of damage could cause fire or flooding, are not to be used in piping sections directly connected to the sea openings or tanks containing flammable fluids.

2.7.7 The mechanical joints are to be designed to withstand internal and external pressure as applicable and where used in suction lines are to be capable of operating under vacuum.

2.7.8 The number of mechanical joints in oil systems is to be kept to a minimum. In general, flanged joints conforming to recognised standards are to be used.

2.7.9 Piping in which a mechanical joint is fitted is to be adequately adjusted, aligned and supported Supports or hangers are not to be used to force alignment of piping at the point of connection.

2.7.10 Slip-on joints are normally not to be used in pipelines in cargo holds, tanks and other spaces which are not easily accessible, unless approved in each case.

2.7.11 Application of mechanical joints inside tanks may be permitted only for the same media that is in the tanks.

2.7.12 Unrestrained slip-on joints are to be used only in cases where compensation of lateral pipe deformation is necessary. Usage of these joints as the main means of pipe connection is not permitted.

2.7.13 In particular cases, sizes in excess of those mentioned in Table 2.7.2 may be accepted if in compliance with a recognised national and/or international standard.

2.7.14 Mechanical joints are to be subjected to the following tests:

.1 leakage test
.2 vacuum test
.3 vibration (fatigue) test
.4 fire endurance test
.5 burst pressure test at 4 times the design pressure (for design pressures above 200 bar, the burst pressure will be specially considered by IRS)
.6 pressure pulsation test
.7 assembly test
.8 pull out test.

NOTE : For details of tests refer classification notes, “Type Approval of Mechanical Joints used in Piping”.

2.7.15 The installation of mechanical joints is to be in accordance with the manufacturer’s assembly instructions and using special tools and gauges as required.

Abbreviations

+ Application is allowed
- Application is not allowed

Footnotes:

1) Inside machinery spaces of category A – only approved fire resistant types.
2) Not inside machinery spaces of category A or accommodation spaces. May be accepted in other machinery spaces provided the joints are located in easily visible and accessible positions.
3) Approved fire resistant types
4) Above free board deck only.
5) In pump rooms and open decks – only approved fire resistant types.
6) If compression couplings include any components which readily deteriorate in case of fire, they are to be of approved fire resistant type as required for slip-on joints.
7) Slip type joints as shown in Fig.2.7 may be used for pipes on deck with a design pressure of 10 bar or less provided that they are restrained on the pipes (i.e. free axial moment of joint with respect to pipe is prevented).

Section 3

Copper and Copper Alloy Pipes and Fittings

3.1 Materials

3.1.1 Pipes are to be seamless and branches are to be provided by cast or stamped fittings, pipe pressings or other approved fabrications. Copper pipes for class I and II are to be seamless.

3.1.2 Brazing and welding materials are to be suitable for the operating temperature and for the medium being carried. All brazing and welding are to be carried out to the satisfaction of the Surveyors.

3.1.3 In general, the maximum permissible service temperature of copper and copper alloy pipes, valves and fittings is not to exceed 200°C for copper and aluminium brass, and 300°C for copper nickel. Cast bronze valves and fittings complying with the requirements of Pt.2 Ch.8 may be accepted up to 260°C.

3.2 Minimum thickness of pipes

3.2.1 The minimum thickness of copper and copper alloy pipes and bends is to be higher of that calculated by Sec.1, Cl.1.7 and that indicated in Table 3.2.2.

3.2.2 The value of 'c' to be used in Sec.1, Cl.1.7 is to be in accordance with Table 3.2.3.

3.3 Heat treatment

3.3.1 Pipes which have been hardened by cold bending are to be suitably heat treated on completion of fabrication and prior to being tested by hydraulic pressure. Copper pipes are to be annealed and copper alloy pipes are to be either annealed or stress relief heat treated.

Table 3.2.1 : Copper and copper alloy pipes

Pipe material	Condition of supply	Specified min. tensile strength [N/mm^2]	Permissible stress [N/mm^2]					
			Maximum design temperature °C					
			50	75	100	125	150	175
Copper	Annealed	220	41.2	41.2	40.2	40.2	34.3	27.5
Aluminium brass	Annealed	320	78.5	78.5	78.5	78.5	78.5	78.5
95/5 90/10 copper nickel-iron	Annealed	270	68.6	68.6	67.7	65.7	63.7	61.8
70/30 copper nickel	Annealed	360	81.4	79.4	77.5	75.5	73.5	71.6
			Maximum design temperature °C					
			200	225	250	275	300	
Copper	Annealed	220	18.6	-	-	-	-	
Aluminium brass	Annealed	320	24.5	-	-	-	-	
95/5 90/10 copper nickel-iron	Annealed	270	58.8	55.9	52.0	48.1	44.1	
70/30 copper nickel	Annealed	360	69.6	67.7	65.7	63.7	61.8	

Notes :

1. Intermediate values may be determined by linear interpolation.
2. For materials not included in the Table, the permissible stress shall be specially considered by IRS.

Table 3.2.2 : Minimum thickness for copper and copper alloy pipes

Standard pipe sizes (outside diameter[mm])	Minimum overriding nominal thickness [mm]	
	Copper	Copper alloy
8 to 10	1.0	0.8
12 to 20	1.2	1.0
25 to 44.5	1.5	1.2
50 to 76.1	2.0	1.5
88.9 to 108	2.5	2.0
133 to 159	3.0	2.5
193.7 to 267	3.5	3.0
273 to 457.2	4.0	3.5
508	4.5	4.0

Table 3.2.3 : Corrosion allowance 'c' for copper and copper alloy pipes

Piping Material	c [mm]
Copper, brass and similar alloys, copper-tin alloys except those with lead contents	0.8
Copper-nickel alloys (with Ni ≥ 10%)	0.5
Note: For media without corrosive action in respect of the material employed and in case of special alloys with sufficient corrosion resistance, the corrosion allowance may be reduced to zero.	

Section 4

Cast Iron Pipes and Fittings

4.1 Spheroidal or nodular graphite cast iron

4.1.1 Spheroidal or nodular graphite iron castings for pipes, valves and fittings in Class II and III piping systems are to be made in a grade having a specified minimum elongation not less than 12 per cent on gauge length of $5.65\sqrt{S_o}$, where S_o is the actual cross-sectional area of the test piece.

4.1.2 Proposals for the use of this material in Class I piping systems will be specially considered, but in no case is the material to be used in systems where the design temperature exceeds 350°C.

4.1.3 Where the elongation is less than the minimum required by 4.1.1, the material is, in general, to be subject to the same limitations as grey cast iron.

4.2 Grey cast iron

4.2.1 Grey cast iron pipes, valves and fittings will, in general, be accepted in Class III piping systems except as stated in 4.2.2. Grey cast iron valves and fittings may be accepted in the Class II steam systems, but the design pressure or temperature is not to exceed 13 bar or 220°C respectively.

4.2.2 Grey cast iron is not to be used for the following:

a) Pipes for steam systems and fire extinguishing systems;

b) Pipes, valves and fittings for boiler blow down systems and other piping systems subject to shock or vibration;

c) Ship-side valves and fittings;

d) Valves fitted on collision bulkhead;

e) Clean ballast lines through cargo oil tanks to forward ballast tanks;

f) Bilge lines in tanks;

g) Outlet valves of fuel and lubricating oil tanks with static head.

Section 5

Plastic Pipes and Fittings

5.1 General

5.1.1 Proposals to use plastics material in shipboard piping systems will be considered in relation to the properties of the materials, the operating conditions of temperature and pressure, and the intended service. Any proposed service for plastics pipes not mentioned in these Rules is to be submitted for special consideration.

5.1.2 Attention is also drawn to the Guidelines for the Application of Plastic Pipes on Ships contained in IMO Resolution A.753(18).

5.1.3 Plastic pipes and fittings will, in general, be accepted in Class III piping systems. Proposals for the use of plastics in Class I and Class II piping systems will be specially considered.

5.1.4 These requirements are not applicable to flexible pipes and hoses and mechanical couplings used in metallic piping systems.

5.1.5 Piping systems made of thermoplastic materials, such as polyethylene (PE), polypropylene (PP), polybutylene (PB) and intended for non-essential services are to meet the requirements of recognized standards and that of 5.8 and 5.9. However the safety aspects due to fire will require to be considered.

5.1.6 The use of plastics may be restricted by statutory requirements of the National Authority of the country in which the ship is to be registered.

5.1.7 The specification of piping is to be in accordance with a recognized national or international standard acceptable to IRS. In addition, requirements given in 5.3 to 5.6 are to be complied with.

5.2 Terms and definitions

5.2.1 "Plastic(s)" means both thermoplastic and thermosetting plastic materials with or without reinforcement, such as PVC and fibre reinforced plastics - FRP.

5.2.2 "Pipes/piping systems" means those made of plastic(s) and include the pipes, fittings, system joints, method of joining and any internal or external liners, coverings and coatings required to comply with the performance criteria.

5.2.3 "Joint" means joining pipes by adhesive bonding, laminating, welding, etc.

5.2.4 "Fittings" means bends, elbows, fabricated branch pieces etc. of plastic materials.

5.2.5 "Nominal pressure" means the maximum permissible working pressure which should be determined in accordance with the requirements in 5.3.3.

5.2.6 "Fire endurance" means the capability of piping to maintain its strength and integrity (i.e. capable of performing its intended function) for some predetermined period of time while exposed to fire.

5.3 Strength

5.3.1 The strength of the pipes is to be determined by hydrostatic pressure tests to failure on representative sizes of the pipe.

5.3.2 The strength of fittings and joints is to be not less than that of the pipes.

5.3.3 The nominal pressure is to be determined from the following conditions :

a) Internal Pressure

For an internal pressure the nominal pressure, Pn, is to be lesser of the following :

$$\text{Pn Int} \leq \frac{\text{Psth}}{4}$$

or

$$\text{Pn Int} \leq \frac{\text{Plth}}{2.5}$$

where,

Psth = short-term hydrostatic test failure pressure;

Plth = long-term hydrostatic test failure pressure (> 100,000 h)

b) For an external pressure the nominal pressure, Pn, is to be as under :

$$\text{Pn ext} \leq \frac{\text{Pcol}}{3}$$

where,

Pcol = pipe collapse pressure.

5.3.4 In no case is the collapse pressure to be less than 3 bar.

5.3.5 The maximum working external pressure is a sum of the vacuum inside the pipe and a head of liquid acting on the outside of the pipe.

5.3.6 The maximum permissible working pressure is to be specified with due regard for maximum possible working temperatures in accordance with Manufacturer's recommendations.

5.3.7 The thickness of pipes is in no case to be less than that specified in Table 5.3.1.

Table 5.3.1 : Minimum wall thickness for plastic pipes

External diameter D [mm]	Minimum wall thickness [mm]	External diameter D [mm]	Minimum wall thickness [mm]
10.2 to 17.2	1.0	219.1	2.6
21.3 to 48.3	1.6	273.0	2.9
60.3 to 88.9	2.0	323.9 to 406.4	3.6
114.3 to 168.3	2.3	Over 406.4	4.0
Note : The external diameters and thicknesses have been selected from ISO 1127 : 1980. For pipes covered by other standards, slightly less thicknesses may be accepted.			

5.4 Axial strength

5.4.1 The sum of the longitudinal stresses due to pressure, weight and other loads is not to exceed the allowable stress in the longitudinal direction.

5.4.2 In the case of fibre reinforced plastic pipes, the sum of the longitudinal stresses is not to exceed half of the nominal circumferential stress derived from the nominal internal pressure condition (See 5.3.3).

5.5 Impact resistance

5.5.1 Plastic pipes and joints are to have a minimum resistance to impact in accordance with recognised national or international standards such as ASTM D.2444 or equivalent.
5.5.2 After the test the specimen is to be subjected to hydrostatic pressure equal to 2.5 times the design pressure for at least 1 hour.

5.6 Temperature

5.6.1 The permissible working temperature depending on the working pressure is to be in accordance with Manufacturer's recommendations, but in each case it is to be at least 20°C lower than the minimum heat distortion temperature of the pipe material, determined according to ISO 75 method A, or equivalent.

5.6.2 The minimum heat distortion temperature is to be not less than 80°C.

5.7 Requirements for pipes/piping systems depending on service and/or locations

5.7.1 Fire endurance

5.7.1.1 Pipes and their associated fittings whose integrity is essential to the safety of ships are required to meet the minimum fire endurance requirements of Appendix 1 or 2, as applicable, of IMO Res A.753(18).

5.7.1.2 Depending on the capability of a piping system to maintain its strength and integrity, there exist three different levels of fire endurance for piping systems.

a) Level 1. Piping having passed the fire endurance test specified in Appendix 1 of IMO Res A.753(18) for a duration of a minimum of one hour without loss of integrity in the dry condition is considered to meet level 1 fire endurance standard (L1).

b) Level 2. Piping having passed the fire endurance test specified in Appendix 1 of IMO Res A.753(18) for a duration of a minimum of 30 minutes in the dry condition is considered to meet level 2 fire endurance standard (L2).

c) Level 3. Piping having passed the fire endurance test specified in Appendix 2 of IMO Res A.753(18) for a duration of a minimum of 30 minutes in the wet condition is considered to meet level 3 fire endurance standard (L3).

5.7.1.3 Permitted use of piping depending on fire endurance, location and piping system is given in Table 5.7.1 "Fire Endurance Requirements Matrix".

5.7.2 Flame spread

5.7.2.1 All pipes, except those fitted on open decks and within tanks, cofferdams, pipe tunnels and ducts are to have low surface flame spread characteristics not exceeding average values listed in IMO Res. A.653(16).

5.7.2.2 Surface flame spread characteristics are to be determined using the procedure given in IMO Res. A.653(16) with regard to the modifications due to the curvilinear pipe surfaces as listed in Appendix 3 of IMO Res. A.753(18).

5.7.3 Fire protection coatings

5.7.3.1 Where a fire protective coating of pipes and fittings is necessary for achieving the fire endurance level required, it is to meet the following requirements:

a) The pipes are generally to be delivered from the manufacturer with the protective coating on.

b) The fire protection properties of the coating are not to be diminished when exposed to salt water, oil or bilge slops. It is to be demonstrated that the coating is resistant to products likely to come into contact with the piping.

c) In considering fire protection coatings, such characteristics as thermal expansion, resistance against vibrations and elasticity are to be taken into account.

d) The fire protection coatings are to have sufficient resistance to impact to retain their integrity.

5.7.4 Electrical conductivity

Where electrical conductivity is to be ensured, the resistance of the pipes and fittings is not to exceed 1 x 105 Ohm/m.

Table 5.7.1 : Fire endurance requirements matrix

Abbreviations:

L1 : Fire endurance test (appendix 1) in dry conditions, 60 min
L2 : Fire endurance test (appendix 1) in dry conditions, 30 min
L3 : Fire endurance test (appendix 2) in wet conditions, 30 min
O : No fire endurance test required
NA : Not applicable
X : Metallic materials having a melting point greater than 925°C

Footnotes:

1 Where non-metallic piping is use, remotely controlled valves to be provided at ship's side (valve is to be controlled from outside space).

2 Remote closing valves to be provided at the cargo tanks.

3 When cargo tanks contain flammable liquids with f.p. > 60°C, "O" may replace "NA" or "X".

4 For drains serving only the space concerned, "O" may replace "L1".

5 When controlling functions are not required by statutory requirements or guidelines, "O" may replace "L1".

6 For pipe between machinery space and deck water seal, "O" may replace "L1".

7 For passenger vessels, "X" is to replace "L1".

8 Scuppers serving open decks in positions 1 and 2, as defined in Regulation 13 of the International Convention on Load Lines, 1966 should be "X" throughout unless fitted at the upper end with the means of closing capable of being operated from a position above the freeboard deck in order to prevent downflooding.

9 For essential services, such as fuel oil tank heating and ship's whistle, "X" is to replace "O".

10 For tankers where compliance with paragraph 3 (f) of Regulation 13F of Annex I of MARPOL 73/78 is required, "NA" is to replace "O".

Location Definitions:

A	Machinery spaces of Category A	Machinery spaces of Category A as defined in SOLAS* Regulation II-2/3.19.
B	Other machinery spaces and pump rooms	Spaces, other than Category A machinery spaces and cargo pump rooms, containing propulsion machinery, boilers, steam and internal combustion engines, generators and major electrical machinery, pumps, oil filling stations, refrigerating, stabilising, ventilation and air-conditioning machinery and similar spaces and trunks to such spaces.
C	Cargo pump rooms	Spaces containing cargo pumps and entrances and trunks to such spaces.
D	Ro-ro cargo holds	Ro-ro cargo holds are ro-ro cargo spaces and special category spaces as defined in SOLAS* Regulation II-2/3.14 and 3.18.
E	Other dry cargo holds	All spaces other than ro-ro cargo holds used for non-liquid cargo and trunks to such spaces.
F	Cargo tanks	All spaces used for liquid cargo and trunks to such spaces.
G	Fuel oil tanks	All spaces used for fuel oil (excluding cargo tanks) and trunks to such spaces.
H	Ballast water tanks	All spaces used for ballast water and trunks to such spaces.
I	Cofferdams, voids, etc.	Cofferdams and voids are those empty spaces between two bulkheads separating two adjacent compartments.
J	Accommodation, service	Accommodation spaces, service spaces and control stations as defined in SOLAS* Regulation II-2/3.10, 3.12, 3.22.
K	Open decks	Open deck spaces as defined in SOLAS* Regulation II-2/26.2.2(5).

* SOLAS 74 as amended by the 1978 SOLAS Protocol and the 1981 and 1983 amendments (consolidated text).

5.8 Material approval and quality control during manufacture

5.8.1 Prototypes of pipes and fittings are to be tested to determine short-term and long-term design strength, fire endurance and low surface flame spread characteristics, electrical resistance (for electrically conductive pipes), impact resistance in accordance with this Section.

5.8.2 For prototype testing representative samples of pipes and fittings are to be selected to the satisfaction of the Classification Society.

5.8.3 The Manufacturer is to have quality system that meets ISO 9000 series standards or equivalent. The quality system is to consist of elements necessary to ensure that pipes and fittings are produced with consistent and uniform mechanical and physical properties.

5.8.4 Each pipe and fitting made by hand lay up technique, is to be tested by the Manufacturer at a hydrostatic pressure not less than 1.5 times the nominal pressure. For other pipes and fittings, manufactured in accordance with the recognized standards by machined processes (e.g. ‘Continuous extruding’, ‘Filament wound and centrifugally cast’) the hydrostatic pressure test may be carried out in accordance with requirements stipulated in the relevant standard to which the pipe or fittings are manufactured, provided that there is an effective quality system in place at manufacturer’s works.

5.8.5 Piping and fittings are to be permanently marked with identification. Identification is to include pressure ratings, the design standards that the pipe or fitting is manufactured in accordance with and the material of which the pipe or fitting is made.

5.8.6 In case the Manufacturer does not have an approved quality system complying with ISO 9000 series or equivalent, pipes and fittings are to be tested in accordance with this Section to the satisfaction of the attending surveyors for every batch of pipes.

5.8.7 Depending upon the intended application, IRS may require, pressure testing of each pipe and/or fitting.

5.9 Installation

5.9.1 Supports

5.9.1.1 Selection and spacing of pipe supports in shipboard systems are to be determined as a function of allowable stresses and maximum deflection criteria. Support spacing is not to be greater than the pipe Manufacturer's recommended spacing. The selection and spacing of pipe supports are to take into account pipe dimensions, mechanical and physical properties of the pipe material, mass of pipe and contained fluid, external pressure, operating temperature, thermal expansion effects, loads due to external forces, thrust forces, water hammer, vibrations, maximum accelerations to which the system may be subjected. Combination of loads is to be considered.

5.9.1.2 Each support is to evenly distribute the load of the pipe and its contents over the full width of the support. Measures are to be taken to minimise wear of the pipes where they contact the supports.

5.9.1.3 Heavy components in the piping system such as valves and expansion joints are to be independently supported.

5.9.2 Expansion

5.9.2.1 Suitable provision is to be made in each pipeline to allow for relative movement between pipes made of plastic and the steel structure, having due regard to:

i) the difference in the coefficients of thermal expansion;

ii) deformations of the ship's hull and its structure.

5.9.2.2 When calculating the thermal expansions, account is to be taken of the system working temperature and the temperature at which assembly is performed.

5.9.3 External loads

5.9.3.1 When installing the piping, allowance is to be made for temporary point loads, where applicable. Such allowances are to include at least the force exerted by a load (person) of 100 kg at mid-span on any pipe of more than 100 mm nominal outside diameter.

5.9.3.2 Besides for providing adequate robustness for all piping including open-ended piping a minimum wall thickness, complying with 5.3.7 may require to be increased taking into account the conditions encountered during service on board ships.

5.9.3.3 Pipes are to be protected from mechanical damage where necessary.

5.9.4 Strength of connections

5.9.4.1 The strength of connections is to be not less than that of the piping system in which they are installed.

5.9.4.2 Pipes may be assembled using adhesive-bonded, welded, flanged or other joints.

5.9.4.3 Adhesive, when used for joint assembly, are to be suitable for providing a permanent seal between the pipes and fittings throughout the temperature and pressure range of the intended application.

5.9.4.4 Tightening of joints is to be performed in accordance with Manufacturers' instructions.

5.9.5 Installation of conductive pipes

5.9.5.1 In piping systems for fluids with conductivity less than 1000 pico siemens per metre (pS/m) such as refined products and distillates use is to be made of conductive pipes.

5.9.5.2 Regardless of the fluid being conveyed, plastic piping is to be electrically conductive if the piping passes through a hazardous area. The resistance to earth from any point in the piping system is not to exceed 1×10^6 Ohm. It is preferred that pipes and fittings be homogeneously conductive. Pipes and fittings having conductive layers are to be protected against a possibility of spark damage to the pipe wall. Satisfactory earthing is to be provided.

5.9.5.3 After completion of the installation, the resistance to earth is to be verified. Earthing wires are to be accessible for inspection.

5.9.6 Application of fire protection coatings

5.9.6.1 Fire protection coatings are to be applied on the joints, where necessary for meeting the required fire endurance for 5.7.3, after performing hydrostatic pressure tests of the piping system.

5.9.6.2 The fire protection coatings are to be applied in accordance with Manufacturer's recommendations, using a procedure approved in each particular case.

5.9.7 Penetration of divisions

5.9.7.1 Where plastic pipes pass through "A" or "B" class divisions, arrangements are to be made to ensure that the fire endurance is not impaired. These arrangements are to be tested in accordance with Recommendations for fire test procedures for "A", "B" and "F" bulkheads (Resolution A.754(18) as amended).

5.9.7.2 When plastic pipes pass through watertight bulkheads or decks, the watertight integrity of the bulkhead or deck is to be maintained.

5.9.7.3 If the bulkhead or deck is also a fire division and destruction by fire of plastic pipes may cause the inflow of liquid from tanks, a metallic shut-off valve operable from above the freeboard deck should be fitted at the bulkhead or deck.

5.9.8 Control during installation

5.9.8.1 Installation is to be in accordance with the Manufacturer's guidelines.

5.9.8.2 Prior to commencing the work, joining techniques are to be approved by the Classification Society.

5.9.8.3 The tests and examinations specified in this Section are to be completed before shipboard piping installation commences.

5.9.8.4 The personnel performing this work are to be properly qualified and certified to the satisfaction of the Classification Society.

5.9.8.5 The procedure of making bonds is to include:

i) materials used,

ii) tools and fixtures,

iii) joint preparation requirements,

iv) cure temperature,

v) dimensional requirements and tolerances, and

vi) tests acceptance criteria upon completion of the assembly.

5.9.8.6 Any change in the bonding procedure which will affect the physical and mechanical properties of the joint is to require the procedure to be requalified.

5.9.9 Bonding procedure quality testing

5.9.9.1 A test assembly is to be fabricated in accordance with the procedure to be qualified and it is to consist of at least one pipe-to-pipe joint and one pipe-to-fitting joint.

5.9.9.2 When the test assembly has been cured, it is to be subjected to a hydrostatic test pressure at a safety factor 2.5 times the design pressure of the test assembly, for not less than one hour. No leakage or separation of joints is allowed. The test is to be conducted so that the joint is loaded in both longitudinal and circumferential directions.

5.9.9.3 Selection of the pipes used for test assembly, is to be in accordance with the following:

a) When the largest size to be joined is 200 mm nominal outside diameter, or smaller, the test assembly is to be the largest piping size to be joined.

b) When the largest size to be joined is greater than 200 mm nominal outside diameter, the size of the test assembly is to be either 200 mm or 25% of the largest piping size to be joined, whichever is greater.

5.9.9.4 When conducting performance qualifications, each bonder and each bonding operator are to make up test assemblies, the size and number of which are to be as required above.

5.9.10 Testing after installation on board

5.9.10.1 Piping systems for essential services are to be subjected to a test pressure not less than 1.5 times the design pressure or 4 bar whichever is greater.

5.9.10.2 Piping systems for non-essential services are to be checked for leakage under operational conditions.

5.9.10.3 For piping required to be electrically conductive, earthing is to be checked and random resistance testing is to be conducted.

5.10 Test specification for plastic pipes

5.10.1 Scope

Section 5.10 contains requirements for the Type Approval of plastic pipes. It is applicable to rigid pipes, pipe joints and fittings.

5.10.2 Documentation

The following information for the plastic pipes, fittings and joints is to be submitted for consideration and approval:

I. General information

1) Pipe and fitting dimensions
2) Maximum internal and external working pressure
3) Working temperature range
4) Intended services and installation locations
5) The level of fire endurance
6) If electrically conductive
7) Fluids Intended to be carried
8) Limits on flow rates
9) Serviceable life
10) Installation instructions
11) Details of marking.

II. Drawings and supporting documentation:

1) Certificates and reports for relevant tests previously carried out.
2) Details of relevant standards.
3) All relevant design drawings, catalogues, data sheets, calculations and functional descriptions.
4) Fully detailed section assembly drawings showing pipe, fittings and pipe connections.

III. Materials

1) The resin used for the construction of plastic pipes and fittings.
2) Catalyst and accelerator types and concentration employed in the case of reinforced polyester resin pipes or hardeners where epoxide resins are employed.
3) A statement of all reinforcements employed where the reference number does not identify the mass per unit area or the text number of a roving used in a filament winding process, these are to be detailed.
4) Full information regarding the type of gel-coat or thermoplastic liner employed during construction, as appropriate.
5) Cure/post-cure conditions. The cure and post-cure temperatures and time required and resin/reinforcement ratio.
6) Winding angle and orientation.

5.10.3 Testing

Testing is to demonstrate that pipes, fittings and joints for which Type Approval is sought comply with requirement of Section 5.

The standards to be used for testing of pipes, joints and fittings are given in Table 5.10.1 and Table 5.10.2.

Table 5.10.1 : Typical standards for general requirements for all systems

	Test	**Rule clause no. / Typical Standard**	**Remarks**
1	Internal pressure [(1)]	5.3.3a) ASTM D 1599 ASTM D 2992 ISO 15493 or equivalent	Top, Middle, Bottom (of range) Tests are to be carried out on pipe spools made of different pipe sizes, fittings and pipe connections
2	External pressure [(1)]	5.3.3b) ISO 15493 or equivalent	As above, for straight pipes only
3	Axial strength	5.4	As above
4	Load deformation	ASTM D2412 or equivalent	Top, Middle Bottom (of each pressure range)
5	Temperature limitations	ISO 75 Method A GRP piping system: HDT test on each type of resin acc. To ISO 75 method A Thermoplastic piping systems: ISO 75 Method A; ISO 306 Plastics – Thermoplastic materials – Determination of Vicat softening temperature (VST) VICAT test according to ISO 2507 Polyesters with an HDT below 80°C should not be used.	Each type of resin
6	Impact resistance	ISO 9854:1994, ISO 9653:1991 ISO 15493 ASTM D2444 or equivalent	Representative sample of each type of construction
7	Ageing	Manufacturer's standard ISO 9142:1990	Each type of construction
8	Fatigue	Manufacturer's standard or service experience	Each type of construction
9	Fluid absorption	ISO 8361:1991	
10	Material compatibility [(2)]	ASTM C581 Manufacturer's standard	

Notes:
(1) Test to be witnessed by IRS Surveyor.
(2) If applicable.

Table 5.10.2 : Typical standards for additional requirements depending on service and/or locations of piping

	Test	Rule clause no. / Typical Standard	Remarks
1	Fire endurance (1) (2)	IMO Res. A753(18), Appendix 1,2	Representative samples of each type of construction and type of pipe connection
2	Flame spread (1) (2)	5.7.2	Representative samples of each type of construction
3	Smoke generation (2)	IMO Fire Test Procedures Code	Representative samples of each type of construction
4	Toxicity (2)	IMO Fire Test Procedures Code	Representative samples of each type of construction
5	Electrical conductivity (1) (2)	ASTM F1173-95 or ASTM D257, NS6126 para 11.2 or equivalent	Representative samples of each type of construction

Notes:
(1) Test to be witnessed by IRS Surveyor.
(2) If applicable.

Tests 1, 2 and 5 of above table are optional. However, if carried out, the range of approved applications for the pipes will be limited accordingly (See Table 5.7.1).

Section 6

Flexible Hoses

6.1 Definition

6.1.1 Flexible hose assembly is defined as short length of integral metallic or non-metallic hose with prefabricated end fittings ready for installation.

6.2 Scope

6.2.1 The requirements of 6.3 to 6.6 apply to flexible hoses of metallic or non-metallic material intended for a permanent connection between a fixed piping system and items of machinery where necessary to accommodate relative movement between the machinery and the fixed piping system. The requirements may also be applied to temporarily connected flexible hoses or hoses of portable equipment.

6.2.2 Flexible hose assemblies as defined in 6.1.1 may be accepted for use in oil fuel, lubricating, hydraulic and thermal oil systems, fresh water and sea water cooling systems, compressed air systems, bilge and ballast systems and Class III steam systems where they comply with 6.3 to 6.6. Flexible hoses are not accepted in high pressure fuel oil injection systems.

6.2.3 These requirements for flexible hose assemblies are not applicable to hoses intended to be used in fixed fire extinguishing systems.

6.3 Design and construction

6.3.1 Flexible hoses are to be designed and constructed in accordance with recognized National or International Standards. Flexible hoses constructed of rubber or plastics materials and intended for use in bilge, ballast, compressed air, oil fuel, lubricating, hydraulic and thermal oil systems are to incorporate a single double or more closely woven integral wire braid or other suitable material for reinforcement.

Flexible hoses of plastics materials such as Teflon or Nylon, (which are used for the purposes mentioned above), where reinforcement is not possible by incorporating closely woven integral wire braid are to have suitable reinforcing material as far as practicable.

Where rubber or plastic material hoses are to be used in oil supply lines to burners, the hoses are to have external wire braid protection in addition to the reinforcement mentioned above which is provided during manufacturing. Flexible hoses for use in steam systems are to be of metallic construction.

6.3.2 Flexible hoses are to be complete with approved end fittings in accordance with manufacturer's specification. The end connections that do not have a flange are to comply with 2.7 as applicable and each type of hose/fitting combination is to be subject to prototype testing to the same standard as that required by the hose with particular reference to pressure and impulse tests. Refer Pt.4, Ch.4, 4.8.5.2.

6.3.3 The use of hose clamps and similar types of end attachments is not acceptable for flexible hoses in piping systems for steam, flammable media, starting air systems or for sea water systems where failure may result in flooding. In other piping systems, the use of hose clamps may be accepted where the working pressure is less than 5 bar and provided there are double clamps at each end connection.

6.3.4 Flexible hose assemblies intended for installation in piping systems where pressure pulses and/or high levels of vibration are expected to occur in service, are to be designed for the maximum expected impulse peak pressure and forces due to vibration. The tests required by 6.5 are to take into consideration the maximum anticipated in-service pressures, vibration frequencies and forces due to installation.

6.3.5 Flexible hose assemblies constructed of non-metallic materials intended for installation in piping systems for flammable media and sea water systems where failure may result in flooding, are to be of fire-resistant type. Fire resistance is to be demonstrated by testing to ISO 15540 and ISO 15541.

6.3.6 Flexible hose assemblies are to be selected for the intended location and application taking into consideration ambient conditions, compatibility with fluids under working pressure and temperature conditions consistent with the manufacturer's instructions and any requirements given elsewhere in the Rules. (Refer Pt.4, Ch.3, 4.3.5; Pt.4, Ch.6, 3.4; Pt.5, Ch.26, 2.6.10; Pt.5, Ch.29, 2.1.2).

6.4 Installation

6.4.1 In general, flexible hoses are to be limited to a length necessary to provide for relative movement between fixed and flexibly mounted items of machinery / equipment or systems.

6.4.2 Flexible hose assemblies are not to be installed where they may be subjected to torsional deformation (twisting) under normal operating conditions.

6.4.3 The number of flexible hoses, in piping systems mentioned in 6.2.2 is to be kept to minimum and to be limited for the purpose stated in 6.2.1.

6.4.4 Where flexible hoses are intended to be used in piping systems conveying flammable fluids that are in close proximity of heated surfaces the risk of ignition due to failure of the hose assembly and subsequent release of fluids is to be mitigated as far as practicable by the use of screens or other similar protection to the satisfaction of the Surveyor.

6.4.5 Flexible hoses are to be installed in clearly visible and readily accessible locations.

6.4.6 The installation of flexible hose assemblies is to be in accordance with the manufacturer's instructions and use limitations with particular attention to the following, if any:

- Orientation
- End connection support (where necessary)
- Avoidance of hose contact that could cause rubbing and abrasion
- Minimum bend radii.

6.5 Tests

6.5.1 Acceptance of flexible hose assemblies is subject to satisfactory prototype testing. Prototype test programmes for flexible hose assemblies are to be submitted to IRS by the manufacturer and are to be sufficiently detailed to demonstrate performance in accordance with the specified standards given in 6.5.2 and 6.5.3.

6.5.2 The tests are, as applicable, to be carried out on different nominal diameters of hose type complete with end fittings for pressure, burst, impulse resistance and fire resistance in accordance with the requirements of the relevant standard. The following standards are to be used as applicable:

- ISO 6802 – Rubber and plastics hoses and hose assemblies with wire reinforcements– Hydraulic impulse test with flexing.

- ISO 6803 – Rubber or plastics hoses and hose assemblies – Hydraulic-pressure impulse test without flexing.

- ISO 15540 – Ships and marine technology – Fire resistance of hose assemblies – Test methods.

- ISO 15541 – Ships and marine technology – Fire resistance of hose assemblies – Requirements for test bench.

- ISO 10380 – Pipe work – Corrugated metal hoses and hose assemblies. Other standards may be accepted where agreed by IRS.

6.5.3 All flexible hose assemblies are to be satisfactorily prototype burst tested to an international standard***** to demonstrate they are able to withstand a pressure not less than four times its design pressure without indication of failure or leakage.

Note : ***** The international standards, e.g. EN or SAE for burst testing of non-metallic hoses, require the pressure to be increased until burst without any holding period at 4 x MWP.

6.6 Marking

6.6.1 Flexible hoses are to be permanently marked by the manufacturer with the following details:

- Hose manufacturer’s name or trademark.
- Date of manufacture (month/year).
- Designation type reference.
- Nominal diameter.
- Pressure rating.
- Temperature rating.

Where a flexible hose assembly is made up of items from different manufacturers, the components are to be clearly identified and traceable to evidence of prototype testing.

Section 7

Hydraulic Tests on Pipes and Fittings

7.1 Hydraulic tests before installation on board

7.1.1 All Class I and II pipes and their associated fittings are to be tested by hydraulic pressure to the Surveyor's satisfaction. Further, all steam, feed, compressed air and fuel oil pipes, together with their fittings, are to be similarly tested where the design pressure is greater than 3.5 bar. The test is to be carried out after completion of manufacture and before installation on board and, where applicable, before insulating and coating.

7.1.2 Where the design temperature does not exceed 300°C, the test pressure is to be 1.5 times the design pressure.

7.1.3 For steel pipes and integral fittings for use in systems where the design temperature exceeds 300°C, the test pressure is to be as follows but need not exceed twice the design pressure:

$$P_t = 1.5\,P\,\frac{K_{100}}{K_t}\,\text{bar}$$

where,

P_t and P are defined in Sec.1, Cl.1.5.1

K_{100} = allowable stress for 100°C [N/mm^2]

K_t = allowable stress for the design temperature [N/mm^2].

7.1.4 In no case is the membrane stress to exceed 90 per cent of the yield stress at the testing temperature.

7.1.5 All valves and fittings are to be tested in accordance with recognized standards, but not less than 1.5 times the nominal pressure rating at ambient temperature. Valves, cocks and distance pieces intended to be fitted on the ship side below the load waterline are to be hydraulically tested to a pressure not less than 5 bar.

7.1.6 When, for technical reasons, it is not possible to carry out complete hydrotesting before assembly on board for all sections of piping, proposals for testing the remaining/ closing lengths of piping, particularly in respect of the closing seams, are to be submitted for approval.

7.1.7 Pressure testing of small bore pipes (less than 15 mm) may be waived at the discretion of IRS depending on the application.

7.2 Testing after assembly on board

7.2.1 Heating coils in tanks and liquid or gas fuel oil piping are to be tested by hydraulic pressure, after installation on board, to 1.5 times the design pressure but in no case to less than 4 bar.

7.2.2 Where pipes specified in 7.1.1 are butt welded together during assembly on board, they are to be tested by hydraulic pressure in accordance with the requirements of 7.1 after welding. The pipe lengths may be insulated, except in way of the joints made during installation and before hydraulic test is carried out.

7.2.3 The hydraulic test required by 7.2.2 may be omitted provided non- destructive tests by ultrasonic or radiographic methods are carried out on the entire circumference of all butt welds with satisfactory results. Where ultrasonic test has been carried out, the manufacturer is to provide the Surveyor with a signed statement confirming that ultrasonic examination has been carried out by an approved operator and that there were no indications of defects which could be expected to have prejudicial effect on the service performance of the piping.

7.2.4 Where bilge pipes are accepted in way of double bottom tanks or deep tanks, the pipes after fitting are to be tested by hydraulic pressure to the same pressure as the tanks through which they pass.

End of Chapter

Chapter 3

Pumping and Piping

Contents

Section 1

General

1.1 Scope

1.1.1 The requirements of this Chapter are applicable to all ships but may be modified for ships classed for restricted services or for special services.

1.1.2 Whilst these requirements are considered to satisfy the relevant requirements of the International Convention for the Safety of Life at Sea, 1974, and applicable amendments, attention should be given to any relevant statutory requirements of the National Authority of the country in which the ship is to be registered.

1.1.3 Consideration will be given to special cases or to arrangements which are considered equivalent to those required by Rules.

1.2 Plans

1.2.1 The following plans in diagrammatic form are to be submitted for consideration before proceeding with the work:

a) General arrangement of pumps and piping systems;

b) Oil-fuel filling, transfer and service piping systems;

c) Boiler feed piping systems;

d) Steam piping and condensate piping systems;

e) Bilge and ballast piping systems;

f) Lubricating-oil piping systems;

g) Liquid cargo pumping systems;

h) Hydraulic power piping systems for essential services;

i) Compressed air piping systems;

j) Steering gear piping systems;

k) Sea water and fresh water service piping systems;

l) Vents, sounding and overflow piping systems;

m) Sanitary piping systems;

n) Fire main and fire extinguishing piping systems.

1.2.2 The plans are to include the information like size, wall thickness, maximum working pressure, temperature and material of all pipes, and type, size and material of the valves and fittings.

1.3 Materials

1.3.1 The materials to be used in piping systems are to be suitable for the service intended. In general, except where otherwise stated, pipes, valves and fittings are to be made of steel, cast iron, copper, copper alloy or other approved material. See Ch.2 also.

Materials for pipes carrying corrosive fluids are to be compatible with the fluids being handled and are to be specially considered. See Ch.2, 1.9.5.

1.3.2 Materials sensitive to heat such as aluminium, lead or plastics, are not to be used in systems essential to the safe operation of the ship.

1.4 Valves and cocks

1.4.1 All the valves and cocks are to be so designed and constructed so that the valve covers or glands will not slacken up when the valves are operated.

1.4.2 All the valves are to be designed to close with right hand (clockwise when facing the end of the stem) motion of the wheel of the valve.

1.4.3 All the valves and cocks are to be fitted in places where they are easily accessible at all times and are to be fitted with legible nameplates indicating their function in the system and their installation is to be such that it can be readily observed that they are open or closed.

1.4.4 All the valves and cocks fitted with remote control are to be provided with local manual control independent of the remote operating mechanism. The operation of the local control is not to render the remote control system inoperable.

1.4.5 The valves, cocks and other fittings which are attached directly to plating, which is required to be of watertight construction, are to be secured to the plating by means of studs screwed into the plating and not by bolts passing through clearance holes. Alternatively the studs may be welded to the plating.

1.5 Shipside fittings (other than sanitary discharges and scuppers)

1.5.1 All sea inlet and overboard discharge valves are to be fitted in either of the following ways :

a) directly on the shell plating;

b) to the plating of fabricated steel water boxes of rigid construction integral with the ship's plating;

c) to short, rigid distance pieces welded to the shell plating.

1.5.2 All valves and cocks fitted directly to the shell plating are to have spigots extending through the plating. These spigot on valves may however be omitted, if valves are fitted on pads which themselves form spigots in way of plating.

1.5.3 Boiler blow-down valves or cocks are to have a protection ring fitted on the outside of the shell plating. The spigot of the valve or the cock is to be flush with the outer surface of the protection ring.

1.5.4 Valves and cocks are to be attached to the shell plating by bolts tapped into the plating and fitted with countersunk heads, or by studs screwed into heavy steel pads fitted to the plating. The stud holes are not to penetrate the pad plating.

1.5.5 Ship side valves and fittings, if made of steel or material with low corrosion resistance, are to be suitably protected against wastage.

1.5.6 Gratings are to be fitted at all openings in ship's side for inlet of seawater. The net area through the gratings is to be at least twice the area of the valves connected to the opening. Provision is to be made to clear the gratings by low pressure steam or compressed air.

1.5.7 The scantlings of valves and valve stools fitted with steam, or compressed air clearing connections are to be suitable for the maximum pressure to which the valves and stools may be subjected.

1.6 Piping installation

1.6.1 Heavy pipes and valves are to be so supported that their weight is not taken up by connected pumps and fittings.

1.6.2 Support of the pipes is to be such that detrimental vibrations do not arise in the system.

1.6.3 Where pipes are carried through watertight bulkheads or tank tops, means are to be made to ensure the integrity of the watertightness of the compartment.

1.6.4 As far as possible, installation of pipes for water, oil, exhaust gases from oil engines or steam, is to be avoided near electric switchboards. If this is impracticable, all the joints in pipe line and valves are to be at a safe distance from the switchboards and shielded to prevent damage to switchboard.

1.6.5 Provision is to be made to take care of expansion or contraction stresses in pipes due to temperature stresses or working of the hull.

1.6.6 Expansion pieces of approved type, made of oil resistant re-inforced rubber or other approved material may be used in circulating water systems in machinery spaces.

1.6.7 All piping systems, where a pressure greater than the designed pressure could be developed, are to be protected by suitable relief valves.

1.6.8 All pipes, situated in cargo spaces, fish holds or other spaces, where they can be damaged mechanically, are to be suitably protected.

1.6.9 All pipes which pass through chambers intended for the carriage or storage of refrigerated cargo are to be well insulated. In case the temperature of the chamber is below 0°C the pipes are to be insulated from the ship's structure also, except at positions where the temperature of the ship's structure is always above 0°C and is controlled by outside temperature.

Air refreshing pipes leading to and from refrigerated chambers need not be insulated from the ship's structure.

1.6.10 Deck wash pipes and discharge pipes from the pumps to domestic water tanks are not to pass through cargo holds.

Section 2

Bilge and Ballast Piping Systems

2.1 General

2.1.1 All ships are to be provided with necessary pumps, suction and discharge piping and means of drainage so arranged that any compartment can be pumped out effectively, when the ship is on an even keel and/or designed trim and is either upright or has a list of not more than 5 degrees, through at least one suction, except for machinery spaces where at least two suctions are required, one of which is to be a branch bilge suction and the other is to be a direct bilge suction. Wing suctions will, generally, be necessary for this purpose, except for short narrow compartments, where a single suction may be sufficient.

2.1.2 All passenger ships are to be provided with an efficient bilge pumping plant capable of pumping from and draining any watertight compartment which is neither a permanent oil compartment nor a permanent water compartment under all practicable conditions, after a casualty, whether the ship is upright or listed.

2.2 Drainage of cargo holds

2.2.1 In ships without a double bottom one bilge suction is normally to be provided on each side of the cargo hold, at the after ends. However, if the rise of floor exceeds 5 degrees, one bilge suction at the after end situated as near the centerline as practicable may be accepted.

In ships where the bilge water cannot be entirely drained by suctions as provided above due to the fitting of watertight floors or keelsons, additional suctions may be required. Recesses and cementing/composition are to be so arranged that water in any part of the hold may find its way to the suction pipes easily.

2.2.2 In the holds of ships with double bottom, bilge suctions are to be provided on each side at the after end of the holds. Where the tanktop extends to the shipside, bilge suctions are to be led from bilge wells of at least 0.15 [m^3] capacity each, situated at the after end at each side of the hold. Where the tanktop has inverse camber, an additional bilge suction from a well situated near the centerline is also to be provided. Bilge wells of smaller size may be considered depending on the size of the vessel and the size of the compartment.

If the tanktop is of a design having discontinuities or depressions, the number and position of bilge suctions will be given special consideration.

2.2.3 Ships with one cargo hold, are to have suctions in the fore and after ends of the hold. In ships having two or more holds, bilge suctions are to be fitted in suitable positions in the fore and after ends of holds over 30 [m] in length.

2.3 Drainage from refrigerated cargo spaces

2.3.1 Provision is to be made for the continuous drainage of the inside of all insulated chambers and cooler trays.

2.3.2 Drains which are led from lower holds and cooler trays situated on the tank top are to be fitted with liquid sealed traps and non-return bilge valves.

2.3.3 Drains from 'tween deck chambers and from cooler trays which are situated well above the tank top are to be fitted with liquid sealed traps.

2.3.4 Where drains from separate chambers join a common main, the branch pipes are each to be provided with a liquid sealed trap.

2.3.5 The liquid sealed traps are to be of adequate depth and are to have a pressure head of at least 100 [mm] when connected to air ducts and 50 [mm] otherwise and arrangements are to be made for ready access to the traps for cleaning and refilling with brine.

2.3.6 Sluices, scuppers or drain pipes, which would permit drainage from compartments outside the insulated chambers into the bilges of the latter, are not to be fitted.

2.3.7 Screwed plugs or other means for blanking off scuppers draining insulating chambers and cooler trays are not to be fitted. If, however, it is especially desired to provide means for temporarily closing these scuppers, they may be fitted with shutoff valves controlled from readily accessible positions on a deck above the load waterline. An indicator is to be provided to indicate whether the valve is open or shut.

2.4 Drainage from fore and aft peaks

2.4.1 Where the peaks are used as tanks, a power pump suction is to be led to each tank, except in case of small tanks (generally not exceeding 2 [m^3] used for the carriage of domestic fresh water where hand pumps may be used.

2.4.2 The peaks may be drained by hand pumps provided the peaks are not used as tanks and they are not connected to bilge main. The suction lift is to be well within the capacity of the hand pumps and is not to exceed 7.3 [m].

In case of vessels of length 24 [m] or less and fishing vessels, after peak may be drained by means of a self closing cock situated in a well lighted and accessible position, and draining into engine room or tunnel.

2.4.3 The collision bulkhead is not to be pierced below the bulkhead deck by more than one pipe for dealing with the contents inside the fore peak tank. Where the forepeak is divided into two compartments for carrying two different kinds of liquids, the collision bulkhead may be pierced by two pipes, i.e. one for each compartment provided that there is no practical alternative to piercing by such a second pipe and that having regard to the additional subdivision provided in the forepeak, the safety of the ship is maintained.

2.4.4 The pipe/pipes piercing the collision bulkhead is/are to be provided with screwdown valve/s capable of being operated from above the bulkhead deck/freeboard deck and the chest of the valve is to be secured to the collision bulkhead inside the forepeak tank except as permitted by 2.4.5. An indicator is to be provided to indicate whether the valve is open or shut.

IR2.4.4 Local hand powered operation is required from above the bulkhead deck/freeboard deck for the valve specified above.

2.4.5 Any valve required by 2.4.4 may be fitted on the after side of the collision bulkhead, provided the valve is readily accessible at all times and the space in which it is located is not a cargo space.

2.4.6 In ships other than passenger ships, the valve required by 2.4.3 may be fitted on the after side of the collision bulkhead, provided the valve is readily accessible at all times and is not subject to mechanical damage.

2.5 Drainage from tanks, cofferdams and void spaces

2.5.1 All the tanks except self-draining tanks, whether for water ballast, oil fuel, liquid cargoes etc. are to be provided with suction pipes led to suitable power pumps. The pumping plant is to be so arranged that any water or liquid within any compartment of the ship can be pumped out through atleast one suction, when the ship is on an even keel and/or designed trim and is either upright or has a list of not more than 5 degrees.

2.5.2 Where the length of the ballast tank exceeds 30 [m], an additional suction is to be provided at the forward end of the tank. Where the width of the tank is unusually large, suctions near the centerline in addition to wing suctions may be required.

2.5.3 Suction pipes from the cofferdams and void spaces are to be led to the main bilge line.

2.5.4 In ships where deep tanks may be used for either water ballast or dry cargo, provision is to be made for blanking the water ballast suction and filling when the tank is being used for carrying cargo and for blanking the bilge line when the tank is being used for carriage of water ballast.

2.6 Drainage from spaces above fore and after peaks, chain lockers and above machinery spaces

2.6.1 Provision is to be made for the drainage of chain locker and watertight compartments above the fore peak tank by hand or power pump suctions.

2.6.2 Steering gear compartments or other small enclosed spaces situated above the after peak tank are to be provided with suitable means of drainage, either by hand or power bilge suctions.

2.6.3 If the compartments referred to in 2.6.2 are adequately isolated from the adjacent 'tween decks, they may be drained by scuppers of not less than 38 [mm] bore, discharging into the tunnel (or machinery spaces in case of ships with machinery aft) and fitted with self-closing cocks situated in well lighted and visible positions. These arrangements are not applicable to passenger ships unless they are specially approved in relation to subdivision considerations.

2.7 Drainage from machinery spaces

2.7.1 Machinery spaces with double bottom:

a) Where the inner bottom extends the full length of the engine room forming bilges at the wings, one branch bilge suction and one direct bilge suction will be required at each side. Where the inner bottom extends the full length and breadth of machinery space, one branch and one direct bilge suctions are to be led to each of the two bilge wells, situated one at each side;

b) The capacity of the bilge wells is to be at least 0.15 [m^3];

c) If the inner bottom has inverse camber or discontinuity or depressions formed due to crankpins or other recesses, additional suctions are to be provided.

2.7.2 Machinery spaces without double bottom:

In ships without inner bottom, where the rise of floor is 5 degrees or more, one branch and one direct bilge suctions are to be led to positions as near the center-line as possible. Bilge suctions at wings will be required in all ships having rise of floor less than 5 degrees.

2.7.3 General requirements for machinery spaces:

a) In ships where machinery is situated at the after end, it will generally be necessary to provide suctions at the forward wings in addition to the suctions at the after end of the machinery space;

b) Special means are to be provided to prevent accumulation of bilge water under main propulsion generators and motors;

c) Where the machinery space is divided into watertight compartments, the drainage system for all compartments except for main engine room is to be same as for cargo holds except that one direct bilge suction from each watertight compartment would also be required;

d) The direct bilge suctions in machinery space(s) are to be led to independent power pump(s), and the arrangements are to be such that these direct suctions can be used independently of the main bilge line suctions.

2.7.4 Emergency bilge suction :

a) An emergency bilge suction is to be fitted to the largest independent power pump, the capacity of which is at least equal to the bilge pump. The suction is to be led to a suitable low position in the machinery space fitted with a screw-down non-return valve having the spindle so extended that the hand wheel is at least 450 [mm] above the engine room floor plates. The valve name plate is to be clearly marked - 'EMERGENCY BILGE SUCTION';

b) In motorships, the emergency bilge suction is to be led to the main cooling water pump. The suction is to be the same size as that of the cooling water pump;

c) In steamships, the main sea water circulating pump is to be fitted with an emergency bilge suction. This suction is to have diameter of at least two third of the pump suction;

d) If two or more cooling water pumps are provided for main engine(s), each capable of supplying sufficient cooling water for normal power, only one pump need be fitted with an emergency bilge suction;

e) Where the main circulating pump is not suitable for emergency bilge suction, the emergency bilge suction is to be led to the largest available independent power pump, which is not fitted with a direct bilge suction and is situated in the same compartment;

f) If the pump to which emergency bilge is connected is of self priming type, then the direct bilge suction on the same side as the emergency bilge suction may be omitted except in passenger ships.

2.8 Drainage from tunnel

2.8.1 A bilge suction, connected to the main bilge line is to be provided for draining the tunnel well. This tunnel well may extend to the outer bottom. If the shaft tunnel slopes from aft to forward end, an additional bilge suction at forward end is to be provided.

2.8.2 Internal diameter of the tunnel bilge suction pipe is not to be less than 65 [mm] except for vessels of length less than 60 [m], where tunnel bilge suction pipes of 50 [mm] bore are acceptable.

2.8.3 Where the length of the tunnel is more than 30 [m], bilge suctions are to be provided at both the forward and aft ends.

2.9 Sizes of bilge suctions

2.9.1 The internal diameter of the bilge pipes is not to be less than that found by the following formula to the nearest 5 [mm] commercial size available:

$$dm = 1.68\sqrt{L\,(B + D)} + 25 \text{ [mm]}$$

$$db = 2.15\sqrt{C\,(B + D)} + 25 \text{ [mm]}$$

where,

dm = internal diameter of bilge main [mm];

db = internal diameter of branch bilge [mm];

L = Rule length of ship [m];

B = Moulded breadth of ship [m];

C = Length of the compartment [m];

D = Moulded depth to bulkhead deck [m].

2.9.2 In any case, bilge main suction line and branch bilge suction line diameters are not to be less than 50 [mm] and the diameter of the main bilge line is not be less than that of the branch bilge line.

2.9.3 The internal diameter of the direct bilge suction is not to be less than the main bilge line.

2.9.4 In oil tankers and similar ships, where the engine room pumps do not deal with bilge drainage outside the machinery spaces, the rule diameter of the bilge main may be reduced provided the proposed cross-sectional area of the bilge main is not less than twice that required for the branch bilge suction in machinery spaces.

2.9.5 The area of each branch pipe connecting the bilge main to a distribution chest is to be not less than the sum of the areas required by the rules for the two largest branch bilge suction pipes connected to that chest, but need not be greater than that required for the main bilge line.

2.10 Bilge pumps and ejectors

2.10.1 All ships, other than passenger ships, are to be provided with at least two independent power bilge pumps. For ships of length 91.5 [m] and below, one of these pumps may be main engine driven. See 2.13 for requirements regarding passenger ships.

2.10.2 The capacity of each bilge pump is to be sufficient enough to give the water a speed of at least 122 [metres/minute] through the rule size of the main bilge line under normal working conditions.

The capacity of the bilge pump may be found by the following formula :

$Q = 5.75 \times 10^{-3} \times d^2$ [m^3/hour]

where,

Q = Capacity of pump [m^3/hour];

d = rule diameter of bilge main [mm].

2.10.3 In ships, other than passenger ships, where one bilge pump is of slightly less than rule capacity, the deficiency may be made good by an excess capacity of the other pump. In general this deficiency is to be limited to 30 per cent.

2.10.4 An ejector in conjunction with a sea water pump may be accepted as a substitute for independent power bilge pump. This, however, is not acceptable on passenger ships.

2.10.5 Pumps required for essential services are not to be connected to a common suction or discharge chest or pipe unless the arrangements are such that the working of any pumps so connected is unaffected by the other pumps being in operation at the same time.

2.10.6 General service pumps and ballast pumps may be accepted as independent power bilge pumps, provided :

a) Their capacity is adequate and in accordance with 2.10.2.

b) These pumps, together with the pipelines to which they are connected, are fitted with necessary devices to ensure that there is no risk of entry of water or oil fuel in the holds or machinery spaces.

c) The arrangements are such that at least one of these pumps is immediately available for bilge duty, when required, even when the remaining pumps are in use for other essential duties such as fire fighting.

2.10.7 For bilge pump capacity for ships having closed vehicle and ro-ro spaces and special category spaces, refer Pt.6, Ch.7, Cl. 3.6.1.4 and 3.6.1.5.

2.11 Pump types

2.11.1 The bilge pumps required by the rules are to be of self-priming type, unless an approved priming system is provided for these ships.

2.12 Bilge piping arrangements and fittings

2.12.1 Bilge pipes are not, as far as possible, to pass through double bottom tanks. If unavoidable, such bilge pipes are to be provided with welded joints or heavy flanged joints and are to be tested after fitting to the same pressure as the tanks through which they pass.

2.12.2 The parts of bilge pipes passing through deep tanks, intended to carry water ballast, fresh water, liquid cargo or fuel oil are normally to be contained in a pipe tunnel, but where this is not done, the pipes are to be of heavy gauge with welded or heavy flanged joints. The open ends of such pipes are to be fitted with non-return valves. The pipes are to be tested, after fitting, to a pressure of not less than the maximum head to which the tanks may be subjected.

2.12.3 Expansion bends, not glands, are to be fitted to pipes passing through double bottom tanks or deep tanks.

2.12.4 The intactness of the machinery spaces, bulkheads and of tunnel plating is not to be impaired by fitting of scuppers discharging into machinery spaces or tunnel from adjacent compartments which are situated below the bulkhead deck. These scuppers may, however, be led into a strongly built scupper drain tank situated in the machinery space or tunnel but closed to these spaces and drained by means of a suction of appropriate size led from the main bilge line through a screw-down non-return valve.

a) The scupper tank air pipe is to be led above the bulkhead deck and provision is to be made for ascertaining the level of the water in the tank;

b) Where one tank is used for the drainage of several watertight compartments, the scupper pipes are to be provided with screw-down non- return valves.

2.12.5 No drain valve or cock is to be fitted to the collision bulkhead. Drain valves or cocks are not to be fitted to other watertight bulkheads if alternative means of drainage are practicable. These arrangements are not permissible in passenger ships.

2.12.6 Where drain valves or cocks are fitted to bulkheads other than collision bulkhead, as permitted by 2.12.5, the drain valves or cocks are to be at all times readily accessible and are to be capable of being shut off from positions above the bulkhead deck. Indicators are to be provided to show whether the drains are open or shut.

2.12.7 Bilge pipes which are required for draining cargo or machinery spaces are to be entirely distinct from sea inlet pipes or from pipes which may be used for filling or emptying spaces where water or oil is carried. This does not, however, exclude a bilge ejection connection, a connecting pipe from a pump to its suction valve chest, or a deep tank suction pipe suitably connected through a change-over device to bilge, ballast or oil line.

2.12.8 The arrangement of pumps, valves and piping is to be such that any pump could be opened up for overhaul and repairs without affecting the operation of the other pumps.

2.12.9 The arrangement of valves, pumps, cocks and their pipe connections is to be such as to prevent the possibility of placing one watertight compartment in communication with another, or of cargo spaces, machinery spaces or other dry spaces coming in communication with the sea or the tanks. For this purpose the bilge suction pipe of any pump also having sea suction is to be fitted with a non-return valve which cannot permit communication between the bilges and the sea or the compartments in use as tanks.

2.12.10 Screw-down non-return valves are to be provided in the following fittings :

a) Bilge distribution chest valves;

b) Direct bilge suction and bilge pump connection to main line;

c) Bilge suction hose connections on the pumps or on the main line;

d) Emergency bilge suctions.

2.12.11 Bilge suction pipes from machinery spaces and shaft tunnel, except emergency bilge suction, are to be led from easily accessible mud boxes fitted with straight tail pipes to the bilges. The open ends of the tail pipes are not to be fitted with strum boxes. The mud boxes are to be provided with covers which can be easily opened and closed for cleaning purposes.

2.12.12 Strum boxes are to be fitted to the open ends of bilge suction pipes from the cargo holds. The diameter of holes from these strum boxes is not to be more than 10 [mm] and the total area of the holes is not to be less than twice the area of the pipes.

2.12.13 Where access manholes to bilge wells are necessary, they are to be fitted as near to the suction strums as practicable.

2.12.14 Adequate distance is to be provided between the open ends of suction pipes and bilge well bottom to permit adequate and easy flow of water and to facilitate cleaning.

2.12.15 All the valves, cocks and mud boxes are to be located in easily accessible positions above or at the same level as the floor plates. Where this is unavoidable, they may be fitted immediately below the floor plates provided the floor plates are capable of being opened and closed easily and suitable name plates are fitted indicating the fittings below.

2.12.16 Where relief valves are fitted to pumps having sea connections, these valves are to be fitted in readily visible positions above the platform. The arrangement is to be such that any discharge from the relief valves will also be readily visible.

2.12.17 Where non-return valves are fitted to the open ends of bilge suction pipes in cargo holds in order to decrease the risk of flooding, they are to be of an approved type which does not offer undue obstruction to the flow of water.

2.13 Additional requirements for passenger ships

2.13.1 All passenger ships are to have at least three power bilge pumps connected to the bilge main, one of which may be attached to the propelling unit. Where the bilge pump numeral is 30 or more, one additional independent power pump is to be provided. Sanitary, ballast and general service pumps may be accepted as independent power bilge pumps if fitted with necessary connections to the bilge pumping system.

The bilge pump numeral is to be calculated as follows:

When P_1 is greater than P : bilge pump numeral

$$= 72\left[\frac{M + 2P_1}{V + P_1 - P}\right]$$

in other cases: bilge pump numeral

$$= 72\left[\frac{M + 2P}{V}\right]$$

where,

L_L = the load line length of the ship (metres), as defined in Pt.3, Ch.1, Cl.2.1.9;

M = the volume of the machinery space (cubic metres), as defined in Pt.6, Ch.1, Sec.3 that is below the bulkhead deck; with the addition thereto of the volume of any permanent oil fuel bunkers which may be situated above the inner bottom and forward of, or abaft, the machinery space;

P = the whole volume of the passenger and crew spaces below the bulkhead deck (cubic metres) which are provided for the accommodation and use of passengers and crew, excluding baggage, store, provision and mail rooms;

V = the whole volume of the ship below the bulkhead deck (cubic metres);

P_1 = KN,

where,

N = the number of passengers for which the ship is to be certified, and

K = $0.056L_L$

However, where the value of KN is greater than the sum of P and the whole volume of the actual passenger spaces above the bulkhead deck, P_1 is to be taken as the above sum (i.e. the sum of P and the whole volume of the actual passenger spaces above the bulkhead deck) or two-thirds KN, whichever is the greater.

2.13.2 Where practicable, the power bilge pumps are to be placed in watertight compartments so arranged or situated that these compartments will not readily be flooded by the same damage. If the engines and boilers are in two or more watertight compartments, the pumps available for bilge service are to be distributed throughout these compartments as far as is possible.

2.13.3 On ships 91.5 [m] or more in length or having a bilge pump numeral of 30 or more, the arrangements are to be such that at least one power pump is available for use in all ordinary circumstances in which a ship may be flooded at sea. This requirement will be satisfied if:

a) One of the required pumps is an emergency pump of reliable submersible type having a source of power situated above the bulkhead deck; or

b) The pumps and their sources of power are so disposed throughout the length of the ship that under any condition of flooding which the ship is required to withstand, at least one pump in undamaged compartment will be available.

2.13.4 In passenger ships, independent power bilge pumps situated in machinery spaces are to have direct suctions from these spaces, except that not more than two such suctions are required in any one space, where two or more such suctions are provided there is to be at least one on the port side and one on the starboard side.

2.13.5 Provision is to be made to prevent the compartment served by any bilge suction pipe being flooded in the event of the pipe being severed, or otherwise damaged by collision or grounding in any other compartment. For this purpose where the pipe is at any part situated nearer the side of the ship than one-fifth the breadth of the ship (measured at right angles to the centerline at the level of the deepest subdivision loadline), or in a duct keel, a non-return valve is to be fitted to the pipe in the compartment containing the open end.

For the purpose of 2.13.5 and 2.13.6, 'breadth' means the maximum moulded breadth of the ship at or below the deepest sub-division loadline.

2.13.6 All the distribution boxes, cocks and valves in connection with the bilge pumping arrangements are to be in positions which are accessible at all times under ordinary circumstances. They are to be so arranged that, in the event of flooding, one of the bilge pumps may be operative on any compartment, in addition, damage to a pump or its pipe connecting to the bilge main outboard of a line drawn at one-fifth of the breadth of the ship (measured as per 2.13.5) is not to put the bilge system out of action. If there is only one system of pipes common to all the pumps, the necessary cocks or valves for controlling the bilge suctions must be capable of being operated from above the bulkhead deck. Where in addition to the main bilge pumping system an emergency bilge pumping system is provided, it is to be independent of the main system and so arranged that a pump is capable of operating on any compartment under flooding conditions, in that case only the cocks and valves necessary for the operation of the emergency system need be capable of being operated from above the bulkhead deck.

2.13.7 All valves and cocks mentioned in 2.13.6 which can be operated from above the bulkhead deck shall have their controls at their place of operation clearly marked and provided with means to indicate whether they are open or closed.

2.13.8 Where it is necessary to correct large angles of heel, in case of damage, the means adopted, are where practicable, to be self acting, but in any case where controls to cross flooding fittings are provided, they are to be operable from above the bulkhead deck.

2.13.9 Bilge wells constructed in the double bottom in connection with drainage arrangements of holds, etc. are not to extend downwards more than necessary. The depth of the well is in no case to be more than the depth less 457 [mm] (18 inches) of the double bottom at the center line nor is the well to extend below the horizontal plane passing through the point of intersection with the frame line amidships of a transverse diagonal line inclined at 25 degrees to the base line and cutting it at a point one half the ship's moulded breadth from the middle line. A well extending to the outer bottom is, however, permitted at the after end of the shaft tunnel.

2.14 Drainage arrangements on vessels not fitted with propelling machinery

2.14.1 Vessels not fitted with propelling machinery are to be provided effective hand pumps which can be operated from above the bulkhead deck or the highest convenient level which is always available. There is to be one pump for each compartment or two pumps connected to a bilge main having at least one branch to each compartment.

2.15 Ballast system

2.15.1 Provision is to be made for ballasting and deballasting all the ballast tanks by pipe lines which are entirely separate and distinct from pipe lines used for bilging.

2.15.2 Where the length of the ballast tanks exceeds 30 [m], an additional suction is to be provided at the forward end of the tanks. Where the width of the tank is unusually large, suction near the centerline in addition to wing suctions may be required.

Section 3

Vents, Sounding, Overflow and Scuppers and Discharges Piping Systems

3.1 General

3.1.1 Reference to oil in this Section is to be taken to mean oil which has a flash point of 60°C or above (closed cup test).

3.1.2 The portions of vent, overflow and sounding pipes fitted above the weather deck are to be of steel.

3.1.3 Name plates are to be affixed to the upper ends of all vent and sounding pipes.

3.1.4 For vent pipes and sounding pipes passing through refrigerated spaces, see Pt.5.

3.1.5 For design and test heads of tanks see Pt.3.

3.2 Vent pipes

3.2.1 Vent pipes are to be fitted to all tanks, cofferdams, tunnels, sea chests and other compartments which are not fitted with alternative ventilation arrangements.

3.2.2 The vent pipes are to be fitted at the opposite end of the tank to which the filling pipes are placed and/or at the highest part of the tank. Where the tank top is of unusual or irregular profile, special consideration will be given to the number and positions of the vent pipes.

3.2.3 Tanks provided with anodes for cathodic protection, are to be provided with vent pipes at forward and aft ends.

3.2.4 Vent pipes to double bottom tanks, deep tanks extending to the shell plating or tanks which can be run up from the sea and sea chests are to be led above the bulkhead deck.

3.2.5 Air pipes for sea chests are to be fitted with shut off valve directly on sea chest.

3.2.6 Vent pipes to oil fuel and cargo oil tanks, cofferdams, all tanks which can be pumped up, shaft tunnels and pipe tunnels are to be led above the bulkhead deck and to open air.

3.2.7 Vent pipes from lubricating oil storage tanks may terminate in the machinery spaces, provided that the open ends are so situated that issuing oil cannot come into contact with electrical equipment or heated surfaces.

3.2.8 The open ends of vent pipes to oil fuel and cargo oil tanks are to be situated where no danger will be incurred from issuing oil or vapour when the tank is being filled.

3.2.9 For details regarding height and closing devices for vent pipes see Pt.3.

3.2.10 The open ends of vent pipes to oil fuel, cargo oil and ballast tanks fitted with anodes for cathodic protection, are to be fitted with a wire gauze diaphragm of incorrodible material which can be readily removed for cleaning. The clear area through the wire gauze is to be at least equal to the area of the vent pipe. Location and arrangement of vent pipes for fuel oil service, settling and lubricating oil tanks is to be such that a broken vent pipe will not directly lead to the risk of ingress of seawater splashes or rainwater.

3.2.11 In the case of all tanks which can be pumped up either by ship's pumps or by shore pumps through a filling main, the total cross-sectional area of the vent pipes to each tank, or of the overflow pipes where an overflow system is provided, is to be not less than 25 per cent greater than the effective area of the respective filling pipes.

3.2.12 Where tanks are fitted with cross flooding connections, the vent pipes are to be of adequate area for these connections.

3.2.13 Vent pipes are not to be less than 50 [mm] bore.

3.2.14 Shaft tunnels and pipe tunnels are to be fitted with vent pipes with an internal diameter of not less than 75 [mm].

3.2.15 Vent pipes are to be self-draining under normal conditions of trim.

3.2.16 The thickness of the exposed portion of the vent pipes are to be as required in Pt.3, Ch.13, 3.2.5.

3.3 Overflow pipes

3.3.1 All tanks which can be pumped up are to be fitted with overflow pipes when the pressure head corresponding to the height of vent pipe is greater than that for which the tanks are suitable or when the sectional area of the vent pipes is less than that required by 3.2.11.

3.3.2 Oil fuel and lubricating oil tanks which can be pumped up and which have openings for fittings, for example - for a float sounding system, are to be fitted with overflow pipes. The tank openings, for such fittings, are to be situated above the highest point of the overflow piping.

3.3.3 In the case of oil fuel and lubricating oil tanks, the overflow pipe is to be led to an overflow tank of adequate capacity or to a storage tank having space reserved for overflow purposes and be in readily visible position. A sight glass is to be provided in the overflow pipe to indicate when the tanks are overflowing. Such sight glasses are to be placed only in the vertical portion of the pipes and be located in a readily visible position. Alternatively, an alarm device is to be provided to give warning either when the tanks are overflowing or when the oil reaches a predetermined level in the tanks.

3.3.4 Overflow pipes from tanks, other than oil fuel, cargo oil and lubricating oil tanks, are to be led to the open or to suitable overflow tanks arranged as in 3.3.3.

3.3.5 Where overflow from tanks, which are used for the alternative carriage of oil and water ballast, are connected to an overflow system, arrangements are to be made to prevent water ballast overflowing in to tanks containing oil.

3.3.6 The arrangement of the vent and/or overflow system is to be such that in the event of any one of the tanks being bilged, tanks situated in other watertight compartments of the ship cannot be flooded through combined vent pipes or the overflow main. In the case of vessels of 24 [m] length and less, fishing vessels and trawlers the arrangement is to be such that in the event of any one of the tanks being bilged, the other tanks cannot be flooded from the sea through combined vent pipes or the overflow main.

3.3.7 Overflow pipes are to be self-draining under normal conditions of trim.

3.3.8 For size of overflow pipes, see 3.2.11.

3.4 Sounding arrangements (Also refer Pt.6, Ch.2, 1.2.for F.O., L.O. and other flammable oils)

3.4.1 All tanks, cofferdams and pipe tunnels are to be provided with sounding pipes or other approved means for ascertaining the level of liquid in the tanks. Means of ascertaining the level of liquid in oil fuel tanks is to be of safe type. Level switches may be used provided they are contained in steel enclosure or other enclosures not destroyed by fire. Bilges of compartments which are not, at all times, readily accessible are to be provided with sounding pipes. The soundings are to be taken as near the suction pipes as practicable.

3.4.2 Oil level gauges may be used for tanks containing lubricating oil, oil fuel or other flammable liquid in place of sounding pipes, subject to the following conditions:

- In passenger ships such gauges should not require penetration below the top of the tank and their failure or overfilling of the tanks will not allow release of their contents; and

- In cargo ships, the failure of level gauges or overfilling of the tank will not allow release of their contents into the space. The use of cylindrical gauge glasses is not acceptable. Flat type glasses may be accepted provided they are of heat resisting quality, adequately supported, protected from mechanical damage and fitted with self closing valves between the gauges and the tanks.

3.4.3 Except as permitted by 3.4.4 sounding pipes are to be led to positions above the bulkhead deck which are at all times accessible. In the case of oil fuel tanks, cargo oil tanks and lubricating oil tanks, the sounding pipes are to be led to safe positions on the open deck. The sounding pipes should not terminate in any space where the risk of ignition from spillage from sounding pipe exists. Sounding pipes are not to terminate in passenger or crew spaces.

3.4.4 Where it is impracticable to comply with 3.4.3 above, short sounding pipes may be fitted in readily accessible positions as indicated in the following:

a) Passenger ships:

- Only to double bottom tanks and cofferdams in machinery spaces.
- All short sounding pipes are to be provided with self-closing cocks as described in Pt.6, Ch.2, 1.2.2.3.5.1.

b) Cargo ships:

- Only to tanks and cofferdams in machinery spaces and shaft tunnels.
- Short sounding pipes to oil fuel, lubricating oil and other flammable oil tanks are to be provided as per Pt.6, Ch.2, 1.2.2.3.51 and 1.2.3.1(a) and (b). Short sounding pipes to other types of tanks and cofferdams may be fitted with screw caps attached by chain to the pipe or with shut-off cocks.

3.4.5 Elbow sounding pipes are not to be used for deep tanks unless the elbows and pipes are situated within closed cofferdams or within tanks containing similar liquids. They may, however, be fitted to other tanks and may be used for sounding bilges, provided that it is not practicable to lead them direct to the tanks or compartments.

a) The elbows are to be of heavy construction and adequately supported;
b) In passenger ships, elbow sounding pipes are not permissible.

3.4.6 Striking plates of adequate thickness and size are to be fitted under open ended sounding pipes. Where slotted pipes having closed ends are employed, the closing plugs are to be of substantial construction.

3.4.7 All sounding pipes are to be not less than 32 [mm] bore. All sounding pipes, whether for compartments or tanks, which pass through refrigerated spaces or the insulation thereof, in which the temperatures contemplated are 0°C or below, are to be not less than 65 [mm] bore.

3.4.8 The upper ends of all sounding pipes are to be provided with efficient closing devices. The sounding pipes are to be arranged as straight as practicable, and if curved, the curvature is to be large enough to permit easy passage of sounding rod/chain.

3.5 Scuppers and discharges (Also refer Pt.3, Ch.13)

3.5.1 Scupper and discharge pipes which are not required to be of substantial thickness in accordance with Pt.3 are to be at least 4.5 [mm] thick for pipes of 155 [mm] external diameter and less; and 6.0 [mm] for pipes of external diameter of 230 [mm] and more, intermediate sizes are to be determined by linear interpolation.

3.5.2 Scupper and discharge pipes which are required to be of substantial thickness in accordance with Pt.3 are to be at least of following thickness:

- 7 [mm] thick for pipes of external diameter of equal to or less than 80 [mm];
- 10 [mm] thick for pipes of external diameter equal to 180 [mm];
- 12.5 [mm] thick for pipes of external diameter equal to or more than 220 [mm];

Intermediate sizes are to be determined by linear interpolation.

3.5.3 Overboard discharges are to be so located as to prevent any discharge of water into the life boats.

3.6 Water level detectors on single hold cargo ships other than bulk carriers

3.6.1 Ships of load line length L_{LL} (see Pt.3, Ch.1 for definition of L_{LL}) less than 80 [m] and having a single cargo hold below the freeboard deck or cargo holds below the freeboard deck which are not separated by at least one full watertight bulkhead, are to be fitted with water level detectors in such cargo hold/s, unless exempted by 3.6.3.

3.6.2 The water level detectors are to:

i) give an audible and visual alarm at the navigation bridge when the water level above the inner bottom in the cargo hold reaches a height of not less than 0.3 [m] and another when such level reaches not more than 15% of the mean depth of the cargo hold; and

ii) be fitted at the aft end of the hold, or above its lowest part where the inner bottom is not parallel to the design waterline. Where webs or partial watertight bulkheads are fitted above the inner bottom, fitting of additional detectors may be required.

3.6.3 The water level detectors required in 3.6.1 need not be fitted in ships having watertight side compartments each side of the cargo hold length extending vertically at least from inner bottom to freeboard deck.

Note : The water level detectors are to be of approved type. For further details regarding performance tests, sensor locations, installation and other testing requirements refer classification notes: “Type approval, installation and testing of water level detectors on bulk carriers and Single Hold Cargo Ships other than Bulk Carriers”.

Section 4

Fuel Oil Systems

4.1 General

4.1.1 Reference to oil in this Section is to be taken to mean oil which has a flash point of 60°C (closed cup test) or above.

4.2 Oil fuel tanks

4.2.1 Oil fuel tanks are to be separated from fresh water and lubricating oil tanks by means of cofferdams. For requirements in respect of protective location of fuel oil tanks, see Pt.3, Ch.1, Sec.1.6.

4.2.2 The clearance spaces between the boilers and tops of the double bottom tanks, and between the boilers and the sides of the storage tanks in which oil fuel and cargo oil is carried, are to be adequate for the free circulation of the air necessary to keep the temperature of the stored oil sufficiently below it's flash point except in the case of tanks complying with arrangement in 4.5.3 Where water tube boilers are installed, there is to be a space of at least 760 [mm] between the tanktop and the underside of the pans forming the bottom of the combustion spaces. The boilers are to be adequately lagged.

4.2.3 Oil fuel tanks are not to be located directly above the boilers or other highly heated surfaces.

4.2.4 Minimum two fuel oil service tanks for each type of fuel used on board necessary for propulsion and vital systems or equivalent arrangements (See Fig. 4.2.4 for equivalent arrangement) are to be provided with a capacity of at least 8 hours at maximum continuous rating of the propulsion plant and normal operating load of the generating plant.

Fig.4.2.4 : 'Equivalent arrangement' for F.O. service tanks (Refer Clause 4.2.4)

A) Main and auxiliary engines and boilers operating on heavy fuel (one fuel ship)

Rule requirements

HFO Serv Tank Capacity for at least 8.h each Main Eng + Aux. Eng + Aux Boiler	HFO Serv Tank Capacity for at least 8.h each Main Eng + Aux. Eng + Aux Boiler	MDO Tank For initial cold starting or repair work of engines/Boiler

Equivalent arrangements

HFO Serv Tank Capacity for at least 8.h each Main Eng + Aux. Eng + Aux Boiler	MDO Serv Tank Capacity for at least 8.h each Main Eng + Aux. Eng + Aux Boiler

The above arrangement only applies where main and auxiliary engines can operate with heavy fuel oil under all load conditions and, in the case of main engines, during manoeuvring.

For pilot burners of auxiliary boilers if provided, an additional MDO tank for 8 h operation may be necessary.

B) Main engines and boilers on HFO and aux. Engines on MDO (two fuel ship)

Rule requirement

HFO Serv Tank Capacity for at least 8.h each Main Eng + Aux Boiler	HFO Serv Tank Capacity for at least 8.h each Main Eng + Aux Boiler	MDO Serv Tank Capacity for at least 8.h each Aux. Eng	MDO Serv Tank Capacity for at least 8.h each Aux. Eng

Equivalent arrangement

HFO Serv Tank Capacity for at least 8.h each Main Eng + Aux Boiler	MDO Serv Tank Capacity for at least the highest of : 8h each Aux. Eng + Aux. Boiler or 4h each Main Eng + Aux. Eng + Aux Boiler	MDO Serv Tank Capacity for at least the highest of : 8h each Aux. Eng + Aux Boiler or 4h each Main Eng + Aux. Eng + Aux Boiler

Fig.4.2.4 : (Contd.)

Notes:

1. The arrangements in A) and B) above apply, provided the propulsion and vital systems which use two types of fuel, support rapid fuel change over and are capable of operating in all normal operating conditions at sea with both types of fuel (MDO and HFO)

2. Service tank is a fuel oil tank which contains only fuel of a quality ready for use, i.e. fuel of a grade and quality that meets the specification required by the equipment manufacturer. A service tank is to be declared as such and not to be used for any other purpose.

3. Use of a settling tank with or without purifiers alone and one service tank is not acceptable as an "equivalent arrangement" to two service tanks.

4. The equivalent arrangements described above are the interpretations followed by IRS, unless the flag administration has provided a different interpretation.

4.3 Oil fuel piping

4.3.1 Oil fuel pressure pipes are to be led, where practicable, remote from heated surfaces and electrical appliances, but where this is impracticable the pipes are to have a minimum number of joints and are to be led in well lighted and readily visible positions.

4.3.2 Pipes conveying oil heated above 60°C are to be of seamless steel or other approved material having flanged or welded joints.

4.3.3 The flanges are to be machined, and the jointing material, which is to be impervious to oil heated to 150°C, is to be the thinnest possible, so that the flanges are practically metal to metal. The scantlings of the pipes and their flanges are to be suitable for a pressure of at least 14 bar or for the design pressure, whichever is the greater.

4.3.4 The short joining lengths of pipes to the burners from the control valves at the boiler may have cone unions, provided these are of specially robust construction.

4.3.5 Flexible hoses of approved material and design may be used for the burner pipes, provided that spare length complete with couplings, are carried on board.

4.3.6 Transfer, suction and other low pressure oil pipes and all pipes passing through oil storage tanks are to be made of cast iron or steel, having flanged joints suitable for a working pressure of not less than 7 bar. The flanges are to be machined and the jointing material is to be impervious to oil. Where the pipes are of 25 [mm] bore or less, they may be seamless copper or copper alloy, except those which pass through storage tanks.

4.3.7 Pipes for tanks storing fresh water are to be separate and distinct from any pipes which may be used for oil or oily water, and are not to be led through tanks which contain oil, nor are oil pipes to be led through fresh water tanks.

4.3.8 Pipes conveying vegetable oils or similar cargo oils are not to be led through oil fuel tanks, nor are oil fuel pipes to be led through tanks containing such cargoes.

4.3.9 In passenger ships, provision is to be made for the transfer of oil fuel from any oil fuel storage or settling tank to any other oil fuel storage tank.

4.3.10 Where IRS may permit the conveying of oil and combustible liquids through accommodation and service spaces, the pipes conveying oil or combustible liquids are to be of a material approved by IRS having regard to the risk of fire.

4.4 Arrangement of valves, cocks, pumps and fittings

4.4.1 The oil fuel pumping arrangements are to be distinct from other pumping systems as far as practicable and the means provided for preventing dangerous interconnection in service are to be thoroughly effective.

4.4.2 All valves and cocks forming part of the oil fuel installation are to be capable of being controlled from readily accessible positions which, in the engine room and boiler spaces are to be above the working platform.

4.4.3 Every oil fuel suction pipe from a double bottom tank is to be fitted with a valve or a cock.

4.4.4 For oil fuel tanks which are situated above the double bottom tanks, the inlet and outlet, pipes which are connected to the tank at a point lower than the outlet of the overflow pipe or below the top of the tanks without an overflow pipe, are to be fitted with shut off valves located on the tank itself.

4.4.5 In the engine and boiler spaces, valves, mentioned in 4.4.4, are to be capable of being closed locally and from positions outside these spaces which will always be accessible in the event of fire occurring in these spaces. Instructions for closing the valves are to be indicated at the valves and at the remote control positions. The controls for remote operation of the quick closing valve for the emergency generator fuel tank are to be in a separate location from other quick closing valves for tanks in the engine room.

4.4.6 Every oil fuel suction pipe which is led into the engine and boiler spaces, from a tank situated above the double bottom, outside these spaces (including shaft tunnel, pipe tunnel or similar spaces), is to be fitted in the machinery space with a valve controlled as in 4.4.5, except where the valve on the tank is already capable of being closed from an accessible position above the bulkhead deck.

4.4.7 Settling tanks are to be provided with means for draining water from the bottom of the tanks. If the settling tanks are not provided, the oil fuel bunkers or daily service tanks are to be fitted with water drains.

Open drains for removing water from oil tanks are to be fitted with valves or cocks of self-closing type, and suitable provision is to be made for collecting the oily discharge.

4.4.8 Where a power driven pump is necessary for transferring oil fuel, a stand by pump is to be provided and connected ready for use, or, alternatively, emergency connections may be made to another suitable power driven pump.

4.4.9 All pumps which are capable of developing a pressure exceeding the design pressure of the system are to be provided with relief valves. Each relief valve is to be in close circuit, i.e. arranged to discharge back to the suction side of the pump and to effectively limit the pump discharge pressure to the design pressure of the system. Pressure relief valves need not be fitted when the system is secured only by centrifugal pumps so designed that the pressure delivered cannot exceed that for which the piping is designed.

4.4.10 Valves or cocks are to be interposed between the pumps on the suction and discharge pipes in order that any pump may be shut off for opening up and overhaul.

4.4.11 Relief valves are to be fitted on the oil side of the heaters and are to be adjusted to operate at a pressure of 3.5 bar above that of the supply pump relief valves. The discharge from the relief valves is to be led to a safe position.

4.4.12 Drip trays are to be fitted at location where frequent leakage is expected, oil burners at furnace mouths, drain and valves under daily service tanks, filter and all other oil fuel appliances which are required to be opened up frequently for cleaning or adjustment. Where drain pipes are provided from collected leakages, they shall be led to a suitable oil drain tank not forming part of an overflow system.

4.4.13 Where MARPOL Regulation I/12A for protective location of fuel oil tanks applies (see Pt.3, Ch.1, Sec.1.6), the fuel oil lines, suction wells and valves are to satisfy the requirements of paragraph 9 and 10 of the above MARPOL Regulation.

Valves for such fuel oil tanks are to be located above the bottom at distances not less than that required for suction wells` in paragraph 10 of MARPOL Regulation I/12A. Plan showing the location of tanks, suction wells and valves, indicating the distances are to be submitted for approval.

The requirements for locations of oil fuel lines do not apply to fuel oil air escapes and overflow pipes.

4.5 Heating arrangements

4.5.1 Steam heating installation

4.5.1.1 Where steam is used for heating oil fuel, cargo oil or lubricating oil, in bunkers, tanks, heaters or separators, the exhaust drains are to discharge the condensate into an observation tank in a well lighted and accessible position where it can be readily seen whether or not it is free from oil.

4.5.2 Thermal oil installations

4.5.2.1 The inlet and outlet valves of oil-fired thermal oil heaters and exhaust-fired thermal oil heaters is to be controllable from outside the compartment where they are situated.

Alternatively an arrangement for quick gravity drainage of the thermal oil contained in the system into a collecting tank is acceptable.

4.5.2.2 Heating of liquid cargoes with flash points below 60°C shall be arranged by means of a separate secondary system, located completely within the cargo area.

A single circuit system is acceptable on the following conditions:

- system is so arranged that a positive pressure in the coil shall be at least 3 [m] water column above the static head of the cargo when circulating pump is not in operation,

- the thermal oil system expansion tank shall be fitted with high and low level alarms,

- means to be provided in the thermal oil system expansion tank for detection of flammable cargo vapours. Portable equipment is accepted,

- valves for the individual heating coils is to be provided with locking arrangement to ensure that the coils are under static pressure at all times.

4.5.2.3 The thermal oil circulating pumps is to be arranged for emergency stopping from a position outside the space where they are situated.

4.5.2.4 Vents from expansion tanks and thermal oil storage tanks of thermal oil heating plants is to be led to open deck.

4.5.2.5 Exhaust-fired thermal oil heaters

– The heater is to be so designed and installed that all tubes are easily and readily be inspected for signs of corrosion and leakage.

– Visual inspection and tightness testing of the heater tubes is to be not less than the working pressure and is to be carried out annually. Hydraulic testing is to be carried out bi-annually.

– The heater is to be fitted with temperature sensor(s) and an alarm for fire detection.

– A fixed fire extinguishing and cooling system is to be fitted. A drenching system providing copious amounts of water is acceptable. The exhaust ducting below the exhaust boiler is to be arranged for adequate collection and drainage, to prevent water flowing into the diesel engine. The drain is to be led to a suitable location.

4.5.3 Oil fuel in storage tanks is not to be heated to a temperature within 10°C below the flash point of the oil. Where oil fuel in service tanks, settling tanks and any other tanks in the supply system is heated following arrangements are to be provided:

- The length of the vent pipes from such tanks and/or a cooling device is sufficient for cooling the vapours to below 60°C; otherwise the outlet of the vent pipes is to be located at least 3 m away from a source of ignition;

- There are no openings from the vapour space of the fuel tanks in to machinery spaces (bolted manholes are acceptable);

- Any enclosed spaces are not to be located directly above such oil fuel tanks, except for vented cofferdams; and

- Electrical equipment is not to be fitted in the vapour space of the tanks, unless they are certified intrinsically safe.

4.6 Temperature indication

4.6.1 Tanks and heaters in which oil is heated are to be provided with suitable means for ascertaining the temperature of the oil.

4.7 Filling arrangements

4.7.1 The bunkering of the ship is to be carried out through a permanently fitted pipeline, provided with the required fittings and ensuring fuel delivery to all storage tanks. The open end of the filling pipe is to be led to the tank bottom.

In passenger ships fuel bunkering stations are to be isolated from other spaces and are to be efficiently drained and ventilated.

4.7.2 Provision is to be made against over-pressure in the filling pipes, served by pumps on board, and any relief valve fitted for this purpose is to discharge into an overflow tank or other safe position.

4.8 Alternate carriage of oil fuel and water ballast

4.8.1 Where it is intended to carry oil fuel and water ballast in the same tanks alternatively, the valves or cocks connecting the suction pipes of these tanks with the ballast pump and those connecting them with the oil fuel transfer pump are to be so arranged that the oil may be pumped from one tank by the oil fuel pump at the same time as the ballast pump is being used on any other tank.

Where settling or service tanks are fitted, each having a capacity sufficient to permit 12 hour normal service without replenishment, the above requirement may be dispensed with.

4.8.2 Attention is drawn to the statutory requirements issued by the National Authorities in connection with *International Convention for the Prevention of Pollution of the Sea by Oil, 1973/78.*

4.9 Deep tanks for the alternative carriage of oil, water ballast or dry cargo

4.9.1 In the case of deep tanks which can be used for the carriage of oil fuel, cargo oil, water ballast or dry cargo, provision is to be made for blank flanging the oil and water ballast filling and suction pipes, also the steam coils if retained in place, when the tank is used for dry cargo, and for blank flanging the bilge suction pipes when the tanks are used for oil or water ballast.

4.9.2 If the deep tanks are connected to an overflow system, the arrangements are to be such that liquid or vapour from other tanks cannot enter the deep tanks when dry cargo is carried in them.

4.10 Oil fuel burning arrangements

4.10.1 For boilers

4.10.1.1 Where steam is required for the main propelling engines, for auxiliary machinery for essential services, or for heating of heavy fuel oil and is generated by burning oil fuel under pressure, there are to be not less than two oil burning units, each unit comprising a pressure pump, suction and discharge filters and a heater. For auxiliary boilers, a single oil burning unit may be accepted, provided that alternative means, such as an exhaust gas boiler or composite boiler, are available for supplying steam for essential services.

4.10.1.2 In two unit installations, each unit is to be capable of supplying fuel for generating all the steam required for essential services. In installations of three or more units, the capacities and arrangements of the units are to be such that all the steam required for essential services can be maintained with any one unit out of action.

4.10.1.3 In systems where oil is fed to the burners by gravity, duplex filters are to be fitted in the supply pipeline to the burners and so arranged that one filter can be opened up when the other is in use.

4.10.1.4 Where steam is required to bring the boiler plant into operation, starting up oil fuel unit, including an auxiliary heater and hand pump, or other suitable starting up device, which does not require power from shore, is to be provided.

4.10.1.5 Where burners are provided with steam purging and/or atomizing connections, the arrangements are to be such that oil fuel cannot find its way into steam system in the event of valve leakage.

4.10.1.6 The burner arrangements are to be such that a burner cannot be withdrawn unless the oil fuel supply to that burner is shut off and that oil cannot be turned on unless the burner has been correctly coupled to the supply line.

4.10.1.7 A quick-closing master valve is to be fitted to the oil supply to each boiler manifold, suitably located so that the valve can be readily operated in an emergency, either directly or by means of remote control, having regard to the machinery arrangements and location of controls.

4.10.1.8 In the case of top-fired boilers, means are to be provided so that, in the event of flame failure, oil fuel supply to the burners is shut off automatically, and audible and visual warnings are given.

4.10.1.9 Provision is to be made, by suitable non-return arrangements, to prevent oil from spill systems being returned to the burners when oil supply to these burners has been shut off.

4.10.1.10 For alternatively fired furnaces of the boilers using exhaust gases and oil fuel, the exhaust gas inlet pipe is to be provided with an isolating device and interlocking arrangements whereby oil fuel can only be supplied to the burners when the isolating device is closed to the boiler.

4.10.2 For internal combustion engines

4.10.2.1 Filters are to be fitted in the supply lines to the main and auxiliary machinery. For non-redundant units for essential services, it must be possible to clean the filters without stopping the unit or reducing the supply of filtered oil to the unit.

For auxiliary engines one single oil fuel filter for each engine may be accepted.

4.10.2.2 Where an oil fuel booster pump is fitted, which is essential to the operation of the main engine(s), a standby pump is to be provided. The standby pump is to be connected ready for immediate use but where two or more main engines are fitted, each with its own pump, a complete spare pump may be accepted provided that it is readily accessible and can be easily installed.

4.10.2.3 Where pumps are provided for fuel valve cooling, the arrangements are to be as in 4.10.2.2.

4.10.2.4 In multi-engine installations which are supplied from the same fuel source, means of isolating the fuel supply and spill piping to individual engines, shall be provided. The means of isolation shall not affect the operation of the other engines and shall be operable from a position not rendered inaccessible by a fire on any of the engines.

4.10.3 Oil fired galleys

4.10.3.1 The fuel supply to the burners is to be controlled from a position which will always be accessible in the event of a fire occurring in the galley.

4.10.3.2 The galley is to be well ventilated.

4.10.4 Special requirements for low sulphur Oil fuel burning arrangements:

For ships intending to use Heavy Fuel Oil (HFO) or Marine Diesel Oil (MDO) in non-restricted areas and marine fuels with a sulphur content not exceeding 0,1 % m/m and minimum viscosity of 2 cSt in emission control areas, the oil fuel burning arrangements essential for the normal operation of propulsion machinery are to comply with the following:

4.10.4.1 In non-restricted areas, ships are provided with two (2) fuel oil pumps that can each supply the fuel primarily used by the ship (i.e. HFO or MDO) in the required capacity for normal operation of the propulsion machinery.

4.10.4.2 In emission control areas one of the following configurations are to be provided:

a) Fuel oil pumps as in 4.10.4.1, provided these are each suitable for marine fuels with a sulphur content not exceeding 0.1 % m/m and minimum viscosity of 2 cSt operation at the required capacity for normal operation of propulsion machinery, or,

b) When the fuel oil pumps in 4.10.4.1 are suitable to operate on marine fuels with a sulphur content not exceeding 0.1 % m/m and minimum viscosity of 2 cSt but one pump alone is not capable of delivering marine fuels with a sulphur content not exceeding 0.1 % m/m and minimum viscosity of 2 cSt at the required capacity, then both pumps may operate in parallel to achieve the required capacity for normal operation of propulsion machinery. In this case, one additional fuel oil pump is to be provided. The additional pump is to, when operating in parallel with one of the pumps in 4.10.4.1, be suitable for and capable of delivering marine fuels with a sulphur content not exceeding 0,1 % m/m and minimum viscosity of 2 cSt at the required capacity for normal operation of the propulsion machinery, or,

c) In addition to 4.10.4.1, two separate fuel oil pumps are provided, each capable of and suitable for supplying marine fuels with a sulphur content not exceeding 0,1 % m/m and minimum viscosity of 2 cSt at the required capacity for normal operation of propulsion machinery.

Notes:

1. If a marine distillate grade fuel with a different maximum sulphur content is specified by regulation for the area of operation of the ship (e.g., ECA, specific ports or local areas, etc.) then that maximum is to be applied.

2. In the case of vessels with class notation SYJ, requirement in Pt. 5, Ch. 22 for activating of alarm when pumps are automatically started is applicable regardless of the pump arrangement.

3. Where electrical power is required for the operation of propulsion machinery, the requirements are also applicable for machinery for power generation when such machinery is supplied by common fuel supply pumps.

4. The minimum viscosity of 2cSt specified above is the value corresponding to the standard reference temperature.

4.11 Remote stop of oil fuel pumps and fans

4.11.1 Emergency stop of power supply to the following pumps and fans is to be arranged from a central place outside the engine and boiler room (Also refer Ch.8, Cl. 2.15.2) and Pt.6, Ch.2, Sec.2:

- oil fuel transfer pump;

- oil fuel booster pump;
- nozzle cooling pumps when oil fuel is used as coolant;
- oil fuel purifiers;
- pumps for oil-burning installations;
- fans for forced draught to boilers;
- fans for ventilation of engine and boiler rooms.

Section 5

Steam Piping and Condensate Piping Systems

5.1 Expansion and drainage

5.1.1 In all steam piping systems, ample provision is to be made for expansion and contraction to take place without unduly straining the pipes.

5.1.2 The slope of the pipes and the number and position of the drain valves or cocks are to be such that water can be efficiently drained from any portion of the steam piping system, when the ship is on even keel and/or designed trim and is either upright or has a list of not more than 5 degrees.

5.1.3 Drain valves or cocks are to be readily accessible.

5.2 Steam pipes in way of holds, shaft and pipe tunnels

5.2.1 In general, steam pipes are not to be led through spaces which may be used for carrying cargo. But where it is impracticable to avoid steam pipes passing through cargo spaces, the pipes are to be efficiently insulated, secured and protected against mechanical damage. Plans for such arrangements are to be submitted for consideration.

5.2.2 Where the steam pipes pass through shaft tunnels and pipe tunnels, these are to be efficiently secured and insulated in such a way that the lagging surface temperature does not exceed 60°C.

5.3 Relief valves

5.3.1 Auxiliary steam lines not designed to withstand boiler pressure are to be fitted with relief valves, installed on the low pressure side, immediately after pressure reducing valve, having sufficient discharge capacity to protect the piping against excessive pressure.

5.4 Steam supply to auxiliaries

5.4.1 The steam supply to steering gear and essential auxiliaries is to be so arranged that it is not affected in the event of main steam supply to propulsion machinery or cargo oil pumps being shut off.

5.5 Steam for fire extinguishing in cargo holds

5.5.1 Where steam is used for fire extinguishing in cargo holds, provision is to be made to prevent damage to cargo by leakage of steam or drip. Details of proposed precautionary measures are to be submitted for approval.

5.6 Condensate pumps

5.6.1 Two or more extraction pumps are to be provided for dealing with the condensate from the main and auxiliary condensers, at least one of which is to be independently driven. Where one of the independent feed pumps is fitted with direct suctions from the condensers and a discharge to the feed tank, it may be accepted as an independently driven extraction pump.

5.6.2 Condensate pumps are to be provided with valves or cocks, interposed between the pumps and the suctions and the discharge pipes, so that any pump may be opened up for overhaul while the others continue in operation.

Section 6

Boiler Feed Piping Systems

6.1 Feed water piping

6.1.1 Two separate means of feed are to be provided for all main and auxiliary boilers, which are required for essential services, with the exception of boilers in which steam is generated exclusively by exhaust gases or steam, where one means of feed will be accepted provided an alternative steam supply is available.

IR6.1.1 Where a steam generating system consists of two or more adequately sized boilers, one independent feed water supply pipe to each boiler from two feed pumps is considered acceptable.

6.2 Feed pumps

6.2.1 Two or more feed pumps are to be provided of sufficient capacity to supply the boilers under full load conditions with any one pump out of action. At least one of these pumps is to be independently driven.

6.2.2 In multiple screw ships in which there is only one independently driven feed pump, each main engine is to be provided with a feed pump.

6.2.3 Where only one independent feed pump has been provided, a harbour feed pump or an injector is to be fitted to provide second means of feed to the boilers which are in use when the main engines are not working.

6.2.4 The harbour feed pump, as required by 6.2.3, may be used as general service pump, provided that it is not connected to tanks containing oil, or to tanks, cofferdams and bilges which may contain oily water.

6.3 Valves, cocks and fittings

6.3.1 Independent feed pumps, required for feeding the main boilers, are to be fitted with automatic regulators for controlling their output.

6.3.2 The valves on the suction pipes from hotwell or condenser and the feed drain tanks or filter are to be of the non-return type.

6.3.3 Feed pumps are to be provided with valves or cocks, interposed between the pumps and the suction and the discharge pipes, so that any pump may be opened up for overhaul while the others continue in operation.

6.4 Fresh-water connections

6.4.1 Feed pumps for water-tube boilers are to have fresh-water connections only.

6.5 Feed water tanks

6.5.1 All ships fitted with boilers are to be provided with storage space for reserve feed water. Capacity of these tanks is to be at least twice the hourly evaporation rate of the boilers.

6.5.2 Feed water tanks are to be separated from oil tanks by cofferdam.

6.6 Evaporators

6.6.1 For main boilers, one or more evaporators, of adequate capacity, are to be provided.

Section 7

Engine Cooling Water Systems

7.1 General

7.1.1 Centrifugal cooling water pumps are to be installed as low as possible in the ship.

7.2 Cooling water main supply

7.2.1 Provision is to be made for an adequate supply of cooling water to the main propelling machinery and essential auxiliary engines, also to lubricating oil and fresh water coolers and air coolers for electric propelling machinery, where these coolers are fitted. The cooling water pump(s) may be worked from the engines or be driven independently.

7.3 Cooling water standby supply

7.3.1 Provision is also to be made for a separate supply of cooling water from a suitable independent pump of adequate capacity.

7.3.2 The following arrangements are acceptable, depending on the purpose for which the cooling water is intended:

a) Where only one main engine is fitted, the standby pump is to be connected ready for immediate use;

b) Where more than one main engine is fitted, each with its own pump, a complete spare pump of each type may be accepted;

c) Where a sea inlet scoop arrangement is fitted, and there is only one independent condenser circulating pump, a further pump, or a connection to the largest available pump suitable for circulation duties, is to be fitted to provide the second means of circulation when the ship is maneuvering. The pump is to be connected ready for immediate use;

d) Where fresh water cooling is employed for main/or auxiliary engines, a standby means of cooling need not be fitted if there are suitable emergency connections from a salt water system;

e) Where each auxiliary is fitted with a cooling water pump, standby means of cooling need not be provided for auxiliaries. Where, however a group of auxiliaries is supplied with cooling water from a common system, a standby cooling water pump is to be provided for this system. This pump is to be connected ready for immediate use and may be a suitable general service pump.

7.3.3 When selecting a pump for standby purposes, consideration is to be given to the maximum pressure which it can develop if the overboard discharge valve is partly or fully closed and, when necessary, condenser doors, water boxes, etc. are to be protected by an approved device against inadvertent over pressure.

7.4 Relief valves on cooling water pumps

7.4.1 Where cooling water pumps can develop a pressure head greater than the design pressure of the system, they are to be provided with relief valves on the pump discharge to effectively limit the pump discharge pressure to the design pressure of the system.

7.5 Sea inlets for cooling water pumps

7.5.1 Sea-water cooling systems for main and auxiliary machinery are to be connected to at least two cooling water inlets, preferably on opposite sides of the ship.

7.5.2 Where sea water is used for the direct cooling of main engines and auxiliaries, the sea water suction pipes are to be provided with strainers which can be cleaned without interrupting the cooling water supply.

Section 8

Lubricating Oil Piping Systems

8.1 General

8.1.1 The lubricating systems are to be so arranged that they will remain efficient with the ship inclined from the normal to any angle up to 15° transversely and when pitching 10° longitudinally and when rolling up to 22.5° from the vertical.

8.1.2 Lubricating oil systems are to be entirely separated from other systems. This requirement, however, does not apply to hydraulic governing and maneuvering systems for main and auxiliary engines.

8.1.3 Lubricating oil tanks are to be separated from other tanks containing water, fuel oil or cargo oil, by means of cofferdams.

8.1.4 For fire protection requirements also refer Pt.6, Ch.2, 1.2.3.

8.2 Pumps

8.2.1 Where lubricating oil for the main engine(s) is circulated under pressure, a standby lubricating oil pump is to be provided where the following conditions apply:

a) The lubricating oil pump is independently driven and the total output of the main engine(s) exceeds 370 [kW];

b) One main engine with its own pump is fitted and the output of the engine exceeds 370 [kW];

c) More than one main engine each with its own lubricating oil pump is fitted and the output of each engine exceeds 370 [kW].

8.2.2 The standby pump is to be of sufficient capacity to maintain the supply of oil for normal conditions with any one pump out of action. The pump is to be fitted and connected ready for immediate use, except that where the conditions referred to in 8.2.1(c) apply, a complete spare pump may be accepted. In all cases satisfactory lubrication of the engines is to be ensured while starting and maneuvering.

8.2.3 Similar provisions to those of 8.2.1 and 8.2.2 are to be made where separate lubricating oil systems are employed for piston cooling, reduction gearing, oil operated couplings and controllable pitch propellers, unless approved alternative arrangements are provided. Where the oil glands for stern tubes are provided with oil circulating pump, and the continuous running of this pump is necessary during normal operation, then a standby pump for this purpose is to be provided.

8.2.4 Independently driven rotary type pumps are to be fitted with non- return valves on the discharge side of the pumps.

8.2.5 A relief valve in close circuit is to be fitted on the pump discharge if the pump is capable of developing a pressure exceeding the design pressure of the system, the relief valve is to effectively limit the pump discharge pressure to the design pressure of the system.

8.3 Control of pumps and alarms

8.3.1 The power supply, to all independently driven lubricating oil service pumps is to be capable of being stopped from a position outside the space which will always be accessible in the event of fire occurring in the compartment in which they are situated, as well as from the compartment itself.

8.3.2 All main and auxiliary engines and turbines intended for essential services are to be provided with means of indicating the lubricating oil pressure supply to them. Alarms for reduction in pressure of the lubricating oil supply are to be actuated from the outlet side of any restrictions such as filters, coolers etc. For main and auxiliary internal combustion engines, above 37 [kW] an alarm device with audible and visual signal for failure of lubricating system is to be provided.

8.4 Emergency supply for propulsion turbines and propulsion turbogenerators

8.4.1 A suitable emergency supply of lubricating oil is to be arranged to come automatically into use in the event of low oil pressure.

The emergency source of supply is to be independent of power from main switchboard.

8.4.2 The emergency supply may be obtained from a gravity tank containing sufficient oil to maintain adequate lubrication for not less than 6 minutes, and, in case of propulsion turbo-generators, until the unloaded turbine comes to rest from its maximum rated running speed.

8.5 Filters

8.5.1 In systems, where lubricating oil is circulated under pressure, provision is to be made for efficient filtration of the oil. For non-redundant units, for essential services, it must be possible to clean the filters without stopping the unit or reducing the supply of filtered oil to the units.

8.5.2 In the case of propulsion turbines and their gears, arrangements are to be made for lubricating oil to pass through magnetic strainers and fine filters.

8.6 Valves and cocks on lubricating oil tanks

8.6.1 The provisions of 4.4.4, 4.4.5 and 4.4.6 are also to apply to lubricating oil tanks except those having a capacity less than 500 litres, storage tanks on which valves are closed during the normal operation mode of the ship, or where it is determined that an unintended operation of a quick closing valve on the oil lubricating tank would endanger the safe operation of the main propulsion and essential auxiliary machinery.

8.6.2 Where an engine lubricating oil drain tank extends to the bottom shell plating in ships that are required to be provided with a double bottom, a shutoff valve is to be fitted in the drain pipe between the engine crank case and the double bottom lubricating oil tank. This valve is to be capable of being closed from an accessible position above the level of the lower platform (floor plates).

End of Chapter

Chapter 4

Prime Movers and Propulsion Shafting Systems

Contents

Section 1

General

1.1 Scope

1.1.1 The requirements of this Chapter are applicable to all ships but may be modified for ships classed for restricted services or for special services.

1.1.2 Prime movers of less than 100 [kW] capacity may be accepted based upon manufacturer's certificate provided the prime movers are of an approved type.

1.1.3 Attention is drawn to any relevant statutory requirements of the country in which the ship is to be registered.

1.1.4 Prime movers and power transmission systems not specified in this Chapter will be specially considered by IRS.

1.2 Materials

1.2.1 Materials intended for the main parts of the prime movers and power transmission systems are to be manufactured and tested in accordance with the requirements of Pt.2.

1.3 Turning gear

1.3.1 Arrangements are to be provided to turn the prime movers of main propulsion systems, reduction gears and auxiliary drives. Suitable interlocks are to be provided.

1.4 Power ratings

1.4.1 Where requirements to dimensions in this Chapter are based on power and revolutions per minute, the values to be applied are maximum continuous power measured on engine output shaft and corresponding revolutions per minute.

1.4.2 The maximum continuous power for which the engine is to be approved is defined in ISO 3046/I for oil engines and ISO 3977 for gas turbines.

1.4.3 For plants where overload is used frequently, the scantling criteria may have to be based on over load due to accumulated fatigue.

1.5 Overload capacity

1.5.1 Prime movers of electric generators are to be capable of developing 10 per cent overload for a short period of time (15 minutes). The overload power refers to the power of the generator set.

1.6 Certification of machinery

1.6.1 The certification of machinery is to be in accordance with requirements given in Chapter 1, Section 4 of this part.

1.7 Type approval program

1.7.1 Products that can be consistently manufactured to the same design and specification may be type approved in accordance with "IRS certification scheme for type approval of products".

1.7.2 For non mass-produced engines the requirements given in subsection 4.12 of this chapter are applicable for type approval.

1.7.3 For mass-produced machinery, "Type approval certification scheme for machinery manufactured by mass production system" is to be referred to.

Section 2

Steam Turbines

2.1 Scope

2.1.1 The requirements of this Section are applicable to steam turbines for main propulsion and to those for essential auxiliary services.

2.2 Plan and particulars

2.2.1 The following plans are to be submitted for consideration, together with particulars of materials, maximum shaft powers and revolutions per minute. The pressures and temperatures applicable at maximum shaft power and under the emergency conditions are to be stated or indicated on the plans.

- General technical specifications;
- General arrangement;
- Sections showing rotors, bearings and casings;
- Sections showing typical blades and blade fastenings;
- Integrated steam and drain piping;
- Foundation and fastening;
- Block diagram with functional description of control and monitoring system;
- Lubricating oil system;
- Operating instructions manual; and
- Test programmes.

If required, the following information is also to be submitted:

- Vibration calculation of rotors and/or blades;
- Performance characteristics with functional description;
- Specification of reliability and availability; and
- Analysis proving the specified reliability and availability.

2.2.2 Full particulars of the means proposed for emergency propulsion are to be submitted.

2.2.3 Where rotors and castings are of welded construction, details of the welded joints are also to be submitted for consideration.

2.3 Materials

2.3.1 In the selection of materials, consideration is to be given to their creep strength, corrosion resistance and scaling properties at working temperatures to ensure satisfactory performance and long life under service condition.

2.3.2 Grey cast iron is not to be used for temperatures exceeding 260°C.

2.3.3 Turbine rotors and discs are to be of forged steel. For carbon and carbon-manganese steel forgings, the specified minimum tensile strength is to be selected within the limits of 400 and 600 [N/mm^2]. For alloy steel rotor forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 800 [N/mm^2]. For discs and other alloy steel forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 1000 [N/mm^2].

2.3.4 For alloy steels, details of the proposed chemical composition, heat treatment and mechanical properties are to be submitted for approval.

2.3.5 When it is proposed to use material of higher tensile strength, full details are to be submitted for approval.

2.4 Design and construction

2.4.1 In the design and arrangement of turbine machinery, adequate provision is to be made for the relative thermal expansion of the various turbine parts, and special attention is to be given to minimizing casing and rotor distortion under all operating conditions.

2.4.2 Turbine bearings are to be so disposed and supported that lubrication is not adversely affected by heat flow from adjacent hot parts of the turbine. Effective means are to be provided for intercepting oil leakage and preventing oil from reaching high temperature glands and casings and steam pipes pockets are to be sufficiently large to prevent excessive accumulation and leakage of oil.

2.4.3 The design analysis, if required, is to include a full vibration analysis with measurements as necessary, covering vibration of the rotor as well as blade vibrations.

2.4.4 Turbine rotors, cylinders and associated components fabricated by means of welding will be considered for acceptance if constructed by firms whose works are properly equipped to undertake welding to equivalent standards, for rotors and cylinders respectively, to those required by the Rules for Class 1 welded pressure vessels, See Ch.10.

2.4.5 Before work is commenced, manufacturers are to submit for consideration details of proposed welding procedures and their proposals for routine examination of joints by non-destructive means.

2.4.6 Where it is proposed to construct rotors from two or more forged components joined by welding, full details of the chemical composition, mechanical properties and heat treatment of the materials, together with particulars of the welding consumables, an outline of the welding procedure, method of fabrication and heat treatment, are to be submitted for consideration.

2.4.7 Joints in rotors and major joints in cylinders are to be designed as full-strength welds and for complete fusion of the joint.

2.4.8 Adequate preheating is to be employed for mild steel cylinders and components and where the metal thickness exceeds 44 [mm], and for all low alloy steel cylinders and components and for any part where necessitated by joint restraint.

2.4.9 Stress relief heat treatment is to be applied to all cylinders and associated components on completion of the welding of all joints and attached structures. For details of stress relief procedures, temperature and duration, See Ch.10.

2.4.10 Surveyors are to be satisfied that the desired quality of welding is attainable with the proposed welding equipment and procedure, and for this purpose test specimens representative of the welded joints are to be provided for radiographic examination and mechanical tests.

2.4.11 Smooth fillets are to be provided at abrupt changes of section of rotors, spindles, discs, blade roots and tensions. The rivet holes in blade shrouds are to be rounded and radiused on top and bottom surfaces, and tenons are to be radiused at their junction with blade tips. Balancing holes in discs are to be well rounded and polished.

2.4.12 Surveyors are to be satisfied as to the workmanship and riveting of blades to shroud bands, and that the blade tenons are free from cracks, particularly with high strength blade material. Test samples are to be sectioned and examined, and pull-off tests made if considered necessary by Surveyors.

2.4.13 Main turbine rotor discs fitted by shrinking are to be secured with keys, dowels or other approved means.

2.5 Vibration

2.5.1 Care is to be taken in the design and manufacture of turbine rotors, rotor discs and blades to ensure freedom from undue vibration within the operating speed range. Consideration of blade vibration should include the effect of centrifugal force, blade root fixing, metal temperature and disc flexibility where appropriate.

2.6 External influences

2.6.1 Pipes and ducts connected to turbine casings are to be so designed that no excessive thrust loads or moments are applied by them to the turbines. Grating and any fittings in way of sliding feet or flexible-plate supports are to be so arranged that casing expansion is not restricted. Where main turbine seatings incorporate a tank structure, consideration is to be given to the temperature variation of the tanks in service to ensure that turbine alignment will not be adversely affected.

2.7 Steam supply and water system

2.7.1 In the arrangement of the gland sealing system, the pipes are to be made self-draining and every precaution is to be taken against the possibility of condensed steam entering the glands and turbines. The steam supply to the gland sealing system is to be fitted with an effective drain trap. In the air ejector re-circulating water system, the connection to the condenser is to be so located that water cannot impinge on the L.P. rotor or casing.

2.8 Turning gear

2.8.1 The turning gear for all propulsion turbines is to be power-driven and if electric, is to be continuously rated.

2.9 Safety arrangement

2.9.1 Overspeed protective devices

a) An overspeed protective device is to be provided for main and auxiliary turbines to shut off the steam automatically and prevent the maximum designed speed being exceeded by more than 15 per cent.

b) Where two or more turbines of a compound main turbine installation are separately coupled to the same main gear wheel, and one over-speed protective device is provided, this is to be fitted to the L.P. ahead turbine. Hand trip gear for shutting off the steam in an emergency is to be provided at the maneuvering platform.

c) Where exhaust steam from auxiliary systems is led to the main turbine, activation of the over-speed protective device is to cut off this steam supply to the main turbine.

2.9.2 Speed governors

a) Where a turbine installation incorporates a reverse gear, electric transmission or reversible propeller, a speed governor in addition to, or in combination with, the overspeed protective device is to be fitted, and is to be capable of controlling the speed of the unloaded turbine without bringing the overspeed protective device into action.

b) Auxiliary turbines intended for driving electric generators are to be fitted with speed governors which, with fixed setting, are to control the speed within 10 per cent momentary variation and five per cent permanent variation when full load is suddenly taken off or put on. The permanent speed variations of alternating current machines intended for parallel operations are to equal within a tolerance of $\pm$ 0.5 per cent.

2.9.3 Low vacuum and over pressure protective device

a) Sentinel relief valves are to be provided at the exhaust ends of all turbines, to provide a warning to personnel of allowable pressure being exceeded. The valve discharge outlets are to be visible and suitably guarded if necessary to avoid injury to personnel. Where a low vacuum cut-out device is provided, the sentinel relief valve at the L.P. exhaust may be omitted.

b) Sentinel relief valves are to be provided at the exhaust ends of all auxiliary turbines and the valve discharge outlets are to be visible and suitably guarded if necessary. Low vacuum or over pressure cut-out devices, as appropriate, are also to be provided for auxiliary turbines not installed with their own condensers.

c) When for auxiliary turbines, the inlet steam pressure exceeds the pressure for which the exhaust casing and associated piping up to exhaust valve are designed, means to relieve the pressure are to be provided.

2.10 Bled steam connections

2.10.1 Non-return or other means, which will prevent steam and water returning to the turbines, are to be fitted in bled steam connections.

2.11 Steam strainers

2.11.1 Efficient steam strainers are to be provided close to the inlets to ahead and astern high pressure turbines, or alternatively at the inlets to the maneuvering valves.

2.12 Emergency arrangements

2.12.1 Lubricating oil failure

a) Arrangements are to be made for the steam to the ahead propulsion turbines to be automatically shut off in the event of failure of the lubricating oil pressure; however, steam is to be made available at the astern turbine for braking purposes in such an emergency.

b) Auxiliary turbine arrangements are to be such that steam supply is automatically shut off in the event of failure of the lubricating oil pressure.

c) Main turbines are to be provided with a satisfactory emergency supply of lubricating oil which will come into use automatically in case of lubricating oil pressure falling below a predetermined value. The emergency supply may be obtained from a gravity tank containing sufficient oil to maintain adequate lubrication until the turbine is brought to rest or by equivalent means. If emergency pumps are used these are to be so arranged that their operation is not affected by failure of the power supply. Suitable arrangements for cooling the bearings after stopping may also be required.

2.12.2 Single screw ships

a) In single screw ships fitted with cross compound steam turbine installations in which two or more turbines are separately coupled to the same main gear wheel, the arrangements are to be such as to enable safe navigation, when the steam supply to any one of the turbines is required to be isolated. For this emergency operation purpose, the steam may be led direct to the L.P. turbine and either the H.P. or I.P. turbine can exhaust direct to the condenser. Adequate arrangements and controls are to be provided for these operating conditions to ensure that the pressure and temperature of the steam will not exceed those which the turbines and condenser can safely withstand.

b) The necessary pipes and valves for these arrangements are to be readily available and properly marked. A fit up test of all combinations of pipes and valves is to be performed prior to the first sea trials.

c) The permissible power/speeds when operating without one of the turbines (all combinations) is to be specified and information provided on board.

d) The operation of the turbines under emergency conditions is to be assessed for the potential influence on shaft alignment and gear teeth loading conditions.

2.12.3 Single main boiler

a) Ships intended for unrestricted service, fitted with steam turbines and having a single main boiler, are to be provided with means to ensure emergency propulsion in the event of failure of the main boiler.

2.13 Tests and equipment

2.13.1 Stability testing of turbine rotors

a) All solid forged H.P. turbine rotors intended for main propulsion service where the inlet steam temperature exceeds 400°C are to be subjected to at least one thermal stability test. This requirement is also applicable to rotors constructed from two or more forged components joined by welding. The test may be carried out at the forge or turbine builders' works (a) after heat treatment and rough machining of the forging or (b) after final machining, or (c) after final machining and blading of the rotor. The stabilizing test temperature is to be not less than 28°C above the maximum steam temperature to which the rotor will be exposed and not more than the tempering temperature of the rotor material.

b) Where main turbine rotors are subjected to thermal stability tests at both forge and turbine builders' works the foregoing requirements are applicable to both tests. It is not required that auxiliary turbine rotors be tested for thermal stability, but if such tests are carried out, the requirements for main turbine rotors will be generally applicable.

2.14 Balancing

2.14.1 All rotors as finished-bladed and complete with half-coupling are to be dynamically balanced to the Surveyor's satisfaction, in a machine of sensitivity appropriate to the size of rotor.

2.15 Hydraulic tests

2.15.1 Maneuvering valves are to be tested to twice the working pressure. The nozzle boxes of impulse turbines are to be tested to 1.5 times the working pressure.

2.15.2 The cylinders of all turbines are to be tested to 1.5 times the working pressure in the casing, or to 2.0 bar whichever is greater.

2.15.3 For test purposes, the cylinders may be subdivided with temporary diaphragms for distribution of test pressures.

2.15.4 Condensers are to be tested in the steam space to 1.0 bar. The water space is to be tested to the maximum pressure which the pump can develop at ship's full draught with the discharge valve closed plus 0.7 bar with a minimum test pressure of 2.0 bar. Where the operating conditions are not known, the test pressure is to be not less than 3.4 bar.

2.16 Indicators for movement

2.16.1 Indicators for determining the axial position of rotors relative to their casings, and for showing the longitudinal expansion of casings at the sliding feet, if fitted, are to be provided for main turbines. The latter indicators should be fitted at both sides and be readily visible.

2.17 Weardown gauges

2.17.1 Main and auxiliary turbines are to be provided with bridge weardown gauges for testing the alignment of the rotors.

Section 3

Gas Turbines

3.1 Scope

3.1.1 The requirements of this Section are applicable to gas turbines for main propulsion and to those for essential auxiliary services. These requirements do not apply to exhaust gas turbo-blowers.

3.1.2 The spare gear for gas turbines has not been indicated in view of the variation in turbine design and service conditions. In the circumstances, a list of proposed spare gear is to be submitted for consideration.

3.2 Plans and particulars

3.2.1 Following data is to be submitted:

- Rated power;
- Rated speed;
- Maximum turbine entry temperature at which rated power can be achieved;
- Mass and velocity of rotating elements;
- Balancing data;
- Type test schedule, measurements and data;
- Manufacturer’s shop test schedule.

3.2.2 The following plans are to be submitted for consideration together with particulars of materials.

- General technical specifications including effect of inlet temperature on power;
- General arrangement;
- Sectional assembly;
- Casings;
- Combustion chambers and heat exchangers;
- Gasifiers;
- Regenerators or recuperators;
- Rotors (turbine and compressor), including discs, blades, bearings couplings, and clutches;
- Sections showing blades, blade fastenings and sealings;
- Oil fuel and lubricating oil systems including controls and safety devices;
- Governor arrangements;
- Enclosure configurations (where applicable);
- Starting arrangements;
- Air intake and exhaust system;
- Control systems, safety systems and devices and associated failure mode and effect analysis;
- Details of proposed automatic safety devices to safeguard against hazardous conditions arising in the event of malfunctions in the gas turbine installation together with failure mode and effect analysis;

- Vibration monitoring systems; and

- All other critical systems such as fire fighting arrangements for enclosures, ventilation, lighting, smoke detector etc.

3.2.3 Where applicable, plans are to indicate the most onerous pressures and temperatures to which each component is subject.

3.2.4 Details are to be submitted, where applicable, of high temperature characteristics of the materials, including (at the working temperatures) the associated creep rate and rupture strength for the designed service life, fatigue strength, corrosion resistance and scaling properties. Particulars of heat treatment, including stress relief, where applicable, are to be submitted.

3.3 Materials

3.3.1 Rotors and discs are to be of forged steel. For carbon and carbon- manganese steel forgings, the specified minimum tensile strength is to be selected within the limits of 400 and 600 [N/mm^2]. For alloy steel rotor forgings, the specified minimum tensile strength is to be selected within the limits of 500 and 800 [N/mm^2]. For discs and other alloy steel forgings, the specified minimum tensile strength is to be selected within the limits of 500 to 1000 [N/mm^2].

3.3.2 For alloy steels, specifications giving the proposed chemical composition and heat treatment are to be submitted for approval.

3.3.3 When it is proposed to use a material of higher tensile strength, full details are to be submitted for approval.

3.4 Design and construction

3.4.1 All parts of turbines, compressors, etc., are to have clearances and fits consistent with adequate provision for the relative thermal expansion of the various components. Special attention is to be given to minimizing casing and rotor distortion under all operating conditions.

3.4.2 Turbine bearings are to be so disposed and supported that lubrication is not adversely affected by heat flow from adjacent hot parts. Effective means are to be provided for intercepting oil leakage and preventing oil from reaching high temperature glands and casings.

3.4.3 Design basis

a) Calculations of the steady stresses, including the effect of stress raisers, etc., in the turbine and compressor rotors and blading at the maximum speed and temperature in service, are to be submitted for consideration. Such calculations should indicate the designed service life and be accompanied, where possible, by test results substantiating the limiting criteria.

b) Details of calculations and tests to establish the service life of other stressed parts, including gearing (where applicable), bearings, seals, etc., are to be submitted. All calculations and tests should take account of all relevant environmental factors including particular type of service and fuels intended to be used.

3.5 Welded components

3.5.1 Components fabricated by means of welding will be considered for acceptance if constructed by firms whose works are properly equipped to undertake welding of the standards appropriate to the components according to the relevant requirements of Ch.10.

3.5.2 Before work is commenced, manufacturers are to submit for consideration details of proposed welding procedures and their proposals for routine examination of joints by non-destructive means.

3.5.3 Major joints are to be designed as full-strength welds and for complete fusion of the joint.

3.5.4 Stress relief treatment is to be applied to all cylinders, rotors and associated components on completion of the welding of all joints and attached structures. For details of stress relief procedure, temperature and duration, See Ch.10.

3.5.5 Surveyors are to be satisfied that the desired quality of welding is attainable with the proposed welding equipment and procedure, and for this purpose test specimens representative of the welded joints are to be provided for radiographic examination and mechanical tests as required for steam turbines.

3.6 Vibration

3.6.1 Care is to be taken in the design and manufacture of turbine and compressor rotors, rotor discs and rotor blades to ensure freedom from undue vibration within the operating speed range. Calculations of the critical speeds giving full details of the basic assumptions are to be submitted for consideration. Where critical speeds are found by calculation to occur within the operating speed range, vibration tests may be requested in order to verify the calculations.

3.7 Containment

3.7.1 Consideration should be given to the need for containment, with a view to minimizing and localizing damage, in the event of rotor blade failure.

3.8 Inlet and exhaust systems

3.8.1 The air-inlet system is to be designed to minimize the entrance of harmful foreign matter.

3.8.2 The arrangement of the turbine exhaust system is to be such as to prevent exhaust gases being drawn into the compressors.

3.9 Fuel and salt deposits

3.9.1 When it is intended to burn non-distillate fuels forming harmful deposits, adequate provision should be made for periodic removal of the deposits.

3.9.2 Means for preventing the accumulation of salt deposits in the compressors and turbines are to be provided.

3.9.3 Flow path cleaning or washing system is to be provided, where required by the gas turbine manufacturer. Provision is to be made for periodical cleaning / washing by inhibiting liquids, steam or any other cleaning medium. The details of the arrangements and the associated system are to be submitted for approval.

3.10 Indication of temperature

3.10.1 Means are to be provided for indicating the temperature of the power turbine exhaust gases.

3.11 External influences

3.11.1 Pipes and ducting connected to casings are to be so designed that no excessive thrust loads or moments are applied by them to the compressors and turbines.

3.11.2 Platform gratings and fittings in way of the supports are to be so arranged that casing expansion is not restricted.

3.11.3 Where main turbine seatings incorporating a tank structure are proposed, consideration is to be given to the temperature variation of the tank in service to ensure that turbine alignment will not be adversely affected.

3.11.4 Where the turbine is provided with an acoustic enclosure, this is to act as shield to prevent contamination of machinery spaces from external hazards and contain the heat emission from the gas generator. The enclosure is to be structurally sound and is to be a self-contained unit with arrangements for ventilation, lighting and noise attenuation. The drainage arrangements in the enclosure are to be provided to prevent build up of liquids. A self contained and independent fire fighting system is to be provided for such enclosure. One or more observation window/s is/are to be provided for visual inspection of critical components such as auxiliary gearbox and burner manifold.

3.12 Overhaul life

3.12.1 The overhaul schedule recommended by the manufacturer is to be submitted for consideration.

3.13 Safety arrangements

3.13.1 Overspeed protective devices

a) An overspeed protective device is to be provided for each shaft of main and auxiliary turbines to shut off the fuel automatically, near the burners, to prevent a dangerous overspeed condition of the shaft, except where it can be established that such a condition cannot arise.

b) The overspeed device should normally be set to operate when the speed of the line exceeds the rated maximum speed by 15 per cent.

3.13.2 Speed governors

a) Where a main propulsion installation incorporates a reverse gear, electric transmission or controllable (reversible) pitch propeller, a speed governor, independent of the overspeed protective device, is to be fitted and is to be capable of controlling the speed of the unloaded power turbine without bringing the overspeed protective device into action.

b) Where an auxiliary turbine is intended for driving an electric generator, a speed governor, independent of the overspeed protective device, is to be fitted which, with fixed setting, is to control the speed within 10 per cent momentary variation and 5 per cent permanent variation when full load is suddenly taken off or put on. The permanent speed variation of a.c. machines intended for parallel operations are to be equal within a tolerance of 0.5 per cent.

3.13.3 The following turbine services are to be provided with automatic temperature controls so as to maintain steady state conditions throughout the normal operating range of the main turbine:

- lubricating oil system;
- oil fuel supply (or automatic control of oil fuel viscosity as an alternative); and
- exhaust gas.

3.13.4 Alarms and automatic shutdown devices are to be provided in accordance with Table 3.13.1.

3.13.5 Hand trip gear for shutting off the fuel in an emergency is to be provided locally at the turbine control platform and where applicable, at the centralized control station.

3.13.6 All non-mobile gas turbines are to be provided with independent, self contained suitable foam or CO_2 or water mist fire fighting system with detection ability to give warning automatically at local and remote control positions when activated. This system is to be distinctly separate from the fire fighting arrangements in the machinery space. The arrangements together with calculations showing the capacities of the cylinders is to be submitted for approval.

3.13.7 Inlet and exhaust silencers are to be fitted to limit the sound power level at one meter from the gas turbine system to 110 dB for unmanned machinery spaces or to 90 dB for manned machinery spaces.

3.14 Starting arrangements

3.14.1 Means are to be provided, preferably automatic or interlocked, to clear all parts of the gas turbine of the accumulation of liquid fuel, or for purging gaseous fuel, before ignition commences on starting, or recommences after failure to start.

3.14.2 The starting arrangements can be pneumatic, hydraulic or electric. The starting air pipes system, safety fittings and number of starts are to comply with the requirements for oil engines as given in Section 4.11.

3.14.3 Starting devices are to be so arranged that firing operation is discontinued and main fuel valve is closed within pre-determined time in case of ignition failure.

Table 3.13.1 : List of alarms and shutdown

Monitoring parameter	Alarm	Shutdown
Turbines speed	High value	Yes
Lubricating oil pressure	Low value	Yes
Lubricating oil pressure of reduction gear	Low value	Yes
Differential pressure across lubricating oil filter	High value	
Lubricating oil temperature	High value	
Oil fuel supply pressure	Low value	
Oil fuel temperature	High value	
Cooling medium temperature	High value	
Bearing temperature	High value	
Flame and ignition failure	Activated	Yes
Automatic starting failure	Activated	
Vibration	High value	Yes
Axial displacement of rotor	High value	Yes
Exhaust gas temperature	High value	Yes
Vacuum pressure at the compressor inlet	High value	Yes
Loss of control system	Activated	

3.14.4 Where the gas turbine is arranged for air starting, the total air receiver capacity is to be sufficient to provide, without replenishment, not less than six consecutive starts. At least two air receivers of equal capacity are to be provided. For details of air receivers, see Chapter 5. For multi engine installations three consecutive starts per engine are required.

3.15 Tests

3.15.1 Balancing

a) The rotors as finished-bladed and complete with half-coupling are to be dynamically balanced to the Surveyor's satisfaction, in a machine of sensitivity appropriate to the size of rotor.

3.15.2 Hydraulic tests

a) All casings are to be tested to a hydraulic pressure equal to 1.5 times the highest pressure in the casing during normal operation or 1.5 times the pressure during starting, whichever is the higher. For test purposes if necessary, the casings may be subdivided with temporary diaphragms for distribution of test pressure.

b) Where hydraulic tests cannot be carried out, the manufacturers are to submit, for approval, alternative proposals for determining the soundness of the component.

c) Inter coolers and heat exchangers are to be tested to 1.5 times the maximum working pressure on each side separately.

3.16 Shop trials

3.16.1 Upon completion of fabrication and assembly, each gas turbine is to be subjected to a shop trial in accordance with the manufacturer’s test schedule, which is to be submitted for review before the trial. During the trial, the turbine is to be brought up to its over speed limit to enable testing of the overspeed protective device.

3.17 Electric starting

3.17.1 Where main turbines are fitted with electric starters, two batteries are to be fitted. Each battery is to be capable of starting the turbines when cold and the combined capacity is to be sufficient without recharging to provide the number of starts of the main turbines as required by 3.14.4.

3.17.2 Electric starting arrangements for auxiliary turbines are to have two separate batteries or be supplied by separate circuits from the main turbine batteries when such are provided. Where one of the auxiliary turbines only is fitted with an electric starter one battery will be acceptable.

3.17.3 The combined capacity of the batteries for starting the auxiliary turbines is to be sufficient for at least three starts for each turbine.

3.17.4 The requirements for battery installations are given in Pt.4, Ch.8.

3.18 Type testing of gas turbine

3.18.1 Type tests are to be carried out in accordance with the agreed test programme on a representative machine comprising gas generator and power turbine and are to be witnessed by IRS surveyor. It may be carried out at the manufacturer’s works or at any establishment having suitable facilities acceptable to IRS.

3.18.2 Where the gas turbine unit can be separated conveniently into a gas generator and a power turbine, the type test is to include an initial test of the gas generator to ascertain that the fuel consumption and gas horse power are within $\pm 2.5\%$ of design maximum conditions at rated speed.

3.18.3 After completion of the initial test of the gas generator, the gas generator and power turbine are to be assembled together and prepared for the gas turbine type test.

3.18.4 On the over speed test, a propulsion gas generator is to be run at not less than 10% in excess of gas generator speed corresponding to specified full power of the gas turbine engine for not less than 10 minutes continuously and the power turbine disconnected from the dynamometer is to be run at not less than 15% in excess of the maximum designed speed for not less than 10 minutes continuously.

3.18.5 Where it is impracticable to overspeed the complete installation, each rotor, completely bladed and with all relevant parts such as half-couplings, shall be overspeed tested individually at the appropriate speed.

3.18.6 During the type tests at specified full power the pressure and temperature of the gas at outlet from the gas generator is to be recorded and the gas mass flow is to be assessed from air flow and fuel flow measurements.

3.18.7 During the type tests the following features are to be demonstrated:

i) Freedom from air and gas leaks.
ii) Operation of starting arrangements.
iii) Effectiveness of interlocks, if fitted.
iv) Satisfactory lubricating oil and fuel oil system characteristics.
v) Wet and dry motoring.
vi Engine start following a failure to start.
vii) Operation of engine cleaning system.
viii) Reliability of operation at minimum idling speed.

3.18.8 Starting tests are to be carried out to determine:

i) Time to light from cold.
ii) Time to reach idling speed from cold.
iii) Time to reach full output from idling speed.
iv) That the required number of starts can be obtained from the specified starting air bottle capacity.
v) The minimum pressure to ensure a cold start is to be established.

- A cold start is defined as a start after 2 hours or more of natural cooling with the engine at rest.

- A warm start is defined as a start within 15 minutes of shutting down after the engine has been running for not less than two hours.

- An intentional failure to start is defined as the performance of a normal starting sequence with the ignition system deliberately rendered inoperative.

Note : i), ii), iii) and iv) are to be average of four readings.

Section 4

Oil Engines

4.1 Scope

4.1.1 The requirements of this Section apply to conventional type of internal combustion engines used as prime movers for main propulsion and for essential auxiliary machinery.

4.1.2 The approval of IC Engines is covered in detail in the IRS *Classification Note "Approval of I.C Engines"*. The document flow between the engine designer, IRS Plan Approval Centre, engine builder/ licensee and IRS Surveyors is indicated in the Classification Note. The Classification Note also covers the procedure to be followed for certification of engine components. The requirements with regard to design approval, type testing and certification of turbochargers and their matching on engines is also indicated in the Classification Note (Also refer Cl. 4.11.4).

4.2 Materials and material testing

4.2.1 Materials used for the construction of oil engines are to comply with the requirements of Pt.2 in so far as applicable. Other materials will be specially considered.

4.2.2 The specified minimum tensile strength of castings and forgings for crankshafts is to be selected within the following general limits:

a) Carbon and carbon-manganese steel castings 400 - 550 [N/mm^2];

b) Carbon and carbon manganese steel forgings (normalized and tempered) : 400 - 600 [N/mm^2];

c) Carbon and carbon-manganese steel forgings (quenched and tempered) : not exceeding 700 [N/mm^2];

d) Alloy steel castings : not exceeding 700 [N/mm^2];

e) Alloy steel-forgings : not exceeding 1000 [N/mm^2];

f) Spheroidal or nodular graphite iron castings: 370 - 800 [N/mm^2].

4.2.3 Where it is proposed to use alloy steel castings, forgings or iron castings for crankshafts, details of the chemical composition, heat treatment and mechanical properties are to be submitted for approval.

4.2.4 Documentation required to be submitted for certification of engine components including their materials are indicated in the IRS *Classification Note "Approval of I.C Engines"*.

4.3 Crankshaft design

4.3.1 Detailed analysis to prove the design of the crankshaft is to be submitted for consideration. Classification Notes on design of crankshafts may be followed in this regard. Manufacturers may also be required to submit detailed analysis for special design features, e.g. serrations in connecting rods and bearing caps.

4.4 Design and construction

4.4.1 The design and construction is to be such as to enable the oil engine to meet the general requirements with regard to environmental conditions, functional capability and reliability.

4.4.2 Cylinders, cylinder liners, cylinder covers, pistons and other parts subject to high temperature or pressure are to be of material suitable for the stress and temperature to which they are exposed.

4.4.3 The engine bedplate or crankcase is to be of rigid and oil-tight construction. The bedplate is to be provided with sufficient number of holding down bolts to effectively secure it to the engine seatings.

4.4.4 Transverse girders, cylinder blocks and columns, when of fabricated construction, are normally to be stress-relieved after welding.

4.4.5 Crankcases and their doors are to be of robust construction and the doors are to be securely fastened so that they will not be readily displaced by an explosion taking into account the installation of explosion relief valve as required by 4.6.

4.4.6 Piston rod glands, which are subjected to pressure from scavenging air, are to be of a design ensuring that air will not leak into the crankcase.

4.5 Crankcase ventilation

4.5.1 Ventilation of crankcase and any arrangement which could produce a flow of external air within the crankcase, is in general not permitted except for dual fuel engines where crankcase ventilation is to be provided in accordance with 4.13.1.3. If forced extraction of the gases from crankcase is provided (e.g. for smoke-detection purposes), the vacuum in the crankcase is not to exceed 25 [mm] of water column.

4.5.2 Crankcase ventilation pipes where provided are to be as small as practicable to minimize the in rush of air after crankcase explosion.

4.5.3 To avoid interconnection between crankcases and the possible spread of fire following an explosion, crankcase ventilation pipes and oil drain pipes for each engine are to be independent of each other.

4.6 Safety devices

4.6.1 For crankcase:

4.6.1.1 Crankcases are to be provided with light weight spring-loaded valves or other quick-acting and self closing devices, of an approved type, to relieve the crankcases of pressure in the event of an internal explosion and to prevent any inrush of air thereafter. The valves are to be designed to open at a pressure not greater than 0.2 bar.

4.6.1.2 The valve lids are to be made of ductile material capable of withstanding the shock of contact with stoppers at the full open position. The discharge from the valves is to be shielded by flame guard or flame trap to minimise the possibility of danger and damage arising from the emission of flame.

4.6.1.3 Crankcase explosion relief valves are to be type tested in a configuration that represents the installation arrangements that will be used on an engine, in accordance with IRS Classification Notes on “Guidance for Type Testing of Crankcase Explosion Relief Valves”.

4.6.1.4 Where crankcase relief valves are provided with arrangements for shielding emissions from the valve following an explosion, the valve is to be type tested to demonstrate that the shielding does not adversely affect the operational effectiveness of the valve.

4.6.1.5 Crankcase explosion relief valves are to be provided with a copy of manufacturer’s installation and maintenance manual that is specific to the size and type of valve being supplied for installation on a particular engine. The manual is to contain the following information:

- Description of valve with details of function and design limits.
- Copy of type test certificate.
- Installation instructions.
- Instructions for testing and renewal of any sealing arrangements.
- Actions required after a crankcase explosion.

4.6.1.6 A copy of the installation and maintenance manual required by 4.6.1.5 is to be provided on board ship.

4.6.1.7 Plans / documentation showing details and arrangements of crankcase explosion relief valves are to be submitted for approval, as indicated in the IRS *Classification Note "Approval of I.C Engines"*.

4.6.1.8 Valves are to be provided with suitable markings that include the following information:

- Name and address of manufacturer
- Designation and size
- Month / Year of manufacture
- Approved installation orientation.

4.6.1.9 In engines having cylinders not exceeding 200 [mm] bore and having a crankcase gross volume not exceeding 0.6 [m^3], relief valves may be omitted.

4.6.1.10 In engines having cylinders exceeding 200 [mm] bore, but not exceeding 250 [mm] bore, at least two relief valves are to be fitted, each valve is to be located at or near the ends of the crankcase. Where the engine has more than 8 crank throws an additional valve is to be fitted near the center of the engine.

4.6.1.11 Engines, with cylinder bores exceeding 250 [mm], but not exceeding 300 [mm], are to have at least one relief valve in way of each alternate crank throw, with a minimum of two relief valves.

4.6.1.12 In engines having cylinders exceeding 300 [mm] bore, at least one relief valve is to be fitted in way of each main crank throw.

4.6.1.13 Additional relief valves are to be fitted for separate spaces on the crankcase, such as gear or chain cases for camshaft or similar drives, when the gross volume of such spaces exceeds 0.6 [m^3].

4.6.1.14 The free area of each crankcase relief valve is not to be less than 45 [cm^2]. The combined free area of the relief valves fitted on the engine is not to be less than 115 [cm^2/m^3] of the crankcase volume.

The free area of the relief valve is the minimum flow area at any section through the valve, when the valve is fully open.

When calculating the gross volume of the crankcase, the volume of stationary parts within the crankcase may be deducted.

4.6.1.15 A warning notice is to be fitted in a prominent position, preferably on a crankcase door on each side of the engine, or alternatively at the engine room control location. This warning notice is to specify that whenever overheating is suspected in the crankcase, the crankcase doors or sight holes are not to be opened until a reasonable time has elapsed after stopping the engine, sufficient to permit adequate cooling within the crankcase.

4.6.1.16 Where crankcase oil mist detection arrangements are to be fitted to engines (as per Pt.4, Ch.7 and Pt.5, Ch.22) they are to be of a type approved by IRS and tested in accordance with Note 1) and comply with 4.6.1.17 to 4.6.1.28. Engine bearing temperature monitors or equivalent devices used as safety devices are to be type approved by IRS for such purposes.

Note 1) : Classification Notes – "Type approval of crankcase oil mist detection and alarm equipment".

4.6.1.17 The oil mist detection system and arrangements are to be installed in accordance with the manufacturer's and engine designer's instructions / recommendations. The following particulars are to be included in the instructions:

- Schematic layout of engine oil mist detection and alarm system showing location of engine crankcase sample points and piping or cable arrangements together with dimensions of the pipe to the detector.

- Evidence of study to justify the selected location of sample points and sample extraction rate (if applicable) in consideration of the crankcase arrangements and geometry and the predicted, crankcase atmosphere where oil mist can accumulate.

- The manufacturer's maintenance and test manual.

- Information relating to type or in-service testing of the engine with engine protection system test arrangements having approved types of oil mist detection equipment.

4.6.1.18 A copy of the oil mist detection equipment maintenance and test manual required by 4.6.1.17 is to be provided on board ship.

4.6.1.19 Oil mist detection and alarm information is to be capable of being read from a safe location away from the engine.

4.6.1.20 Each engine is to be provided with its own independent oil mist detection arrangement and a dedicated alarm.

4.6.1.21 Oil mist detection and alarm systems are to be capable of being tested on the test bed and onboard under engine at standstill and engine running at normal operating conditions in accordance with test procedures that are acceptable to IRS.

4.6.1.22 Alarms and shutdowns for the oil mist detection system are to be in accordance with Pt.5, Ch.22, Sec.3 and the system arrangements are to comply with Pt.5, Ch.22, Sec.2.

4.6.1.23 The oil mist detection arrangements are to provide an alarm indication in the event of a foreseeable functional failure in the equipment and installation arrangements.

4.6.1.24 The oil mist detection system is to provide an indication when any lenses fitted in the equipment and used in determination of the oil mist level have been partially obscured to a degree that will affect the reliability of the information and alarm indication.

4.6.1.25 Where oil mist detection equipment includes the use of programmable electronic systems, the arrangements are to be in accordance with the rule requirements for such systems.

4.6.1.26 Plans of showing details and arrangements of oil mist detection and alarm arrangements are to be submitted for approval in accordance with Pt.4, Ch.7.

4.6.1.27 The equipment together with detectors is to be tested when installed on the test bed and on board ship to demonstrate that the detection and alarm system functionally operates. The testing arrangements are to be to the satisfaction of IRS.

4.6.1.28 Where sequential oil mist detection arrangements are provided the sampling frequency and time is to be as short as reasonably practicable.

4.6.1.29 Where alternative methods are provided for the prevention of the build-up of oil mist that may lead to a potentially explosive condition within the crankcase details are to be submitted for consideration. The following information is to be included in the details:

- Engine particulars – type, power, speed, stroke, bore and crankcase volume.

- Details of arrangements to prevent the build up of potentially explosive conditions within the crankcase, e.g. bearing temperature monitoring, oil splash temperature, crankcase pressure monitoring, recirculation arrangements.

- Evidence to demonstrate that the arrangements are effective in preventing the build up of potentially explosive conditions together with details of in-service experience.

- Operating instructions and the maintenance and test instructions.

4.6.1.30 Where it is proposed to use the introduction of inert gas into crankcase to minimize a potential crankcase explosion, details of the arrangements are to be submitted to IRS for consideration.

4.6.2 Scavenge spaces:

4.6.2.1 Scavenge spaces in open connection to the cylinders are to be fitted with relief valves. The valves are to open quickly in case of an explosion.

4.6.2.2 For crosshead type engines, scavenge spaces in open connection to the cylinders are to be provided with an approved fire extinguishing system, which is to be entirely separate from the fire extinguishing system of the engine room.

4.6.3 Cylinders:

4.6.3.1 Cylinder relief valves are to be fitted to engines having cylinders over 230 [mm] bore. The valves are to open at a pressure not exceeding 40 per cent above the designed maximum pressure and are to discharge where no damage can occur. Consideration will be given to any other alternative relief arrangement.

4.6.3.2 In the case of auxiliary engines, consideration will be given to the replacement of the relief valve by an efficient warning device of over pressure in the cylinders.

4.6.4 Lubrication system:

4.6.4.1 The lubricating oil drain pipes from the engine sump to drain tank are to be taken down as low as possible, to ensure that their outlet ends are submerged at all times. Where two or more engines are installed, vent pipes, if fitted, and lubricating oil drain pipes are to be installed independently of each other to prevent intercommunication between crankcases.

4.6.5 Fuel systems:

4.6.5.1 All external high-pressure fuel delivery lines between the high-pressure fuel pumps and fuel injectors are to be protected with a jacketed piping system capable of containing fuel from a high-pressure line failure. A jacketed pipe incorporates an outer pipe into which the high-pressure fuel pipe is placed, forming a permanent assembly. The jacketed piping system is to include means for collection of leakages and arrangements provided for an alarm to be given of a fuel line failure. However, this requirement need not be applied for engines intended to be fitted on board non-passenger vessels of less than 500 GT.

4.6.5.2 Components of a diesel engine fuel system is to be designed considering the maximum peak pressure which will be experienced in service, including any high pressure pulses which are generated and transmitted back into the fuel supply and spill lines by the action of fuel injection pumps. Connections within the fuel supply and spill lines are to be constructed having regard to their ability to prevent pressurized oil fuel leaks while in service and after maintenance.

4.6.6 Starting air:

4.6.6.1 In order to protect air main against explosion arising from improper functioning of starting valves, the following are to be fitted:

a) an isolating non-return valve or equivalent at the starting air supply connection to each engine;

b) a bursting disc or flame arrestor in way of the starting valve of each cylinder for direct reversing engines having a main starting manifold or at the supply inlet to the starting air manifold for non-reversing engines.

4.6.6.2 Bursting disc or flame arrestor may be omitted for engines having a bore not exceeding 230 [mm], or where the power of the engine is less than 1100 [kW].

4.6.7 Overspeed protective devices:

4.6.7.1 Each main engine developing 220 [kW] or over, which can be declutched or which drives a controllable pitch propeller, also each auxiliary engine developing 220 [kW] and over for driving an electric generator, is to be fitted with an approved overspeed protective device.

4.6.7.2 The overspeed protective device, including its driving mechanism is to be independent of the governor required by 4.7 and is to be so adjusted that the speed does not exceed that for which the engine and its driven machinery are to be classed by more than 20 per cent for main engines and 15 per cent for auxiliary engines.

4.7 Governing

4.7.1 For main propulsion engines:

An efficient governor is to be fitted to each main engine and so adjusted that the speed of the engine does not exceed that for which the engine is to be classed by more than 15 per cent.

When electronic speed governors of main engines form part of a remote control system, they are to comply with the following:

a) if lack of power to the governor may cause major and sudden changes in the preset speed and direction of the thrust of the propeller, back up power supply is to be provided;

b) local control of engines is always to be possible;

c) electronic speed governor and its actuators are to be type tested as per *IRS Classification Notes "Type Approval of Electrical Equipment used for Control, Monitoring, Alarm and Protection Systems for use in Ships; and*

d) Also refer requirements of *IRS Classification Notes "Approval of I.C. Engines".*

4.7.2 For auxiliary engines:

Governors on diesel engines driving main or emergency electric generators are to be capable of automatically maintaining the speeds within following limits:

a) Momentary variations of 10 per cent of the maximum rated speed when the rated load of the generator is suddenly thrown off;

b) Momentary variations of 10 per cent of the maximum rated speed when 50 per cent of the rated load is suddenly thrown on followed by the remaining 50 per cent load after an interval sufficient to restore the speed to steady state. Steady state conditions should be achieved in not more than 5 seconds;

Note : Steady state conditions are those at which the envelope of speed variation does to exceed +1% of the declared speed at the new power.

c) At all loads between no load and rated load the permanent speed variation is not to be more than 5 per cent of the maximum rated speed;

d) For generating sets operating in parallel, the governing characteristics of the engine are to be such that within the limits of 20 per cent and 100 per cent of total load, the load on any generating set does not normally differ from its proportionate share of the total load by more than

i) 15 per cent of the rated output of the largest machine; or

ii) 25 per cent of the rated output of the individual machine in question, whichever is less;

e) For generating sets intended to operate in parallel, it is to be possible to adjust the governor so that the load is kept within 5 per cent of the rated load at normal frequency;

f) For alternating current installations, the permanent speed variation of the machines intended for parallel operations are to be equal within a tolerance of ± 0.5 per cent.

g) Application of electrical load in more than 2 load steps (See Fig.4.7.2) can only be permitted on the condition that

- the design of the ship's electrical system enables the use of such generator sets

- such a provision is made in the design stage and same is approved while scrutinising the drawings

- the safety of the ship's electrical system in the event of parallel operation and failure of a generator is to be demonstrated at ship's trials.

4.7.3 Emergency generator sets must satisfy the above governor conditions even when :

a) their total consumer load is applied suddenly, or

b) their total consumer load is applied in steps, subject to following:

- the total load is supplied within 45 seconds since power failure of the main switchboard
- the maximum step load is declared and demonstrated
- the power distribution system is designed such that the declared maximum step loading is not exceeded

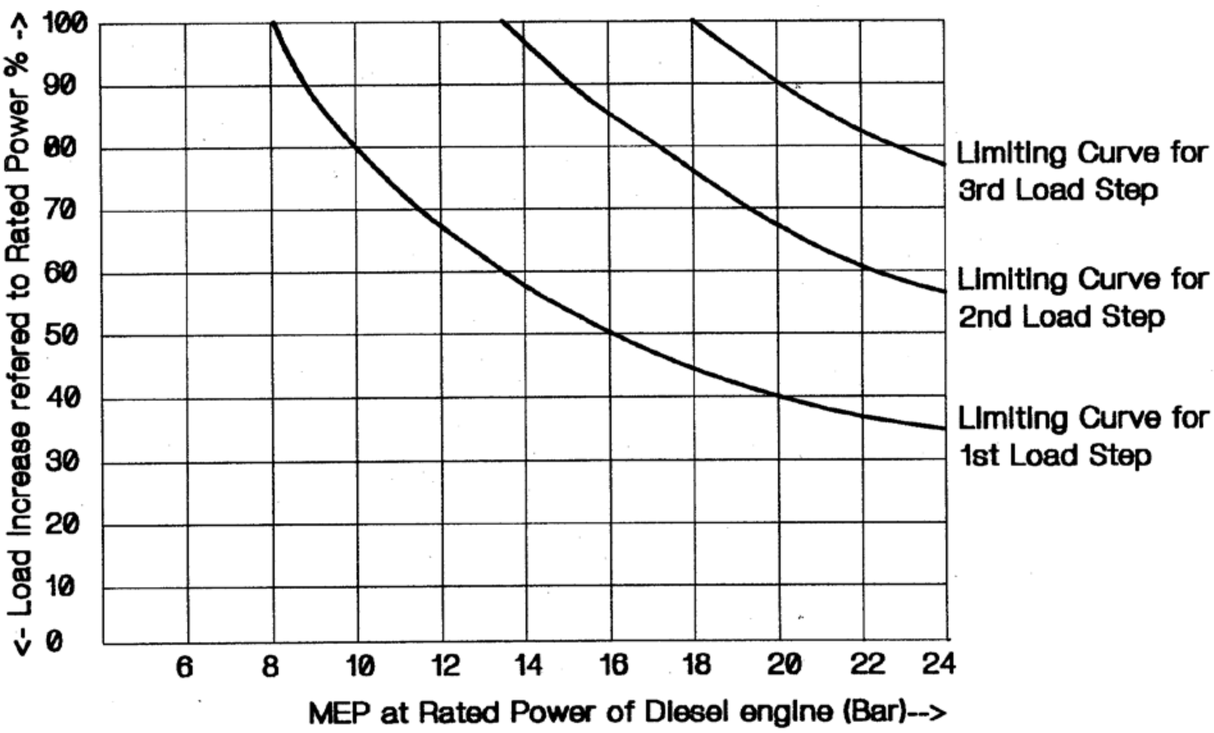

Fig.4.7.2 : Limiting curves for loading 4-stroke diesel engines step by step from no-load to rated power as function of the brake mean effective pressure

- the compliance of time delays and loading sequence with the above is to be demonstrated at the time of ship's trials.

4.8 Oil fuel, lubricating oil, cooling water and exhaust gas systems

4.8.1 Oil fuel, lubricating oil and cooling water piping systems are to comply with the requirements of Ch.3 in so far as these are applicable.

4.8.2 Exhaust pipes which are led overboard near the waterline are to be protected against the possibility of water finding its way inboard. Where the exhaust is cooled by water spray, the exhaust pipes are to be self-draining overboard.

4.8.3 Exhaust pipes of two or more engines are not to be connected together, but are to be led separately to the atmosphere unless arranged to prevent the return of gases to an idle engine.

4.9 Engine starting arrangements

4.9.1 First start arrangement:

4.9.1.1 Equipments for starting the main and auxiliary engines are to be provided so that the necessary initial charge of starting air or initial electric power can be developed on board ship without external aid. If for this purpose an emergency air compressor or electric generator is required, these units are to be power driven by hand starting oil engines or steam engines, except in the case of small installations where a hand operated compressor of approved capacity may be accepted. Alternatively, other devices of approved type may be accepted as a means of providing the initial start.

4.9.2 Compressed air starting systems:

4.9.2.1 Two or more starting and maneuvering air compressors of sufficient total capacity for the requirements of the main engines are to be fitted. At least one of the compressors is to be driven independent of the main propulsion unit and is to have a capacity not less than 50 per cent of the total required capacity. The total capacity of air compressors is to be sufficient to supply within one hour the quantity of air needed to satisfy the requirement of 4.9.2.9 by charging the receivers from atmospheric pressure. The main air compressors are to be of approximately the same size.

4.9.2.2 The compressors are to be so designed that the temperature of the air discharged to the starting air receivers will not substantially exceed 93°C in service. A small fusible plug or an alarm device operating at 121°C is to be provided on each compressor to give warning of excessive air temperature. The emergency air compressor need not comply with these requirements.

4.9.2.3 Each compressor is to be fitted with a safety valve so proportioned and adjusted that accumulation of pressure, with the outlet valve closed, will not exceed 10 per cent of the maximum working pressure.

4.9.2.4 The castings of the cooling water spaces are to be fitted with a safety valve or bursting disc so that ample relief will be provided in the event of the bursting of an air cooler tube.

4.9.2.5 Air compressor inlets are to be located in an atmosphere reasonably free from oil vapour or, alternatively, an air duct from outside the machinery space is to be led to the compressors.

4.9.2.6 The air discharge pipe from the compressors is to be led direct to the starting air receivers. Provision is to be made for intercepting and draining oil and water in the air discharge for which purpose a separator or filter is to be fitted in the discharge pipe between compressors and receivers.

4.9.2.7 The starting air pipe system from air receivers to main and auxiliary engines is to be entirely separate from the compressor discharge system. Stop valves on the air receivers are to permit slow opening to avoid sudden pressure rises in the piping system. Valve chests and fittings in the piping systems are to be of ductile material.

4.9.2.8 Drain valves for removing accumulations of oil and water are to be fitted on compressors, separators, filters and air receivers. In the case of any low-level pipelines, drain valves are to be fitted to suitably located drain pots or separators.

4.9.2.9 The total air receiver capacity is to be sufficient to provide, without replenishment, number of starts as per Table 4.9.1.

a) If starting system serves two or more of the above specified purposes, the capacity of the system is to be the sum of the capacity required.

b) At least two air receivers of about equal capacity are to be provided.

Table 4.9.1 : Number of starts of engines

Duty of engine	No. of starts
Propulsion engines – reversible	12 consecutive starts alternating between Ahead and Astern of each engine
Propulsion engines - non-reversible, connected to a controllable pitch propeller or other device enabling the start without opposite torque	6 starts for each engine
Engines for driving electric generators and emergency generators and engines for other purposes	3 starts for each engine

4.9.3 Electric starting

4.9.3.1 Where main engines are fitted with electric starters, two batteries are to be fitted. The arrangement is to be such that batteries cannot be connected in parallel.

4.9.3.2 Each battery is to be capable of starting the engines when in cold and ready to start conditions. The combined capacity is to be sufficient without recharging to provide within 30 minutes the number of starts of the main engines as required by 4.9.2.9.

4.9.3.3 The electric starting arrangements for auxiliary engines are to have two separate batteries or may be supplied by separate circuits from main engine batteries when such are provided. In case of a single auxiliary engine, only one battery is required.

4.9.3.4 The starting batteries are to be used for starting and engine's own monitoring purposes only. Provision is to be made to maintain continuously the stored energy at all times.

4.10 Type testing of oil engines

4.10.1 General

4.10.1.1 Requirements for Type Testing of Oil Engines are specified in *Classification Note "Approval of I.C Engines"*. The documentation required and document flow between the engine designer, IRS Plan Approval Centre, engine builder/ licensee and IRS Surveyors is also indicated in the Classification Note.

4.10.1.2 Upon finalization of the engine design for production of every new engine type intended for the installation on board ships, one engine is to be presented for type testing, as detailed in the IRS *Classification Note "Approval of I.C Engines"*.

4.11 Factory Acceptance Test

4.11.1 Safety Precautions

4.11.1.1 Before any test run is carried out, all relevant equipment for the safety of attending personnel is to be made available by the manufacturer / shipyard and is to be operational.

4.11.1.2 This applies especially to crankcase explosive conditions protection, but also to over-speed protection and any other shut down function.

4.11.1.3 The overspeed protective device is to be set to a value, which is not higher than the overspeed value that was demonstrated during the type test for that engine. This set point will be verified by the surveyor.

4.11.2 General

4.11.2.1 Before any official testing, the engines are to be run-in as prescribed by the engine manufacturer.

4.11.2.2 Adequate test bed facilities for loads as required in 4.11.3.7 are to be provided. All fluids used for testing purposes such as fuel, lubrication oil and cooling water are to be suitable for the purpose intended, e.g. they are to be clean, preheated if necessary and cause no harm to engine parts. This applies to all fluids used temporarily or repeatedly for testing purposes only.

4.11.2.3 The testing consists of workshop and shipboard (quay and sea trial) testing.

4.11.2.4 Engines are to be inspected for:

- Jacketing of high-pressure fuel oil lines including the system used for the detection of leakage.

- Screening of pipe connections in piping containing flammable liquids.

- Insulation of hot surfaces by taking random temperature readings that are to be compared with corresponding readings obtained during the type test. This is to be done while running at the rated power of engine. Use of contact thermometers may be accepted at the discretion of the attending Surveyor. If the insulation is modified subsequently to the Type Approval Test, IRS may request temperature measurements as required by *Classification Note "Approval of I.C Engines" 2.8.9.*

4.11.2.5 These inspections are normally to be made during the works trials by the manufacturer and the attending surveyor, but at the discretion of IRS parts of these inspections may be postponed to the shipboard testing.

4.11.3 Works trials

4.11.3.1 The purpose of the works trials is to verify design premises such as power, safety against fire, adherence to approved limits (e.g. maximum pressure), and functionality and to establish reference values or base lines for later reference in the operational phase.

4.11.3.2 The following environmental test conditions are to be recorded:

- Ambient air temperature
- Ambient air pressure
- Atmospheric humidity

4.11.3.3 For each required load point, the following parameters are normally to be recorded:

- Power and speed
- Fuel index (or equivalent reading)
- Maximum combustion pressures (only when the cylinder heads installed are designed for such measurement).
- Exhaust gas temperature before turbine and from each cylinder (to the extent that monitoring is required in *Classification Note "Approval of I.C Engines"* Sec 4 and Pt 5, Ch 22)
- Charge air temperature
- Charge air pressure
- Turbocharger speed (to the extent that monitoring is required in *Classification Note "Approval of I.C Engines" Sec 4*)

4.11.3.4 Calibration records for the instrumentation are, upon request, to be presented to the attending Surveyor.

4.11.3.5 For all stages at which the engine is to be tested, the pertaining operational values are to be measured and recorded by the engine manufacturer. All results are to be compiled in an acceptance protocol to be issued by the engine manufacturer. This also includes crankshaft deflections if considered necessary by the engine designer.

4.11.3.6 In each case, all measurements conducted at the various load points are to be carried out at steady state operating conditions. However, for all load points provision should be made for time needed by the Surveyor to carry out visual inspections. The readings for MCR, i.e. 100% power (rated maximum continuous power at corresponding rpm) are to be taken at least twice at an interval of normally 30 minutes.

4.11.3.7 Test loads for various engine applications are given in Tables below. In addition, the scope of the trials may be expanded depending on the engine application, service experience, or other relevant reasons.

Note:
Alternatives to the detailed tests may be agreed between the manufacturer and IRS when the overall scope of tests is found to be equivalent.

Table 4.11.3.7 (a) : Propulsion engines driving propeller or impeller only		
A)	100% power (MCR) at corresponding speed n_0 :	At least 60 [min]
B)	110% power at engine speed $1.032n_0$ Note: Only required once for each different engine/turbocharger configuration.	Records to be taken after 15 [min] or after steady conditions have been reached, whichever is shorter
C)	Approved intermittent overload (if applicable)	Testing for duration as agreed with the manufacturer
D)	90% (or normal continuous cruise power), 75%, 50%, and 25% power in accordance with the nominal propeller curve, the sequence to be selected by the engine manufacturer.	
E)	Reversing manoeuvres (if applicable)	
Note: *After running on the test bed, the fuel delivery system is to be so adjusted that overload power cannot be given in service, unless intermittent overload power is approved by IRS. In that case, the fuel delivery system is to be blocked to that power.*		

Table 4.11.3.7 (b) : Engines driving generators for electric propulsion and Engine driving generators for auxiliary purposes		
A)	100% power (MCR) at corresponding speed n_0 :	At least 60 [min]
B)	110% power at engine speed n_0	15 [min] - after having reached steady conditions
C)	Governor tests for compliance with 4.11.3.1 to 4.11.3.6 are to be carried out.	
D)	75%, 50%, and 25% power and idle, the sequence to be selected by the engine manufacturer.	
Note: *After running on the test bed, the fuel delivery system is to be adjusted so that full power plus a 10% margin for transient regulation can be given in service after installation onboard.* *The transient overload capability is required so that the required transient governing characteristics are achieved also at 100% loading of the engine, and also so that the protection system utilised in the electric distribution system can be activated before the engine stalls.*		

Table 4.11.3.7 (c) : Propulsion engines also driving power take off (PTO) generator		
A)	100% power (MCR) at corresponding speed n_0 :	At least 60 [min]
B)	110% power at engine speed n_0	15 [min] - after having reached steady conditions
C)	Approved intermittent overload (if applicable)	Testing for duration as agreed with the manufacturer.
D)	90% (or normal continuous cruise power), 75%, 50% and 25% power in accordance with the nominal propeller curve or at constant speed n_0, the sequence to be selected by the engine manufacturer.	
Note: *After running on the test bed, the fuel delivery system is to be adjusted so that full power plus a margin for transient regulation can be given in service after installation onboard. The transient overload capability is required so that the electrical protection of downstream system components is activated before the engine stalls. This margin may be 10% of the engine power but at least 10% of the PTO power.*		

Table 4.11.3.7 (d) : Engines driving auxiliaries

A)	100% power (MCR) at corresponding speed n_0 :	At least 30 [min]
B)	110% power at engine speed n_0	15 [min] - after having reached steady conditions
C)	Approved intermittent overload (if applicable)	Testing for duration as agreed with the manufacturer.
D)	For variable speed engines, 75%, 50% and 25% power in accordance with the nominal power consumption curve, the sequence to be selected by the engine manufacturer.	

Note:
After running on the test bed, the fuel delivery system is normally to be so adjusted that overload power cannot be delivered in service, unless intermittent overload power is approved. In that case, the fuel delivery system is to be blocked to that power.

4.11.4 Turbocharger matching with engine

4.11.4.1 Compressor chart

.1 Turbochargers are to have a compressor characteristic that allows the engine, for which it is intended, to operate without surging during all operating conditions and also after extended periods in operation.

.2 For abnormal, but permissible, operation conditions, such as misfiring and sudden load reduction, no continuous surging is to occur.

.3 In this section, *surging* and *continuous surging* are defined as follows:

Surging means the phenomenon, which results in a high pitch vibration of an audible level or explosion-like noise from the scavenger area of the engine.

Continuous surging means that surging happens repeatedly and not only once.

4.11.4.2 Surge margin verification

.1 Category C turbochargers used on propulsion engines are to be checked for surge margins during the engine workshop testing as specified below. These tests may be waived if successfully tested earlier on an identical configuration of engine and turbocharger (including same nozzle rings).

.2 For 4 stroke engines, following are to be performed without indication of surging:

- With maximum continuous power and speed (=100%), the speed is to be reduced with constant torque (fuel index) down to 90% power.
- With 50% power at 80% speed (= propeller characteristic for fixed pitch), the speed is to be reduced to 72% while keeping constant torque (fuel index).

.3 For 2 stroke engines, the surge margin is to be demonstrated by at least one of the following methods:

- The engine working characteristic established at workshop testing of the engine is to be plotted into the compressor chart of the turbocharger (established in a test rig). There is to be at least 10% surge margin in the full load range, i.e. working flow is to be 10% above the theoretical (mass) flow at surge limit (at no pressure fluctuations).
- Sudden fuel cut-off to at least one cylinder is not to result in continuous surging and the turbocharger is to be stabilised at the new load within 20 seconds. For applications with more than one turbocharger the fuel is to be cut-off to the cylinders closest upstream to each turbocharger. This test is to be performed at two different engine loads:
    - The maximum power permitted for one cylinder misfiring.
    - The engine load corresponding to a charge air pressure of about 0.6 [bar] (but without auxiliary blowers running).

- No continuous surging and the turbocharger is to be stabilised at the new load within 20 seconds when the power is abruptly reduced from 100% to 50% of the maximum continuous power.

4.11.5 Integration tests

4.11.5.1 For electronically controlled engines, integration tests are to be made to verify that the response of the complete mechanical, hydraulic and electronic system is as predicted for all intended operational modes and the tests considered as a system are to be carried out at the works. If such tests are technically unfeasible at the works, however, these tests may be conducted during sea trial. The scope of these tests is to be agreed with IRS for selected cases based on the FMEA required in *Classification Note "Approval of I.C Engines" Sec 1.*

4.11.6 Component inspections

4.11.6.1 Random checks of components will be carried out by the attending surveyor.

4.12 Shipboard trials

4.12.1 Safety Precautions

4.12.1.1 Refer to 4.11.1

4.12.2 Objectives

4.12.2.1 The purpose of the shipboard testing is to verify compatibility with power transmission and driven machinery in the system, control systems and auxiliary systems necessary for the engine and integration of engine / shipboard control systems, as well as other items that had not been dealt with in the FAT (Factory Acceptance Testing).

4.12.3 Starting capacity

4.12.3.1 Starting manoeuvres are to be carried out in order to verify that the capacity of the starting media satisfies the required number of start attempts.

4.12.4 Monitoring and alarm system

4.12.4.1 The monitoring and alarm systems are to be checked to the full extent for all engines, except items already verified during the works trials.

4.12.5 Test loads

4.12.5.1 Test loads for various engine applications are given in tables below. In addition, the scope of the trials may be expanded depending on the engine application, service experience, or other relevant reasons.

4.12.5.2 The suitability of the engine to operate on fuels intended for use is to be demonstrated.

Note:
Tests other than those listed below may be required by statutory instruments (e.g. EEDI verification).

Table 4.12.5.1 (a) : Propulsion engines driving fixed pitch propeller or impeller

A)	At rated engine speed n_0 :	At least 4 [Hrs]
B)	At engine speed $1.032n_0$ (if engine adjustment permits , see 4.11.3.7)	30 [min]
C)	At approved intermittent overload (if applicable)	Testing for duration as agreed with the manufacturer
D)	Minimum engine speed to be determined	
E)	The ability of reversible engines to be operated in reverse direction is to be demonstrated.	

Note:
During stopping tests according to Resolution MSC.137 (76), see 4.12.6.1 for additional requirements in the case of a barred speed range.

Table 4.12.5.1 (b) : Propulsion engines driving controllable fixed pitch propellers		
A)	At rated engine speed n_0 with a propeller pitch leading to rated engine power (or to the maximum achievable power if 100% cannot be reached):	At least 4 [Hrs]
B)	At approved intermittent overload (if applicable)	Testing for duration as agreed with the manufacturer
C)	With reverse pitch suitable for manoeuvring, see 4.12.6.1 for additional requirements in the case of a barred speed range.	

Table 4.12.5.1 (c) : Engine(s) driving generator(s) for electrical propulsion and/or main power supply		
A)	At 100% power (rated electrical power of generator):	At least 60 [Min]
B)	At 110% power (rated electrical power of generator):	At least 10 [Min]
	Note: *Each engine is to be tested 100% electrical power for at least 60 min and 110% of rated electrical power of the generator for at least 10 min. This may, if possible, be done during the electrical propulsion plant test, which is required to be tested with 100% propulsion power (i.e. total electric motor capacity for propulsion) by distributing the power on as few generators as possible. The duration of this test is to be sufficient to reach stable operating temperatures of all rotating machines or for at least 4 hours. When some of the gen. set(s) cannot be tested due to insufficient time during the propulsion system test mentioned above, those required tests are to be carried out separately.*	
C)	Demonstration of the generator prime movers' and governors' ability to handle load steps as described in 4.11.3.2 and 4.11.3.3.	

Table 4.12.5.1 (d) : Propulsion engines also driving power take off (PTO) generator		
A)	100% power (MCR) at corresponding speed n_0 :	At least 4 [Hrs]
B)	100% propeller branch power at engine speed n_0 (unless already covered in A):	2 [Hrs]
C)	100% PTO branch power at engine speed n_0:	At least 1 [Hr]

Table 4.12.5.1 (e) : Engines driving auxiliaries		
A)	100% power (MCR) at corresponding speed n_0 :	At least 30 [Min]
B)	Approved intermittent overload:	Testing for duration as approved

4.12.6 Torsional vibrations

4.12.6.1 Barred speed range

.1 Where a barred speed range (BSR) is required, passages through this BSR, both accelerating and decelerating, are to be demonstrated. The times taken are to be recorded and are to be equal to or below those times stipulated in the approved documentation, if any. This also includes when passing through the BSR in reverse rotational direction, especially during the stopping test.

Note: Applies both for manual and automatic passing-through systems.

.2 The ship's draft and speed during all these demonstrations is to be recorded. In the case of a controllable pitch propeller, the pitch is also to be recorded.

.3 The engine is to be checked for stable running (steady fuel index) at both upper and lower borders of the BSR. Steady fuel index means an oscillation range less than 5% of the effective stroke (idle to full index).

4.13 Dual fuel diesel engines

4.13.1 Control and safety systems for Dual Fuel Diesel (DFD) engines

4.13.1.1 Application

a) The following requirements are applicable to dual-fuel diesel engines utilising high pressure Methane gas (NG: Natural Gas) as fuel. These requirements are in addition to those given in Pt.4, Ch.4 for oil fired diesel engines and Pt.5, Ch.4, Sec.5, 16 of the 'Rules and Regulations for the Construction and Classification of Steel Ships'.

4.13.1.2 Operation mode

a) DFD engines are to be of the dual-fuel type employing pilot fuel ignition and to be capable of immediate change-over to oil fuel only.

b) Oil fuel only is to be used when starting the engine.

c) Oil fuel only, in principle, is to be used when the operation of an engine is unstable and/or during manoeuvring and port operations.

d) In case of shut-off of the gas fuel supply, the engines are to be capable of continuous operation by oil fuel only.

4.13.1.3 Protection of crankcase

a) Crankcase relief valves are to be fitted in way of each crankthrow. The construction and operating pressure of the relief valves are to be determined considering explosions due to gas leaks.

b) If a trunk piston type engine is used as DFD engine, the crankcase is to be protected by the following measures:

i) Ventilation is to be provided to prevent the accumulation of leaked gas, the outlet for which is to be led to a safe location in the open space through flame arrester.

ii) Gas detecting or equivalent equipment. (It is recommended that means for automatic injection of inert gas are to be provided).

iii) Oil mist detector.

c) If a cross-head type engine is used as DFD, the crankcase is to be protected by oil mist detector or bearing temperature detector.

4.13.1.4 Protection for piston underside space of cross-head type engine

a) Gas detecting or equivalent equipment is to be provided for piston underside space of cross-head type engine.

4.13.1.5 Engine exhaust system

a) Explosion relief valves or other appropriate protection system against explosion are to be provided in the exhaust, scavenge and air inlet manifolds.

b) The exhaust gas pipes from DFD engines are not to be connected to the exhaust pipes of other engines or systems.

4.13.1.6 Starting air line

a) Starting air branch pipes to each cylinder are to be provided with effective flame arresters.

4.13.1.7 Combustion monitoring

a) A failure mode and effect analysis (FMEA) examining all possible faults affecting the combustion process is to be submitted for approval.

Details of required monitoring will be considered based on the outcome of the analysis. The following table may serve as guidance:

Faulty condition	Alarm	Automatic shut-off of the interlocked valves*
Function of gas fuel injection valves and pilot oil fuel injection valves	X	X
Exhaust gas temperature at each cylinder outlet and deviation from average	X	X
Cylinder pressure or ignition failure of each cylinder	X	X
* It is recommended that the gas master valve is also closed.		

4.13.1.8 Gas fuel supply to engine

a) Flame arresters are to be provided at the inlet to the gas supply manifold for the engine.

b) Arrangements are to be made so that the gas supply to the engine can be shut-off manually from manoeuvring platform or any other control position.

c) The arrangement and installation of the gas piping are to provide the necessary flexibility for the gas supply piping to accommodate the oscillating movements of DFD engine, without risk of fatigue failure.

d) The connections of gas line and protection pipes or ducts required in 4.13.1.9(a) to the gas fuel injection valves are to provide complete coverage by the protection pipe or ducts.

4.13.1.9 Gas fuel supply piping systems

a) Gas fuel piping may pass through or extend into machinery spaces or gas-safe spaces other than accommodation spaces, service spaces and control locations provided that they fulfill one of the following:

i) The system when complying with 16.3.1.1 of Pt.5, Ch.4, Sec.16 of the 'Rules and Regulations for the Construction and Classification of Steel Ships' and in addition, with 1), 2) and 3) given below:

1) The pressure in the space between concentric pipes is monitored continuously. Alarm is to be issued and automatic valves specified in Cl. 16.3.6 of Pt.5, Ch.4, Sec.16 of the 'Rules and Regulations for the Construction and Classification of Steel Ships' and the master gas fuel valves specified in Cl.16.3.7 of Pt.5, Ch.4, Sec.16 of the 'Rules and Regulations for the construction and Classification of Steel Ships' are to be closed before the pressure drops to below the inner pipe pressure (however, an interlocked gas valve connected to vent outlet is to be opened).

2) Construction and strength of the outer pipes are to comply with the requirements of Pt.5, Ch.4, Sec.5, Cl.5.2 of the 'Rules and Regulations for the Construction and Classification of Steel Ships'.

3) It is to be so arranged that the inside of the gas fuel supply piping system between the master gas valve and the DFD engine is to be automatically purged with inert gas, when the master gas valve is closed; or

ii) The system when complying with Cl. 16.3.1.2 of Pt.5, Ch.4, Sec.16 of the 'Rules and Regulations for the construction and Classification of Steel Ships' and in addition, with 1) through 4) given below:

1) Materials, construction and strength of protection pipes or ducts and mechanical ventilation systems are to be sufficiently durable against bursting and rapid expansion of high pressure gas in the event of gas pipe burst.

2) The capacity of mechanical ventilating system is to be determined considering the flow rate of gas fuel and construction and arrangement of protective pipes or ducts, as deemed appropriate by the Rules of IRS.

3) The air intakes of mechanical ventilating systems are to be provided with non-return devices effective for gas fuel leaks. However, if a gas detector is fitted at the air intakes, these requirements may be dispensed with.

4) The number of flange joints of protective pipes or ducts is to be minimised; or

iii) Alternative arrangements to those given in paragraph 4.13.1.9(i) and 4.13.1.9(ii) will be specially considered based upon an equivalent level of safety.

b) High pressure gas piping system are to be ensured to have sufficient constructive strength by carrying out stress analysis taking into account the stresses due to the weight of the piping system including acceleration load when significant, internal pressure and loads induced by hog and sag of the ships.

c) All valves and expansion joints used in high pressure gas fuel supply lines are to be of an approved type.

d) Joints on entire length of the gas fuel supply lines are to be butt-welded joints with full penetration and to be fully radiographed, except where specially approved by IRS.

e) Pipe joints other than welded joints at the locations specially approved by IRS are to comply with the appropriate National or International standards or those whose structural strength has been verified through tests and analysis as deemed appropriate by IRS.

f) For all butt-welded joints of high pressure gas fuel supply lines, post-weld heat treatment are to be performed depending on the kind of material.

4.13.1.10 Shut-off of gas fuel supply

a) In addition to the causes specified in Pt.5, Ch.4, Sec.16, Cl. 16.3.6 of the 'Rules and Regulations for the construction and Classification of Steel Ships' supply of gas fuel to DFD engines is to be shut off by the interlocked gas valves in case following abnormality occurs:

i) Abnormality specified in 4.13.1.7

ii) DFD engine stops from any cause

iii) Abnormally specified in 4.13.1.9(a)(i).

b) In addition to the causes specified in Pt.5, Ch.4, Sec.16, Cl.16.3.7 of the 'Rules and Regulations for the construction and Classification of Steel Ships', the master gas valve is to be closed in case of any of the following:

i) Oil mist detector or bearing temperature detector specified in 4.13.1.3(b)(iii) and (c) detects abnormality.

ii) Any kind of gas fuel leakage is detected

iii) Abnormality specified in 4.13.1.9

iv) Abnormality specified in 4.13.1.11(a).

c) The master gas valve is to close automatically upon activation of the interlocked gas valves.

4.13.1.11 Emergency stop of the DFD engines

a) DFD engine is to stopped before the gas concentration detected by the gas detectors specified in Pt.5, Ch.4, Sec.16, Cl.16.2.2 of the 'Rules and Regulations for the Construction and Classification of Steel Ships', reaches 60% of lower flammable limit.

4.13.1.12 Gas fuel make-up plant and related storage tanks

a) Construction, control and safety system of high pressure gas compressors, pressure vessels and heat exchangers constituting a gas fuel make-up plant are to be arranged to the satisfaction of IRS.

b) The possibility for fatigue failure of the high pressure gas piping due to vibration is to be considered.

c) The possibility for pulsation of gas fuel supply pressure caused by the high pressure gas compressor is to be considered.

Section 5

Gearing

5.1 Scope

5.1.1 The requirements of this Section cover the construction, material and inspection of reduction gears for main propelling purposes and for driving electric generators.

5.1.2 Design of bevel gears will be specially considered.

5.1.3 For torsional vibration requirements, See Sec.8.

5.1.4 Rated power of gear is the maximum transmitted power at which the gear is designed to operate continuously at its rated speed.

5.1.5 The rated torque is defined by the rated power and speed and is the torque used in the gear rating calculations.

5.1.6 The gear rating is the rating for which the gear is designed to transmit it’s rated torque.

5.2 Plans and particulars

5.2.1 The following plans, in triplicate, of the reduction gearing are to be submitted:

For Approval

a) Pinion(s) and wheel(s);

b) Shafts;

c) Hub(s);

d) Other power transmitting parts;

For information only

e) Longitudinal and transverse sections of the gear box;

f) Clutch(es) and/or coupling(s);

g) Gear casing including propeller thrust bearing housing, if applicable.

5.2.2 The plans are to show clearly all dimensions, details of all fillets and stress raisers, and material of all the parts.

5.2.3 At least the following particulars of the gearing are to be submitted along with the plans:

a) Shaft power and revolutions for each pinion;

b) Number of teeth in each gear;

c) Generating pitch diameters;

d) Helix angles at generating pitch diameters;

e) Normal pitches of teeth at generating pitch diameters;

f) Tip diameters;

g) Root diameters;

h) Face widths and gaps, where applicable;

i) Pressure angles of teeth (normal or transverse) at generating pitch diameters;

j) Minimum backlash;

k) Centre distance;

l) Basic rack tooth form;

m) Details of tooth flank corrections, if adopted;

n) Details of post hobbing process, if any;

o) Case depth for surface-hardened teeth;

p) Shrinkage allowance for shrunk-on rims and hubs;

q) Type of coupling proposed for oil engine applications.

5.2.4 Gears with Multiple Prime Mover Inputs

5.2.4.1 For single helical gears with arrangements utilizing multiple prime mover inputs, and single or multiple outputs, the following analyses for all operating modes are to be conducted:

- All bearing reactions
- Tooth modifications
- Load distributions on the gear teeth
- Contact and tooth root bending stresses

A summary of the results of these analyses for each operating mode is to be submitted for review.

5.3 Materials

5.3.1 Specifications for materials of pinions, pinion sleeves, wheel rims, gear wheels and shafting giving chemical composition, heat treatment and mechanical properties are to be submitted for approval with the plans of gearing and are to be in accordance with Pt.2.

5.3.2 Where the teeth of a pinion or gear wheel are to be surface hardened, the proposed specification and details of the procedure are to be submitted for approval.

5.3.3 In the selection of materials for pinions and wheels consideration should be given to their compatibility in operation. In general, for gears of through hardened steels, except in the case of low reduction ratios, provision should also be made for a hardness differential between pinion teeth and wheel teeth. For this purpose the specified minimum tensile strength of the wheel materials should not be more than 85 per cent of that of the pinion.

5.3.4 Subject to 5.3.3, the specified minimum tensile strength of steel gear forgings is to be selected within the following limits:

- Pinions and pinion sleeves - 550-1050 [N/mm^2];

- Gear wheels and rims - 400-850 [N/mm^2].

A tensile strength range is also to be specified and is not to exceed 120 [N/mm^2] when the specified minimum tensile strength is 600 [N/mm^2] or less. For higher strength steels, the range is not to exceed 150 [N/mm^2].

5.3.5 Unless otherwise agreed, the specified minimum tensile strength of the core is to be 800 [N/mm^2] for induction-hardened or nitrided gearing and 750 [N/mm^2] for carburized gearing.

5.4 Design and construction

5.4.1 The design and construction is to be such as to enable the gearing to meet the general requirements with respect to functional capability and reliability.

5.4.2 Detailed analysis to prove the design of the gearing is to be submitted for consideration. In this regard, Classification Notes on the design of gearing may be followed.

5.4.3 Where castings are used for wheel centres, any radial slots in the periphery are to be fitted with permanent chocks before shrinking-on the rim.

5.4.4 Where bolts are used to secure side plates to rim and hub, the bolts should be tight fit with the holes and the nuts should be suitably locked by means other than welding.

5.4.5 When welding is employed in the construction of wheels, the welding procedure is to be approved by the Surveyors before work is commenced. For this purpose, welding procedure approval tests are to be carried out with satisfactory results. Such tests are to be representative of the joint configuration and materials. Wheels are to be stress relieved after welding. All welds are to have a satisfactory surface finish and contour. Magnetic particle or liquid penetrant examination of all important welding joints is to be carried out to the satisfaction of the Surveyors.

5.4.6 In general arrangements are to be made so that the interior structure of the wheel may be examined. Alternative proposals will be specially considered.

5.5 Accuracy of gear cutting and alignment

5.5.1 Gears are to be cut only on machines which are maintained at a high standard of accuracy. Hobbing machines used in the production of large gears are to be operated under conditions of temperature control with a total temperature variations not exceeding 2°C for the finishing cut. The blank should be allowed sufficient time to stabilize to the machine temperature before cutting commences.

5.5.2 The accuracy of gear-cutting of pinions and wheels is to be demonstrated to the satisfaction of the Surveyors. For this purpose, records of measurements of pitch error, undulations, axial pitch errors, tooth thickness and backlash should be available for review by Surveyors on request.

5.5.3 The alignment is to be demonstrated in the workshop by meshing in the gearbox without oil clearance in the bearings, or in the meshing frame without oil clearance in the bearings or on rollers. Meshing is to be carried out with the gears locating in their load positions, and a load sufficient to overcome pinion weight and axial movement is to be imposed.

5.5.4 A permanent record is to be made of the meshing contact for the purpose of re-checking the alignment when installed on board ship. The meshing contact on each helix is not to be less than following:

a) For through-hardened gears,

  - 40 per cent of the working depth for 35 per cent of the length; and

  - 20 per cent of the working depth for further 35 per cent of the length;

b) For through-hardened gears and for all surface hardened gears,

  - 40 per cent of the working depth for 50 per cent of length; and

  - 20 per cent of the working depth for a further 40 per cent of the length.

5.6 Balancing of gear pinions and wheels

5.6.1 All pinions, gear wheels and flexible couplings or sleeves whose maximum designed speed of rotation exceeds 1000 revolutions per minute are to be dynamically balanced, where the speed of rotation is 1000 revolutions per minute or less, these components are to be statically or, alternatively, dynamically balanced. Parts of couplings, etc., which are to be fixed to the gear in service are normally to be attached before balancing.

5.6.2 For static balancing the final out of balance of each assembly at the balancing planes is not to exceed 2200 [N mm/tonne] of gears whose maximum design speed is less than 300 revolutions per minute and 680 [N mm/tonnes] for gears whose maximum design speed is between 300 and 1000 revolutions per minute. For dynamic balancing the final out of balance is not to exceed 190,000/N_1 [N mm/tonne], where N_1 = revolutions per minute appropriate to the assembly.

5.6.3 Balancing may, however, be omitted for turbine secondary pinions and for oil engines gearing, provided that the rotating components are of solid forged construction or have a solid forged centre with shrunk-on rim and in both cases are machined to give a concentric and uniform cross-section.

5.7 Gearcases

5.7.1 Gearcases and their supports are to be designed sufficiently stiff such that misalignment at the mesh due to movements of the external foundations and the thermal effects under all conditions of service do not disturb the overall tooth contact. If welding is employed in their construction they are to be stress-relieved on completion.

5.7.2 Inspection openings should be provided at the peripherals of gearcases to enable the teeth of pinions and wheels to be readily examined. When the construction of gearcases is such that sections of the structure cannot readily be moved for inspection purposes, access openings of adequate size are to be also provided at the ends of the gearcases to permit examination of the structure of the wheels. Their attachment to the shafts should be capable of being examined by removal of bearing caps or by equivalent means.

5.8 Type tests and sea trials

5.8.1 Upon completion of fabrication and assembly, reduction gear unit is to be subjected to type testing in accordance with the agreed test programme which is to be submitted by the manufacturer for approval. Type tests are to be witnessed by the Surveyor.

5.8.2 Reduction gearing units, in general, are to be type tested at maker’s works and test load and duration of testing is to be agreed upon in each case.

5.8.3 Tests are to include demonstration of satisfactory operation of clutches and couplings, if fitted.

5.8.4 After completion of type tests, all gear elements are to be examined for tooth contact marking and alignment. All gear tooth contact is to conform to the requirements given in Cl. 5.5.5.

5.8.5 The gear lub.oil system is to be provided with means of indicating the lub.oil pressure supply to them. Alarms are to be provided to indicate low lub.oil pressure, low clutch oil/air pressure and high lub.oil temperature in accordance with Part 4, Chapter 7, Table 1.9.1.

5.9 Alignment and weardown gauges

5.9.1 Reduction gears with sleeve bearings for main and auxiliary turbines and oil engines, are to be provided with weardown gauges or micrometers for testing the internal alignment of the various elements in the gearcases. In certain gears, e.g. gears of the dual tandem type, the direction of loading on the bearings of a gear element may be such that an accurate indication of its alignment under operating conditions cannot be obtained using weardown gauges. In these instances, suitable alternatives such as crown thickness micrometer are to be provided.

5.9.2 Approved means are to be provided by the gear manufacturer to enable the Surveyors to verify that no distortion of the gearcase has taken place, when chocked and secured to its seating on board ship.

5.10 Trials

5.10.1 The sea trials should be of sufficient duration to prove the gears. After these trials, the marking revealed by inspection should indicate freedom from hard bearings, particularly towards both ends of each helix.

5.10.2 In the case of through-hardened gears, not less than 70 per cent contact across effective face width should be indicated. When the teeth of such gears are finished by an approved post hobbing process or profile ground, not less than 90 per cent contact across the effective face width is to be indicated.

5.10.3 For surface hardened gears, the contact across the effective face width is also to be not less than 90 per cent.

Section 6

Main Propulsion Shafting

6.1 Scope

6.1.1 The requirements of this Section apply to shafting for main propulsion of straight forged design and which are driven by rotating machines such as diesel engines, turbines or electric motors. The requirements for couplings, coupling bolts, keys, keyways, sternbushes and associated components are also included. The diameter of shafting as calculated may require to be modified as a result of alignment considerations and vibration characteristics (See Sec.8) or the inclusion of stress raisers, other than those contained in this section.

The requirements given in this section do not cover shafts intended for following application.

- gearing shafts
- electric motor shafts
- generator rotor shafts
- turbine rotor shafts.

6.1.2 The scantlings of shafts that are integral to equipment, such as for gear boxes, podded drives, electrical motors and/or generators, thrusters, turbines and which in general incorporate particular design features are to be determined taking into account appropriate additional criteria including that for stiffness, high temperature application etc. The requirements given in this section may be applied if such shafts are subjected mainly to torsion and are having traditional design features.

6.1.3 For additional strengthening for shafts in ships classed for navigation in waters with ice condition, refer Pt.5, Ch.21 and for diesel engine crankshaft refer IRS Classification Note “Crankshaft for Internal Combustion Engines”.

6.2 Alternative calculation methods

6.2.1 Alternative calculation methods will be considered provided these calculations take into account all relevant loads in the complete dynamic shafting system under all permissible operating conditions giving due consideration to the dimensions and arrangements of all shafting connections. The alternative calculation method is to also take into account design criteria for continuous and transient operating loads for dimensional adequacy for fatigue strength and peak operating loads for yield strength. Refer 6.2.2 to 6.2.5 as guidance for alternative calculations.

6.2.2 The two important considerations that are essential for the design of propulsion shafting are:

a) Fatigue
b) Stress concentration and notch sensitivity.

***Fatigue** : The deterioration of the properties of material which takes place under conditions involving fluctuating stresses. Fatigue failures generally occur at loads, which if applied statically would be below the elastic limit. The fatigue limit of a material is the stress which will not produce failure, even if many fluctuations of it are imposed.*

***Stress concentration in shafts** : Basic stress analysis calculations assume that the components are smooth, have a uniform section and have no irregularities. In practice virtually all engineering components have to have changes in section and/or shape. Common examples are shoulders on shafts, oil holes, key ways and screw threads. Any discontinuity changes the stress distribution in the vicinity of the discontinuity, so that the basic stress analysis equations no longer apply. Such ‘discontinuities’ or ‘stress raisers’ cause local increase of stress referred to as ‘stress concentration’.*

For static loading the theoretical or geometric stress concentration factors K_t or K_{ts} relate to actual maximum stress at the discontinuity to the nominal stress as follows:

K_t = maximum direct stress/nominal direct stress
K_{ts} = maximum shear stress/nominal shear stress.

The subscript ‘t’ denotes that the stress concentration value is a theoretical calculation based only on the geometry of the component and discontinuity.

Some materials are not as sensitive to notches as implied by the theoretical stress concentration factor. For these materials a reduced value of stress concentration factor K_f may be used where the maximum stress = K_f x nominal stress. The value of K_f which depends on notch sensitivity ‘q’ is to be determined using the following equation:

$q = (K_f - 1) / (K_t - 1)$ where q is between 0 and 1.

If q = 0, then $K_f = 1$ as the material has no sensitivity to notches. If q = 1, then $K_f = K_t$ and the material is fully notch sensitive.

When designing, usual practice is to first find K_t from the geometry of the component, then specify the material and determine the notch sensitivity, q from the chart for the notch radius.

For cyclic loading, the theoretical stress concentration factor is to be defined as

$$K_{t1} = \frac{\text{endurance limit without stress concentration}}{\text{endurance limit with stress concentration}}$$

Using the notch sensitivity factor ‘q’ in cyclic loading of shaft, fatigue stress concentration factor K_f is calculated as :

$$K_f = 1 + q\,(K_{t1} - 1)$$

6.2.3 The alternative calculation methods are to take into account following fatigue related issues as have been considered in rule formulations:

a) Low cycle fatigue criterion (typically < 10^4), i.e. the primary cycles represented by zero to full load and back to zero, including reversing torque if applicable.

b) High cycle fatigue criterion (typically > 10^7), i.e. torsional vibration stresses permitted for continuous operation as well as reverse bending stresses.
The limits for torsional vibration stresses are given in 8.4.2.

c) The accumulated fatigue due to torsional vibration when passing through a barred speed range or any other transient condition with associated stresses beyond those permitted for continuous operation is addressed by the criterion for transient stresses in 8.4.2.

6.2.4 The factors k (for low cycle fatigue) and c_k (for high cycle fatigue) as given in Table 6.5.1 and Table 8.4.2 respectively take into account the influence of:

- The stress concentration factors (scf) relative to the stress concentration for a flange with fillet radius of $0.08d_o$ (geometric stress concentration of approximately 1.45).

$$c_k \approx \frac{1.45}{scf} \quad \text{and} \quad k \approx \left[\frac{scf}{1.45}\right]^x$$

where the exponent x considers low cycle notch sensitivity.

- The chosen values of the notch sensitivity are mainly representative for soft steels (σ_B < 600), while the influence of steep stress gradient s in combination with high strength steels may be underestimated.

- The size factor C_D being a function of diameter only does not purely represent a statistical size influence, but rather a combination of this statistical influence and the notch sensitivity.

6.2.5 The stress concentration factor (scf) at the end of slots can be determined by means of the following empirical formulae:

$$scf = \alpha_{t(hole)} + 0.8\,.\frac{(l - e)/d}{\sqrt{\left(1 - \frac{d_i}{d}\right).\frac{e}{d}}}$$

where,

e = slot width
l = length of the slot
d_o = outer diameter
d_i = inner diameter (Refer figure given under Table 6.5.1).

This formula applies to:

- slots at 120 or 180 or 360 degrees apart.

- slots with semicircular ends. (Though multi-radii slot end can reduce the local stresses, this is not included in this empirical formula).

- slots with no edge rounding (except chamfering), as any edge rounding increases the scf slightly.

$\alpha_{t(hole)}$ = factor representing the stress concentration of radial hole of diameter e:

$$= 2.3 - 3.\frac{e}{d} + 15.\left(\frac{e}{d}\right)^2 + 10.\left(\frac{e}{d}\right)^2.\left(\frac{d_i}{d}\right)^2$$

6.3 Plans and particulars

6.3.1 The following plans, in triplicate, together with the necessary particulars of the machinery, including the maximum power and revolutions per minute, are to be submitted for approval before the work is commenced.

- Power take-off arrangement if any (e.g. shaft generator), propulsion boosters or similar equipment rated for 100 [kW] and above;
- Final gear shaft;
- Thrust shaft;
- Intermediate shafting, shaft bearings;
- Tube shaft, where applicable;
- Tail shaft;
- Stern tube, shaft seals and Stern bush;
- Stern tube lubrication system;
- Couplings (integral, demountable, keyed or shrink-fit), coupling bolts and keys;
- Flexible coupling including constructional details, static and dynamic torsional stiffness, damping characteristic, rated power, torque and RPM, allowable vibratory torque for continuous and transient operation and allowable misalignment for continuous operations;
- Cardan shafts, if fitted.

6.3.2 The specified minimum tensile strength of each shaft is to be stated.

6.3.3 A shafting arrangement plan indicating the relative position of the main engines, flywheel, flexible coupling, gearing, thrust block, line shafting and bearings, stern tube, 'A' brackets and propeller, as applicable, is to be submitted for information.

6.4 Materials for shafting

6.4.1 The materials are to comply with the relevant requirements of Pt.2, Ch.5. The specified minimum tensile strength of forgings is to be selected within the following general limits:

a) Carbon and carbon-manganese steel 400-760 [N/mm^2];

b) Alloy steels - 400-800 [N/mm^2];

Where shafts may experience vibratory stresses close to the permissible stresses for transient operation, the materials are to have a specified minimum tensile strength of 500 [N/mm^2].
